MAY, PHILIP WILLIAM, called PHIL MAY (1864-1903), humorous draughtsman, born at 66 Wallace Street, New Wortley, Leeds, on 22 April 1864, was seventh child of Philip William May, an engineer. His father's father was Charles May, squire of Whittington, near Chesterfield, a sportsman and amateur caricaturist. His mother's father was Eugene Macarthy (1788-1866), an Irish actor and for a while manager of Drury Lane Theatre. An elder sister of his mother, Maria (1812-1870), was an actress of repute, and married Robert William Honner [q.v.], manager of the Sadler's Wells and Surrey Theatres. Charles May being a friend of George Stephenson, his son Philip (the artist's father) was admitted as a pupil to Stephenson's locomotive works at Newcastle-on-Tyne, but failed to succeed in business on his own account, with the result that his family were in very needy circumstances. Phil May was sent to St. George's School, Leeds, but left very early. His own wish was to be a jockey; but when still quite a child

he was employed as timekeeper in a foundry, and at twelve years of age had begun to help the scene painter and make himself generally useful at the Leeds theatre. Subsequently he joined a touring company as an actor, his first appearance being at the Spa Theatre, Scarborough. He played among other parts François in 'Richelieu' and the cat in 'Dick Whittington.' In his fifteenth year he set out for London to earn his fortune, suffering there great hardships. Part of the return journey he performed on foot. In Leeds again, he took to drawing in earnest, contributed to a paper called 'Yorkshire Gossip,' and designed pantomime costumes. At the age of nineteen he married Sarah Elizabeth Emerson.

In 1883, after more London poverty, May drew a caricature of Irving, Bancroft, and Toole leaving a Garrick Club supper, which was published by a print-seller in the Charing Cross Road. The print caught the eye of Lionel Brough, the actor, who bought the original (cf. *The Bancrofts: Recollections of Sixty Years*, 1909, p. 330, with reproduction). Replicas were subsequently acquired by King Edward VII, Sir Arthur Pinero, and Sir Squire Bancroft. Brough recommended May to the editor of 'Society.' For 'Society' he did some work, and then passed to 'St. Stephen's Review,' of which paper he was the artistic mainstay until a break down of health made it advisable to go to Australia, where he had an offer of 20l. a week from the 'Sydney Bulletin.' He left London in 1885 and remained in Australia until 1888, completing altogether some 900 drawings for the 'Bulletin.' For a while after leaving that paper he remained in Melbourne practising painting, and then settled in Paris to study art as seriously as he was able. Returning to live in London in 1892, he resumed his labours on 'St. Stephen's Review,' to which from Paris he had contributed his first widely successful work, the illustrations to 'The Parson and the Painter,' published as a book in 1891. In 1892 appeared the first 'Phil May's Winter Annual,' destined to be continued until 1903, containing some thirty to fifty drawings by himself, with miscellaneous literary matter. There were fifteen issues in all (three being called 'Summer Annual'), and these shilling books probably did as much to make the artist's reputation as a humorist as any of his journalistic drawings. His first important newspaper connection was with the 'Daily Graphic,' for which paper he started on a tour of the world,

which however came to an abrupt close in Chicago, and he returned to London in 1893, never to leave it again. There followed a very busy period, during which he contributed not only to the 'Daily Graphic' and 'Graphic' but, among other illustrated papers, to the 'Sketch' and 'Pick-me-up,' and steadily acquired a name for comic delineations of low life such as none could challenge. In 1895 there appeared 'Phil May's Sketch Book: Fifty Cartoons,' and in 1896 his 'Guttersnipes: Fifty Original Sketches,' containing some of his most vivid and characteristic work, on the strength of which he was elected to the Royal Institute of Painters in Water Colours. In the same year he succeeded to a chair at the 'Punch' Table. Although he retained it until his death the traditions of the paper were a little cramping to one so essentially Bohemian as he, while some of his contributions to it, such as the illustrations to the 'Essence of Parliament' (reissued in Lucy's 'Balfourian Parliament,' 1906), must be considered a misapplication of his genius. Portraits were not his forte, and any time which he spent on drawing from photographs was lost. In 1897 appeared 'Phil May's Graphic Pictures' and also 'The ZZG., or Zig-Zag Guide. Round and about the beautiful and bold Kentish coast. Described by F. C. Burnand and illustrated by Phil May,' to which the artist contributed 139 illustrations; in 1899 followed both 'Fifty hitherto unpublished Pen and Ink Sketches' and the 'Phil May Album, collected by Augustus M. Moore,' with a biographical preface.

Phil May once stated that all he knew about drawing had come from Edward Linley Sambourne [q. v. Suppl. II]. Although the initial line work of the two men is very similar, the difference in the completed drawings is wide. Sambourne progressed by multiplying strokes; May by the process of omitting them. Phil May struck out line after line until only the essentials remained. His usual method for his 'Punch' contributions was to draw more or less fully in pencil and then work over this with pen and ink, with the utmost economy of stroke, and finally rub out the pencil. But latterly he often omitted the pencil foundation. Those who attended his lectures, which he illustrated as he talked, or were present at Savage Club entertainments at which he acted as 'lightning cartoonist,' say that the rapidity and sureness of his hand were miraculous. May's line at its best may be said to be alive.

It is certain that no English draughtsman has ever attained greater vigour or vivacity in black and white. In this frugal and decisive medium he drew thousands of droll and cynical scenes of Bohemian and street life, becoming thereby as pre-eminently the people's illustrator of the end of the Victorian period as Keene had been during its middle years and Leech during its earlier ones. None could set down London street types, whether of Seven Dials or the Strand, with greater fidelity and brilliance. Critics and artists alike united to praise him. Whistler once remarked that modern black and white could be summed up in two words—Phil May.

In private life May was a man of much humour and a curious amiability and gentleness, qualities which unhappily carried with them a defect of weakness that made him the victim both of sociability and of impecunious friends. He earned large sums but was too easily relieved of them. His 'Punch' editor, Sir Francis Burnand, tells a story illustrative at once both of his generosity and of his inherent sweetness, to the effect that on being asked at a club for a loan of 50*l.*, May produced all he had—namely half that amount—and then abstained from the club for some time for fear of meeting the borrower, because he felt that 'he still owed him 25*l.*'

Before his health finally broke May had been a sedulous horseman. He was greatly interested in boxing, although rather as a spectator than a participant, and another of his hobbies was the composition of lyrics, usually of a sentimental order, some of which were set to music. Not long before his death he made a serious arrangement to return to the stage, as Pistol, in a revival of 'Henry V'; but his appearance did not extend beyond one or two rehearsals taken with impossible levity. A full-length portrait of May in hunting costume by J. J. Shannon was exhibited at the Academy of 1901, so realistic in character as to distress many who saw it and were unaware of May's besetting weakness. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1895. He also introduced himself in his pictures probably more frequently than any other artist, often with a whimsical and half-patetic sidelong glance at his foibles. He died on 5 Aug. 1903 at his home in Medina Place, St. John's Wood, and was buried at Kensal Green. His widow, who received a civil list pension of 100*l.* a year, married again and died in 1910. He left no family.

After his death there were published further collections of published and unpublished sketches in 'Phil May's Sketches from Punch,' 1903, his 'Picture Book,' 1903, with a biographical and critical preface by G. R. Halkett; his 'Medley,' 1904, his 'Folio of Caricature Drawings and Sketches,' 1904, with a biography, and in the same year 'Phil May in Australia,' with both an excellent biography and iconography. On 25 June 1910 a mural tablet subscribed for by the public was unveiled on the house in Leeds where he was born, recording the circumstance and calling him 'the great black and white artist' and 'a fellow of infinite jest.'

[The Times, 6 August 1903; biographical prefaces to Phil May in Australia, Bulletin Office, Sydney, 1904, and The Phil May Folio, London, 1904; James Glover, Jimmy Glover: his book, 1911 (with portrait of May by himself, Leeds, 1880); private information.]

E. V. L.

MAYOR, JOHN EYTON BICKERSTETH (1825–1910), classical scholar and divine, third son of the Rev. Robert Mayor (*d.* 1846), was born on 28 Jan. 1825 at Baddegama in Ceylon, where his father was a missionary of the Church Missionary Society from 1818 to 1828. His mother was Charlotte (1792–1870), daughter of Henry Bickersteth, surgeon, of Kirkby Lonsdale, and sister of Henry Bickersteth, Baron Langdale [q. v.], and Edward Bickersteth, rector of Watton [q. v.]. He was named John Eyton in memory of his father's friend, the Rev. John Eyton (*d.* 1823), rector of Eyton in Shropshire, who had prompted the elder Mayor to abandon the medical profession and to become a missionary (*The Eagle*, xxv. 333).

From his early boyhood Mayor delighted in books. At the age of six he 'revelled in Rollin (in default of Plutarch)' and in English prose versions of Homer and Virgil (*First Greek Reader*, p. xxi, n. 2). After attending the grammar school of Newcastle-under-Lyme as a day boy, he was from 1833 to 1836 at Christ's Hospital, whence he was removed owing to an attack of scarlet fever. For several years he was at home, learning Greek, as well as Latin, from his mother. In 1838, with the aid of his uncle, Robert Bickersteth, a successful surgeon in Liverpool, he was sent to Shrewsbury, the school which won his lifelong devotion. He read much out of school, for his own improvement. He bought for himself and 'perused carefully' the works of Joseph Butler and Richard Hooker (*The Latin Heptateuch*, p. lxvii f.), and was

familiar with the writings of 'Leighton and Burnet and Chalmers—from very early days' (*The Eagle*, xxiii. 106). He 'thumbed the "Corpus Poëtarum" from Lucretius to Ausonius.' Milton's verse, English and Latin, he 'nearly knew by heart' (*First Greek Reader*, p. xxxvi).

In Oct. 1844 he began residence at St. John's College, Cambridge (on his interests as an undergraduate, see *ib.* pp. xli seq. and *The Eagle*, xxiii. 308). His college tutor was the Rev. Dr. Hymers, his private tutor William Henry Bateson [q. v.], ultimately Master of St. John's. He also read classics with Richard Shilleto [q. v.]. In the classical trips of 1848 he was third in the first class. An elder brother, Robert Bickersteth, was third wrangler in 1842; his younger brother, Joseph Bickersteth, was second classic in 1851; all the three brothers were elected fellows of the college, the date of John's admission as fellow being 27 March 1849.

From 1849 to 1853 Mayor was master of the lower sixth at Marlborough College, and there he prepared his erudite edition of 'Thirteen Satires of Juvenal.' This was first published in a single volume with the notes at the foot of the page (1853). A second edition was published in two volumes (1869–78) with the notes at the end of each, and a third edition (1881) with the text of the 'Thirteen Satires' and the notes on Satires i., iii.–v., vii. in the first volume, and the notes on Satires viii., x.–xvi. in the second. A fourth edition of the first volume appeared in 1886.

In 1853 Mayor returned for life to St. John's, at first as an assistant tutor or lecturer in classics, but the vastness of his learning prevented him from being a good lecturer. He was ordained deacon in 1855 and priest in 1857. He subsequently kept the act for the B.D. degree (taking the subject of vernacular services *versus* Latin), preached a Latin and an English sermon, but never took the degree (*The Eagle*, xxiii. 107). To the 'Journal of Classical and Sacred Philology,' founded by Hort, Lightfoot, and Mayor in 1854, he contributed two learned and comprehensive articles on Latin lexicography (Nov. 1855 and March 1857).

Throughout life Mayor applied himself with exceptional ardour to various forms of literary and antiquarian research, and he proved indefatigable in amassing information. He brought together an immense library, which he stored until 1881 in his college rooms over the gateway of the second court. In that year he acquired a small house in Jordan's Yard to make

room for the overflow of books and papers. An accomplished linguist, he was familiar not only with Latin and Greek but with French, Italian, and Spanish, and notably with German and Dutch. To the collecting of biographical material he devoted immense energy, and in later life he placed his biographical notes at the disposal of contributors to this Dictionary.

His early publications include biographies of Nicholas Ferrar (1855), of Matthew Robinson (1856), of Ambrose Bonwicke (1870), and William Bedell (1871), as well as an edition of Roger Ascham's 'Schole-master' (1863; new edit. 1883). But the history of his own university was one of his most absorbing interests, and he emulated the antiquarian zeal of Thomas Baker [q. v.], the ejected fellow of the 18th century. He printed the four earliest codes of the college statutes (1859). He transcribed the admissions to the college from 1630, and his transcript was edited as far as 1715 by himself (1882–93), and as far as 1767 by Mr. R. F. Scott (1903). He calendared Baker's voluminous MSS. in the university library. He supplied material to Prof. Willis and John Willis Clark [q. v. Suppl. II] for their 'Architectural History of Cambridge,' and he gave every aid and encouragement to Charles Henry Cooper [q. v.] in his labours on Cambridge history and biography, and accumulated manuscript notes for a continuation of Cooper's 'Athenæ Cantabrigienses.' Mayor foretold that his own biographical collections would survive with the manuscripts of Baker and Cole. In 1869 Mayor published for the first time Baker's 'History of St. John's College,' a solid work in two large volumes; he continued Baker's text, and added abundant notes to the lives of all the Masters of the college and of the bishops trained within its walls.

In 1864 Mayor was elected without a contest university librarian. He held the post for three years, and was never absent from his duties for more than eight days together. During his tenure of office the catalogue of MSS. was completed, and he substituted for the various series of class-marks a single series of Arabic numerals (a reform which was subsequently abandoned). Although his energy increased the life and vigour of the library, all his literary and antiquarian projects were in his own words put 'out of gear' by his duties, and in 1867 he withdrew to resume his private work. The revision of his 'Juvenal' chiefly occupied him between 1869 and 1872, and in the last year (1872) he was elected

professor of Latin in succession to Hugh Andrew Johnstone Munro [q. v.]. He remained professor till his death. His favourite subjects for lectures were Martial and the Letters of Seneca and the younger Pliny, with Minucius Felix and Tertullian. But, like his college lectures, those delivered before the university were too closely packed with references to parallel passages to be appreciated by the ordinary student. His lectures on Bede bore fruit in 1878 in a joint edition (with Dr. J. R. Lumby) of the 'Ecclesiastical History' (bks. iii. and iv.), in which the learned and multifarious commentary fills a little more space than the text.

Mayor pursued his studies unremittingly, 'taking no exercise for its own sake' and rarely going abroad except on academic or learned business. In 1875 he represented Cambridge University at the tercentenary of Leyden, where he met Madvig and Cobet. In the same year he paid his only visit to Rome, where, apart from its ancient associations, he was mainly interested in the modern schools, where the boys learnt by heart whole books of Virgil and Tasso. A keen interest in the Old Catholics led him to attend the Congress convened at Constance in 1873, when he delivered a German as well as an English discourse (Mayor's *Report of Congress, 1873*; also his edit. of *Bishop Reinkens' Second Pastoral Letter and Speeches, and Prof. Messmer's Speech, 1874*).

His physical constitution was remarkably strong. He attributed the vigour of his old age to his strict adherence to vegetarian diet, which he adopted in middle life and thenceforth championed with enthusiasm. He set forth his views on diet first in 'Modicus Cibi Medicus Sibi, or Nature her Own Physician' (1880); and subsequently in the selected addresses published in 'Plain Living and High Thinking' (1897). In 1884 he became president of the Vegetarian Society, and held office till death. Throughout that period he was a frequent contributor to the 'Dietetic Reformer and Vegetarian Messenger'; and the Vegetarian Society in 1901 printed selections by him from the Bible and from English poets under the title of 'Sound Mind in Body Sound: a Cloud of Witnesses to the Golden Rule of not too much.' He was also keenly interested in missionary work at home and abroad, and especially in the college mission in Walworth.

Mayor became president of his college in Oct. 1902, and at the fellows' table he charmed visitors of the most varied tastes

by his old-fashioned courtesy, and by his learned and lively talk. His interests within their own lines remained alert to the last. When the National Library of Turin was partly destroyed by fire on 26 Jan. 1904, he promptly sent the library no fewer than 710 volumes (*The Eagle*, xxvi. 264 f.). In 1907 he easily mastered Esperanto.

Mayor's wide learning received many marks of respect in his later years. He received the honorary degree of D.C.L. from Oxford in 1895, that of LL.D. from Aberdeen in 1892 and from St. Andrews in 1906, and that of D.D. from Glasgow in 1901. He was one of the original fellows of the British Academy (1902). In 1905, on his 80th birthday, a Latin address of congratulation written by Prof. J. S. Reid and numerous signed, was presented to him at a meeting held in the Combination Room of St. John's, under the presidency of Sir Richard Jebb. Until 1908 he preached in the college chapel and occasionally in the university church. He printed his sermons immediately after delivery, without his name, but with the date and place, and with an appendix of interesting notes. His style in the pulpit reflected the best seventeenth and eighteenth century examples, and his sermons dealt exhaustively with subjects of importance. 'The Spanish Reformed Church' was the theme of two sermons in 1892 and 1895, the first of which was partly delivered in the university church and was published in 'Spain, Portugal, the Bible' (1895). His last sermon, that on 'The Church of Scotland' (1908), was in praise of Scottish learning and Scottish missionary enterprise. A selection of his sermons was edited for the Cambridge University Press by the Rev. H. F. Stewart in 1911, after his death. Mayor, who was unmarried, died suddenly of heart failure within two months of completing the 86th year of his age, on 1 Dec. 1910, while he was preparing to leave his Cambridge residence, with a view to reading prayers in the college chapel. He was buried in St. Giles's cemetery, on the Huntingdon road, Cambridge.

Mayor possessed an unusual power of accumulating knowledge. He had small faculty of construction, and much of the work that he designed was not attempted, or if attempted was uncompleted. A projected commentary on Seneca never appeared. A Latin dictionary, which might have been his *magnum opus*, was never seriously begun. Contemplated editions of Milton and of Boswell's 'Life of Johnson,' and an ecclesiastical history of the first

three centuries came to nothing. Yet his publications are very numerous and cover a wide range. Some of these have been already mentioned. His scholarly reputation mainly rests on his edition of Juvenal. Apart from this, his chief contributions to classical learning are an edition of Cicero's 'Second Philippic,' founded on that of Halm (1861); a bibliography of Latin literature, founded on that of Hübner (1875); and an independent edition of the 'Third Book of Pliny's Letters' (1880). In 1868 he published an excellent 'First Greek Reader,' with a vigorous preface on classical education, interspersed with interesting touches of autobiography. Of proposed editions of 'The Narrative of Odysseus' ('Odyssey,' books ix.-xii.), and of the 'Tenth Book of Quintilian,' only a small portion was published (1872). His annotated editions of Burman's and Uffenbach's visits to Cambridge, printed in 1871, were posthumously published, as part of 'Cambridge under Queen Anne,' in 1911. In 1889 he published a critical review of the 'Latin Heptateuch' of Cyprian, the sixteenth-century poet and bishop of Toulon. Among miscellaneous works may be reckoned Mayor's edition of Richard of Cirencester's 'Speculum Historiale de gestis Regum Angliae' for the Rolls series (2 vols. 1863-9), devoting many pages of the preface to indicating the exact sources of all the borrowed erudition of the forger of the treatise 'De Situ Britanniae,' which its first editor (and, indeed, author), Charles Bertram [q. v.] of Copenhagen, had falsely attributed to Richard of Cirencester. In 1874 he edited Cooper's 'Mémorial of Margaret Countess of Richmond and Derby,' and in 1876 published, for the Early English Text Society, 'The English Works of Bishop Fisher.' His latest work was a 'First German Reader, with Translation and Notes,' which he had printed for himself and published at the Cambridge University Press in Jan. 1910 with the title 'Jacula Prudentium, Verse and Prose from the German.'

His annotated copies of Juvenal and Seneca are among the books presented by his executors to the library of his college, and his interleaved Latin dictionaries are among those presented to the university library, which he named as the ultimate destination of his biographical collections. Of the rest of his library more than 18,000 volumes were sold in Cambridge after his death (Catling's catalogue of sale on 14-18 March 1911).

A presentation portrait painted by (Sir) Hubert (von) Herkomer in 1891 is in

the hall of St. John's College. An etching by the same artist formed the frontispiece of 'Minerva' (1903-4), and is reproduced in 'The Eagle' (xxv. 129).

[Autobiographical passages in prefaces to First Greek Reader, Juvenal (ed. 1886), The Latin Heptateuch, and in Spain, Portugal, the Bible; also in Commemoration Sermon, 1902, in The Eagle, xxiii. 307f. and 106f.; Report of Meeting of Subscribers to Portrait of Prof. Mayor, ib. xvi. 268-76, xvii. 81; Presentation of Address, ib. xxvi. 241-7, with reprint of articles on Prof. Mayor in National Observer, 26 Dec. 1891, and Daily Mail, 25 Aug. 1904; obituary notices by the present writer in The Times, 2 Dec. 1910; Guardian, 9 Dec. p. 1717; Cambridge Review, 8 Dec.; Classical Review, Feb. 1911; Proceedings of the British Academy, April; and The Eagle, xxxii. pp. 189-98, followed on pp. 199-232 by notices by Rev. C. E. Graves, Rev. H. F. Stewart, J. B. Mullinger, and others, and reprint of articles in The Athenæum, 10 Dec. 1910, and Blackwood's Magazine, Jan. 1911, with bibliography of contributions to Notes and Queries; writings on Vegetarianism, ib. pp. 232, 316f., and articles in classical periodicals, ib. xxxiii. pp. 58-62; university tributes to his memory in Cambridge University Reporter, xli. pp. 608, 1270, and xlii. 37; lastly, Mémorial in Select Sermons, edit. by the Rev. H. F. Stewart (with portrait), Cambridge, 1911.] J. E. S.

MEADE, RICHARD JAMES, fourth EARL OF CLANWILLIAM in the Irish peerage, and second BARON CLANWILLIAM in the peerage of the United Kingdom (1832-1907), admiral of the fleet, born on 3 Oct. 1832, was eldest son in the family of four sons and a daughter of Richard Charles Francis Meade [q. v.], third earl of Clanwilliam and Baron Gillford in the Irish peerage and Baron Clanwilliam in the peerage of the United Kingdom, by his wife Lady Elizabeth, eldest daughter of George Augustus Herbert, eleventh earl of Pembroke. He had his early education at Eton, and entered the navy on 17 Nov. 1845; he passed his examination in Nov. 1851 and was promoted to lieutenant on 15 Sept. 1852. In Dec. of the same year he was appointed to the Imperieuse, frigate, in which he served during the whole of the Russian war. The Imperieuse was senior officer's ship of the advanced squadron and followed up the ice and established the blockade of the Gulf of Finland as early in the spring as possible, and before the navigation was thought safe for heavy ships. In Sept. 1856 Lord Gillford was appointed to the Raleigh, Captain Keppel [see KEPPEL, SIR HENRY, Suppl. II],

for the China station, and when the Raleigh was wrecked near Hong Kong on the passage out, he followed Keppel and with him took part in the boat actions of Escape Creek on 25 May 1857 and of Fatshan Creek on 1 June. In August he was appointed to the Calcutta, flagship of Sir Michael Seymour [q. v.], and in Dec. he landed with the naval brigade before Canton. At the storming of Canton on 29 Dec. Gillford was severely wounded in the left arm by a gingle bullet; he was mentioned in despatches, received the medal with clasps for Fatshan and Canton, and on 26 Feb. 1858 was promoted to commander and appointed to the Hornet, which he took to England. On 22 July 1859 he was promoted to captain. From 1862 to 1866 he commanded the Tribune in the Pacific, and from Oct. 1868 to 1871 the battleship Hercules in the Channel. In 1872 he became an aide-de-camp to Queen Victoria, and was given the command of the steam reserve at Portsmouth. On the formation of Disraeli's ministry in 1874 he joined the Board of Admiralty as junior sea lord, and continued at Whitehall until the change of government brought in a new board in May 1880. He was promoted to flag rank on 31 Dec. 1876, received the C.B. in June 1877, and succeeded to the earldom on 7 Oct. 1879. From 1880 to 1882 he had command of the flying squadron, reaching the rank of vice-admiral on 26 July 1881, and being awarded the K.C.M.G. in March 1882; from Aug. 1885 to Sept. 1886 he flew his flag as commander-in-chief on the North American and West Indies station, laying down the command in consequence of his promotion to admiral on 22 June 1886. In June 1887 he was raised to the K.C.B., and in 1888 became a commissioner of the patriotic fund. He was commander-in-chief at Portsmouth from June 1891 to June 1894, was promoted to admiral of the fleet on 20 Feb. 1895, received the G.C.B. in May following, and reached the age for retirement on 3 Oct. 1902.

In the words of one of his messmates, Clanwilliam 'throughout his life was before everything a sailor, studious of the interests of the service and of those under his command, and probably valued his rank as an admiral much more than his title as an Irish earl or English baron.' He died on 4 Aug. 1907 at Badgemore, Henley on Thames, and was buried in the family vault at Wilton, near Salisbury.

He married on 17 June 1867 Elizabeth Henrietta, eldest daughter of Sir Arthur

Edward Kennedy [q. v.], G.C.M.G., governor of Queensland, and had four sons and four daughters. The eldest son, Richard Charles, Lord Gillford, born in 1868, entered the navy, was made lieutenant in 1891, was flag lieutenant to Sir George Tryon [q. v.] in the Victoria in 1893, and leaving the navy shortly afterwards, died in 1905. The second son, Arthur Vesey Meade, Lord Dromore, born in 1873, succeeded to the earldom; the third, Herbert, entered the navy and reached the rank of commander in 1908; and the youngest, Edward Brabazon, was a captain in the 10th hussars.

A portrait by Rudolf Lehmann was exhibited at the Royal Academy in 1899; a 'Vanity Fair' cartoon by 'Spy' was published in 1903; and an engraved portrait was published by Messrs. Walton of Shaftesbury Avenue.

[The Times, 5 and 9 Aug. 1907; Burke's Peerage.] L. G. C. L.

MEAKIN, JAMES EDWARD BUDGETT (1866-1906), historian of the Moors, born at the house of his mother's brother at Ealing Park, London, on 8 Aug. 1866, was the eldest son in a family of three sons and two daughters of Edward Ebenezer Meakin, then a tea-planter in Almora, India, by his wife Sarah, only daughter of Samuel Budgett of Bristol. He was educated first at Mr. Hill's preparatory school, Redhill, and then at Reigate grammar school.

His father, who was keenly interested in oriental peoples and religion, visited Morocco, and founded there on 15 July 1884 the first English newspaper, the 'Times of Morocco,' which urged sympathetic consideration of native interests. James joined his father in Morocco for reasons of health. He acted first as assistant editor of the paper and then as editor. He at once studied the Moorish people and their language. Adopting native dress and the native name Tahar bil Mikki, he mixed freely with all classes, soon mastered the Moorish dialect of Arabic, of which he published in 1891 a word-book with English explanations ('An Introduction to the Arabic of Morocco'), and closely observed Moorish life. In 1890 he returned to England, to consider means of preparing a work on Morocco, which should be as authoritative as Lane's 'Modern Egyptians' on Egypt. But no publisher would encourage the scheme, which was abandoned. Nor would the Royal Geographical or the Scottish Geo-

graphical Society accept Meakin's proposal to explore under their auspices the mountainous district of the Central Atlas behind Morocco. After another year in Morocco (1892), he in 1893 began a journey round the world by way of Turkey and Persia, visiting all the important Mohammedan settlements in Asia and Africa. He returned to Morocco for some months in 1897, and afterwards fixed his permanent home in England, where he devoted himself to literature, journalism, and public lecturing.

Besides Morocco, Meakin now made questions of social reform a special subject of study. In 1901, with a view to raising the standard of health and comfort among the working classes and to exposing the evil conditions of city slums, Meakin organised a scheme for the delivery through the country of lectures on such themes, known as the 'Shaftesbury Lectures.' He often lectured himself, and in 1905 he took a leading part with Dr. John Brown Paton [q. v. Suppl. II] in forming the British Institute of Social Service, under whose auspices the 'Shaftesbury Lectures' were continued. In 1906 he acted as special correspondent of the 'Tribune,' a short-lived London daily newspaper, at the conference of Algéciras. In 1902 he received the Turkish order of the Medjidie in recognition of his studies of Islam. He died in Hampstead Hospital, after a brief illness, on 26 June 1906, and was buried at Highgate cemetery.

Meakin married in 1900 Kate Alberta, daughter of C. J. Helliwell, sometime of Liverpool and afterwards of Vancouver. He had one son.

As a writer on Morocco, Meakin, though without any particular gift of style, was thorough and trustworthy. His chief publications 'The Moorish Empire' (1899, an historical epitome); 'The Land of the Moors' (1901, a general description); 'The Moors' (1902, a minute account of manners and customs), are standard works. Other books of his are: 'Life in Morocco and Glimpses beyond' (1905); 'Model Factories and Villages' (1905); 'Sons of Ishmael.' With his wife, who helped him in many of his books, he wrote the article on Morocco in the 'Encyclopædia Britannica' (11th edit.).

[The Times, 30 June 1906; Who's Who, 1906; Progress, October 1906; introduction to The Moors, 1902; Athenæum, June 1906; private information.] S. E. F.

MEDD, PETER GOLDSMITH (1829-1908), theologian, born on 18 July 1829, was eldest son of John Medd, F.R.C.S.,

of Leyburn, Yorkshire, who practised at Stockport, by his wife Sarah, daughter of William Goldsmith. After education at King's College, London, where he was associate in theology in 1849 and subsequently honorary fellow, Medd matriculated at St. John's College, Oxford, on 1 March 1848, whence he migrated as scholar to University College, graduating B.A. there in 1852, and proceeding M.A. in 1855. He was fellow of University College from 1852 to 1877, bursar in 1856, tutor from 1861 to 1870, dean and librarian (1861). Taking holy orders in 1853, he served the curacy of St. John the Baptist, Oxford (1858-67), and leaving Oxford in 1870 was rector of Barnes until 1876. He declined in 1875 an offer of the bishopric of Brechin; from 1876 till his death he was rector of North Cerney, Cirencester. In 1877 Medd was made honorary canon of St. Albans. He took a leading part in the establishment of Keble College, Oxford, of the council of which he was senior member in 1871. He was select preacher at Oxford in 1881 and Bampton lecturer in 1882. His Bampton lectures, 'The One Mediator,' published in 1884, although condensed and harsh in style, show great learning. In 1883 he was proctor in convocation for the diocese of Gloucester and Bristol.

Medd took a keen interest in the higher education of women, and represented his university on the council of Cheltenham Ladies' College. He died, after a long illness, at North Cerney on 25 July 1908, and was buried there. He married on 19 Jan. 1876 Louisa, daughter of Alexander Nesbitt of Byfield House, Barnes, who with six sons and two daughters survived him.

A learned authority on the liturgy, Medd edited with William Bright [q. v. Suppl. II] in 1865 the 'Liber precum publicarum ecclesiæ Anglicanæ,' the Latin version of the Prayer Book. He contributed in 1869 an historical introduction to Henry Baskerville Walton's edition of the first Prayer Book of Edward VI and the ordinal of 1549, and in 1892 he edited Andrewes's 'Greek Devotions' from a manuscript annotated by Andrewes himself, which was discovered by Robert George Livingstone, tutor of Pembroke College. This manuscript was an earlier and more authentic transcript than that made in 1648 for Richard Drake, on which all previous editions had been based. Besides the works mentioned, Medd published several sermons and devotional volumes, including: 1. 'The Christian Meaning of the Psalms and the Supernatural Character

of Christian Truth,' 1862. 2. 'The Church and Wesleyanism,' 1868. 3. 'Home Reunion,' 1871. 4. 'Catholic Unity,' 1875. 5. 'The Country Clergyman's Ideal,' 1887. He also contributed the introductory memoir to 'Selected Letters of William Bright,' 1903.

[The Times, 28 July 1908; Brit. Mus. Cat.; private information.] W. B. O.

MEDLICOTT, HENRY BENEDICT (1829–1905), geologist, born at Loughrea, co. Galway, on 3 Aug. 1829, was second of three sons of Samuel Medlicott, rector of Loughrea, by his wife Charlotte, daughter of Colonel H. B. Dolphin, C.B. The eldest son, Joseph G. Medlicott (*d.* 1866), of the geological survey of India, afterwards in the Indian educational service, was author of a 'Cotton Hand-book for Bengal' (1862). The youngest son, Samuel, became rector of Bowness in Cumberland in 1877.

Medlicott received his early education partly in France, partly in Guernsey, and then entered Trinity College, Dublin, where he graduated B.A. in 1850, with diploma and honours in the school of civil engineering, proceeding M.A. in 1870. In 1851 he joined the geological survey of Ireland, and worked for two years under Joseph Beete Jukes [q. v.], when he was transferred to the English staff and was engaged during 1853 in field-work in Wiltshire. On 24 March 1854 he joined the geological survey of India, and from August till 1862 was professor of geology at the Thomason College of Civil Engineering at Rurki. During his vacations he carried on geological field-work for the survey under Dr. Thomas Oldham [q. v.]. In 1857, as a volunteer, he joined the garrison of Rurki against the mutineers, and for his services was awarded the Indian Mutiny medal. In 1862 he rejoined the geological survey as deputy superintendent for Bengal.

During his early years in India, Medlicott, with his brother Joseph, investigated the stratigraphical position of the Vindhyan series, and sought to separate these ancient unfossiliferous and possibly pre-Cambrian strata from the Gondwana series which ranges from upper palaeozoic into mesozoic. In a memoir published by the Indian survey in 1864 Medlicott dealt with the structure of the southern portion of the Himalayan ranges, and expressed the view that the elevation of the mountains did not commence before tertiary times. He instituted some comparisons between the structure of the Alps and the Himalayas in a paper published by the Geological Society

in 1868. In his opinion too little attention had been given to the effects of shrinkage and subsidence, and he questioned whether the sea-level has permanently maintained the same radial distance from the centre of the earth. In the words of William Thomas Blanford [q. v. Suppl. II], 'Some of the views expressed by him required and have since received revision, but as an original description of mountain-building, from a uniformitarian as opposed to a catastrophic point of view, it deserves far more attention than it has received.'

In 1876 Medlicott succeeded Oldham as superintendent of the geological survey of India, the title being altered to director in 1885. His duties kept him mainly in Calcutta, where he gave the most painstaking attention to editing the survey publications.

He retired on 27 April 1887, and died at Clifton, Bristol, on 6 April 1905. He was elected F.R.S. in 1877, and in 1888 the Wollaston medal was awarded to him by the Geological Society. He was president of the Asiatic Society of Bengal 1879–81, and was a fellow of Calcutta University.

On 27 Oct. 1857 he married at Landour (Landhaur) Louisa, second daughter of the Rev. D. H. Maunsell, by whom he had three sons and three daughters. His wife, with one son and one daughter, survived him.

His published works include: 1. 'Sketch of the Geology of the Punjab,' 1874; revised 1888. 2. 'Manual of the Geology of India,' two vols. (with W. T. Blanford), 1879; new edit., revised by R. D. Oldham, 1893. 3. 'Agnosticism and Faith,' 1888. 4. 'The Evolution of Mind in Man,' 1892.

[Obituaries by W. T. Blanford, *Proc. Roy. Soc.* lxxix. B. 1906, p. xix, and *Nature*, lxxi. 1905, p. 612.] H. B. W.

MEIKLEJOHN, JOHN MILLER DOW (1836–1902), writer of school books, born in Edinburgh on 11 July 1836, was son of John Meiklejohn, an Edinburgh schoolmaster. Educated at his father's private school (7 St. Anthony Place, Port Hopetoun), he graduated M.A. at Edinburgh University on 21 April 1858, when he was the gold medalist in Latin. At an early age he devoted himself to German philosophy, and when still under twenty produced for Bohn's Philosophical Library a translation of Immanuel Kant's 'Critique of Pure Reason.' Meiklejohn became a private schoolmaster, first in the Lake district and then in Orme Square and York Place, London. He also lectured and engaged in journalism. His linguistic powers and

general interest in affairs induced him in 1864 to act as a war correspondent in the Danish-German war, when he was arrested as a spy. But he was already busy with useful compilations for the schoolroom. Between 1862 and 1866 he issued 'An Easy English Grammar for Beginners, being a Plain Doctrine of Words and Sentences' (Manchester, 4 parts). For some years he published his schoolbooks for himself in Paternoster Square. In 1869 he issued (jointly with Adolf Sonnenschein) 'The English Method of Teaching to Read,' and this was followed in 1870 by 'The Fundamental Error in the Revised Code, with Special Reference to the Problem of Teaching to Read.' In 1874 Meiklejohn's educational energy was rewarded by his appointment as assistant commissioner to the endowed schools commission for Scotland. To the report of that commission he contributed valuable educational suggestions. In 1876 Dr. Bell's trustees instituted a chair of the theory, history, and practice of education in St. Andrews University, and Meiklejohn was appointed as the first professor. In his new capacity Meiklejohn from the outset exerted much influence on educational ideas at a time when the national system of education was undergoing complete reconstruction. He was a frequent contributor to the 'Journal of Education' and was a fair and humorous controversialist. Meanwhile Meiklejohn steadily continued to compile and edit school textbooks on history, geography, and literature. His works, apart from numerous school texts and reading books for Blackwood's educational series (1883-7) and the like, included 'The Book of the English Language' (1877), 'The English Language: its Grammar, History, and Literature' (1886), and 'The British Empire: its Geography, Resources, Commerce, Land-ways, and Water-ways' (1891). His numerous geographical manuals adapted to modern use the work of James Cornwell [q.v. Suppl. II]. Meiklejohn's series of school books, which was inaugurated in 1894, included a book on Australasia (1897) and 'The Art of Writing English' (1899; 4th edit. 1902). There followed 'English Literature: a New History and Survey from Saxon Times to the Death of Tennyson' (posthumous, 1904). Meiklejohn did much to raise the standard of school books in use throughout the country. A keen politician, he unsuccessfully contested the Tradeston division of Glasgow as a Gladstonian liberal in 1886.

He died at Ashford, Kent, on 5 April

1902, and was buried there. He married Jane Cussans or de Cusance. Of his sons and daughters, Lieutenant H. B. Meiklejohn, R.N., died on 18 May 1902.

Besides the works mentioned Meiklejohn was author of 'An Old Educational Reformer, Dr. Andrew Bell' (Edinburgh, 12mo, 1881), and he edited the 'Life and Letters of William Ballantyne Hodgson' (Edinburgh, 1883).

[The Times, 7 April 1902; The Journal of Education, May 1903; Post Office Edinburgh and Leith Directory, 1846-7; Meiklejohn's works; Brit. Mus. Cat.] J. E. G. DEM.

MELDRUM, CHARLES (1821-1901), meteorologist, born at Kirkmichael, Banffshire, in 1821, was son of William Meldrum, farmer, of Tomintoul, Banffshire. Educated at Marischal College, Aberdeen, he was lord rector's prizeman, and graduated M.A. in 1844. In 1846 he was appointed to the education department, Bombay, and two years later was transferred to the Royal College of Mauritius as professor of mathematics. There later (Sir) Walter Besant [q.v. Suppl. II] was a colleague and intimate friend. In 1851 Meldrum founded the Mauritius Meteorological Society, which he served for many years as secretary.

In 1862 he was appointed government observer in charge of the small meteorological observatory then maintained at Port Louis. Here he devoted himself to the examination of ships' logs, and worked out the laws of cyclones in the Indian Ocean, work of great practical benefit to navigators, which brought considerable credit to the Mauritius observatory. The site at Port Louis was unsuitable for a meteorological observatory, and with the support of Sir E. Sabine he was able to obtain the erection of a new station at Pamplemousses—a site unhappily marshy and fever-stricken. Here the foundation stone of the Royal Alfred Observatory was laid in 1870 by the Duke of Edinburgh. The principal work of the observatory was as before the study of the movement of storms, but from 1880 photographs of the solar surface have been taken daily to supplement the series made at Greenwich and Dehra Dun for a continuous record of the number of spots on the sun.

In 1876 Meldrum was elected a fellow of the Royal Society, and in the same year the degree of LL.D. was conferred on him by the university of Aberdeen. He was made C.M.G. in 1886, and was a member of the governor's council from 1886 until his retirement from service in 1896, when he returned to England, settling at Southsea.

He died at Edinburgh on 28 August 1901. He married in 1870 Charlotte, daughter of Percy Fitzpatrick.

[Monthly Notices, Royal Astron. Soc. lxii. 243, 1902; P. J. Anderson, Records of Marshchal College, ii. 510; Proc. Roy. Soc. 1905; Who's Who, 1901.] A. R. H.

MELLON, MRS. SARAH JANE, formerly SARAH JANE WOOLGAR (1824-1909), actress, born at Gosport, Hampshire, on 8 July 1824, was daughter of a tailor named Woolgar, who went on the stage in 1829 and proved an indifferent tragedian. He gave his child an excellent professional training. Making her first appearance at Plymouth in May 1836, as Leolyn in 'The Wood Demon,' she quickly acquired a reputation as a 'young phenomenon,' performing at Halifax, York, Nottingham, and on the Worcester circuit. Subsequently she studied music, and at Birmingham in 1841, during the visit of Mr. and Mrs. Wood, the operatic vocalists [see PATON, MARY ANN], sang for five nights as Adalgisa in 'Norma.' In November 1842 she fulfilled a successful engagement at the Theatre Royal, Manchester, where she appeared as Ophelia.

On 9 Oct. 1843 Miss Woolgar made her London début at the Adelphi as Cleopatra in Selby's burletta 'Antony and Cleopatra.' With the Adelphi she was long associated. Her first original character there was in T. Egerton Wilks's romantic drama 'The Roll of the Drum' on 16 October. On 8 April 1844 she joined the Keeleys at the Lyceum, and after appearing in several light pieces she rendered to great advantage the part of Mercy in Stirling's version of 'Martin Chuzzlewit.'

In the autumn of 1844 the Adelphi reopened under the management of Benjamin Webster and Madame Celeste, and the golden period of Miss Woolgar's career at that theatre began. On 14 October she showed dramatic feeling as Lazarillo in Boucicault's 'Don Cesar de Bazan.' At the Haymarket on 18 Nov. (owing to the sudden illness of Madame Vestris) she played Lady Alice Hawthorn, on half a day's notice, in the same author's new comedy 'Old Heads and Young Hearts.' She returned to the Adelphi at Easter 1845, and afterwards fulfilled some provincial engagements with her father. At the Adelphi on 11 March 1847 she was the original Lemuel in Buckstone's melodrama 'The Flowers of the Forest.' Dickens spoke of this performance as the most remarkable and complete piece of melo-

drama he had seen. Appearances in a variety of unimportant dramas, farces, and burlesques followed. After a severe illness she reappeared at the Adelphi on 1 March 1852 as Phoebe to Wright's Paul Pry, acting 'with her usual correct perception of character and vivacity.' In April 1853 she was Mrs. Vane in 'Masks and Faces,' and among her original characterisations in 1854 was Anne Musgrave in Tom Taylor and Charles Reade's 'Two Loves and a Life' (20 May).

In 1856 Miss Woolgar joined the Lyceum company under Charles Dillon, appearing there on 15 Sept. as Florizel in the burlesque of 'Perdita,' to the Perdita of Miss Marie Wilton (Lady Bancroft), who then made her metropolitan début. On 16 Oct. she was the original Constance in 'The Three Musketeers.' In March 1857 she gave a notable rendering of Ophelia, and in the following Christmas sustained a leading character in the Oriental pantomime of 'Lalla Rookh.' On 20 Jan. 1858 she was the original Countess de Montelons in Leigh Hunt's comedy 'Lovers' Amaze-ments.' At this period she was married to Alfred Mellon [q. v.], the musician, and thenceforth acted under her married name.

On the opening of the new Adelphi Theatre on 27 Dec. 1858, Mrs. Mellon played Memory in the apropos sketch 'Mr. Webster's company is requested at a Photographic Soirée,' afterwards delivering Shirley Brooks's inaugural address in the same character. Her finest original rôle at this period was Catherine Duval in Watts Phillips's 'The Dead Heart' (10 Nov. 1859). In January 1860 her Mrs. Cratchit in 'The Christmas Carol' was highly praised by Prof. Henry Morley. On 29 March 1860, at Covent Garden, in aid of the funds of the ill-fated Dramatic College, she played Black-Eyed Susan in Douglas Jerrold's drama to T. P. Cooke's William, notable as Cooke's last appearance on the stage. At the Adelphi on 10 Sept. 1860, when 'The Colleen Bawn' was performed for the first time in England, Mrs. Mellon played Anne Chute, 'winning, perhaps, the foremost honours of the night' (MORLEY). Her acting with J. L. Toole at the Adelphi in Oct. 1864 in 'The Area Belle' Dickens described in a letter as quite admirable. In September 1865 her Nan in 'Good for Nothing' was said by a competent critic to be as excellent in its way as Jefferson's Rip Van Winkle, which it then preceded. On 5 Oct. 1867 the Adelphi was reopened under her own supervision (but not responsible management). She then

demonstrated her versatility by playing Peg Woffington in 'Masks and Faces' and Tom Croft in 'The School for Tigers.' On 26 Dec. 1867 she was the original Sally Goldstraw in Charles Dickens and Wilkie Collins's drama 'No Thoroughfare.' In March 1875 she played Mrs. Squeers in a revival of Halliday's version of 'Nicholas Nickleby,' and in the following October Gretchen to Joe Jefferson's *Rip Van Winkle*. But, failing to keep step with the steady march towards naturalness, she came to be considered stilted and over pronounced, and she gradually lost caste. On 15 May 1878 a testimonial performance of 'The Green Bushes' was given on her behalf at Drury Lane, when Madame Celeste made her last appearance on the stage. On 14 May 1879 she reappeared at the Adelphi as Mrs. Candour in a revival of 'The School for Scandal,' and there on 24 April 1880 she played Mrs. O'Kelly in the first performance given in England of 'The Shaughraun.' On 2 August following, at the Haymarket, she was the original Miss Sniffe in Boucicault's comedy 'A Bridal Tour.' She remained on the stage till 1883.

Mrs. Mellon died at her residence, Vardens Road, Wandsworth Common, after a very brief illness, on 8 Sept. 1909, and was buried in Brompton cemetery beside her husband, whom she survived forty-two years. She left two daughters, of whom the younger, Miss Mary Woolgar Mellon, became an actress.

'In her prime,' writes John Coleman, 'Miss Woolgar was one of the most accomplished all-round actresses of her day; tragedy, comedy, melodrama, farce, or burlesque—nothing came amiss to her. . . . In high comedy she lacked distinction and hauteur; but a plenitude of sprightliness, piquancy, and even elegance, atoned for this drawback.' At the Victorian Era Exhibition in Earl's Court in 1897 was shown a water-colour drawing, by T. Harrington Wilson, of Mrs. Mellon as Laura in 'Sweethearts and Wives' (1849), lent by the artist. At the Toole sale at Sotheby's in November 1906 were sold an oil-painting by R. Clothier of Toole and Miss Woolgar in the milkmaid scene from 'The Willow Copse' (1869) and a water-colour sketch by Alfred Edward Chalon of Miss Woolgar as the Countess in 'Taming a Tartar.'

J. L.

MELVILLE, ARTHUR (1855-1904), artist, born at Loanhead of Guthrie, Forfarshire, on 10 April 1855 (*Parish Register*), was fourth son (in the family of seven sons and two daughters) of Arthur Melville, a coachman, by his wife Margaret Wann. When Arthur was quite young the family removed to East Linton, a picturesque village on the Haddingtonshire Esk. There he went to school, and at an early age was apprenticed to a grocer. Devoted to drawing from childhood, he gave up a situation at Dalkeith, when about twenty, and went to Edinburgh, determined to become an artist. He worked with energy and enthusiasm in the school of art, and later in the life school of the Royal Scottish Academy, receiving encouragement from J. Campbell Noble, R.S.A., of whom he was a personal pupil.

In 1875 he exhibited for the first time at the Scottish Academy, and during the next few years painted some oil pictures of homely incident, which secured the interest of one or two local connoisseurs and led to his going to Paris in 1878. There he studied at Julien's Passage Panorama atelier and sketched on the quays. He also painted at Grez and Granville, and it was in the work then done in water-colour, though his oil pictures possessed distinctive qualities also, that he began to reveal the special qualities which developed rapidly and distinguished his art to the end. Three years later, in 1881, he went to Egypt, where he found material and effects eminently suited to stimulate his artistic development. From Egypt he went by Suez and Aden to Kurrachi, whence he found his way up the Persian Gulf to Bagdad, rode across Asia Minor to the Black Sea, and took steamer to Constantinople. During these two years he made many striking drawings and stored up a wealth of impressions, which bore fruit in future years.

When Melville returned to Scotland, the artistic movement, which issued in what came to be known as the Glasgow school, had already begun. There was a certain affinity between his work and that of the young Glasgow painters. Meeting Mr. (now Sir James) Guthrie and E. A. Walton at Cockburnspath in 1883,

Melville associated himself with them. He had already achieved a more individual style than they, and his strong personality helped to accelerate and mould the Glasgow movement, but he on his part was influenced by the Glasgow artists' enthusiasm and audacity in experiment. During the following years, besides completing many Eastern sketches, he painted in water-colours in the Orkneys; but the most important pictures which he produced before leaving Edinburgh for London in 1888 were several oil portraits, amongst them 'The Flower Girl' (1883), 'Miss Ethel Croall' (1886), and the 'Portrait of a Lady' shown at the Royal Scottish Academy in 1889, each in its way a *tour de force*. A visit to Spain and Tangier in 1889-90 was followed in 1892 by an expedition to northern Spain with Mr. Frank Brangwyn. These journeys supplied Melville with motives for a series of important drawings executed on a larger scale and more subtle and masterly in style and finer in colour than their predecessors. Venice in 1894 was his next fruitful venture. After 1897 he devoted more attention to oil painting. There, however, his work, although always interesting and powerful, was more experimental and less satisfying, and, in portraiture at least, tended to extravagance. In 1904 he was again in Spain, at San Sebastian, Granada, and Barcelona, but he contracted typhoid fever while there, and on 29 Aug. he died from its after-effects, at his residence, Redlands, Witley, Surrey. His body was cremated and his ashes lie in Brookwood cemetery.

On 18 Dec. 1899 he married in London Ethel, daughter of David Croall of Southfield, Liberton, Midlothian, who, with a daughter, survived him. Mrs. Melville has a charcoal drawing of him by Sir James Guthrie; Mr. Graham Robertson, an intimate friend, made two sketches of him, which remain in his own possession.

Melville was elected an associate of the Royal Scottish Academy in 1886, and was for some years a member of the Royal Scottish Water-Colour Society. In London he became an associate of the Royal Water Colour Society in 1889 and full member in 1900. The National Gallery of Scotland possesses 'A Moorish Procession,' one of the finest of his Tangier drawings, and 'Christmas Eve,' one of four large oil pictures illustrating Christmas carols, upon which he was engaged at his death; the Glasgow Gallery has an important water-colour, 'The Capture of a

Spy,' and in the water-colour collection at the Victoria and Albert Museum, London, is 'The Little Bull Fight—Bravo Toro!' There are also notable drawings by him in the Luxembourg, Paris, and the Metropolitan Museum, New York.

[Information from Mrs. Melville and Mr. J. C. Noble; exhibition catalogues; R.S.A. Report, 1904; Baldwin Brown, *The Glasgow School of Painters*, 1908 (with photographic portrait); J. L. Caw, *Scottish Painting*, 1908.]
J. L. C.

MEREDITH, GEORGE (1828-1909), novelist and poet, was born at 73 High Street, Portsmouth (the Lympot of 'Evan Harrington'), on 12 Feb. 1828. His great-grandfather, John Meredith, was living at Portsea in the middle of the eighteenth century, and there in the parish church his son Melchizedek or Melchisedec was baptised in June 1763. 'Mel' early in life became a tailor and naval outfitter in the chief street of Portsmouth, and his business soon became the leading one of its kind in the port (there is a reference to it in chap. vi. of the second vol. of Marryat's *Peter Simple*, 1834). His ambitions ranged beyond the counter; he was on friendly terms with many distinguished customers, was welcomed as a diner-out, and talked like Sydney Smith. He kept horses and hunted, was a member of a local Freemasons' Lodge, and joined the Portsmouth yeomanry as an officer on Napoleon's threat of invasion. In 1801 and 1803-4 he was a churchwarden in the parish church of St. Thomas, to which he presented two offertory plates. He died on 10 July 1804, leaving a large family by his wife Anne, like himself, tall, handsome, and (it is said) the daughter of a solicitor in good practice. 'Mel's' son, Gustave Urmston (1797-1876), whose name was changed subsequently to Augustus Armstrong, succeeded to the business. Though not without commercial ability, he was wild and extravagant, being, possibly, hampered by his father's grand ideas. He married in 1824 Jane Eliza (1802-1833), daughter of Michael Macnamara of the Point, Portsmouth, 'an old inhabitant' of the town. The only child of this marriage was George Meredith, born above the ancestral shop and baptised on 9 April 1828 in the church of St. Thomas, just seven months before the death of Mrs. 'Mel,' his grandmother. In July 1833 his mother died, the business fell into a rapid decline, and the father migrated first to London and subsequently to Cape Town. He retired after 1860 to 2 Oxford Villas (now 50 Elm Grove), Southsea, where his son

visited him occasionally, and he died there on 18 June 1876. His second wife (his cook), Matilda (Buckett), died in 1885, aged sixty-seven, and they are interred together in the Highland Road cemetery, Southsea. The four 'daughters of the shears,' as Meredith called the great Mel's daughters in 'Evan Harrington,' were all exceedingly beautiful, and they married men somewhat above their own social station. The eldest, Anne Eliza, married in April 1809 Thomas Burbey, banker, of 46 High Street, Portsmouth, who became mayor of the town in 1833. The second, Louisa, married in March 1811 John Read, consul-general for the Azores. The third, Harriet, married John Hellyer, a brewer; and the youngest, Catherine Matilda, married, also in St. Thomas's church, on 28 Oct. 1819, (Sir) Samuel Burdon Ellis [q. v.]. Three of these aunts can be identified without difficulty, *mutatis mutandis*, for Meredith never mimicked environment too closely, in 'Evan Harrington.'

Meredith's first ten or twelve years were spent at Portsmouth, where he enjoyed the hospitality of his aunts, their friends and relatives. He went as a day boy to St. Paul's church school, Southsea; afterwards the trustees of his mother's small estate put him to a boarding school in the town, his chief recollections of which centred round the dreariness of the Sunday services and the reading of the 'Arabian Nights.' Early in 1843 he was sent to the Moravian School at Neuwied on the Rhine, ten miles north-west of Coblenz, where Professor Henry Morley had preceded him about five years. He remained there until the close of 1844, when he returned home to be articled to a solicitor in London. He began to learn in earnest, though never very systematically, at Neuwied, and his ideas were much enlarged, but he was mainly self-educated. He studied Goethe and Richter. His sympathy with the German point of view in 'Farina,' 'Harry Richmond,' 'The Tragic Comedians,' 'One of our Conquerors,' and elsewhere is sometimes attributed to his sojourn upon the Rhine when he was fifteen; but his stay at Neuwied was brief and his allusions to it in later life were very limited and inconclusive. He read German with perfect ease, but spoke it indifferently, with less ease, indeed, than he spoke French, which he wrote with facility.

In 1845 he was articled to Richard Stephen Charnock of 10 Godliman Street, lawyer and antiquary, who is thought to have combined certain of the traits of the two uncles in

'Richard Feverel.' Charnock was a Bohemian and a 'character' who, in 1847-8, when he became accessible to Meredith, was one of the 'old boys' of the Arundel Club. George's income during this period was very small and irregular, and he frequently lived on a single bowl of porridge a day. His recreation was walking out into Surrey. His patrimony had dwindled, and seeing no definite prospect in the law he turned instinctively to journalism. At or through the Arundel Club he obtained introductions to R. H. Horne, Lord John Manners, and Charles Dickens, through whom he hoped to obtain work on the 'Standard,' 'Household Words,' and other papers. Twenty-four of his earliest poems were contributed to 'Household Words,' while he acted as 'writing master' to a small circle of amateurs who sent other poems to the same periodical. In 1849 he began sending contributions, including a piece on Kossuth, to 'Chambers's Journal,' and on 7 July a poem by him on 'Chillian-wallah' was printed there. He had already made the acquaintance of 'Ned' [Edward] Gryffydd, son of Thomas Love Peacock [q. v.]; had walked with him to Brighton, and afterwards met, at his rooms near the British Museum, his attractive if flighty sister, Mary Ellen, who had married, in Jan. 1844, Lieutenant Edward Nicolls (commander of H.M.S. Dwarf) and was left a widow within four months of the marriage. Extraordinarily gifted, young, poor, ambitious, Meredith was admitted into the intimacy of the Peacock circle. He played cricket with Mrs. Nicolls's little daughter, Edith, and took his place among Mrs. Nicolls's many admirers. In successive months he, young Peacock, Mrs. Nicolls, Charnock, and other friends, edited the manuscript periodical 'The Monthly Observer,' which ran from March 1848 to July 1849 (cf. *Athenæum*, 24 Aug. 1912); Mrs. Nicolls was at least seven years older than Meredith, but they were married at St. George's, Hanover Square, on 9 Aug. 1849. They paid visits to Felixstowe and elsewhere, and then, depending chiefly upon a small Portsmouth legacy, spent a year or more abroad before taking up their residence at Weybridge. There they boarded at The Limes, the house of Mrs. Macaroni, a highly cultured woman, where Meredith met, among others, Sir Alexander Duff Gordon, his accomplished wife (Lucy), Eyre Crowe, Tom Taylor, and Samuel Lucas of 'The Times,' whose 'Mornings of the Recess' formed the literary *causerie* most valued by men of letters. Two miles across

the ferry stood Peacock's house at Lower Halliford. Meredith's youthful admiration for Peacock bore fruit in a genuine though not very close influence. While still at Weybridge Meredith dedicated his 'Poems' of 1851 to 'Thomas Love Peacock, Esq. . . . with the profound admiration and affectionate respect of his son-in-law, Weybridge, May 1851.' In all probability Peacock had assisted in the publication of the volume, which was issued by Peacock's friends, J. W. Parker & Son of West Strand, and which cost the poor author about 60*l*. (a single copy has since fetched as much as 30*l*.). Parker & Son also published 'Fraser's Magazine,' to the pages of which Peacock's daughter and son-in-law were early contributors. An 'Essay on Gastronomy and Civilisation' (Dec. 1851) is signed M[ary] M[eredith]; it was subsequently expanded into a little book. Two among George Meredith's earliest identified single poems, 'Invitation to the Country' and 'Sweet of the Year,' also appeared in 'Fraser' (Aug. 1851, June 1852). While still at Weybridge, with 'duns knocking at the door,' Meredith began working at 'The Shaving of Shagpat,' much of it being read aloud to his little step-daughter, and many passages declaimed to Janet Duff Gordon, his literary Egeria of a few years later. In 1853 Peacock invited Meredith and his wife, whose struggle with poverty threatened to overwhelm them, to live in his house. There Arthur Gryffydh (1853-90), the only child of the union, was born on 11 June 1853. Soon after Peacock installed the young family in a cottage (still standing) at Lower Halliford.

'No sun warmed my roof-tree,' Meredith was said to have exclaimed in later years; 'the marriage was a blunder.' The course of estrangement, though not its cause, is traced implicitly in 'Modern Love.' Outwardly relations were amicable, and visits were paid to the FitzGerald's (nephews of the author of 'Omar') at Seaford, and were returned. In 1858 Mrs. Meredith went off to Capri with the artist Henry Wallis, eventually returning to Weybridge, where she died at Grotto Cottage in 1861. Meredith claimed his son, and for a time they lived together in London, no one knows where, or upon what resources. Ned Peacock and his son, however, were still occasional visitors, as they continued to be for at least another ten years.

In Meredith's first volume, 'Poems' of 1851, there is nothing, perhaps, altogether first rate, for the 'Love in the Valley,' as we know it, was rewritten in 1878.

But the general level of accomplishment and beauty is high; there is daring in the young poet's rhythmical experiments without rhyme. Although Meredith often complained later of the lack of encouragement extended to his early efforts, his first volume won much praise. W. M. Rossetti, then twenty-two years old, described it as Keatsian in the 'Critic' (15 Nov.), and Charles Kingsley in 'Fraser' (Dec. 1851) put the 'Love Poems' above Herrick's. Tennyson also wrote that he found the verse of 'Love in the Valley' very sweet upon his lips. The quinine, so distinctive of Meredith's later verse, was imported later. Meredith's second venture, 'The Shaving of Shagpat: An Arabian Entertainment,' followed in 1855. It is a fantasia on the subject-matter of 'The Arabian Nights,' easily outstripping its forerunner, Beckford's 'Vathek,' in the skill with which it catches the oriental spirit. Arabic students have indeed sought a lost original. The author expressly repudiated any elaborate allegorical intention. George Eliot in 'The Leader' (5 Jan. 1856) described it as a work of genius—poetical genius, and as 'an apple tree among the trees of the wood.' 'Farina: a Legend of Cologne,' which followed the Arab tale in 1857, is a rather slighter burlesque or ironical sketch, something in the vein of Peacock, aimed at the mediæval and romantic tale. George Eliot praised it, though without very much emphasis, in the 'Westminster Review' October 1857.

All three volumes had been easel-pieces from which the author could hardly with reason expect pecuniary return, and from 1856, when Meredith severed his connection with Halliford, down to the close of 1858, we can only conjecture his means of support. Extremely poor, he almost despaired of literature while doing a certain amount of hackwork and supplementing his slender income by occasional journalism. He may possibly have received some assistance from his father's sisters. His home was temporarily fixed in London. There at 8 Hobury Street, Chelsea, 'The Ordeal of Richard Feverel,' commenced at The Limes, was concluded with comparative rapidity, during 1858-9. Published in 1859, it was reviewed with enthusiasm in 'Cope's Tobacco Plant' by James Thomson [q. v.] in May, and favourably by the 'Athenæum' on 9 July 1859; on 14 October 'The Times' devoted three columns to it. Mudie, it seems, took three hundred copies, but then lost nerve owing to suspicion of 'low ethical tone' formulated by the 'Spectator.'

The main idea of the book, the victimisation of the Fairy Prince hero by a fond paternal system of education, was suggested by Herbert Spencer's famous article in the 'British Quarterly Review' (April 1858), with occasional hints from 'Tristram Shandy,' 'Émile,' and the more recent 'The Caxtons.' In this book Meredith first and successfully assumes the airy Olympian and omniscient manner which is the inspiration of his genius and is not explained by anything in his personal experience or training. But his power was little recognised. Nineteen years elapsed before a second edition was called for, and Meredith realised that he could not look to books for a living. He thereupon definitely accepted regular work for the 'Ipswich Journal,' a Conservative newspaper since dead. The offer was due to connections formed in his early London days through Charnock with Foakes, proprietor of the 'Ipswich Journal,' and other newspaper men, among whom was Algernon Borthwick. Every Thursday or Friday he posted a leading article (occasionally two, for the second of which he was expressly paid) and two columns of news-notes, for which he received approximately 200*l.* per annum. He spoke with feeling later of the Egyptian bondage of (tory) journalism; but the leaders and notes were admirably done (DOLMAN, *New Review*, March 1893). Indirectly 'Richard Feverel' did Meredith service, for it brought him into nearer contact with Swinburne, Monckton Milnes, and the Pre-Raphaelite group. At a meeting with Swinburne during the summer of 1859 in the Isle of Wight, Swinburne at one sitting 'composed before our eyes his poem "Laus Veneris"' (M. PHOTIADÈS), and in a letter to the 'Spectator' of 7 June 1862 Swinburne protested with chivalrous eloquence against the freezing reception accorded to 'Modern Love' in the 'Spectator.' In 1859-60 Meredith had returned to the sand and pines and river that he loved, and it was while he was lodging in High Street, Esher, that Janet Duff Gordon stumbled accidentally upon him and his son Arthur. The Duff Gordons' proximity, between Esher and Oxshott, determined his settlement at Copsham in a fit dwelling for a poet, on a breezy common, close to the humming pine woods, behind Claremont and the Black Pool—a small lake surrounded by tall dark trees and frequented by a stately heron (JANET ROSS, *Early Days Recalled*, 1891). At the Duff Gordons, he was introduced to notable people, such as Mrs.

Norton, Kinglake, Millais, Sir F. B. Head, G. F. Watts, and at Copsham he continued to live for six years. An epicure of aristocratic type in his zest for choice living and varied society, he was afflicted with a weak stomach and tormented by a constitutional flatulence which he sought to exorcise by many-sided activity; thence came conference with and observation of all sorts and conditions of men. He scoured the countryside by night and day with a hawk's eye for uncommon types; of sportsmen, cricketers, prize-fighters, boxers, race meetings, and alehouse assemblies he was ever, as his books attest, a connoisseur. During the second half of 1859 he contributed six poems to successive numbers of 'Once a Week,' including 'The Last Words of Juggling Jerry' (3 Sept.), and on 11 Feb. 1860, besides submitting one or two short stories, traces of which have since disappeared, he began in the same periodical the serial publication of 'Evan Harrington, or He would be a Gentleman,' which was illustrated by Charles Keene. Keene, Sandys, Millais, and Rossetti were among the illustrators of 'Once a Week,' and with these Meredith became familiar. 'Evan Harrington' is the most real, and perhaps the most generally entertaining, of all Meredith's novels. It describes in a sardonic vein the frantic attempts of Evan's sisters (and sidelights here are assumed to have been drawn from a whimsical observation of his own paternal aunts) to escape from the Demogorgon of Tailorism. The spirit of 'Great Mel,' who dies before the action begins, pervades the book. In so far as he ever drew his characters direct from life Janet Duff Gordon (Mrs. Janet Ross from 1860), who begins now to be a regular correspondent, was his model for Rose Jocelyn (see Mrs. Ross, *The Fourth Generation*, 1912). 'Evan Harrington' was much more remunerative than its predecessor, and was pirated in America before the year was out. But again it proved a disappointment. The 'Saturday Review,' which had condemned 'Richard Feverel' for its affectations, wearisome word-painting, and immorality, described 'Evan Harrington' as a surprisingly good novel; the other papers either ignored or damned it with vapid mouthings.

The next three years (1861-4) were among the busiest in Meredith's life, although his novel-writing was temporarily interrupted. He wrote much poetry, publishing in 1862 an autobiographical commentary (now in the mood of Hamlet,

now in that of Leontes) upon his first love and his disillusion in 'Modern Love (perhaps 'the most intensely modern poem ever written') and Poems of the English Roadside.' The book included 'Juggling Jerry,' 'The Old Chartist,' and other poems reprinted from 'Once a Week,' besides twelve new poems. He became a contributor to the 'Morning Post,' and in 1862 began reading for the publishers Messrs. Chapman & Hall, in addition to his editorial contributions to the 'Ipswich Journal.' His connection with Chapman & Hall was soon close. Batches of manuscripts were forwarded periodically, and on blank enclosed slips headed by the titles, Meredith inscribed crisp, sharp, and epigrammatic criticism. Once a week or thereabouts he interviewed authors in the firm's old office, 193 Piccadilly. By rejecting 'East Lynne' it has been estimated that he lost the firm a round sum of money. He also declined works by Hugh Conway, Mrs. Lynn Linton, Mr. Baring Gould, Herman Merivale, Cuthbert Bede, Stepniak's 'Underground Russia,' 'The Heavenly Twins,' and 'Some Emotions and a Moral.' Samuel Butler's 'Erewhon' he dismissed with a 'Will not do,' and Shaw's 'Immaturity' with a 'No.' On the other hand he encouraged William Black, Sir Edwin Arnold, Thomas Hardy, Olive Schreiner, and George Gissing. Meredith was deeply interested in the work of his younger contemporaries; Gissing and Thomas Hardy confessed no small obligation to his encouragement. But he often vacillated in his opinions of both current and past literature.

¶ Meredith was now earning probably over 500*l.* a year; the death of his wife in 1861 and of her mother-in-law, Lady Nicolls, within two years, meant the ultimate as well as the actual pecuniary responsibility for his son Arthur, to whom he had become perilously devoted. He was in Tirol and Italy with his son during the summer of 1861. Arthur was first sent in October 1862 to Norwich grammar school under Dr. Jessopp, who had become a close friend, and then to a Pestalozzi school near Berne (recommended by G. H. Lewes, suggestive in some ways of Weyburn's school in 'Lord Ormont'), and eventually to Stuttgart. A post was afterwards obtained for him in the De Koninck's firm at Havre and later (through Benecke) in a linseed warehouse at Lille. He was provided for subsequently by a legacy from a great-aunt, and resided at Bergamo and Salò on Lake Garda; he wrote some agreeable travel sketches (one of a raft journey from Bale to Rotterdam

in 'Macmillan's Magazine'). Meredith sent him many stimulating, sympathetic, and profoundly touching letters, rarely of reproof, more often of reconciliation and bracing exhortation. Spoiled in childhood, of a jealous, self-conscious temperament, suspicious, not without just cause, of a certain lack of consideration on the part of his father, Arthur became, in spite of welcome offered, an incompatible figure at his father's home; his health was ever declining, and he died at Woking at the house of his half-sister, Mrs. Clarke (Edith Nicolls).

Meredith was still in the early 'sixties living economically at Copsbam, but his friendships were extending and his visitors were numerous. His intimate circle included William Hardman (later of the 'Morning Post'), Mr. H. M. Hyndman, Frederick Jameson, Frederic Chapman the publisher, J. A. Cotter Morison, Rossetti, Swinburne (who interchanged satires and squibs with him), William Tinsley, Mr. Lionel Robinson, and Frederic Maxse. He was known among them as 'Robin,' Hardman as 'Friar Tuck,' and Mr. Robinson as 'Poco.' To Frederic Augustus Maxse [q. v. Suppl. I.], a very close associate, he dedicated 'By the Rosanna' (Oct. 1861), as well as 'Modern Love' (1862); with him he sailed on a stormy voyage to Cherbourg in *The Grebe*, a cutter yacht, in 1858, and he took a brief walking tour round Godalming in July 1861. In May 1862 Meredith and Hardman tramped round Mickleham and Dorking. Entertainment was drawn from the associations of Burford Bridge (Keats), The Rookery (Malthus), and Albury (Tupper), and many aphorisms were read by 'Robin' from his note-books. Soon after this Meredith paid a visit to his friend Hyndman at Trinity College, Cambridge, and made acquaintance with university life for the first time. He spent Christmas 1862 with the Hardmans. In the early summer of 1863 he was at Seaford with Burnand, Hyndman, and the FitzGerals, and Hyndman relates how, after much fine open talk, a good deal of it monologue, upon the beach, Burnand exclaimed 'Damn you, George, why don't you write as you talk?' In August, Meredith and Hyndman were at Paris together, reading Renan's 'Vie de Jésus,' and visiting Véfours, Versailles, Sèvres, and admiring the ædileship of Napoleon III. On 23 August Meredith left to join his friend Mr. Lionel Robinson at Grenoble, trudging thence like a packman through Dauphiné and the Graian Alps. He went abroad

upon several occasions with Mr. Robinson, and began to store up material for his marvellous Alpine effects, making a study of passes and visiting more than once the villa of friends on Lake Como. In January and again in October 1863 he went on a cruise in Cotter Morison's yacht, Irene, on the second occasion to the Channel Islands. The acquaintance with Morison was begun some three years earlier, when Morison was fresh from Oxford, where he had formed an intimacy with Mr. John Morley. In 1862 Morison sought Meredith's counsel in correcting the proofs of his 'Life of St. Bernard' (Meredith always called him 'St. Bernard' afterwards). Meredith denounced him for writing in Carlylese, 'a wind-in-the-orchard style,' and Morison was eventually induced to re-write and simplify much of it. Through Morison, Meredith grew rapidly more intimate with Mr. John Morley, and this friendship proved of material importance to him. He meanwhile resisted pressing invitations to leave Copsham to settle in London with Rossetti and Swinburne at their 'phalanstery,' the Queen's House (Tudor House), Cheyne Walk, Chelsea. Meredith went so far as to take a room in their house in 1861-2. But Rossetti's Bohemianisms were distasteful to him; he seldom went to the house, and after three months paid no more rent. About this time he joined the Garrick Club (elected 23 April 1864, resigned 1899), where he was soon to meet Frederick Greenwood and others, who admired and helped him much.

Of his personal appearance at this period Meredith's friends have recorded ample impressions. Sir F. Burnand, who first saw him at Esher talking to his publisher, 'Pater' Evans (of Bradbury & Evans), and was introduced by Maurice FitzGerald, nephew of Edward FitzGerald [q. v.], wrote: 'George strode towards us . . . he never merely walked, never lounged; he strode, he took giant strides. He had on a soft, shapeless wide-awake, a sad-coloured flannel shirt, with low open collar turned over a brilliant scarlet neckerchief tied in a loose sailor's knot; no waistcoat; knickerbockers, grey stockings, and the most serviceable laced boots which evidently meant business in pedestrianism; crisp curly brownish hair, ignorant of parting; a fine brow, quick observant eyes, greyish, if I remember; beard and moustache a trifle lighter than the hair. A splendid head, a memorable personality. Then his sense of humour, his cynicism, and his absolutely boyish enjoyment of mere fun, of any pure and simple absurdity.

His laugh was something to hear; it was of short duration, but it was a roar.' A portrait of the same date exists in the pen-drawing of 'Mary Magdalen at the Gate of Simon the Pharisee' by D. G. Rossetti, in which the figure of Christ was George Meredith drawn from the life. According to another friend, H. M. Hyndman, Meredith's physical strength in early manhood was great. 'He was all wire and whipcord. . . . I shall never forget a playful struggle I had with him in the Dolphin Hotel at Chichester, where we were staying with a party for Goodwood races. I was then strong and active and thought I was pretty good at a rough and tumble, but he wore me down by sheer endurance' (*Justice*, May 1910). He was addicted to throwing up and catching a heavy iron weight at the end of a wooden shaft—which he called his 'beetle exercise.' Over-indulgence in this, it is thought, sowed the seeds of future spinal trouble. His robustness, never so great in reality as in appearance, was also impaired for a time about 1862 and (later) by a fanatical but generally short-lived ardour for vegetarianism, with which his friend Maxse infected him. From Hardman he imbibed a faith in homeopathy. He was habitually fastidious and often difficult (to the utmost acerbity) about the quality and dressing of his food.

In 1863, while still at Copsham, Meredith reconcentrated upon fiction, and submitted to the gradual intensification of labour which the completion of a novel always involved. In April 1864 he brought out 'Emilia in England' (afterwards rechristened 'Sandra Belloni'), the only story which he furnished with a sequel (in 'Vittoria,' 1866). Emilia's passion for Italy forms the central theme of the whole. Her figure, the most beautiful and elaborate he had yet portrayed, dominates the two novels. Nowhere are the gems of his insight more lavishly scattered. There are admirable woodland scenes. At the same time he first formulates his anti-sentimental philosophy and his growing belief in the purifying flame of the Comic Spirit. The reception of the book was, however, meagre.

In September 1864 Meredith married Marie, fourth daughter of Justin Vulliamy (d. 1870), of the Old House, Mickleham; her mother Elizabeth Bull came of an old Cheshire family. Meredith got to know the Vulliamys through his friend N. E. S. A. Hamilton of the British Museum and first met his future wife in Norfolk. The

Vulliamys were of Swiss Huguenot origin [see VULLIAMY, BENJAMIN LEWIS]. After a few weeks at Pear Tree Cottage, Bursledon, Meredith and his wife took lodgings and then a lease of Kingston Lodge, Norbiton, almost opposite the gates of Norbiton Hall, where Hardman resided. Meredith was at the moment full of schemes, 'laying traps for money.' He had hopes of conducting a review, writing rambling remarks, an autobiography. He settled down in a chastened frame of mind to complete 'Rhoda Fleming,' but in the meantime he had improved his position with Chapman & Hall. His enthusiasm for Norbiton, where his son, William Maxse, was born on 26 July 1865, cooled down as buildings began to close in his horizon, and at the end of 1867 he moved to Flint Cottage, facing Box Hill, near Burford Bridge, in Mickleham. There, the scene of Miss Austen's 'Emma,' his opportunities of seeing and knowing people who were useful to him as types were ever enlarging. He became attached to the literary associations of the place, its connections with Keats, with the French exiles of Juniper Hall, and with the Burneys. He knew mid-Surrey extraordinarily well, and, devoted to outdoor life, he acquired a detailed and intimate knowledge of the natural history of the countryside (cf. GRANT ALLEN, in *Pall Mall Gazette*, May 1904). He is probably the closest observer of nature among English novelists. At the top of the sloping garden, about four minutes' remove from Flint Cottage, he put up in 1875-6 a Norwegian chalet where, in one of the two rooms, he slung his 'hammock-cot,' and could live alone with his characters for days together. On the terrace in front of the chalet, whence he descended to meals, he was often to be heard carrying on dialogues with his characters and singing with unrestrained voice. Whimsical and sometimes Rabelaisian fabrications accompanied the process of quickening the blood by a spin (a favourite word with him) over Surrey hills. There he wrote his master-works, 'Beauchamp's Career' and 'The Egoist,' and welcomed his friends, often reading aloud to them in magnificent recitative, unpublished prose or verse.

After his second marriage Meredith mainly devoted himself to 'Vittoria,' the sequel of 'Emilia,' Marie, his 'capital wife' and 'help-meet,' copying the chapters. G. H. Lewes, editor of the 'Fortnightly,' eventually offered 250*l.* for the serial rights, and 'Vittoria' in an abbreviated form ran through that Review (January-

December 1865). Meanwhile he completed a new novel, 'Rhoda Fleming.' He had promised upon his marriage to 'write now in a different manner,' and 'Rhoda' (originally 'The Dyke Farm'), expanded and much altered in process of construction, yet written consistently against the grain, was the fruit of this conformity. It was adequately reviewed on 18 Oct. 1865 in the 'Morning Post,' with whose proprietor Borthwick his relations were cordial, and hardly anywhere else. 'Rhoda Fleming' is, comparatively speaking, a plain tale, mostly about love, and concerned primarily with persons in humble life. He attempts the delicate task of describing the innate purity of a woman after a moral lapse.

In May 1866 Meredith was sent out by the 'Morning Post' as special correspondent with the Italian forces then in the last phase of the war with Austria. He stayed at the Hotel Cavour in Milan, and afterwards at the Hotel Vittoria in Venice, awaiting events and forgoing with the other special correspondents at the Café Florian. Hyndman was there, and Charles Brackenbury, and G. A. Sala, an antipathetic figure, with whom Meredith was nearly drawn into a serious quarrel. He saw something of the inconclusive operations in Italy and addressed thirteen interesting and vivid letters in plain prose to the paper, the first dated Ferrara, 22 June 1866, and the last Marseilles, 24 July 1866 (reprinted in memorial edition, vol. xiii, and privately printed as 'Correspondence from the Seat of War in Italy'). For a time Meredith had some hopes of becoming 'The Times' correspondent in Italy, Paris, or elsewhere. As he went home over the Stelvio pass and then by way of Vienna, where he met Leslie Stephen for the first time, he collected fresh material for the revision and expansion of his 'Fortnightly' novel, 'Vittoria' (or 'Emilia in Italy'), which was published on his return to England in 1866. This novel of the revolution of 1848-9 has a complex plot in which Charles Albert, Mazzini, and other historic persons figure; the opening scene on the summit of Monte Motterone, walked over in company with 'Poco,' ranks with that of 'Harry Richmond' or 'The Amazing Marriage.' On its publication the style of the book was complained of as that of prose trying to be poetry, and the author in essaying the novel of history was warned against handicapping himself by extra weight. Swinburne, however, overflowed with generous praise. In 1867 Mr. John

Morley became editor of the 'Fortnightly Review,' and Meredith's contributions to it, which included some reviews of new books, grew frequent. During part of 1867-8 Mr. Morley was absent in America and Meredith was left in charge of the magazine. In 1868 Meredith made his single incursion into active politics by assisting his friend Maxse, who was standing as radical candidate for Southampton. His powers were now at their ripest, and during 1869 and 1870 he was engaged on the great first-person romance of 'The Adventures of Harry Richmond.' Serial publication in the 'Cornhill' was arranged on liberal terms (500*l.* for copyright and 100*l.* on sale of 500 copies), and the first part appeared in Sept. 1870. There were fifteen illustrations by Du Maurier. The father and son theme of 'Feverel' is reanimated in an atmosphere at times dazzlingly operatic; Richmond Roy, on whose character Meredith lavished all his powers, stalks larger than life alongside of Wilkins Micawber and My Uncle Toby. Not one of the author's books rivals this one in invention.

Meanwhile Meredith, whose sympathy with France was increasing in strength, though he admitted now that the war was chargeable on France and its emperor, wrote for the 'Fortnightly' (Jan. 1871) a rather cryptic defensive poem—'France, 1870,' which formed the nucleus of his 'Odes in Contribution to the Song of French History.' French history and memoir (especially Napoleonic) and the fruitage of European travel remained his favourite pastime to the end. In 1872 his friend Leslie Stephen welcomed to the 'Cornhill' his 'Song of Theodolinda.' Meredith spent short holiday seasons more than once in the early seventies in the neighbourhood of Dreux at Nonancourt on the Avre, where his wife's brothers owned wool-spinning mills. His succeeding book, 'Beauchamp's Career,' is enriched by local colour derived from observations made during this Norman sojourn as well as at the Café Florian in 1866. The next two novels, 'Beauchamp's Career' and 'The Egoist,' mark the summit of Meredith's power of concentration. The first, 'Beauchamp's Career' (refused by 'Cornhill'), began to appear in a painfully condensed form in the 'Fortnightly' in August 1874. The book protests through the brains of Beauchamp, the young naval officer (a reflection of Maxse), on the one hand against lolling aristocrats who refuse to lead and against the false idols of Manchester on the other; the complex hero is hampered by apple-fever (as Meredith styles

his prepossession for some of the fairest daughters of Eve) and at times by a species of megalomania. The construction keeps the interest intensely alive, and the book ends with the sting of the hero's death by drowning.

Meredith was at this time acquiring new friends, among whom were Moncure Conway, R. L. Stevenson, Russell Lowell, and W. E. Henley; his books were becoming known among the younger generation at Oxford; he was seen in London, though never a familiar figure there, at picture exhibitions or concerts, or dining at Krehl's in Hanover Square. He was preparing to drop his work for the Ipswich paper, done as he said with his toes to leave room for serenier operations above, but was still dependent pecuniarily to a considerable extent upon journalism and reading for Chapman & Hall. He managed to combine with his weekly expedition to London a reading engagement to Mrs. Benjamin Wood, 'the great lady of Eltham,' a great-aunt of Sir Evelyn Wood, a woman of marked intelligence, with whom he often discussed contemporary topics. This brought in an appreciable addition to his income. After the reading he returned to the Garrick to dine and then by the 8.40 train from London Bridge to Box Hill. The cool reception accorded to his 'favourite child,' 'Beauchamp's Career' (despite a highly favourable notice by Traill in the 'Pall Mall'), chilled him. Mark Pattison spoke of his name on a book as a label to novel-readers, warning them not to touch. Two short stories in the 'New Quarterly Magazine'—'The House on the Beach' (Jan. 1877) and 'The Case of General Ople and Lady Camper,' a little masterpiece (July 1877)—added range to his repute. In a lecture on 'The Idea of Comedy and the Uses of the Comic Spirit,' which he delivered at the London Institution on 1 Feb. 1877, he defined one of his dominant conceptions of life—the destined triumph of comedy in its tireless conflict with sentimentalism. The lecture was printed with amendments in the 'New Quarterly Magazine' and not separately until 1897. Meredith continued to harp upon the function of the Comic Spirit, notably in the prelude to 'The Egoist,' in the 'Ode to the Comic Spirit,' and in 'The Two Masks.'

After the lecture a new period in Meredith's career as a novelist opens. For a quarter of a century he had been producing novels of the first rank. Yet his best work was still addressed to empty benches.

Henceforth he abandoned any idea of a compromise with his readers. He determined to write in his own way, upon his own themes uninterrupted. In 'The Egoist' (3 vols. 1879) or 'Sir Willoughby Patterne, The Egoist,' as it was first called when it began to run through the 'Glasgow Weekly Herald' in June 1879, he develops a new novel-formula consisting of a kind of fugue—innumerable variations upon one central theme, that of the fatuity of a pontifical egoism, mercilessly exposed by the search-lights of the Comic Spirit. 'I had no idea of the matter,' wrote Stevenson when re-reading the novel, 'human red matter he has contrived to plug and pack into this strange and admirable book. Willoughby is of course a fine discovery, a complete set of nerves not heretofore examined, and yet running all over the human body—a suit of nerves . . . I see more and more that Meredith is built for immortality.' The noble but 'coltish' Vernon Whitford is sketched after the author's friend Leslie Stephen. The book was hastily written in five months, by night as well as by day, to the injury of health. It was the first among Meredith's novels to provoke a cross-fire of criticism. Henley reviewed it three (or four) times, frankly as regarded the ingrained peculiarities of the style, but with an almost reverential admiration for its analytic power. Mr. William Watson attacked (in *National Review*, October 1889) the plethoric mentality of the writer, his fantastic foppery of expression, oracular air of superiority, and sham profundity. The controversy did the author no harm. The three volumes of 1879 were followed by a second one-volume edition in 1880. This fact, the reprints of 'Shagpat' and 'Feverel' and 'Love in the Valley,' the appearance of 'Feverel' and 'Beauchamp's Career' in Tauchnitz editions, and the reproduction of several of the novels in America, all began to point to a rediscovery on the part of the public of the Meredith revealed by 'The Times' in 1859 and then obscured for twenty years.

Meredith next published 'The Tale of Chloe,' a short story of a singular and grievous pathos, in the 'New Quarterly Magazine' (July 1879); and then began sketching in the first instance from newspaper reports, and from 'Meine Beziehungen zu Ferdinand Lassalle' by Hélène von Racowitza (Breslau, 1879), a contemporary romance, the love story and death in a duel of Ferdinand Lassalle, the German socialist. Meredith called his dramatic recital 'The Tragic Comedians,' and enriched it with

some of his most brilliant and original epigrams. It first appeared in the 'Fortnightly' (Oct. 1880–Feb. 1881), and was enlarged for separate publication (by Kegan Paul) in December 1880. In spite of his imperfect materials, Meredith accurately assessed the values of his hero and heroine, Alvan (Lassalle) a Titan, a sun-god, inured to success, of Jewish race, a revolutionary and a free-liver, and Clotilde (Hélène von Dönniges) a Christian girl from a noble and exclusive, demagogue-hating family of the Philistines. The book attracted attention, was taken over by Chapman & Hall in 1881, and was reprinted in America and in the Tauchnitz collection.

In 1879 he had by hard exertion carved out a good holiday, spent partly in Patterdale with Mr. John Morley, and partly in Dauphiné and Normandy. But premonitions of advancing ill-health, a growing sense of neglect, and the necessities of unremitting labour saddened him. For a time he was estranged from his son Arthur, but news of Arthur's spitting blood in June 1881 awoke the old tenderness, and next year he made a Mediterranean excursion with him. Meanwhile the enthusiastic devotion of literary friends was increasing. In 1882 he joined Leslie Stephen's society of Sunday Tramps, which more than once made Box Hill a base for the ascent of Leith Hill. In 1882 the Stevensons visited him. In 1883 he met Sir Charles Dilke and Prof. R. C. Jebb for the first time. He was cheered by Browning's appreciation of his verse.

In May 1883 he brought out his most notable poetic volume, 'Poems and Lyrics of the Joy of Earth,' no testimony to his wisdom, he describes it. Here we have, with a few personal poems, such as the verses to J[ohn] M[orley] and 'To a Friend Lost' (Tom Taylor, whose 'Lady Clancarty' he had applauded), the finished version of 'Love in the Valley,' and lyrics such as 'The Lark Ascending,' 'Earth and Man,' 'Melampus,' and 'The Woods of Westernmain,' which satisfactorily answer the complaint that Meredith's 'Philosophical Lyrics' contain too much brain and too little music or magnetism. He urges the need of the mutual working of blood (the flesh, senses, bodily vigour) and brain, and the steering of a course between ascetic rocks and sensual whirlpools, in quest of spiritual exaltation.

In 1884–5 there ran through the 'Fortnightly Review' chapters i.–xxvi. of 'Diana of the Crossways' (so named after a beautiful old Surrey farm house, pictured in the memorial edition). The book (with a dedication to one of his

Sunday Tramp friends, Sir Frederick Pollock) appeared in 1885, and three editions were exhausted during the year. At length the general public was captured. Diana was clearly modelled upon the brilliant Caroline Sheridan, the Hon. Mrs. Norton [q. v.], whom he had met at the Duff Gordons before 1860, and who was long a favourite theme of society gossip. The legend of her having betrayed to 'The Times' the secret confided to her by Sidney Herbert that Peel had resolved on the repeal of the Corn Laws was of later growth, and Meredith was subsequently persuaded by the Dufferins to repudiate the popular identification of Mrs. Norton's career with that of his heroine. The book was blessed by Henley in the 'Athenæum' and the heroine celebrated as of the breed of Shakespeare and of Molière. A parody appeared among 'Mr. Punch's Prize Novels,' and society grew alive to the peculiar flash of the Meredithian epigram. Invitations from society and societies inundated him, and Box Hill became a place of pilgrimage. Collective editions of his works were arranged and proposals were made to dramatise 'Evan Harrington' and 'The Egoist.' The belated success coincided tragically with the insidious development of a spinal complaint and with the serious and soon hopeless malady of his wife. Two operations proved ineffectual, and she died on 17 Sept. 1885. Despite ebullitions of temper, which appeared at times almost uncontrollable, Meredith was devotedly attached to one who protected him not only from himself but also from adroit strangers, concerning whose claims upon his attention he was often far too sanguine. It was to the poetic mood that his mind reverted during this period of privation and suffering. The years 1887-8 yielded two of his most characteristic volumes of verse, 'Ballads and Poems of Tragic Life' and 'A Reading of Earth'—the last containing 'The South-Wester,' 'The Thrush in February,' 'Nature and Life,' 'Dirge in Woods,' and above all the 'Hymn to Colour,' with the touching epitaph 'M. M.' The 'Nature Poems' were collected with beautiful drawings by W. Hyde, 1898 (sm. fol.).

His temper mellowed greatly during his last twenty years, and he became in a sense far more approachable. In 1887 he spent a month at St. Ives in Cornwall to be near his friends the Leslie Stephens. In July 1888 he dined at the Blue Posts tavern in Bond Street with (Lord) Haldane and Mr. Asquith, sitting between Mr. A. J. Balfour and Mr. John Morley. In August 1888 he

paid a visit to his younger son William, who was interested in an electrical engineering firm with business in South Wales, and was at Tenby, Llandilo, Towyn, and Brecon (see *Cardiff Western Mail*, 12 Feb. 1908). In 1889 he was at Browning's funeral. 'The Ring and the Book' and Tennyson's 'Lucretius' were among his favourite poems. Similarity of temperament with his elder son Arthur precluded equable relations, but he was distressed and made despondent by the news of Arthur's death at Woking in March 1890, when he himself was shaken and ill. In 1892 he underwent the first of three operations for stone in the bladder.

Meanwhile in 1889 Meredith returned to fiction. The most individual of the later novels, a new study of modern femininity, 'One of our Conquerors,' ran simultaneously through the 'Fortnightly,' 'Australasian,' and 'New York Sun' (Oct.-May 1890-1). 'When I was sixty,' Meredith wrote, 'and a small legacy had assured my pecuniary independence, I took it into my head to serve these gentlemen (the critics) a strong dose of my most indigestible production. Nothing drove them so crazy as "One of our Conquerors." In the prologue Meredith's mania for analogy, epigram, and metaphors runs riot. "Lord Ormont and his Aminta," in which a similar motive—that of people rendered strangers to themselves by a false position—is reinvoked, first appeared in the 'Pall Mall Magazine' (Dec. 1893-Aug. 1894). Issued separately in three volumes by Chapman & Hall in 1894 (and by Scribners in America), it was gratefully inscribed to the surgeon who had operated on him, George Buckston Browne. The basis of the story is to be found in the secret marriage of the famous Charles Mordaunt, earl of Peterborough [q. v.], in 1735 with Anastasia Robinson. The novel, which reverts to an easier style of writing than 'One of our Conquerors,' contains many of the writer's adroitest sayings. Meredith still had several novels in solution in his mind, the names of which have partially survived, such as 'Sir Harry Firebrand of the Beacon,' 'A Woman's Battle,' and a novel dealing with the career of Lady Sarah Lennox, in addition to the half-finished 'Celt and Saxon' (sketch on a great scale in 1890), the torso of which appeared in the 'Fortnightly' in 1910 and subsequently in the memorial edition (vol. xx.); but the last completed novel at which he travailed hard in 1894 was 'The Amazing Marriage,' in which the character of Woodseer, the virtuoso of nature and style, was a long-promised sketch of one of his

friends, in this case R. L. Stevenson. The story had been begun and laid aside in 1879; it was resumed in 1894 at the urgent instance of his friend Frederick Jameson, to whom the work was dedicated. 'The Amazing Marriage' shows no declension of power—the style is less mannered than that of its three predecessors, but the subject-matter is almost extravagantly varied and complex. The arrangement affords the reader two peeps at English society of an almost Disraelian luxuriance, respectively in 1814 and 1839. The work appeared serially in 'Scribner's Magazine' (Jan.-Dec. 1895), and was published in two volumes in the same year by Constable & Co. His son William had recently joined this firm, which now assembled (under the author's direction) the copyrights of all his works and in 1896 commenced a collective edition de luxe in thirty-six volumes (completed 1910-11).

Meredith's life-work in prose fiction, which taxed his brain and health far more severely than his verse, was now completed. Henceforth he was regarded by the enlightened public as literary and political arbitrator and court of appeal, and in that capacity wrote during his later years various poems, platform letters, introductions, and the like, his opinions being cited in the newspapers in every form and context. His mental activity though still formidable was evidently more upon the surface than it had been during the harassing turmoil of the creative period. For the last sixteen years, owing to paraplegia, he had to abandon the physical activities which had been such an important element in his life and thought.

In 1892, upon the death of Tennyson, Meredith was elected president of the Society of Authors. In 1894 he relinquished his long established relation as reader with Chapman & Hall. In 1895 his quiet routine was broken by visits from the Daudets and Mr. Henry James and in July by a visit of ceremony of the Omar Khayyam Club, upon which occasion Mr. Edward Clodd ('Sir Reynard') 'discovered his brush' by eliciting a speech in answer to laudatory apostrophes by Thomas Hardy and George Gissing. Five years later he welcomed a similar visitation from the Whitefriars Club. In 1898 Leslie Stephen forwarded him a parchment bearing the felicitations of the authors of the day upon the attainment of his seventieth birthday. A similar tribute was paid him ten years later on his eightieth birthday. Among other honours were the vice-presidency of

the London Library in 1902 and the Order of Merit in 1905, together with the rarely bestowed gold medal of the Royal Society of Literature.

In 1905 Meredith had the misfortune to break his leg, but he made an excellent recovery. Keenly alert and abreast of modern movements and interested in the work of the younger men, he envied only the power to be one of the active workers. On 13 April 1909 he wrote his last letter—an expression of condolence—to Mr. Watts-Dunton, on Swinburne's death. He insisted on being taken out in his bath-chair in all weathers. On 14 May 1909 he caught a slight chill; on the 16th he was taken ill. He died quietly on 18 May at Flint Cottage in the presence of his son, William Maxse, his daughter, Marie Eveleen ('Dearie'), wife of Henry Parkman Sturges, and his faithful nurse, Bessie Nicholls. A request from leading men of the day (and the expressed wish of Edward VII) for Meredith's burial in Westminster Abbey was refused by the dean. After cremation his ashes were laid beside his wife in Dorking cemetery (23 May), as he had himself arranged that they should be. On the day of his funeral some verses in terza rima by Mr. Thomas Hardy appeared in 'The Times,' and a memorial service was held in the Abbey. At Browning's funeral he had expressed the sentiment 'better the green grass turf than Abbey pavements.' On the headstone of his simple grave reclines an open book with the lines from 'Vittoria,' 'Life is but a little holding, Lent to do a mighty labour.' His will, dated Aug. 1892, was proved by his son, Lord Morley, and Mr. J. C. Deverell of Pixham Firs, Dorking (see *The Times*, 26 June 1909), his property being divided between son and daughter, with remainder to their children.

Meredith inherited a fine figure, and (strikingly good looking as a young man, when his abundant hair was chestnut red) his face grew handsomer as he grew older. He was in his heyday vividly and victoriously alive and had the optimism of high vitality. 'When I ceased to walk briskly part of my life was ended.' He was devoted to English fare; a connoisseur of cigars, he glowed over a generous wine and was proud of his small cellar; his hospitality was exquisite. He had a delicate, untrained ear for good music, and could play well by ear. He talked rotundly and resonantly (and several good phonographic records of his reading voice are preserved) on every topic discussed in Burton's 'Anatomy.'

Many thought him greater in conversation than in any other art.

Meredith's novels are more like Platonic dialogues than works of fiction. His characters have as a rule singularly little volition or speech of their own. The voice of their creator can be heard perpetually prompting them from behind a screen. The poems fill the interstices of thought in the novels. Oscar Wilde said with some point that Meredith had mastered everything but language: as a novelist he could do anything except tell a story, as an artist he was everything except articulate. To this it might be replied that he sought commonly to adumbrate conceptions not susceptible to lucid or exact statement, that he did not wish to narrate a story but to exemplify projections of his individual imagination. He was articulate enough when he desired to be so. He never pretended to make or take things easy; and the 'pap and treacle' style in fiction or poetry was his special abhorrence. But the novel was more or less accidental to him. It was his object in the capacity of virtuoso to express a code of connoisseurship in life and conduct. He delineates character by a strange shorthand process of his own; his men, and especially his women, transcend ordinary human nature, yet his heroines, and chief among them his 'English roses,' can hardly be matched outside Shakespeare. His descriptive power and insight into the secret chambers of the brain were indeed superb. But description, character, plot were in the novels wholly subservient to the ideals of his imagination. Thoroughly tonic in quality, his writings are (as Lamb said of Shakespeare) essentially manly.

Of posthumous works by Meredith the chief were the unfinished story of 'Celt and Saxon' ('Fortnightly Review,' Jan.-Aug. 1910), containing an interesting résumé of some of his frequent race speculations; 'The Sentimentalists,' a conversation comedy (of two distinct periods) begun at the period of his conception of the Pole family in his most laboured work, 'Emilia in England.' It was produced at the Duke of York's Theatre on 1 March 1910, and subsequently achieved a succès d'estime (see *Eye-Witness*, 2 Nov. 1911); and 'Last Poems by George Meredith,' including 'Milton,' 'Trafalgar Day,' 'The Call,' 'The Crisis,' 'The Warning,' and other poems emphasising England's need of a general defensive service. In the same year the definitive memorial edition was begun, and has been completed in twenty-seven

volumes (1909-11); it includes all his writings (letters only excluded), together with various readings and a bibliography. A collection of Meredith's letters edited by his son appeared in 1912. The most notable portraits are the painting by G. F. Watts in 1893 in the National Portrait Gallery (not a good likeness), the dry-point etching of Mortimer Menpes (1900), drawings by Mr. J. S. Sargent of 1901, and William Strang's portrait commissioned by King Edward VII for the royal collection at Windsor. Two caricatures appeared in 'Punch,' by E. J. Wheeler, 19 Dec. 1891, and by E. T. Reed, 28 July 1894. A caricature by Max Beerbohm appeared in 'Vanity Fair,' 24 Sept. 1896. Of the later portraits the photograph by his friend Mrs. Seymour Trower (*Mem. Ed.* xxii.) is inferior to that at the age of eighty given in the second volume of the Letters. But Meredith was a refractory subject, and though he had a fine portrait of his wife by his friend Frederick Sandys in his sitting-room he would never consent to give Sandys an adequate sitting. An early photograph is given in memorial edition, vol. vii., and two others first appear in the Letters (Oct. 1912). A bronze medallion by Theodore Spicer-Simpson was placed in the miniature room, National Portrait Gallery, in 1910.

Of Meredith's manuscripts, which attest throughout the intense and laborious character of the author's workmanship, the original autographs of 'Celt and Saxon,' 'The Egoist,' and 'One of our Conquerors' were deposited on loan in the British Museum by the novelist's son and daughter in 1910. Other MS. works were given by Meredith as a means of provision to his faithful attendant, Frank Cole, and his trained nurse, Bessie Nicholls, his seven years attendant. Of these 'The Tragic Comedians' fetched 220*l.*, 'A Conqueror of our Time' (an early version of 'One of our Conquerors,' with no fewer than four versions of chapter xiv.) 260*l.*, 'Diana of the Crossways,' in the early serial form, 168*l.*, 'A Reading of Earth,' 205*l.*; 'The Amazing Marriage' and 'The Tale of Chloë' were also offered for sale (see *The Times*, 2, 4, 26 Nov., 1 and 2 Dec. 1910).

[The article is based primarily upon the numerous accounts and reminiscences which appeared in the London press in May 1909 (see *The Times* 20 and 27 May); on two well-packed articles by Mr. Edward Clodd in the *Fortnightly* (July 1909) and by Mr. Stewart M. Ellis in the same review, April 1912 (invaluable for ancestral details); on personal information kindly given by

several of Meredith's friends, among them Mr. Clodd, Mr. Lionel Robinson, Mr. F. Jameson, Dr. Plimmer, and Mr. Kyllmann; and on Meredith's Collected Letters (1912, 2 vols.), kindly put at the writer's disposal before publication by Mr. W. M. Meredith. Of the many books about Meredith J. A. Hammer-ton's *George Meredith in Anecdote and Criticism*, 1909, and C. Photiadès's *George Meredith*, Paris, 1910, will probably be found most useful for biographical purposes. In 1890 appeared the rhapsodical medley on G. Meredith: *Some Characteristics*, by R. Le Gallienne, which has gone through five editions, and this was rapidly followed by Hannah Lynch's *George Meredith*, 1891; Walter Jerrold's *George Meredith: an Essay towards Appreciation*, 1902; Richard Curle's *Aspects of George Meredith*, 1908; Thomson's *George Meredith, Prose Poet*, 1909; Sydney Short's *On Some of the Characteristics of Meredith's Prose Writing*, Birmingham, 1907; A. Henderson's *Interpreters of Life and the Modern Spirit: Meredith*, 1911; J. W. Beach's *The Comic Spirit in George Meredith, an Appreciation*, 1911; Von Eugen Frey's *Die Dichtungen George Meredith*, Zurich, 1910; Ernst Dick's *George Meredith, Drei Versuche*, 1910. Among the critical interpretations the first place is held by *George Meredith, Some Early Appreciations*, 1909 (a most useful collection); *George Meredith*, by Mrs. Sturge Henderson, 1907; *The Poetry and Philosophy of George Meredith*, by G. M. Trevelyan, 1906; and *George Meredith, a Primer to the Novels*, by James Moffatt, 1909. The bibliography by John Lane appended to Le Gallienne's book and revised in the fifth edition of 1900, though incomplete after 1892, is still most useful (it includes personalia, portraits, articles, dedications, appreciations, translations and parodies) and is supplemented now by the *Bibliography of the Writings in Prose and Verse* by Mr. Arundel Esdaile, 1907, and the bibliog. (or chronology) of works in full appended to the *Memorial Edition*, vol. xxvii. (1911) by the same compiler. Other books of service are *Van Doren's Life of Peacock*, 1911; *The Pilgrim's Scrip, or Wit and Wisdom of George Meredith*, with Selections from his Poetry and an Introduction (by Mrs. Gilman), Boston, 1888; *Hyndman's Reminiscences*, 1911, 46-92; *Tinsley's Random Recollections*, 1-137; *Maitland's Life of Leslie Stephen*; *Gleeson White's English Illustration: 'The Sixties'*, 25, 42-3; *Grant Duff's Notes from a Diary*; *Janet Ross's The Fourth Generation*, 1912, and *Three Generations of Englishwomen*, 1888; *Marcel Schwob's Spicilège*, 1894; *Firmin Roz's Le Roman Anglais Contemporain*, 1912; *Mme. Daudet's Notes sur la Vie*; *Daily News*, 12 Feb. 1908; *New Princeton Rev.*, March, April 1887 (Flora Shaw); *Bookbuyer*, Jan. 1889 (home life); *Bookman*, Jan. 1905; *Rev. des Deux Mondes*, 15 June 1867, Feb. 1908;

Westminster Rev., July 1864; *Fortnightly Rev.*, Nov. 1883, June 1890, Feb. 1891 (Wilde), June 1886, March 1892, Nov. 1897; *Contemp. Rev.*, Oct. 1888 (J. M. Barrie); *Henley's Views and Reviews*, 1890; *New Review*, March 1893; *Edin. Rev.*, Jan. 1895; *Free Rev.*, Sept. 1896; *Sat. Rev.*, 27 Mar. 1897 (G. B. Shaw); *Nineteenth Century*, Oct. 1895 (Traill); *Longman's Mag.*, Nov. 1882 (R. L. S.); *Independ. Rev.*, 1904-5, and Dec. 1906 (important articles on the Poems); *Canadian Mag.*, July 1905 (MacFall); *Atlantic Mo.*, June 1902; *Rev. Germanique*, March-April 1906; *Athen.*, 29 May 1909; *Quarterly Rev.*, July 1897, July 1901; *Tribune*, 7 Jan. 1906 (Elton); *Engl. Illustr.*, Feb.-March 1904; *Pall Mall Mag.*, May 1904; *Acad.*, Jan. 1891 (Arthur Symons); *The Times*, 24 Oct. 1909, 13 Feb. 1908.] T. S.

MERIVALE, HERMAN CHARLES (1839-1906), playwright and novelist, born in London on 27 Jan. 1839, was only son of Herman Merivale, permanent under-secretary of the India office [q.v.]. Herman was educated first at a preparatory school and then at Harrow, where C. J. Vaughan, the headmaster, became much attached to him. He gives a full account of his schooldays in 'Bar, Stage, and Platform' (1902; cf. pp. 168-214). On leaving school in 1857 Merivale entered Balliol College, Oxford, where Swinburne and Charles Bowen were his contemporaries. He graduated B.A. in 1861, with a first class in classical moderations and a second in the final classical school. From early youth Merivale had been devoted to the drama, and was a good amateur actor, but his endeavour to found a dramatic club at Oxford, as Sir F. C. Burnand did at Cambridge, was foiled by the opposition of the dons. He was called to the bar of the Inner Temple on 26 Jan. 1864; he went the western circuit, and also the Norfolk circuit, where Matthew Arnold was his companion. Later he was through his father's influence junior counsel for the government on Indian appeals, and in 1867 boundary commissioner for North Wales under the Reform Act. From 1870 to 1880 he edited the 'Annual Register.' At his father's house he met many distinguished men, including Lord Robert Cecil, afterwards Lord Salisbury, who was a lifelong friend.

After his father's death in 1874 Merivale gave up the law, and, following his real tastes, devoted himself to literature and the drama. As early as 1867 he had written, under the pseudonym of Felix Dale, a farce, 'He's a Lunatic,' in which John Clayton [q. v.] played the chief part,

and in 1872 Hermann Vezin produced at the Court Theatre 'A Son of the Soil,' which Merivale adapted from Ponsard's 'Le Lion Amoureux.'

His first dramatic success was 'All for her,' founded on Dickens's 'Tale of Two Cities,' written in collaboration with J. Palgrave Simpson, and produced by John Clayton at the Mirror Theatre (formerly the Holborn) on 18 Oct. 1875. In the autumn of 1879 Miss Genevieve Ward produced 'Forget-me-not,' by Herman Merivale and F. C. Grove (cf. BRAM STOKER, *Personal Reminiscences of Sir Henry Irving*, 1907, p. 350), and she played the part of the heroine, Stéphanie de Mohrivart, for ten years (over 2000 times) in all parts of the world (cf. HELEN C. BLACK, *Pen, Pencil, Baton and Mask*, p. 180). In 1882, at Bancroft's invitation, Merivale adapted with admirable skill Sardou's 'Fédora.' Merivale's 'The White Pilgrim,' produced by Hermann Vezin in 1883, is poetic drama of the highest quality. Merivale published the piece in a volume with other poems in the same year.

Merivale wrote many excellent farces and burlesques. At John Hollingshead's invitation he produced 'The Lady of Lyons Married and Settled' (Gaiety Theatre, 5 Oct. 1878), and 'Called There and Back' (Gaiety, 15 Oct. 1884). 'The Butler' (1886) and 'The Don' (1888) were both written for Toole, who took great pleasure in playing them, especially 'The Don' (cf. J. HATTON, *Reminiscences of J. L. Toole*, 1892, pp. 264-5). In 1882 Merivale sold the acting rights of 'Edgar and Lucy,' a play adapted from Scott's 'Bride of Lammermoor,' to Irving, who produced it on 20 Sept. 1890, under the title of 'Ravenswood' (cf. BRAM STOKER, *Sir Henry Irving*, 1907, pp. 120-2).

Meanwhile Merivale won a reputation as a novelist with 'Faucit of Balliol' (3 vols. 1882), the earlier chapters of which give an admirable picture of Oxford life. He proved his literary facility in a fairy tale for children, 'Binko's Blues' (1884), and 'Florien,' a five-act tragedy in verse (1884), and in frequent contributions to 'Blackwood,' the 'Cornhill,' the 'Spectator,' 'Punch,' 'Saturday Review,' the 'World,' and 'Truth.' But it was in poetic drama that Merivale's ability, which combined fancy and wit with a poetic imagination, showed to best advantage.

Merivale's health required him to live at Eastbourne. There he interested himself in politics as an ardent liberal, working hard for his party between 1880 and 1890.

A brilliant speaker, he refused many invitations to stand for parliament, including the offer of an Irish seat from Parnell.

In 1891 Merivale's health broke down while he was engaged on a memoir of Thackeray, for the 'Great Writers' series of Messrs. Walter Scott, which Sir Frank Marzials completed. Ordered a long sea-voyage to Australia, he and his wife were shipwrecked when six degrees north of the line, and on being rescued were taken to Pernambuco, where Merivale's increasing illness compelled a hasty return to England. Recovery followed, and Merivale was again at work. On leaving for Australia he had been induced to give his solicitor and trustee, Cartmell Harrison, a 'power of attorney,' and in 1900, through Harrison's default, he lost the whole of his fortune of 2000*l.* a year. A civil list pension of 125*l.* was awarded him on 25 May 1900. In June a matinée was given for his benefit at Her Majesty's Theatre. He died suddenly of heart failure on 14 Jan. 1906, at 72 Woodstock Road, Bedford Park, W. A few years before, he became a Roman catholic. He was buried in his father's grave in Brompton cemetery.

Merivale married in London, on 13 May 1878, an Irish lady, Elizabeth, daughter of John Pitman, who often assisted him in his work, notably in 'The Don.' They had no children. His widow was granted a civil list pension of 50*l.* in 1906.

Two portraits, one by Claude Calthrop, M.A., belong to Mrs. Merivale.

Besides the plays cited, Merivale was author of: 1. 'A Husband in Clover' (Lyceum Theatre, 26 Dec. 1873). 2. 'Peacock's Holiday' (Court Theatre, 16 April 1874). 3. 'The Lord of the Manor,' founded on 'Wilhelm Meister' (Imperial Theatre, 3 April 1880). 4. 'The Cynic' (Globe Theatre, 14 Jan. 1882). 5. 'The Whip Hand,' with Mrs. Merivale (Cambridge Theatre Royal, 21 Jan. 1885). 6. 'Our Joan' (Grand Theatre, 3 Oct. 1887).

MERRIMAN, HENRY SETON (pseudonym). [See SCOTT, HUGH STOWELL (1863-1903), novelist.]

MEYRICK, FREDERICK (1827-1906), divine, born at Ramsbury vicarage, Wiltshire, on 28 Jan. 1827, was the youngest son of Edward Graves Meyrick, vicar of

Ramsbury, by his wife Myra Howard. He claimed descent from the ancient family of Meyricks of Bodorgan, Anglesey, through Rowland Merrick or Meyrick, bishop of Bangor, 1559-66 [q. v.]. Educated first at Ramsbury school, he won a scholarship at Trinity College, Oxford, and matriculated on 12 June 1843. He graduated B.A., with a second class in final classical school, in 1847, and proceeded M.A. in 1850. Elected fellow of Trinity in 1847, he travelled on the Continent with pupils, closely observing ecclesiastical affairs. One result was the establishment in 1853 of the Anglo-Continental Society, of which Meyrick for forty-six years acted as secretary. The results of his observations in Spain he published as 'The Practical Working of the Church of Spain (1851).'

Returning to Oxford, Meyrick was ordained deacon in 1850 and priest in 1852; became tutor of Trinity; took an active part in the discussion of university reform; crossed swords with H. E. Manning [q. v.] over Roman catholic ethics as represented by Liguori's works; was select preacher at Oxford (1855-6 and 1875-6), and Whitehall preacher (1856-7). In 1859 he was appointed an inspector of schools, and resigned his fellowship in the following year. In 1868 Meyrick was instituted to the rectory of Blickling with Erpingham, Norfolk, where he spent the remainder of his life. From 1868 to 1885 he served the bishop of Lincoln, Christopher Wordsworth [q. v.], as examining chaplain, and in 1869 became a non-residential canon of Lincoln.

The Vatican Council of 1870 gave new life to Meyrick's interest in continental affairs. He visited Döllinger at the time of his excommunication, and attended the Bonn conferences on reunion (1874 and 1875), which he helped to organise. During 1886 he was principal of Codrington College, Barbadoes, a theological training institution. In 1892 he accompanied the archbishop of Dublin, Lord Plunket [q. v. Suppl. I], on a journey in Spain for the aid of the reformed church; and on the archbishop's consecration in 1894 of Bishop Cabrera he drew up an address, largely signed, in support of Lord Plunket's action. In 1898 he resigned the secretaryship of the Anglo-Continental Church Society, and in 1899 ended the publication of the 'Foreign Church Chronicle,' which he had edited for twenty years. In 1904 he took part in the ritual controversy, identifying himself more intimately with the moderate evangelicals. He died at Blickling on 3 Jan. 1906, and is commemorated in the

church by a window. A wide traveller, an accomplished linguist, and a clever disputant, he hindered his ecclesiastical advancement by his controversial zeal. He married in 1859 Marion E. Danvers, who with two sons and five daughters survived him.

Meyrick contributed to periodical literature; to Smith's 'Dictionary of the Bible' (1860, 1863), to the 'Dictionary of Ecclesiastical Antiquities' (1875), and to 'A Protestant Dictionary' (1904); to the 'Speaker's Commentary' (Joel and Obadiah, 1876; Ephesians, 1880); to the 'Pulpit Commentary' (Leviticus, 1882); and to the 'One Volume Commentary' (1905). His 'Memories' (1905) is especially useful for its account of his contemporaries at Oxford and for its view of Anglican interest in the Old Catholic and other reform movements on the Continent. In connection with these movements he translated into Latin and other languages standard works of English divines, and was the author of several anti-Roman pamphlets. He also published: 1. 'Moral Theology of the Church of Rome,' 1856. 2. 'The Outcast and the Poor of London,' 1858. 3. 'University and Whitehall Sermons,' 1859. 4. 'Is Dogma a Necessity?' 1883. 5. 'The Doctrine of the Church of England on the Holy Communion restated,' 1885; 4th edit. 1899. 6. 'The Church in Spain,' 1892. 7. 'Scriptural and Catholic Truth and Worship,' 1901; 2nd edit. 1908.

MICHIE, ALEXANDER (1833-1902), writer on China, born at Earlsferry, Fifeshire, on 1 March 1833, was only son of Alexander Michie, a weaver, by his wife Ann Laing. On his father's death his mother married again, and Robert Thin, M.D. Edinburgh (*d.* at Shanghai in 1867), and George Thin, M.D. Edinburgh, of London, were Michie's stepbrothers. Educated for commercial life at Kilconquhar school, Michie was for some time a bank assistant at Colinsburgh; but in 1853 he left England to join Lindsay and Co., merchants, at Hong-Kong. Encouraged to depend largely on his own judgment in his work for the firm, he was allowed by

tradition to trade independently and for his own profit. Michie made rapid progress, and in 1857 became a partner of his firm and its representative at Shanghai. Subsequently he transferred his services successively to Chapman, King and Co., to Dyce, Nichol and Co., in which he obtained a partnership, and finally to the leading Chinese firm, Jardine, Matheson and Co. He was meanwhile a prominent member of the Chamber of Commerce, Shanghai, and was for some years chairman.

Michie was active in acquiring information likely to be serviceable to British commerce. After the drafting of the treaty of Tientsin, ratified in 1860, which proposed to open new ports in the north, Michie in the spring of 1859 engaged in a secret trading expedition to the Gulf of Pechili, and was one of the first European traders to gain direct knowledge of Wei-hai-Wei, Chefoo, Newchang, and other places on that then unknown coast. In 1861 he helped Sir James Hope [q. v.] in his negotiations with the Taiping rebels. He went up the River Yangtze with the expedition which was to protect British trade, and at Nanking, Michie, with Lieutenant-colonel (afterwards Lord) Wolseley and J. P. Hughes, vice-consul designate of Kiu-Kiang, was allowed to land, and the three remained for some weeks as the voluntary guests of the rebels, as to whose strength and intentions they acquired useful information.

In 1863 Michie returned temporarily to England by the unusual route of Siberia. He described in the 'Journal of the Geographical Society' his journey between Tientsin and Mukden, and in 1864 published 'The Siberian Overland Route,' a description of the whole journey from Peking to St. Petersburg.

In 1869 Michie, on behalf of the Shanghai Chamber of Commerce, accompanied Mr. Swinhoe, consul of Taiwan, on an expedition into the interior. A revision of the Treaty of Tientsin was contemplated, and Michie and his companion undertook to study the conditions of trade in the districts likely to be affected. After passing through the canal district of the Yangtze valley, he explored Szechuan and made a report of permanent value.

In 1883 Michie settled at Tientsin, where he not only carried on his private business but acted as correspondent of 'The Times.' For some years too he edited the 'Chinese Times,' published at Tientsin, and wrote occasionally for 'Blackwood,' 'Leitner,' and other magazines. In 1895 he was 'The Times' special correspondent during the

Chino-Japanese war. Subsequently he left China for England, only returning in 1901 in order to visit his daughter, who with her husband had been shut up in the legations at Peking. He died on 8 Aug. 1902 at the Hotel Cecil, London, and was buried at Highgate cemetery.

In 'The Englishman in China' (2 vols. 1900) Michie supplied a clear and comprehensive account of European relations with China through the Victorian era. The central figure of the narrative is Sir Rutherford Alcock [q. v.]. Michie's criticisms of English diplomacy and English officials are the fruit of personal observation and first-hand knowledge. He also published 'Missionaries in China' (1891) and 'China and Christianity' (1900).

Michie married on 16 Dec. 1866 Ann, daughter of Charles Morley Robinson of Forest House, Leytonstone, Essex. He had issue one daughter and one son, Alexander, an official in the Chinese customs service.

[The Times, 12 Aug. 1902; Geog. Journ. x. xvii. and xx.; Stanley Lane Poole, Life of Sir Harry Parkes, 1894; Sir Henry Keppel, A Sailor's Life under Four Sovereigns, 1899; private information.] S. E. F.

MICKLETHWAITE, JOHN THOMAS (1843–1906), architect, born at Riskworth House, Wakefield, Yorkshire, on 3 May 1843, was son of James Micklethwaite of Hopton, Mirfield, worsted spinner and colliery owner, by his wife Sarah Eliza Stanway of Manchester.

After education at Tadcaster and Wakefield, and subsequently at King's College, London, which afterwards granted him an hon. fellowship, he became a pupil in 1862 of (Sir) George Gilbert Scott [q. v.], and formed a lifelong friendship with a fellow pupil, Mr. Somers Clarke. He began independent practice in 1869 and was in constant collaboration with Mr. Somers Clarke, who definitely became his partner in 1876 and remained in that capacity till his retirement from active work in 1892.

An earnest churchman and a master of historic ritual, Micklethwaite brought sympathy and knowledge to bear on his work as a designer. His productions, though not strikingly original, were invariably scholarly and correct. The individual responsibilities of Micklethwaite and his partner are not always easy to distinguish. Of their joint works the church of St. John, Gainsborough, the churches of All Saints, Brixham, and St. Paul's, Wimbledon Park, as well as the enlargement of the parish

church at Brighton, were all designed and begun by Mr. Somers Clarke, and were completed by Micklethwaite after 1892. At Brighton church Micklethwaite modified his colleague's design, and at All Saints' church, Haydon Lane, Wimbledon, Micklethwaite, besides completing Mr. Somers Clarke's plans, designed the screens and furniture. The church at Stretton was designed by Mr. Clarke but was carried out by Micklethwaite after 1892.

Among the works which were distinctly or exclusively Micklethwaite's are: St. Hilda's church, Leeds; St. Bartholomew's, Barking Road, East Ham (1902); St. Peter's, Bocking; Widford church; the rebuilding (tower excepted) of All Saints', Morton, near Gainsborough (1891-3); the House of Mercy, Horbury; St. Saviour's, Luton, and St. Matthias', Cambridge. Micklethwaite's ecclesiastical skill was often in demand for the completion or furnishing of chancels and the like, for example at St. John's, Wakefield. The screens and rood of St. Mary Magdalene's, Munster Square, London, are of his design. He was often engaged in restoration, as at Kirkstall Abbey, the churches of Oundle, Thornhaugh, Inglesham, Orford, Winchelsea, West Malling, Lydney North, and All Saints, Great Sturton. The York county council appointed him, with Mr. W. H. Brierley, to restore Clifford's Tower at York, and in 1900 he was made architect to St. George's Chapel, Windsor. At Ranworth, Norfolk, he repaired the celebrated screen, and at St. Andrew's, Cherry Hinton, he restored the chancel.

Of his less frequent domestic and secular work there are examples in the addition to Stapleford Park, and the Technical Schools at Wimbledon.

Micklethwaite's critical knowledge of Westminster Abbey and his affection for the fabric were rewarded in 1898 by his appointment as surveyor to the dean and chapter, on the death of John Loughborough Pearson [q. v.]. The works of renewal on the south transept and west front were carried out during his period of office in collaboration with Mr. W. D. Caröe, F.S.A. As custodian of the Abbey he aimed primarily and essentially at conservation. With the possible exception of the decoration on the west side of the Confessor's shrine carried out at the time of the coronation of King Edward VII (when he also designed some of the vestments for the ceremonial), he made few if any attempts at conjectural renovation.

Throughout his career Micklethwaite

devoted himself to archaeological inquiry and writing as well as to architectural work. In 1870, when he wrote a paper on the Chapel of St. Erasmus in Westminster Abbey, he was elected F.S.A. He served for many years on the executive committee of the Antiquaries' Society, was several times a member of council, and became a vice-president in 1902. A series of articles begun in 'The Sacristy' as early as 1870 were collected in 1874 as 'Modern Parish Churches, their Plan, Design and Furniture.' Among his more important monographs were two essays on Saxon churches and two on Westminster Abbey, all in the 'Archæological Journal,' one on the sculptures of Henry VII's Chapel in 'Archæologia,' and a treatise on the Cistercian plan in the 'Yorkshire Archæological Journal.' He was one of the founders of the Alcuin Club, the Henry Bradshaw Society, and the St. Paul's Ecclesiological Society. His tract on the 'Ornaments of the Rubric' was the first publication of the Alcuin Club in 1897, and reached a third edition. He was a member, and in 1893 master, of the Art Workers' Guild, and took a leading part in the affairs of the Archæological Institute. In 1874 he issued, in conjunction with Mr. Somers Clarke, a pamphlet, 'What shall be done with St. Paul's?' in reference to the internal alterations then in progress.

After some years of failing health, he died, unmarried, on 28 Oct. 1906, at his residence, 27 St. George's Square, London, S.W., and was accorded the honour of burial in the west cloister, Westminster Abbey.

[Athenæum, 10 Nov. 1906, p. 589, article by Prof. Lethaby; Builder, vol. xci. 1906, p. 516; obituary notice by the president, Soc. Antiq. Proceedings, 23 April 1907; Index Proc. Soc. Antiq., second ser., i.-xx. 267 (list of Micklethwaite's contributions); information from Mr. Somers Clarke.] P. W.

MIDLANE, ALBERT (1825-1909), hymn writer, born at Newport, Isle of Wight, on 23 Jan. 1825, was the posthumous child and youngest of the large family of James Midlane (*d.* Oct. 1824) by his wife Frances Lawes, a member of the congregational church then under Thomas Binney [q. v.]. Midlane, after an ordinary education, was employed for some three years in a local printing office, then became an ironmonger's assistant, and ultimately was in business for himself as tinsmith and ironmonger. His religious training was in the congregational church and its Sunday school, in which he became a teacher; he states

that instead of listening to sermons he studied the hymn-book; subsequently he joined the Plymouth brethren. Prompted by his Sunday-school teacher, he began to write verse as a child, contributing to magazines as 'Little Albert.' His first printed hymn, written in September 1842, appeared in the 'Youth's Magazine,' Nov. 1842. The hymn which came first into use ('God bless our Sunday Schools,' to the tune of the National Anthem) was written in 1844. The hymn on which his fame rests ('There's a Friend for little children') was composed on 7 Feb. 1859; it has been translated into a dozen languages, including Chinese and Japanese; it was included in the supplement to 'Hymns Ancient and Modern' (1868), when Sir John Stainer wrote the tune 'In Memoriam' for it. Midlane's output of hymns was amazing; in one year he wrote about 400, chiefly for American newspapers; Julian (July 1907) credits him with having produced over 800 hymns, of which 83 had been introduced into widely used hymnals. Many were published in magazines and in very numerous tiny collections; for the year 1908 he wrote that he counted 'just upon 200 published compositions, which is about the annual average.' This, however, included verses on national and local topics in the 'Isle of Wight County Press' and other periodicals, and historical prose. For some time he edited a local magazine, 'Island Greetings.' He made nothing by his pen, and having become guarantor for a friend he was reduced to bankruptcy. His friends throughout the country, in conjunction with the Sunday School Union, raised a sum which enabled the bankruptcy to be annulled and provided an annuity for Midlane and his wife. He was a man of wide sympathies; his hymns, with little claim to genius, are marked by a winsome religious emotion, and a passionate love of children. He died at Forest Villa, South Mall, Newport, I.W., on 27 Feb. 1909, as the result of an apopleptic seizure, and was buried in Carisbrooke cemetery. He married Miriam Granger, who survived him with two sons and one daughter.

The following works are believed to contain most of his hymns: 1. 'Poetry addressed to Sabbath School Teachers,' 1844, 12mo. 2. 'Vesta Garland,' 1850, 12mo. 3. 'Leaves from Olivet,' 1864, 12mo. 4. 'Gospel Echoes,' 1865, 16mo. 5. 'Above the Bright Blue Sky,' 1867, 16mo; 1889, 24mo. 6. 'Early Listings,' 1880, 16mo. 7. 'God's Treasures,' 1890, 16mo. 8. 'The Bright Blue Sky Hymn Book,' 1904, 12mo

(315 hymns); 1909, 12mo (323 hymns; portrait). 9. 'The Gospel Hall Hymn Book,' 1904, 12mo (218 hymns additional to those in No. 8, 1904). 10. 'A Colloquy between the Gallows and the Hangman,' 1851 (verse). 11. 'Chronological Table of Events . . . Carisbrooke Castle,' Newport, I.W., 1877, 12mo.

[The Times, 1 March 1909; Isle of Wight County Press, 6 March 1909; Miller's Singers and Songs, 1869, p. 572; Julian's Dictionary of Hymnology, 1907, pp. 733 sq., 1672; private information.] A. G.

MILBANKE, RALPH GORDON NOEL KING, second EARL OF LOVELACE (1839-1906), author of 'Astarte,' born at 10 St. James's Square, London, on 2 July 1839, was second son of William King, afterwards King-Noel, first earl of Lovelace (1805-1893), by his first wife, Ada Augusta, daughter of Lord Byron the poet [q. v.]. The father, who succeeded as eighth Baron King in 1833, was created earl of Lovelace on 30 June 1838. He was lord-lieutenant of Surrey from 1840 to his death in 1893, and interested himself in agricultural and mechanical engineering.

During 1847-8 Ralph was a pupil at Wilhelm von Fellenberg's Pestalozzian school at Hofwyl, near Berne [see under HERFORD, WILLIAM HENRY, Suppl. II]. Subsequently educated privately, he matriculated at University College, Oxford, in 1859, but did not graduate. On the death on 1 Sept. 1862 of his elder brother, Byron Noel, Viscount Ockham, who had succeeded his grandmother, Lady Byron, as twelfth Baron Wentworth, Ralph himself became thirteenth Baron Wentworth. He had assumed the surname of Milbanke, Lady Byron's maiden surname, by royal licence on 6 Nov. 1861. Taking little part in public life, he read widely and showed independent if rather erratic judgment. At the age of twenty-two he spent a year in Iceland, and was a zealous student of Norse literature. In early life a bold Alpine climber, he spent much time in the Alps, while a peak of the Dolomites bears his name. An accomplished linguist, he was especially conversant with Swiss and Tyrolese dialects. His intimate acquaintance with French, German, and English literature was combined with a fine taste in music and painting. He enjoyed the intimacy of W. E. H. Lecky and other men of letters. In 1893 he succeeded his father as second earl of Lovelace. In 1905 he privately printed 'Astarte: A Fragment of Truth concerning

George Gordon Byron, first Lord Byron,' dedicated to M. C. L. (his second wife). This vigorous if somewhat uncritical polemic purported to be a vindication of Lovelace's grandmother, Lady Byron, from the aspersions made upon her after the 'revelations' of Mrs. Beecher Stowe in 1869-70. Lovelace alleged, on evidence of hitherto undivulged papers left by Lady Byron, and now at his disposal, that Byron's relations with his half-sister, Mrs. Augusta Leigh, were criminal, and that she was the 'Astarte' of the poet's 'Manfred.' Lovelace printed a statement signed in 1816 by Dr. Lushington, Sir Robert Willmot, and Sir Francis Doyle, and various extracts from correspondence. He also cited a letter in support of his conclusion from Sir Leslie Stephen, who had examined the papers. 'Astarte' provoked replies from Mr. John Murray (*Lord Byron and his Detractors*, 1906) and from Mr. Richard Edgcumbe (*Byron: the Last Phase*, 1909).

Lovelace died very suddenly at Ockham Park, Ripley, Surrey, on 28 Aug. 1906. After cremation at Woking his ashes were buried in the King chapel over the family vault in Ockham church. He was twice married: (1) on 25 Aug. 1869, to Fanny (*d.* 1878), third daughter of George Heriot, vicar of St. Anne's, Newcastle; (2) on 10 Dec. 1880, to Mary Caroline, eldest daughter of the Rt. Hon. James Stuart Wortley; she survived him. There was no male issue. Lovelace's daughter, Ada Mary, by his first wife, succeeded to her father's barony of Wentworth. The earldom of Lovelace devolved on his half-brother Lionel Fortescue King, son of the first earl by his second wife.

[G. E. C.'s and Burke's Peerages; The Times, 30 Aug., 3 and 10 Sept. 1906; Spectator, 15 Sept. 1906 (letter by 'O.' (Mrs. Ady)); Brit. Mus. Cat.; Lovelace's Astarte and works cited.] G. LE G. N.

MILLER, SIR JAMES PERCY, second baronet (1864-1906), sportsman, born at Manderston on 22 Oct. 1864, was eldest surviving son of Sir William Miller, first baronet (1809-1887), of Manderston, Berwick, a Leith merchant, who was M.P. for Leith (1859-64) and Berwickshire (1893-4). James, after education at Eton and Sandhurst, joined the army, becoming captain in the 14th hussars on 8 Sept. 1888. On 10 Oct. 1887 he succeeded to the baronetcy on his father's death. He was afterwards major of the Lothians and Berwickshire imperial yeomanry, and served in South Africa (1900-1) with the 6th battalion

imperial yeomanry, being mentioned in despatches, and receiving the D.S.O. He was a J.P. and D.L. for Berwickshire.

In 1889 Miller, who had previously owned a few steeplechasers, appeared upon the turf as an owner of racehorses, run under Jockey Club rules. In that year he purchased with rare judgment, of Sir Robert Jardine and John Porter, Sainfoin, which had won the Esher Stakes at Sandown Park very easily. The price was 6000*l.* and half the value of the Derby, if the horse won that prize. Sainfoin won the Derby of 1890 from Le Noir, Orwell, and Surefoot.

Miller's next stroke of luck was the purchase in 1894 for 4100 guineas, as a yearling, of the mare Roquebrune (foaled in 1893), by St. Simon, who had been bred by the Duchess of Montrose. With Roquebrune he won the New Stakes at Ascot and the Zetland Stakes at Doncaster. Mated in 1899 with Sainfoin, Roquebrune produced Rook Sand, her first foal. With this colt Sir James won in 1902 the Woodcote Stakes at Epsom, the Coventry Stakes at Ascot, the Champagne Stakes at Doncaster, and the Dewhurst Plate at Newmarket. In the following year Rook Sand won the Two Thousand Guineas, Derby, and St. Leger. During the three seasons he was in training, this horse won stakes to the value of 45,618*l.*, and was chiefly instrumental in placing Sir James at the head of the list of winning owners in 1903 and 1904, with totals of 24,768*l.* and 27,928*l.* Meanwhile Miller had in 1895 won the Oaks with La Sagesse, a daughter of Wisdom, and in 1901 his filly Aida, by Galopin, won the One Thousand Guineas. The most important of his successes in handicaps was that gained in the Cesarewitch of 1898 with Chaleureux, destined to become the sire of the filly Signorinetta, who in 1908 won the Derby and Oaks for the Chevalier Ginistrelli. During the seventeen years he had horses in training Miller won 161 races, worth 114,005*l.*

Miller established a high-class breeding farm at Hamilton Stud, Newmarket, where Rook Sand was foaled. He was elected a member of the Jockey Club in 1903, and was a steward of that body when he died in 1906. In December 1905 he sold by auction most of his mares, and Roquebrune was purchased by a Belgian breeder for 4500 guineas. Six weeks later, on 22 Jan. 1906, Sir James died at Manderston, his Scottish home, from a chill caught in the hunting-field. His remains were interred at Christ Church, Duns. Rook Sand was shortly afterwards sold to Mr. August

Belmont of New York for 25,000*l*. Married in 1893 to the Hon. Eveline Mary Curzon, third daughter of the fourth Baron Scarsdale, Miller left no issue, and was succeeded in the baronetcy by his brother, John Alexander. A cartoon portrait appeared in 'Vanity Fair' in 1890.

[The Times, 23 Jan. 1906; Kingsclere (by John Porter), pp. 124-5; Ruff's Guide to the Turf; Debrett's Peerage; Burke's Peerage.]
E. M.

MITCHELL, SIR ARTHUR (1826-1909), Scottish commissioner in lunacy and antiquary, born at Elgin on 19 Jan. 1826, was son of George Mitchell, C.E., by his wife Elizabeth Cant. He was educated at Elgin Academy, and graduated M.A. at Aberdeen University in 1845, prosecuting his studies for the medical profession at Paris, Berlin, and Vienna, and proceeding M.D. at Aberdeen in 1850. Devoting himself to lunacy, he quickly showed an aptitude for this branch of practice. When the Lunacy Act of 1857 was passed, he was chosen one of the deputy commissioners for Scotland, and was commissioner from May 1870 to September 1895. Improved methods for treating the insane, which he helped to bring into use in Scotland, he developed effectively in his book 'The Insane in Private Dwellings' (Edinburgh 1864). Presenting his views persuasively rather than argumentatively, he won for them wide support. In 1880 he was appointed a member of the English commission on criminal lunacy, and his experience largely influenced the report upon which the Act of 1880 was founded. In 1885 he served on the departmental committee on criminal lunatics in Ireland. From May 1869 till March 1872 he acted as Morison lecturer on insanity to the Royal College of Physicians of Edinburgh. In his lectures, many of which were published in book form, and in other works, he dealt authoritatively with various aspects of lunacy—individual, social, and medical.

Mitchell combined with his professional work much antiquarian study. In 1861 he was appointed a corresponding member, and in 1867 he was elected a fellow, of the Society of Antiquaries of Scotland, and continued an active member till his death, serving from time to time as secretary and vice-president. His researches largely dealt with existing superstitions in the Scottish Highlands, especially in their bearing on problems of insanity. He contributed many papers to the 'Proceedings,' the latest being a series on Scottish topographers (1901-9). In 1876 Mitchell was

the first Rhind lecturer in archæology, and delivered three courses of six lectures each, which were published under the title 'The Past in the Present: What is Civilisation?' (Edinburgh 1880); the book took standard rank. Mitchell was one of the founders of the Scottish History Society, and was a member of council and vice-president. He edited for the society 'Macfarlane's Topographical Collections' (3 vols. 1906-8). He was also president of the Scottish Text Society and professor of ancient history to the Royal Scottish Academy from 1878. He was a member of the royal commission on Scottish universities in 1889, and served till 1900.

In 1886 Mitchell was made C.B., and in 1887 K.C.B. He received the hon. degree of LL.D. from Aberdeen in 1875; and became hon. fellow of the Royal College of Physicians of Ireland in 1891. He died at 34 Drummond Place, Edinburgh, on 12 Oct. 1909, and was buried in Rosebank cemetery, Edinburgh. He married in 1855 Margaret, daughter of James Houston, Tullochgriban, Strathspey; she died on 4 Nov. 1904, leaving one son, Sydney Mitchell.

Besides the works mentioned and editions of Andrew Combe's 'Observations on Mental Derangement' (1887) and 'Management of Infancy' (1896), Mitchell published in 1905 'About Dreaming, Laughing, and Blushing.'

There are two portraits of Mitchell, one painted in 1880 by Norman Macbeth, R.S.A., and the other by Sir George Reid, P.R.S.A., in 1896. Both are in possession of the family.

[Scotsman, and Dundee Advertiser, 13 Oct. 1909; Lancet, 23 Oct. 1909; private information.]
A. H. M.

MITCHELL, JOHN MURRAY (1815-1904), presbyterian missionary and orientalist, born in Aberdeen on 19 Aug. 1815, was fourth son in the family of five sons and three daughters of James Mitchell, Burgess of Aberdeen, by his wife Margaret Gordon. Both parents were related to Patrick Copland [q. v.]. Three brothers, James (1808-1884), Gordon (1809-1893), and Alexander (1822-1901), became ministers of the Church of Scotland. After attending the parish school of Kinneff, Kincardineshire, Mitchell in 1828 entered the grammar school of Aberdeen, where he was strongly influenced by the rector James Melvin [q. v.]. With the second highest bursary, gained by his Latin prose, he entered Marischal College, Aberdeen, at fourteen, and graduated M.A.

with distinction in 1833. Deciding to enter the ministry of the Church of Scotland, he began his divinity course in that year, studying first at Aberdeen, where he won the lord rector's prize for an essay on 'The Septuagint and other Greek Versions of the Old Testament.' In 1837 the fame of Thomas Chalmers [q. v.] drew him to Edinburgh University, where he won a gold medal offered by Professor David Welsh [q. v.] for an essay on 'Eusebius as an Ecclesiastical Historian.' During the session 1837-8 he took charge of a class at Aberdeen grammar school, and among his scholars was James Augustus Grant [q. v. Suppl. I], the African traveller.

Mitchell was from youth interested in foreign missions and was deeply impressed by the labours of Alexander Duff [q. v.]. Ordained in 1838 and appointed by the foreign mission committee of the Church of Scotland to be a missionary to Bombay, he readily mastered the Marathi language and literature and became proficient in Sanskrit and the Parsi Zend. Among the Marathis he made many converts and gave an impulse to missionary work by originating the Bombay missionary conference. While at Bombay he made missionary tours annually throughout Central India. At the disruption of the Church of Scotland in 1843, Mitchell, with his colleagues in India, joined the Free church and bore a leading part in organising the Free church mission. He succeeded in inaugurating a flourishing mission in the British cantonment at Poona, where Scottish missionaries had previously been forbidden, and began work among the Mangs and Mahars of Jalna and North Haidarabad. After a four years' visit to Scotland (1863-7), where he ministered at Broughty Ferry, he proceeded in 1867, at Dr. Duff's request, to Calcutta, and remained in Bengal for the next six years. Mainly through his efforts the 'Union Church,' an important European congregation, was formed at Simla, and he helped to found a mission to the Santals.

On returning home in 1873 he acted as secretary to the foreign mission committee of the Free church. In 1880, after attending the pan-presbyterian council at Philadelphia, he went by way of Japan and China to India, where he spent two years in lecturing and preaching. From 1888, when he retired from the mission field, until 1898 he was minister of the Scottish church at Nice. Here his friends included the Dutch novelist, Maarten Maartens, who wrote admiringly of Mitchell's 'pure

and child-like heart' and of his 'noble aspirations and beliefs.'

Mitchell's closing years were devoted to literary work in Edinburgh. He had published 'Hinduism, Past and Present' (1885; 2nd edit. 1897), a capable introduction to the study of Indian religion. As Duff missionary lecturer in 1903 he gave an exhaustive course on 'The Great Religions of India,' which was posthumously published in 1905 with a prefatory note by his nephew, Dr. James Mitchell.

In December 1858 Mitchell was made hon. LL.D. of Marischal College and the university of Aberdeen. He died at his house in Edinburgh on 14 Nov. 1904, and was buried on 18 Nov. in the Dean cemetery, Edinburgh. On the sixtieth anniversary of his ordination as a missionary to India, his portrait, painted by W. E. Lockhart, R.S.A., was presented (May 1898) to the Free church, and now hangs in the general assembly hall of the United Free church in Edinburgh.

Besides several lectures, contributions to periodicals, and admirable metrical translations from classical and Indian poets, he published: 1. 'Letters to Indian Youth regarding the Evidences of the Christian Religion, with a Brief Examination of the Evidences of Hinduism, Parseism and Mohammedanism' (Bombay 1850; 11th edit. 1894; trans. into several Indian languages). 2. 'The Conflict of Ancient Paganism and Christianity' (n.d.). 3. 'Memoir of Rev. Robert Nesbit, Missionary,' London 1858. 4. 'In Western India: Recollections of my Early Missionary Life,' Edinburgh 1899.

On 22 Dec. 1842 he married Maria Hay, daughter of the Rev. Alexander Flyter, minister of Alness, Ross-shire. There were no children. Mitchell's wife, who died on 31 March 1907, was distinguished for her missionary zeal and literary ability. Many books by her had a large circulation; the chief of them were: 1. 'A Missionary's Wife among the Wild Tribes of South Bengal,' 1871. 2. 'In Southern India,' 1885. 3. 'Sixty Years Ago,' 1905.

[Scotsman, 16 Nov. 1904; Mitchell's writings private information.] W. F. G.

MOBERLY, ROBERT CAMPBELL (1845-1903), theologian, born at Winchester on 26 July 1845, was third son of George Moberly [q. v.], headmaster of Winchester and afterwards bishop of Salisbury. His mother Mary Ann was daughter of Thomas Crokat, a Scottish merchant at Leghorn. The family of seven sons and

eight daughters was brought up in close personal friendship with their near neighbours at Winchester, Rev. John Keble and Miss Charlotte M. Yonge. (Miss C. A. E. MOBERLY, *Dulce Domum: George Moberly, his Family and Friends*, 1911.)

After two years at a preparatory school at Twyford near Winchester, Moberly became a commoner of Winchester in 1856, and obtained a scholarship there in 1857. Thence he passed in 1863 to New College, Oxford, with a Winchester scholarship. In Easter term 1865 he obtained first-class honours in classical moderations, but in the final classical schools, in 1867, he was placed in the second class. He was awarded the Newdigate prize in June 1867 for a poem on Marie Antoinette. He graduated B.A. in 1867, proceeding M.A. in 1870, and D.D. in 1892. He was ordained deacon in 1869 and priest in 1870. In December 1867 he was elected senior student of Christ Church, and held his studentship till his marriage in 1880. He was engaged in lecturing and teaching in classical subjects at the college, 1868-75. From 1871 to 1885, he was domestic chaplain to his father, the bishop of Salisbury.

In January 1876 he accompanied his friend Reginald Stephen Copleston (*Dulce Domum*, p. 254) to Colombo, where Copleston had been appointed bishop. The visit lasted six months, and on his return to Oxford Moberly published a pamphlet, 'An Account of the Question between the Bishop and the C.M.S. in the Diocese of Colombo.' In 1876 he became principal of St. Stephen's House, Oxford, then founded for the training of Anglican clergy for foreign mission work. In 1878, at his father's urgent request, he undertook the principalship of the Diocesan Theological College at Salisbury. In 1880, on the nomination of the dean and chapter of Christ Church, he became vicar of Great Budworth, Cheshire. As a parish clergyman, he proved himself an earnest and fair-minded champion of Anglican opinions, on such questions as the jurisdiction of church courts, the laws as to marriage, and the educational problem. He had an exceptional clearness of perception of the principles that lay behind practical questions. In 1884 his diocesan, William Stubbs [q. v. Suppl. II], bishop of Chester, brought him out of this retirement to act as his examining chaplain, and to address clerical meetings in the diocese. Stubbs's successor, Francis John Jayne, retained Moberly as examining chaplain (1889-92); and nominated him honorary canon of Chester in 1890.

Moberly established a reputation as an exponent of philosophical theology by the paper, entitled 'The Incarnation as the Basis of Dogma,' which he contributed to 'Lux Mundi' in 1889, and his position was strengthened by his paper, 'Belief in a Personal God,' read before the Church Congress at Rhyl in 1891. In 1892 he was appointed regius professor of pastoral theology at Oxford, and canon of Christ Church. His professorial lectures were thoughtful, and he preached with ability in the university pulpit and in the cathedral. In 1900 he became proctor for the dean and chapter of Christ Church in the Lower House of Convocation, and showed brilliant powers of advocacy. From 1893 he was examining chaplain to William Stubbs, bishop of Oxford, and he was honorary chaplain to Queen Victoria, 1898-1901, and chaplain in ordinary to Edward VII, 1901. Moberly died on 8 June 1903, and was buried in the burial-place at the east end of Christ Church Cathedral. In 1880 he married Alice Sidney, second daughter of Walter Kerr Hamilton [q. v.], bishop of Salisbury. His son, Walter Hamilton Moberly, is now fellow of Lincoln College, Oxford.

Moberly judged his true sphere of activity to be that of a writer. His chief work was 'Atonement and Personality' (1901), a treatise dealing with the highest problems of dogmatic theology in an unusually systematic and original manner. Prof. William Sanday, reviewing it in the 'Expositor,' said that, to find its equal in importance, one must go back to Butler and Hooker. Other works are: 1. 'Is the Independence of Church Courts really impossible?' 1886; republished 1899. 2. 'Sorrow, Sin, and Beauty,' 1889 (three devotional addresses); republished posthumously, 1903. 3. 'Considerations upon Disestablishment and Disendowment,' 1894. 4. 'Reason and Religion: Some Aspects of their Mutual Interdependence,' 1896. 5. 'Ministerial Priesthood, with an Appendix upon Romanist Criticism of Anglican Orders,' 1897; republished 1899. 6. 'Doctrinal Standards': No. 1 of 'Pusey House Occasional Papers,' 1898. 7. 'Christ our Life: Sermons chiefly preached in Oxford,' 1902. 8. 'Undenominationalism as a Principle of Primary Education,' 1902. 9. Published after his death, 'Problems and Principles' (a selection of his papers and pamphlets on theological subjects and church problems), 1904.

Times, 12 June 1903; Guardian, 1903, pp. 817, 822. Appreciations by Dr. William Sanday in the Journal of Theological Studies, 1903, p. 499, and by Dr. Henry Scott Holland in Personal Studies, 1905, p. 272. A. C.

MOCATTA, FREDERIC DAVID (1828–1905), Jewish philanthropist, born in London on 16 Jan. 1828, was elder son in a family of two sons and two daughters of Abraham Mocatta (1797–1880). His father was an active member of the movement in England in 1840 for reform of Jewish worship and practice. His mother was Miriam, daughter of Israel Brandon. The Mocatta family, originally named Lumbrozo, was driven from Spain in 1492, when one branch migrated to Italy and the other, after a settlement in Holland, moved to England about 1670. Frederick David represented the seventh generation of the English settlers. In 1790 Abraham Lumbrozo de Mattos, his great-grandfather, who founded the firm of Mocatta & Goldsmid, bullion brokers to the Bank of England, was permitted by George III to change the family name to Mocatta, after a maternal ancestor. Rachel, a daughter of this Abraham, was mother of Sir Moses Montefiore [q. v.].

Educated at home by private tutors, among them Albert Löwy [q. v. Suppl. II], he was taught Hebrew and Latin by his father, and came to speak five or six languages. About 1843 he entered his father's business, from which he retired in 1874. His chief recreations through life were the study of history and antiquities, and foreign travel which extended over Europe, Asia Minor, Palestine and Egypt.

Enjoying a large income, Mocatta was best known as a broad-minded philanthropist. Among the first questions that engaged his attention were the better housing of the working classes and the administration of charity in such a way as not to demoralise the poor. He was an active promoter and vice-president from its formation in 1869 of the Charity Organisation Society, and was chairman from 1901 of the Charity Voting Reform Association, with whose efforts to abolish electioneering in charity administration he was in fullest sympathy. He was specially interested in hospital and nursing work, and he liberally supported almost every hospital in London.

To Jewish charities he devoted the greater part of his wealth and leisure. He was active in organising the Board of Guardians of the Jewish Poor (founded in 1859), and was chairman of a Jewish workhouse started in 1871, and reorganised

in 1897 as the Home for Aged Jews, with himself as president; he also helped to form the Jews' Deaf and Dumb Home in 1865. The situation of the Jews in eastern Europe engaged his constant attention. He was vice-president of the Anglo-Jewish Association, was member of the Alliance Israélite in Paris, and member of the Roumanian committee which was founded in London in 1872 to watch over the affairs of the Roumanian Jews. In 1882 he took active part in administering the Mansion House Committee Fund for assisting Jews to leave Russia.

Mocatta did all he could to promote education, especially that of the Jewish poor, and he encouraged Jewish literature and research. In whole or part he defrayed the expenses of many important publications, including Zunz's two books, 'Zur Geschichte und Literatur' (Berlin, 1850) and 'Literaturgeschichte der Synagogalen Poesie' (Berlin, 1855), Berliner's 'Juden in Rom' (Frankfort, 1893), and the English translation of Graetz's 'History of the Jews' (London and Philadelphia, 1891). In 1887 he was president of the Anglo-Jewish Historical Exhibition at the Albert Hall, which led to the establishment of the Jewish Historical Society of England. He was president of the society in 1900. He bequeathed to public uses his valuable collection of books, principally on Jewish history; it now forms the Mocatta Library at University College, Gower Street, the room being the headquarters of the Jewish Historical Society. He was elected F.S.A. in 1889. He was chairman of the council of founders of the West London Synagogue (1896–1904). On 16 Jan. 1898, his seventieth birthday, he was presented with a book containing signatures of the Empress Frederick and of 8000 other representatives of 250 public bodies to which Mocatta had given his support; the book now belongs to his nephew, Mr. B. Elkin Mocatta.

Mocatta died in London on 16 Jan. 1905, and was buried at the Ball's Pond cemetery of the West London Synagogue of British Jews. There is a drinking fountain to his memory outside St. Botolph's Church, Aldgate. An enlarged photograph is in the committee room of the West London Synagogue.

Mocatta published 'The Jews and the Inquisition' (1877), which has been translated into German, Italian, and Hebrew, and 'The Jews at the Present Time in their Various Habitations,' a lecture (1888).

He married in 1856 Mary Ada, second daughter of Frederick David Goldsmid,

M.P. for Honiton, and sister of Sir Julian Goldsmid; he had no issue.

M. E.

MÖENS, WILLIAM JOHN CHARLES (1833–1904), Huguenot antiquary, born at Upper Clapton on 12 Aug. 1833, was second son of Jacob Bernelot Möens, a Dutch merchant who, born in Rotterdam on 18 Jan. 1796, settled in youth in London, and died at Tunbridge Wells on 19 July 1856. His mother was Susan Baker, daughter of William Wright of the City of London, solicitor. The family, of old standing in Flanders, derived its name from Mons in Hainault. A great uncle, Adrian Möens (1757–1829), became a naturalised British subject in 1809, and was from 1800 consul for the Netherlands in Bristol, where he died 18 May 1829.

Möens, who was privately educated, began his career on the Stock Exchange, but soon retired to a house which he had bought at Boldre in Hampshire, devoting himself to yachting, and later to antiquarian researches. In January 1865 he proceeded with his wife to Sicily and Naples, and on 15 May, while returning from Pæstum with a party, including, besides his wife, the Rev. John Cruger Murray Aynsley and Mrs. Aynsley, the two men were suddenly captured by a band of about thirty brigands near Battipaglia. Möens, a pioneer of amateur photography, had been photographing the temples. The two ladies took refuge in the village, and Aynsley was released next morning to negotiate a ransom fixed at 8000*l.* Möens remained in the brigands' custody for four months, being dragged over the mountains, insufficiently clad and often starving. Italian soldiers hotly pursued the band, without capturing them, and Möens, being very tall, was often a mark for the soldiers' bullets. Strenuous efforts for his release were made by his friends. On 26 Aug. the brigands gave him up after receiving from him the sum of 5100*l.* In January 1866 Möens published a lively account of the episode in 'English Travellers and Italian Brigands.' A new edition was called for in May, and the book was translated into several languages. The proceeds of sale Möens devoted to building a school near his residence at Boldre, Hampshire. In 1867 he bought the estate of Tweed in the same county. In 1869 he sailed his steam yacht *Cicada* down Lymington up the Rhine to Strassburg, and by French

canals to Paris and Havre. A similar trip followed in 1875, and next year he published 'Through France and Belgium by River and Canal in the Steam Yacht *Ytene*.' Möens deeply interested himself in the New Forest. He made a special study of forest law, and fought several battles for the commoners' rights. By his support of the New Forest Pony Association he did much to improve the breed. He was a member of the Hampshire county council from its formation. He published pamphlets on the working of the Allotment Acts in 1890 and Parish Councils Act in 1894.

Möens closely studied genealogy, especially that of Flemish families settled in England. In 1884 he edited 'The Baptismal, Marriage, and Burial Registers of the Dutch Church, Austin Friars.' In 1885 he was one of twelve persons who founded the Huguenot Society of London. He read the first paper on 13 May, on 'The Sources of Huguenot History,' and edited the earliest publications. He was elected a vice-president in 1888, and was president from 1899 to 1902. His work for the society was untiring and of great value. Elected F.S.A. in 1886, he was appointed a local secretary, and was a member of the Hampshire Field Club and Archæological Society.

He died suddenly at Tweed on 6 Jan. 1904, and was buried at Boldre church. He married on 3 Aug. 1863 Anne, sixth daughter of Thomas Writers, of Heathfield Park, Addington, but left no issue. By his will he divided his library between the Hampshire county council and the French Hospital, Victoria Park, London.

Besides the works cited, Möens edited: 1. 'The Walloons and their Church at Norwich: their History and Registers, 1565–1832,' Lymington, 1887–8, with an historical introduction (which was reprinted separately with a new preface, 1888; 150 copies). 2. 'Chronique Hist. der Nederland, Oorlogen, Troublen,' &c., 1888, an account of an anonymous work by Philip de St. Aldegonde, printed at Norwich in 1579 by Antony de Solemne, a Brabant who came there in 1567 (reprinted from *Archæologia*, li. 205). 3. 'Hampshire Allegations for Marriage Licences granted by the Bishop of Winchester, 1689 to 1837' (Harleian Soc. Publications, vol. 34), 1893. 4. 'Registers of the French Church, Threadneedle St.' (Huguenot Soc.), 1896. 5. 'Register of Baptisms in the Dutch Church at Colchester from 1645 to 1728' (Huguenot Soc.), 1905.

[Burke's Landed Gentry; Athenæum, 16 Jan. 1904; Huguenot Soc. Proc., vol. vii. 1901-4, p. 324 (with portrait); Möens's works.]

C. F. S.

MOIR, FRANK LEWIS (1852-1904), song composer, was born at Market Harborough on 22 April 1852. Early in life he showed musical and other artistic talents, and while still a boy composed a song. After acting as tuner in London and Nottingham, he became an art student at South Kensington. Though he had no musical training, he won a scholarship at the National Training School for Music, where he studied under Prout, Stainer, and Bridge; and while there Boosey & Co. engaged him to compose ballads for four years. He won the Madrigal Society's prize in 1881. Possessing a good baritone voice, he gave recitals and taught singing at a studio in Oxford Street, London. He composed sentimental drawing-room ballads with extraordinary facility; many had very great popularity, especially 'Only once more' (1883) and 'Down the Vale' (1885). He wrote both music and words in many cases, including a comic opera, 'The Royal Watchman.' He tried a higher style in a harvest cantata, a communion service in D, and some elaborate songs, which met with little success. He published a work on 'Natural Voice Production' (1889), and contributed organ solos, of little value, to the collections 'Abbey Voluntaries,' 'Chancel Echoes,' 'Cathedral Voluntaries,' and 'Stark's Select Series.'

The music-pirates, who surreptitiously printed popular songs and sold them in the streets at a penny, ruined Moir. Publishers refused his compositions; he fell into despondency and penury, and after a painful illness died at Deal on 14 July 1904. He had married Eleanor Farnol, a vocalist from Birmingham, and left three children.

[Goodworth's Musicians of All Times; Musical Herald and Musical Times, August 1904 (obit.); Moir's works in Brit. Museum.]

H. D.

MOLLOY, GERALD (1834-1906), rector of the Catholic University of Dublin, born at Mount Tallant, near Dublin, on 10 Sept. 1834, was second son of Thomas Molloy by his wife Catharine, daughter of Patrick Whelan. He received his early education at Castleknock College, and thence passed to Maynooth College, the theological seminary of the Irish catholic priesthood. The capacity for sustained work which distinguished him through life carried him with such success through his college course that at its close in 1857, when only

twenty-three years old, he was appointed professor of theology at Maynooth. But his bent was not for theology. With his professorial duties he combined a study of the natural sciences, for which he had special aptitudes. In 1870 he published, under the title 'Geology and Revelation,' a work which testified to his scientific gifts as well as to his acquirements as a theologian. In 1874 he resigned his chair in Maynooth (where he received the degree of D.D.) for the professorship of natural philosophy in the Catholic University, Dublin.

In 1878 he was appointed one of the two assistant commissioners for regulating intermediate education in Ireland according to the new Act of Parliament passed in that year. But after a few months he retired, and resumed his professorship at the Catholic University. Of this institution he became rector in 1883, but the title was then little more than honorary. The Royal University of Ireland had been established in 1879, and on its foundation the buildings of the Catholic University became merely a college in which the Dublin fellows of the new university lectured, and students were prepared for its degrees. Molloy was among the first senators of the Royal University, and was made D.Sc.; in 1882 he resigned the position of senator for a fellowship in the department of physical science, which he held till 1887. In 1885 the government named a commission to inquire into educational endowments in Ireland and to formulate improved schemes for their application. Of two paid commissioners Molloy was one. This appointment he held till the commission concluded its work in 1894. In 1890 he was reappointed a senator of the Royal University, and in 1903 became its vice-chancellor. As vice-chancellor he represented the Royal University at Aberdeen when in 1906 the university there celebrated the four hundredth anniversary of its foundation. During the festivities he died suddenly of heart failure on 1 Oct. 1906. He was buried in Glasnevin cemetery, Dublin. A man of broad sympathies and genial manners, he was a favourite with every rank and section of Irish society.

Molloy's gifts did not lie in the direction of original research, but he had a singular power of lucid exposition, and a faculty to translate scientific knowledge into language comprehensible to the lay mind. His lectures in his own classroom, in the theatre of the Royal Dublin Society, and elsewhere, always attracted

large audiences. His more notable works are, besides 'Geology and Revelation' (1870), 'Outlines of a Course of Natural Philosophy' (1880), 'Gleanings in Science' (1888), and 'The Irish Difficulty—Shall and Will' (1897).

[Freeman's Journal, and Irish Times, 2 Oct. 1906; Irish Ecclesiastical Record, Nov. 1906.]

T. A. F.

MOLLOY, JAMES LYNAM (1837–1909), composer, born at Cornalaur, King's Co., Ireland, on 19 Aug. 1837, was eldest son of Dr. Kedo J. Molloy by his wife Maria Theresa. His brother, Bernard Charles Molloy, born in 1842, was nationalist M.P. for King's Co. 1880–5, and for Birr division 1885–1900. James was educated at St. Edmund's College, Ware, and at the catholic university, Dublin, where he won a junior classical scholarship in 1855, under the rectorship of Cardinal Newman, and graduated in arts in 1858. Among his class fellows were the Roman catholic archbishop of Dublin (Dr. Walsh), and Hugh Hyacinth O'Rorke the MacDermot [q. v. Suppl. II]. He showed much musical ability during his college course, and his singing of the services during Holy Week in 1857 and 1858 attracted attention. The degree of M.A. from the catholic university not being legally recognised, he continued his studies at London University, Paris, and Bonn, and was called to the English bar from the Middle Temple on 6 June 1863. He joined the south-eastern circuit and became a member of Brighton sessions, but did not practise. For a time he acted as secretary to Sir John Holker [q. v.], attorney-general, and resided for many years in London. In 1889 he was made private chamberlain to Pope Leo XIII.

As early as 1865 Molloy issued a number of songs, some of them with words by himself, but he became more ambitious and ventured on an operetta, 'The Students' Frolic,' to a libretto by Arthur Sketchley [see ROSE, GEORGE, 1817–1882]. Though the piece was not very successful, yet the melody of one of the songs, 'Beer, beer, beautiful beer,' was subsequently utilised and became extremely popular as 'The Vagabond,' words by Charles Lamb Kenney [q. v.]. In 1873 he brought out an edition of Irish tunes entitled 'Songs of Ireland,' of which an enlarged edition appeared in 1882. Between 1865 and 1900 Molloy was responsible for nearly one hundred songs, many of which had a wide vogue, e.g. 'Songs from Hans Andersen,' 'Darby and Joan,' 'The Kerry Dance,' 'Love's

Old Sweet Song,' 'Thady O'Flynn,' 'The Clang of the Wooden Shoon,' and 'By the River.' A keen sportsman and in early life an athlete, he showed his versatility in a charmingly written prose work, 'Our Autumn Holiday on French Rivers' (1874; 2nd edit. 1879), illustrated by Linley Sambourne [q. v. Suppl. II]. This book describes a voyage up the Seine and down the Loire in a four-oared outrigger, and suggested to Robert Louis Stevenson the similar expedition described in 'An Inland Voyage' (1878) (BALFOUR's *Life of Stevenson*, 1910, p. 143). Molloy also furnished music for one of Sir Francis Burnand's early comic operas, 'My Aunt's Secret.'

He spent the remainder of his life at Woolleys, Hambleden, Henley-on-Thames. He died there on 4 Feb. 1909. In 1874 Molloy married Florence Emma, youngest daughter of Henry Baskerville, of Crowsley Park, Henley-on-Thames. He left issue two sons and one daughter.

[Brown and Stratton's Brit. Musical Bio. 1897; O'Donoghue's Poets of Ireland, 1892–3; J. A. O'Shea, Roundabout Recollections, 1892, ii. 98–100; Flood's Hist. of Irish Music, 1905; private information.] W. H. G. F.

MOLLOY, JOSEPH FITZGERALD (1858–1908), miscellaneous writer, born in New Ross, co. Wexford, on 19 March 1858, was son of Pierce Molloy and his wife Catherine Byrne, and received his early education at St. Kieran's College, Kilkenny. Originally intended for the ministry of the Roman catholic church, he devoted himself to literature and music, and acted for a time as organist of the Augustinian friary church, New Ross. When twenty years old he decided on a literary career, and, armed with letters of introduction to Mr. and Mrs. S. C. Hall, he went to London in the winter of 1878. Both Mr. and Mrs. Hall proved staunch friends, and he was at once employed on the 'Art Journal,' which Hall edited. Sir Charles Gavan Duffy [q. v. Suppl. II], who had been M.P. for New Ross in 1853, also proved a friend, and engaged him as his private secretary, subsequently obtaining for him a clerkship in the London office of the agent-general for New Zealand.

Molloy was a fertile writer, and won popularity as a biographical and historical compiler. His first work was 'Songs of Passion and Pain' (under the pseudonym of 'Ernest Wilding') (1881). There followed 'Court Life below Stairs, or London under the First Georges' (2 vols. 1882), which was well received and reached a second

edition in 1885. A sequel, 'London under the Last Georges' (2 vols.), appeared in 1883. 'Life and Adventures of Peg Woffington' (2 vols. 1884); 'Royalty Restored, or London under Charles II' (2 vols. 1885); 'Famous Plays' (1886), and 'The Life and Adventures of Edmund Kean' (2 vols. 1888), were works of like calibre. His 'Romance of the Irish Stage' (2 vols. 1897) had a very large sale. Molloy also published serially many novels in leading London and Liverpool papers, as well as in 'Temple Bar,' 'English Illustrated Magazine,' 'Graphic,' and 'Illustrated London News.' Among his separately published novels were: 'Merely Players' (3 vols. 1881); 'It is no Wonder' (2 vols. 1881); 'What hast thou done?' (1883); 'That Villain Romeo' (1886); 'A Modern Magician' (3 vols. 1887); 'An Excellent Knave' (1893); 'His Wife's Soul' (1893; 2nd edit. with the title, 'Sweet is Revenge,' 1895), and 'A Justified Sinner' (1897).

Molloy travelled much on the continent of Europe in search of health, which was never robust, journeying through France, Spain, Belgium, Italy, and Algiers. Despite failing strength he was engaged shortly before his death on 'Victoria Regina,' published posthumously in two volumes. He died unmarried at his residence, 20 Norland Square, Notting Hill, W., on 19 March 1908, and was buried at St. Mary's cemetery, Kensal Green.

Besides the works mentioned above, Molloy wrote: 1. 'The Faiths of the Peoples,' 2 vols. 1892. 2. 'The Most Gorgeous Lady Blessington,' 2 vols. 1896. 3. 'Historical and Biographical Studies,' 1897. 4. 'The Queen's Comrade: the Life and Times of Sarah, Duchess of Marlborough,' 2 vols. 1901. 5. 'The Sailor King: William IV, his Court and his Subjects,' 2 vols. 1903. 6. 'Romance of Royalty,' 2 vols. 1904. 7. 'The Russian Court in the Eighteenth Century,' 1905. 8. 'Sir Joshua and his Circle,' 2 vols. 1906. Molloy also edited, with introduction and notes, the 'Memoirs of Mary Robinson' in 1895.

[Private information from his sister, Miss K. Molloy; Freeman's Journal and Irish Times, 20 March 1908; personal knowledge.]

MOLYNEUX. [See **MORE-MOLYNEUX**, SIR ROBERT HENRY, G.C.B. (1838-1904), admiral.]

MONCREIFF, HENRY JAMES, second BARON MONCREIFF OF TULLIBOLE (1840-1909), Scottish judge, born at Edinburgh

on 24 April 1840, eldest son of James Moncreiff, first Baron Moncreiff [q. v.], by his wife Isabella, daughter of Robert Bell, procurator of the Church of Scotland. After education at Edinburgh Academy and at Harrow School, he went in 1857 to Trinity College, Cambridge, where he graduated B.A. and LL.B. in 1861 (with a first class in the law tripos). Having attended law lectures at Edinburgh University, and becoming a member of the Speculative Society, he passed on 14 July 1863 to the Scottish bar, where he acquired a fair practice. A whig in politics according to the tradition of his family, he was appointed advocate-depute in 1865 by his father, who was then lord advocate, but lost that office when the Russell ministry went out in June 1866. He was re-appointed under Gladstone's administrations of 1868 and 1880. In 1881 he became sheriff of Renfrew and Bute. On Gladstone's adoption of his home rule policy Moncreiff joined the liberal unionists. In 1888 he was raised to the bench, with the title of Lord Wellwood. In 1895, on the death of his father, he succeeded to the peerage, and in 1901 was appointed lord-lieutenant of Kincardineshire. He resigned his judgeship owing to failing health in 1905, died at Bourne-mouth on 3 March 1909, and was buried in the Grange cemetery at Edinburgh.

Moncreiff, who was a versatile writer, with a keen sense of humour, contributed many articles and short stories to 'Blackwood's Magazine,' the 'Cornhill Magazine,' the 'World,' 'Fraser's Magazine,' the 'Badminton Magazine,' and other periodicals, and wrote 'General Remarks on the Game of Golf' for the volume on golf in the 'Badminton Library.' A collection of his articles and stories was printed for private circulation in 1898 and 1907. He was also author of a useful treatise on 'Review in Criminal Cases' (1877).

Moncreiff married (1) in 1866 Susan (d. 1869), daughter of Sir William Dick Cunyngham of Prestonfield, Midlothian; (2) in 1873 Millicent (d. 1881), daughter of Colonel Fryer of Moulton Paddocks, Newmarket. He had no family, and was succeeded in the peerage by his brother, the Hon. and Rev. Robert Chichester Moncreiff (b. 1843). A portrait was painted by Fiddes Watt shortly before Moncreiff's death.

[Scotsman, 4 March 1909; Harrow School Register; Roll of the Faculty of Advocates; History of the Speculative Society, p. 151; personal knowledge.]

G. W. T. O.

MONCRIEFF, SIR ALEXANDER (1829-1906), colonel and engineer, born at 27 George Square, Edinburgh, on 17 April 1829, was eldest son of Captain Matthew Moncrieff, of the Madras army, by Isabella, daughter of Alexander Campbell. His father was a descendant of Alexander Moncrieff [q. v.]. He retained the 'superiority' and designation of Culfargie, but the estate had passed to Lord Wemyss, and he lived at Barnhill near Perth.

Moncrieff was educated at Edinburgh and Aberdeen universities, and spent some time in a civil engineer's office, but did not settle down to a profession. He was commissioned as lieutenant in the Forfarshire artillery (militia) on 16 April 1855, and obtained leave to go to the Crimea during the siege of Sevastopol. He was promoted captain on 16 Sept. 1857, was transferred to the city of Edinburgh artillery (militia) on 9 Nov. 1863, became major on 26 March 1872, and was made colonel of the 3rd brigade, Scottish division, R.A., on 20 Feb. 1878.

As he watched the bombardment of 6 June 1855, and the silencing of the Russian guns in the Mamelon by shots through the embrasures, his mind turned to the problem of raising and lowering guns, so that they might fire over the parapet and then descend under cover for loading. He conceived the idea of mounting guns on curved elevators, which would allow them to recoil backwards and downwards, the energy of recoil being used to raise a counterweight which would bring the gun up again to the firing position. This method had the further advantage, that it lessened the strain on the platform by interposing a moving fulcrum between it and the gun. He carried out experiments at his own expense for several years, and a 7-ton gun mounted on his system was tried at Shoeburyness and favourably reported on in 1868.

From 1867 to 1875 Moncrieff was attached to the royal arsenal, to work out the details of his disappearing carriage, adapt it to heavier and lighter guns, and devise means of laying and sighting guns so mounted. He received 10,000*l.* for his invention and for any improvements on it. In 1869 he submitted designs for a hydro-pneumatic carriage, in which air was compressed by the recoil of the gun and formed a spring to raise it again. This was intended for naval use in the first instance, but it was adapted to siege and fortress guns, and eventually superseded the counterweight system. It met with opposition at first,

being thought too complicated; and Moncrieff complained bitterly of the obstacles placed in his way. He had controversy also with officers of the royal engineers, who held that he claimed too much for his system, and was not entitled to dictate how and where it should be used. There was substantial agreement, however, as to the great merit of his inventions. He published in 1873 a pamphlet on the Moncrieff system, which he explained or defended in lectures at the Royal Institution (7 May 1869) and the United Service Institution (*Journal*, vols. x. xi. xiv. xvii. xix. xxviii.), in the 'Proceedings of the Royal Artillery Institution' for 1863, and the R.E. professional papers of 1870. He was a member of the Institution of Civil Engineers, was elected F.R.S. in 1871, was made C.B. in 1880, and K.C.B. in 1890.

A man of many interests, genial and sociable, he went to South Africa and Canada in search of sport, and exhibited at the Scottish Academy as an amateur artist. He was captain of the Wimbledon Golf Club in 1894. In later life he was a director of two banks, acquired wealth, and bought the estate of Bandirran in Perthshire. He claimed to be head of his family as the heir male of William Moncrieff, who died in 1570; but this claim affected the title to the baronetcy created in 1626, and was opposed by Lord Moncrieff of Tullibole, the holder of the baronetcy. The case came into court in June 1905, and the evidence produced led to the withdrawal of his petition. He died at Bandirran on 3 Aug. 1906, and was buried at Abernethy, Perthshire. In 1875 he had married Harriet Mary, only daughter of James Rimington Wilson of Broomhead Hall, Yorkshire. They had five sons and two daughters. The eldest son, Malcolm Matthew (in the carabiniers), and a younger son, Alaric Rimington (in the Scots Greys), served throughout the South African war, the former being severely wounded.

[The Times, 6 Aug. 1906; Seton, *The House of Moncrieff*, 1890; information from Mr. A. R. Hope Moncrieff.] E. M. L.

MOND, LUDWIG (1839-1909), chemical technologist, manufacturer, and collector of works of art, born at Cassel on 7 March 1839, was of Jewish parentage. His father, Moritz B. Mond, was a well-to-do merchant. His mother's maiden name was Henriette Levinsohn. After studying at the Realschule and the polytechnic school at Cassel, Mond worked in 1855 under

Hermann Kolbe at Marburg and went in 1856 to Heidelberg to work under Robert Wilhelm Bunsen. In 1859 he began his industrial career in a miniature soda-works at Ringkuhl near Cassel, where he began the researches that led to his sulphur recovery process; he next became manager of a factory at Mainz for the production of acetic acid by wood distillation. Thence proceeding to Cologne, he worked there at the production of ammonia from waste leather. Subsequently he spent some time at other factories in Germany and Holland. He came to England in 1862 and took out an English patent for the recovery of sulphur from the Leblanc alkali-waste, by a method of partial oxidation and treatment with acid, and in 1863 he went to John Hutchinson & Co. at Widnes to perfect the process. In 1864 he took over the construction and management of a Leblanc soda-works at Utrecht, but returned to Widnes in 1867, entering into partnership with J. Hutchinson of Hutchinson & Earle in order to push his sulphur recovery process. From this time forward he was domiciled in England; he became a naturalised British subject in 1880. M. Schaffner had invented a process somewhat similar to that of Mond almost simultaneously, and manufacturers in Widnes, Newcastle, and Glasgow for a number of years used a combination of Mond's and Schaffner's processes by which about 30 per cent. of the total sulphur was recovered from the alkali-waste. The process was also used in France; but by 1894 the Mond and Schaffner processes were entirely replaced by the Claus-Chance process (G. LUNGE, *Sulphuric Acid and Alkali*, 2nd edit. ii. 827-51).

In 1872 Mond made the acquaintance of Ernest Solvay, a Belgian chemist, who had effected great improvements in a rival process to that of Leblanc, the ammonia-soda process which had been invented by Harrison Gray Dyer and John Hemming in 1838. Solvay had started a small factory at Couillet near Charleroi for working his process. Mond, with much searching of heart, invested his small capital derived from the sulphur recovery process, in purchasing the option to work Solvay's patents in England. He entered into partnership with Mr. (now the Rt. Hon. Sir) John Tomlinson Brunner, his friend since 1862, who had been in the commercial department of Hutchinson's works. Not without difficulty, the two men raised the capital necessary to start works at Winnington, near Northwich. The Solvay process was imperfect; during the first

year of the working at Winnington 'everything that could explode, exploded, and everything that would break, broke'; but by ceaseless labour Mond by 1880 had succeeded in perfecting the process so that it became a financial success. In 1881 the concern was turned into a limited liability company, of which Mond remained a managing director till his death; and the firm of Brunner, Mond & Co. are now the largest alkali makers in the world, employing about 4000 workmen. The firm was one of the first to adopt an eight hours' day and to provide model dwellings and playing-fields for their workpeople. Mond left 20,000*l.* in trust for the benefit of disabled and aged workpeople belonging to the firm.

In 1879 Mond returned to the problem of the production of ammonia, which was important for the use of its compounds as artificial manure. A series of investigations carried out with his assistant, Dr. Joseph Hawliczek, based on the use of cyanides, was not followed up industrially; a further series carried out with Mr. G. H. Beckett, Dr. Carl Markel, and Dr. Adolf Staub led to the invention of the Mond producer-gas plant, which Mond patented in 1883, and continued to improve till the end of his life. By carefully regulating the temperature of a furnace in which air and steam are led over heated coal or coke, Mond succeeded in converting all the nitrogen of the fuel into ammonia, which could easily be recovered, and generating at the same time a very cheap and useful form of producer-gas. Over three million tons of bituminous fuel, lignites, and peats are now used annually at Dudley Port, Staffordshire, and in other places in various parts of the world in the production of 'Mond-gas.' Mond's next step in 1885 was to try, with the help of Dr. Carl Langer, to convert the heat energy of fuel, and in particular of producer-gas directly into electrical energy by improving the gas battery invented by Sir William Robert Grove [q. v. Suppl. I]. The use of porous plates moistened with sulphuric acid and faced on either side with platinum and platinum black, to separate the hydrogen from the oxygen, led to interesting results; but the inventors were unable to overcome the defects of the cells (of which they published an account in 1889). Mond, in connection with this work, carried out a series of researches with Sir William Ramsay and Dr. John Shields on the occlusion of hydrogen and oxygen by platinum and palladium (*Phil. Trans.*

clxxxvi. 657 (1895); exc. 129 (1897); exci. 124 (1898).

The work on the gas battery was interrupted by investigations of more urgent importance. Mond from 1886 directed his efforts to recover the chlorine wasted in the ammonia-soda process as calcium chloride. By using first nickel oxide, and later magnesia, instead of lime to decompose the ammonium chloride formed, he obtained easily decomposable chlorides, from which chlorine could be recovered by treatment with air or steam, either in the elementary form or in that of hydrochloric acid. Between 1886 and 1889 he took out a number of patents bearing on this point, some independently, some with G. Eschellmann, and his processes were used industrially for some time. The use of nickel compounds, and of nickel valves in the chlorine process, and the use of finely divided nickel to purify producer-gas for use in the gas battery led Mond, in collaboration with Langer and Quincke, to discover nickel carbonyl, a gaseous compound of nickel and carbon monoxide. Mond, after two years' work, based on this discovery a remarkable method for the extraction of metallic nickel from its ores, unlike any metallurgical process previously known (see paper 'On the extraction of nickel from its ores by the Mond process,' by W. C. ROBERTS-AUSTEN, F.R.S., *Proc. Inst. Civil Engineers*, cxxxv. 29, 1899). Mond formed the 'Mond Nickel Company' to work the process, with mines in Canada and a model works at Clydach, near Swansea, with a considerable output of nickel yearly. Mond pursued the scientific investigation of the carbonyls, and with Quincke and Langer obtained iron carbonyls; he suggested to Sir James Dewar an investigation on the production of nickel carbonyl under high pressure, for which Dewar took out a patent in 1902; and a posthumous paper, with a note by Mr. R. L. Mond, gives an account of investigations with Dr. Heinrich Hirtz and Mr. M. Dalton Cowap on carbonyls of cobalt, molybdenum, and ruthenium (*Trans. Chem. Soc.* 1910, p. 798). This was Mond's last research.

In the work of scientific societies Mond was extremely active. In January 1880 he took a leading part in the foundation of a Lancashire Chemical Society, and in the following April urged that it should become a national society; as a result of the movement, which was largely helped by Sir Henry Roscoe, the Society of Chemical Industry was founded in 1881,

and became later one of the largest scientific societies in the world. In August 1881 Mond undertook the arrangements for the foundation of the Society's 'Journal,' drew up a plan for it, and guaranteed the cost till it should become self-supporting. He acted as foreign secretary of the society till his election as president in 1888. In 1906 he was awarded the society's medal for conspicuous services to applied chemistry.

Mond was elected F.R.S. in 1891, honorary member of the German Chemical Society and member of the Società Reale of Naples in 1908, and corresponding member of the Prussian Akademie der Wissenschaften in 1909. He received honorary doctorates from the universities of Padua (1892), Heidelberg (1896), Manchester (1904), and Oxford (1907). He was awarded the grand cordon of the Crown of Italy in 1909.

Mond lived at Winnington from 1867 till 1884, when he removed to London; he spent most of his winters in Rome, where he acquired the Palazzo Zuccari. For some years he had suffered from heart disease, from which he died at his house, The Poplars, Avenue Road, Regent's Park, on 11 Dec. 1909. He was buried with Jewish rites in a family mausoleum at the St. Pancras cemetery, Finchley.

Mond married in 1866 his cousin Frida Loewenthal, who survives him. He left two sons, Robert Ludwig Mond, and Sir Alfred Moritz Mond, liberal M.P. for Swansea, who was created a baronet in 1910.

Mond was a man of great scientific attainments, of indomitable resource and energy, and with a genius for divining the industrial possibilities of discoveries in pure science. Apart from inventions of detail, he will be remembered, as an industrial chemist, for having placed the ammonia-soda process on a practical basis, for his nitrogen recovery process and producer-gas, and for his nickel process. He left a fortune of over 1,000,000*l.* But his commercial success was 'the result and not the object of his work.'

The obituary of Mond by Carl Langer (*Berichte der deutschen chem. Gesellschaft* for 1911, p. 3665) gives a list of his English patents, forty-nine in number, and a list (incomplete) of the papers published by Mond whether independently, with the collaborators previously mentioned, or with R. Nasini (on the physical properties of certain nickel compounds).

Apart from his daily occupations Mond's interests were mainly in pure science, music, and art, and the improvement of

the condition of his workpeople. In his address to students at the opening of the Schorlemmer laboratory at Owens College, Manchester, on 3 May 1895 (*Journ. Soc. Chem. Ind.* xiv. 552), he insisted on the importance to industrial chemists of a training in pure science. None of his great benefactions were devoted to the teaching of applied science. He was inclined to deny that such teaching was of any value in the training of a chemist (NASINI, see bibliography below). In 1896 he gave 100,000*l.* under a special trust to found and equip the Davy-Faraday Laboratory, in a house next to the Royal Institution, for research in chemistry and physics; and by his will he left two sums of 50,000*l.* to the Royal Society and to the University of Heidelberg respectively, for the encouragement of research and other purposes. Between 1892 and his death he gave to the Royal Society sums amounting to 16,000*l.* for the continuance and improvement of the society's catalogue of scientific papers. In 1908 he founded a biennial prize of 400*l.* for chemistry at the Accademia dei Lincei (of which he had been elected an honorary member in 1899) in memory of his friend, the chemist, Stanislas Cannizzaro. He left to the town of Cassel a sum of 20,000*l.*, together with 5000*l.* for a Jewish charitable foundation. In his lifetime he made large gifts for charitable purposes, but as a rule these remained anonymous.

From 1892 onwards Mond formed a remarkable collection of pictures, mainly early Italian, of which a detailed description was published by Dr. J. P. Richter, who acted as Mond's adviser (*The Mond Collection, an Appreciation*, 2 vols. London, 1910). Mond bequeathed, subject to the life-interest of his wife, the greater portion of his pictures to the National Gallery, with a sum to provide for their housing. He also left 20,000*l.* to the Munich Akademie der bildenden Künste for the training of art students.

Though not above the middle height, Mond was a man of impressive presence, with a massive head, full beard, dark piercing eyes, and strongly marked features of an Oriental type. A marble bust (1896) by Joseph von Kopf; a bronze bust by Henrik Glicenstein; a bronze full figure (1906) by Ferdinand Seeboeck; a monumental bronze bas relief (1909) by C. Fontana, presented to Mond by a committee of Italian chemists; a portrait medalion by E. Lanteri (1911), and an oil painting by Solomon J. Solomon, R.A. (at Sir Alfred Mond's house), belong to Mrs. Mond.

Mond, Sir William Ramsay, Sir Henry Roscoe, and Sir Edward Thorpe.] P. J. H.

MONKHOUSE, WILLIAM COSMO (1840-1901), poet and critic, born in London on 18 March 1840, was son of Cyril John Monkhouse, a solicitor, by his wife Amelia Maria Delafosse, of a Huguenot family which came to England after the revocation of the edict of Nantes. Monkhouse entered St. Paul's School on 3 Oct. 1848, and left in 1856 to take up a nomination to a supplementary clerkship in the board of trade, then under the presidency of Lord Stanley of Alderley. Rising through various grades, he was assistant secretary to the finance department at his death. In 1870-1 he was sent by the board to South America in connection with Seamen's Hospitals; in 1894-6 he acted as a member of the committee on the Mercantile Marine Fund.

Monkhouse's literary career began betimes. He wrote much verse while at school, and he was an early contributor to 'Temple Bar,' the 'Argosy,' the 'Englishwoman's' and other magazines. It was not until 1865 that Moxon put forth his first volume, 'A Dream of Idleness, and other Poems.' The volume was of promise, and some of its pieces, e.g. 'The Chief Ringer's Burial' and 'The Night Express,' found their place in anthologies. But it had no great success, pecuniary or otherwise. The moment was perhaps unfavourable to one who was a disciple of Wordsworth and Tennyson. After an essay in the three-volume novel, 'A Question of Honour' (1868), Monkhouse for some years practically abandoned poetry for literary and art criticism. He became a frequent contributor to the 'Academy,' to the 'Magazine of Art' (then under the editorship of W. E. Henley), and eventually to the 'Saturday Review.'

In 1869 he published 'Masterpieces of English Art'; in 1872 he edited and prefaced a photographic edition of Hogarth's works; in 1877 came a 'Handbook of Précis Writing'; in 1879 an excellent short life of Turner for Cundall's 'Great Artists,' and in 1887 a little guide-book on the 'Italian Pre-Raphaelites' in the National Gallery. In 1890 followed a valuable volume on the 'Earlier English Water Colour Painters' (2nd edit. 1897).

In 1890 Monkhouse returned to poetry with 'Corn and Poppies,' some portions of which had appeared in the 'Magazine of Art.' This volume contained many of his best pieces, and notably his highest effort, the stately 'Dead March.' Of a fine ballad entitled 'The Christ upon the Hill,' a limited edition was issued with etchings by William Strang in 1895; and after his death appeared a slender volume entitled 'Pasiteles the Elder and other Poems,' in which this ballad was included. Other prose works were: 'A Memoir of Leigh Hunt' in the 'Great Writers' series, 1893; 'In the National Gallery,' 1895; 'British Contemporary Artists,' chiefly contributed to 'Scribner's Magazine,' 1899; 'A History of Chinese Porcelain,' 1901; and 'Life of Sir John Tenniel' (for the 'Art Journal'), 1901. To this Dictionary Monkhouse was a diligent contributor of lives of artists, including Reynolds and Turner. As a critic he had the happy faculty of conveying a well-considered and weighty opinion without suggesting superiority or patronage; as a poet, though he lacked the leisure to realise his full ambition, he left much which no true lover of finished and thoughtful work can wisely afford to neglect.

Monkhouse died at Skegness on 2 July 1901. He was twice married: (1) in 1865 to Laura, daughter of John Keymer of Dartford in Kent; (2) in 1873 to Leonora Eliza, the daughter of Commander Blount, R.N., by whom he had two sons and six daughters. There are painted portraits of him by C. E. Johnson, R.I., and J. M'Lure Hamilton, and an etching by William Strang, A.R.A.

[Monkhouse's works; personal knowledge. See also art. in Art Journal for March 1902, by Edmund Gosse, on Cosmo Monkhouse as an Art Critic.]

A. D.

MONRO, CHARLES HENRY (1835-1908), author, born in London on 17 March 1835, was second of three sons of Cecil Monro, chief registrar of the court of chancery, by his wife Elizabeth, daughter

of Colonel Henry Howe Knight-Erskine of Pittodrie. Alexander Monro [q. v.], principal of Edinburgh University in 1685, was an ancestor, six of whose descendants are already commemorated in this Dictionary. His elder brother, Cecil James, a man of extraordinary powers, was incapacitated by phthisis soon after his election to a fellowship at Trinity in 1855. His younger brother, Kenneth, a brilliant artillery officer, died in early manhood of phthisis in Nova Scotia. Charles Henry entered Harrow in 1847, proceeded to Gonville and Caius College, Cambridge, as Sayer scholar in 1853, graduated B.A. in 1857 with a first class in classics, and in the same year was elected to a fellowship, of which he resigned the emoluments in 1897. Called to the bar at Lincoln's Inn in 1863, he did not practise, but continued his study of law, though his work was hampered by ill-health, necessitating much residence abroad. From 1872 to 1896 he was law lecturer at his college. In 1900 he represented Cambridge University at the 500th anniversary of the second foundation of the University of Cracow.

In 1891 he published an annotated text and translation of the title 'Locati Conducti' in Justinian's 'Digest'; in 1893 'De Furtis'; in 1896 'Ad legem Aquilian'; in 1900 'De Adquirendo Dominio'; and in 1902 'Pro Socio.' Meanwhile he had begun the heavy task of translating the whole 'Digest.' One volume of this work appeared in 1904 and another in 1909, after his death, covering, altogether, about one-fourth of the book. His work was marked by great acuteness and independence of judgment and accuracy of scholarship. He had a peculiar gift for translation, and his rendering of the 'Digest,' so far as it proceeded, was much superior to any earlier attempt.

Monro, who was an accomplished linguist, and was specially interested in Celtic, died, unmarried, at Eastbourne on 23 Feb. 1908, and was buried there. By his will he left a large sum to his college, which has perpetuated his memory by a Monro fellowship, a Monro lectureship in Celtic, a Monro endowment to the Squire law library in Cambridge, and a Monro extension to the college library.

[Venn, Biogr. Hist. of Gonv. and Caius Coll., ii. 310; memorial notices in The Caian, xvii. 161; Burke's Landed Gentry, s.v. Knight-Erskine; Cass, Hist. of Monken Hadley, p. 181; notices of members of the family in this Dictionary; school and college records; communications from friends; personal knowledge.]

W. W. B.

MONRO, DAVID BINNING (1836-1905), classical scholar, born at Edinburgh on 16 Nov. 1836, was eldest child of the four sons and two daughters of Alexander Monro Binning, writer to the signet (1805-1891), of Auchinbowie, Stirlingshire, and Softlow, Roxburghshire, by his wife and cousin Harriet, daughter of Alexander Monro, M.D. [q. v.], of Craiglockhart. On his marriage his father assumed his wife's surname, which his own ancestors had borne, and on his death in 1891 his Scottish estates passed to his eldest son. Monro was as a boy educated privately. He entered Glasgow University in 1851, and there distinguished himself in logic and mathematics, but the influence of Edmund Lushington [q. v. Suppl. I], professor of Greek, determined the direction of his studies for life. He matriculated at Oxford as scholar of Brasenose College on 16 June 1854, and in November of the same year was elected to a scholarship at Balliol College, where he afterwards held a Snell exhibition. He was placed in the first class in moderations, both in classics and mathematics, in 1856, in the first class in the final classical school, and the second class in the final mathematical schools in 1858. He won the Ireland scholarship (1858) and the prize for a Latin essay (1859), and was elected fellow of Oriel in the same year. He entered at Lincoln's Inn as a student, but was not called to the bar, returning to Oxford in 1862 as lecturer of Oriel College. He became tutor in 1863, and was elected vice-provost in 1874, on the retirement of Dr. Edward Hawkins [q. v.] from Oxford. On Hawkins's death in 1882 Monro was chosen provost.

As tutor at Oriel, Monro raised the standard of the teaching, and won the enthusiastic regard of his pupils by his devotion to their best interests. He lectured, as the manner then was, on a great variety of subjects, comparative philology, early Greek history and philosophy, Homer, Thucydides, Herodotus, early Roman history, Roman constitutional history, and Roman public law, and though his delivery was weak and he lacked fluency, his lectures were valued. Here, as with his pupils in his rooms, his strength lay not merely in the abundance and accuracy of his knowledge, but even more in his method of interpreting an author and of marshalling his facts. As provost he ruled his college in a wise and liberal spirit; a sound judgment and a rare grasp of principle were linked to fine courtesy and warmth of heart. In the life and work of the uni-

versity he played a leading part. He was more than once public examiner; he served on the delegacy of the press, was a curator of the museum, and a member of the hebdomadal council, and he filled the office of vice-chancellor (1901-4).

Meanwhile Monro devoted his literary interests and energies to the elucidation of the 'Homeric Poems,' and to questions arising out of them. In October 1868 he wrote in the 'Quarterly Review' an article on the 'Homeric Question,' which he recast for the 'Encyclopædia Britannica' (edit. 1880). He collated the 'Venetian MSS. of Scholia' to the 'Iliad' for Dindorf's edition (1875-7); published a school edition of 'Iliad I' (1878), a 'Grammar of the Homeric Language' (1882; 2nd edit. 1891), and a school edition of the 'Iliad' (i.-xii. 1884, 3rd edit. 1899; xiii.-xxiv. 1889, 3rd edit. 1901). A complete text of 'Homeri Opera et Reliquiæ' appeared in 1896, and in 1902 there followed, in collaboration with T. W. Allen, a text of the 'Iliad' with an apparatus criticus. The later years of his life were given to an edition of the last twelve books of the 'Odyssey' (1901), with notes and introductions embodying the results of his work. He contributed papers on Homeric questions to the 'Academy,' the 'Journal of Philology,' the 'Journal of Hellenic Studies,' and other periodicals. If the quantity of his published work is small, this is due to his powers of compression, to his self-criticism, and his reluctance to put out anything for which he could not vouch. His school edition of 'Iliad I,' which served the purpose of a 'ballon d'essai,' embodied the results of years of work, and gives concisely the writer's views on disputed points of interpretation and the principles underlying them, whilst the publication of the 'Homeric Grammar' put Monro at once among the first authorities on the subject.

Monro held that the solution of all Homeric questions must be found in philology. He was thoroughly familiar with the work of archaeologists and the contribution made by them to our knowledge, but he did not hold it to be of equal value or certainty. Unwearying industry—a sound judgment, and a true sense of literary form combined to make him a model interpreter of his author; his dislike of anything premature or superfluous, his wide range of knowledge of comparative philology, and his clearness of statement gained for his writings exceptional authority. Monro spoke French, German, and Italian with accuracy of idiom and accent, having

a very sensitive ear, whilst his 'Modes of Greek Music' (1894) attests his fondness for music and his knowledge of it.

Monro founded the Oxford Philological Society in 1870, and was for many years its president; he took part in founding the Hellenic Society and the Classical Association, and was vice-president of both; he was a member of the council of the British School at Athens, officier de l'instruction publique in France, and an original fellow of the British Academy. He was created hon. D.C.L. of Oxford in 1904, LL.D. of Glasgow in 1883, and Doc.Litt. of Dublin in 1892. He died suddenly of heart disease at Heiden, Switzerland, on 22 Aug. 1905, and was buried in Holywell cemetery, Oxford. His portrait by Sir William Quiller Orchardson, R.A., is in the Oriel common room. He was unmarried.

[Personal knowledge; David Binning Monro, a short Memoir, translated with slight alterations from a notice by J. Cook Wilson in the *Jahresbericht über die Fortschritte der Klassischen Alterthumswissenschaft*, Oxford, Clarendon Press, 1907.]

L. R. P.

MONSON, SIR EDMUND JOHN, first baronet (1834-1909), diplomatist, born at Chart Lodge, Seal, near Sevenoaks, on 6 Oct. 1834, was third son of William John Monson, sixth Baron Monson, by his wife Eliza, youngest daughter of Edmund Larken. Educated first at a private school in the Isle of Wight, and then at Eton, he entered Balliol College, Oxford, where he graduated B.A. with a first-class degree in law and modern history in 1855. Elected a fellow of All Souls College in 1858, and proceeding M.A. in the same year, he acted as examiner in modern languages for the Taylorian scholarship in 1868. He entered the diplomatic service in 1856, and on passing an examination was appointed attaché at Paris in July of that year. After a few months in Florence in 1858 he was retransferred to Paris, and thence to Washington, where for nearly five years he acted as private secretary to Lord Lyons [q. v.]. During that period Lyons was occupied with the critical questions which resulted from the outbreak of the American civil war. In 1863 Monson was removed to Hanover, and thence after a few months to Brussels. In 1865 he quitted the diplomatic service and sought election to parliament as member for Reigate in the liberal interest, but was unsuccessful, and remained unemployed till May 1869,

when he became consul in the Azores. This appointment was intended as a stepping-stone to renewed diplomatic employment, for which he was eminently fitted both by disposition and training. In 1871, when the independent position conceded to Hungary by the dual constitution was found to render the presence of a British agent at the Hungarian capital desirable, Monson was selected for the newly created post of consul-general at Buda-Pesth, the diplomatic nature of the appointment being subsequently emphasised by the additional rank of second secretary to the embassy at Vienna. In February 1876, when it grew evident that Serbia and Montenegro were in danger of being driven into active hostilities against Turkey in aid of the insurgents in Bosnia and Herzegovina, it was deemed prudent to have a British representative at the Montenegrin capital, and Monson was sent on a special mission to Cettigne. He remained there, though suffering severely in health, during the war of the Servians and Montenegrins with the Turks which broke out in June following, through the subsequent mediation by Great Britain for the purpose of procuring an armistice, and the deliberations of the conference at Constantinople. The declaration of war by Russia against Turkey, in April 1877, rendered his presence at Cettigne no longer necessary, and he returned to Buda-Pesth, being made C.B. in January 1878. In June 1879 he was appointed minister resident in Uruguay, and five years later was promoted to the rank of envoy at Buenos Ayres. At the close of 1884 he was transferred to Copenhagen, and in February 1888 to Athens, becoming in 1886 K.C.M.G. Before he left Denmark, the Danish and United States governments bore testimony to their 'entire confidence' in his learning, ability, and impartiality by selecting him as arbitrator on the claims of the American firm of Butterfield & Co. against the Danish government on account of the treatment of two of their vessels by the Danish authorities of the island of St. Thomas in 1854 and 1855. This case had been a subject of diplomatic controversy for over thirty years. It was settled in the Danish government's favour by Monson's award, delivered in January 1900. In 1892 he was transferred to Brussels and was made G.C.M.G. Next year he was promoted to be ambassador at Vienna and was sworn a privy councillor. After three years' residence at the Austrian capital he was transferred to Paris in October 1896, having a few months

previously been made G.C.B. In his new post he was called upon to deal with numerous embarrassing disputes arising out of conflicting colonial claims and interests. The themes included the rights of fishery enjoyed by the French in the waters and on the coast of Newfoundland, the exercise of jurisdiction in the New Hebrides, and questions of boundary and spheres of influence in East and West Africa. Monson, calm and judicial by temperament, and grave and courteous in manner, avoided unnecessary irritation, and was personally much liked by the French ministers and officials with whom he was brought in contact. In June 1898 he signed a convention for the delimitation of the possessions and spheres of influence of the two countries in the region of the Niger. Later in the same year Lord Kitchener in his progress up the Nile, after the final defeat of the Dervishes at Omdurman, discovered that a French exploring party from the Congo under Captain Marchand had established themselves on the bank of the river at Fashoda and there hoisted the tricolor, which Captain Marchand refused to lower except on instructions from home. An acute controversy ensued, which at one time seemed likely to lead to very serious results. More moderate counsels, however, prevailed, Captain Marchand's party was withdrawn, and in March 1899 a declaration was signed in London defining the respective spheres of influence of the two countries in central Africa, which disposed of this subject of dispute. Monson's management of his share in the discussions was unexceptionable. But in December 1898, while the question was still awaiting final solution, he caused no little commotion by a speech delivered at the annual meeting of the British chamber of commerce in Paris, in which, after some frank comments on the novel methods recently practised in diplomacy, he expressed his conviction that neither in France nor in Great Britain was there any deep-rooted feeling of animosity against the other country, and made an earnest appeal to those in France who 'were directly or indirectly responsible for the national policy to abstain from the continuance of a policy of pin-pricks which, while it could only procure some ephemeral gratification to a short-lived ministry, must inevitably perpetuate across the Channel an irritation which a high-spirited nation must eventually feel to be intolerable.' It was naturally supposed by many that this utterance was the result of some instructions from

home, but it may safely be asserted that to the British cabinet it came as unexpectedly as to the public at large. It had, however, no evil effects. The allusion to the brief duration of French ministries was made the subject of interpellation and attack in the French chamber of deputies, and it was a striking tribute to Monson's popularity that his defence was warmly and successfully undertaken by the French government, and that the incident in no degree affected his position. He remained at Paris till the end of 1904, and had the satisfaction of seeing a general settlement of the principal questions at issue between the two countries affected by the agreements signed in London in the spring of that year (8 April 1904). He had received the honorary degree of D.C.L. of Oxford University in 1898 and that of LL.D. of Cambridge in 1905, acted in 1900 as one of the British commissioners for the Paris exhibition of 1900, was made G.C.V.O. in 1903, and was created a baronet on his retirement (23 Feb. 1905), being granted also by King Edward VII as a personal favour the use of the 'Thatched House Lodge' in Richmond Park. He also received from the French government the grand cross of the legion of honour. After much ill-health he died in London on 28 Oct. 1909, and was buried in the family mausoleum adjoining South Carlton church near Lincoln.

Monson married in 1881 Eleanor Catherine Mary, daughter of Major Munro, who had held the office of British consul-general at Monte Video, and had by her three sons.

A portrait by the Hungarian artist, Beremy, was subscribed for by Monson's colleagues at Paris, but the painter became bankrupt and the picture disappeared.

[The Times, 30 Oct. 1909; Foreign Office List, 1910, p. 417; papers laid before Parliament.] S.

MONTAGU, LORD ROBERT (1825-1902), politician and controversialist, born at Melchbourne, Bedfordshire, on 24 Jan. 1825, was second son of George Montagu, sixth duke of Manchester, by his first wife, Millicent, daughter and heir of Brigadier-general Bernard Sparrow of Brampton Park, Huntingdonshire. Educated privately, he graduated M.A. from Trinity College, Cambridge, in 1849.

In April 1859 he was returned as a conservative M.P. for Huntingdonshire, and held the seat in successive parliaments till February 1874. He early made his mark as a speaker, championing church rates and winning the congratulations of Sir Stafford

Northcote for his substantial success in persistently urging the need of revival of parliamentary control over the estimates and government expenditure. Montagu, who published in 1852 a treatise on ship-building, suggesting a new method of laying down vessels, on 19 May 1862 pleaded with practical effect for expert advice in ship-building, for plated ships of war in the place of wooden vessels, and for the establishment of a naval school of architecture and engineering on the model of the Woolwich military academy. In foreign affairs Montagu was no less active and sensible. He opposed Roebuck's resolution (30 June 1863) for recognition of the confederation of the southern states of America, and he spoke strongly in favour of non-intervention between Denmark and the German powers (5 July 1864). In later years he gave much attention to the Eastern question. On the reform question Montagu showed individuality. He feared the policy of multiplying the ignorant voter, and advocated plurality voters, with additional franchises to property and the professions. On social questions Montagu's attitude was more liberal. So early as 1860 he supported a measure for a council of conciliation in labour disputes; and in 1875, in a debate on the employers and workmen bill, he declared trades unions to be 'not only a natural right but a preservative of order.' On Montagu's motion (April 1864) a select committee on which he sat inquired into the disposal of sewage in large towns; and subsequent legislation on the subject owed much to his labours. On 19 March 1867 Montagu was made, on the reconstruction of Lord Derby's third ministry, vice-president of the committee of council on education, and was appointed first charity commissioner, being sworn of the privy council. He held office till Disraeli's resignation in December 1868. As education minister Montagu sought vigorously to enforce the conscience clause in all schools which received grants from public funds, and advocated the extension of technical education. He carried a bill assimilating the vaccination procedure of England to that of Scotland and Ireland, and took effective measures to deal with a serious cattle plague which had spread from the Continent to England. While in opposition Montagu, as an adherent of the old system, actively criticised the education bill of 1870 and its successors. His views on the Irish question came to differ from those of his party, and during the parliament of 1874-80 he sat for West-

meath as a conservative home ruler. He left the home rule organisation in 1877, but remained out of harmony with Disraeli's government. To its vacillation he mainly assigned the Bulgarian agitation, and he condemned the Afghan policy of Lords Salisbury and Lytton.

On his retirement from parliament in 1880 Montagu devoted himself to religious controversy. In 1864 he had defended church establishments and upheld Anglicanism in 'The Four Experiments in Church and State and the Conflicts of Churches'; but in 1870 he became a Roman catholic, and in 1874, in 'Expostulation in extremis,' attacked Gladstone's 'Political Expostulation on the Vatican Decrees.' In the same year, too, he published, as the first volume of St. Joseph's theological library (a Jesuit series), a treatise 'On Some Popular Errors in Politics and Religion,' an adaptation of P. Secondo Franco's 'Risposte popolari alle obiezioni più diffuse contro la religione.' In 1882 Montagu rejoined the English church on ethical and political rather than on theological grounds (see his *Reasons for leaving the Church of Rome*, 1886). Thereupon he pursued a vigorous campaign against Romanist doctrine and practice, professing to expose a conspiracy in which the leaders of both political parties were involved, to bring England under the dominion of the papacy (cf. his *Recent Events, and a Clue to their Solution*, 1886, 3rd edit. 1888; *Scylla or Charybdis, which? Gladstone or Salisbury?* 1887). 'The Sower and the Virgin' (1887) was an exhaustive confutation of the doctrines of the immaculate conception and papal infallibility. 'The Lambeth Judgment, or the Marks of Sacerdotalism' (1891) minutely analysed Bishop King's case.

Montagu, whose independence and sincerity unfitted him for success in political life, was widely read and spoke with fluency. He died at 91 Queen's Gate, Kensington, on 6 May 1902, and was buried at Kensal Green. He married (1) on 12 Feb. 1850 Mary (*d.* 1857), only child and heiress of John Cromie, of Cromore, co. Antrim, by whom he had two sons and two daughters; (2) on 13 Oct. 1862 Catherine (*d.* 1897), daughter of William Wade; by her he had three sons and two daughters.

In addition to the works cited and other tracts, theological and political, Montagu published: 1. 'A Few Words on Garibaldi,' three edits. 1861. 2. 'A Mirror in America,' 1861 (a polemic against party spirit). 3. 'Foreign Policy: England and the

Eastern Question,' 1877 (a vigorous exposure of the inconsistencies of English foreign policy).

A spirited cartoon by 'Ape' of Montagu as 'A Working Conservative' appeared in 'Vanity Fair,' on 1 Oct. 1870.

[Burke's Peerage; Men of the Time, 1899; Luard's Grad. Cant.; The Times, 7 and 12 May 1902; Who's Who, 1902; Hansard's Parl. Debates; Brit. Mus. Cat.] G. LE G. N.

MONTAGU, SIR SAMUEL, first BARON SWAYTHLING (1832-1911), foreign exchange-banker and Jewish philanthropist, born at Liverpool on 21 Dec. 1832, was second son and youngest child of Louis Samuel (1794-1859), watchmaker and silversmith, of Liverpool, by his wife Henrietta, daughter of Israel Israel of Bury Street, St. Mary Axe. His parents were orthodox Jews, and he was through life a strict adherent of orthodox Judaism. Whilst still a lad his parents reversed his original name of Montagu Samuel to Samuel Montagu, and he obtained a royal licence for the change in 1894. By a second licence in 1904 he assumed the surname of Samuel-Montagu.

After education at the Mechanics' Institution, Liverpool, now the Liverpool Institute, he came to London when his father retired from business in 1845. He obtained his earliest employment at thirteen with his brother-in-law, Adam Spielmann, a foreign banker in Lombard Street. Soon dissatisfied with his salary and prospects he became manager of the London branch of a Paris banker named Monteaux, opened at 21 Cornhill. Quickly cancelling this engagement he acted as a bullion-broker on his own account, but in Feb. 1853 he resolved on founding a new foreign exchange and banking business. He was still under age, and a small capital, stated to be 3000*l.*, was advanced by his father in his behalf to his elder brother Edwin, a small banker in Liverpool, who became Montagu's partner without an active rôle in the concern. The firm was first known as Samuel & Montagu and had an office in Leadenhall Street. Two years later Montagu took over Monteaux's London branch which was in difficulties, and he moved to its premises in Cornhill. From the start Ellis Abraham Franklin, who afterwards married Montagu's sister, was in the effectual position of Montagu's partner, and he was made a full partner in 1862, when the firm's style was changed to Samuel Montagu & Co. New premises were taken in 1863 at 60 Old Broad Street. The house at Cornhill then became a branch, and later, with capital of Samuel

Montagu & Co.'s provision, the independent concern of A. Keyser & Co. By subsequent agreement two sons of each of the three partners of Samuel Montagu & Co. were taken into that firm's partnership. Five survivors of the six younger partners carry on the business at 60 Old Broad Street.

At the outset Montagu and his colleagues took up with energy the foreign exchange operations from which great firms like those of Rothschild and Baring were withdrawing in view of other occupation. Montagu's house quickly secured a large proportion of the exchange business, and, while establishing its own fortune, helped to make London the chief home of the clearing-house of the international money market. Montagu's knowledge of intricate exchanges was, even among Jewish exchange dealers, remarkable. He calculated profit in the most complicated transactions, involving the conversion and re-conversion of foreign currencies, with a miraculous rapidity. In the silver market his firm's transactions were on an exceptionally large scale. He owed much in later life to his partners' sagacity and to his choice of able assistants.

Self-confident, and of a masterful personality, Montagu soon exerted much influence alike in general financial and public affairs, as well as in the Anglo-Jewish community. The demonetisation of the French copper coinage in England was largely due to his agitation. Mainly owing to his representations the Royal Exchange was roofed in by the City authorities, and the merchants assembling there were protected from the inclemency of the weather. In 1897 he gave one of the picture panels in the Exchange, painted by Solomon J. Solomon, R.A., depicting Charles I's visit to the Guildhall in 1641-2 to demand the surrender of the Five Members.

Montagu, who in politics was a staunch liberal, was elected in the liberal interest M.P. for the Whitechapel division of the Tower Hamlets in 1885 and held the seat for fifteen years. He grew intimate with the party leaders but took little part in the business of the House of Commons save on financial matters and on those touching the Jews. He was chief author of the Weights and Measures Act (1897), which legalised the use of metric weights and measures, and he procured the insertion of a clause in the Finance Act of 1894 (sec. 15) exempting from the death duties bequests to public libraries, museums, and art galleries. An ardent supporter of bimetalism, he was a member of the gold and silver commission (1887-90), and he was president of the

Decimal Association, of the principles of which he was an ardent advocate. In 1888 he was a member of the select committee of the House of Commons on alien immigration, which in the interest of persecuted foreign Jews he was averse from restricting unduly.

With the public work of the Anglo-Jewish community Montagu from an early period intimately identified himself, but he had many differences with leading fellow-workers. He was a life member of the council of the United Synagogue, but disagreement with Lord Rothschild led him to forgo active association. For some years he was a prominent member of the Jewish board of deputies, of the Jewish board of guardians, and of the Religious Education Board, but from the two latter bodies he withdrew before his death. In 1870 he founded in Aldgate, and became president of, the Jewish Working-men's Club. He was until 1909 president of the Shechita board (for supervising the slaughtering of animals according to Jewish ritual), and was chairman of the building committee of the New West End Synagogue in Bayswater (his own place of worship), of which he was first warden. One of his greatest services to the Jewish community was his successful effort to form in 1887 the federation of the smaller East End synagogues. By insisting on English being the official language at meetings of the members of these synagogues he helped to anglicise the foreign Jewish population.

His efforts on behalf of the East London poor, both Jewish and Christian, were unremitting. He was treasurer of the Jews' Temporary Shelter. To facilitate the distribution of working Jews among the less populated provincial districts he founded without much success the Congregational Union and Dispersion Committee. In 1887 he established the East London Apprenticeship Fund, of which he was president. He was also a trustee of the People's Palace at Mile End, a member of the house committee of the London Hospital, and a director of the Four per Cent. Industrial Dwellings Company. On 28 July 1903 he gave 10,000*l.* to the London County Council for its housing scheme for the poor of Tottenham.

He frequently travelled abroad in the interests of his oppressed co-religionists. In 1875 he visited the Holy Land and subsequently founded with Lord Rothschild the first secular and industrial school in Jerusalem. On the outbreak, in 1882, of

the violent Jewish persecution in Russia he went to the Continent, at the request of the Mansion House Committee for the relief of Russian Jews, to control and direct the ensuing stream of emigration. Two years later he visited the United States to assist in the establishment of Jewish agricultural colonies in the Far West. In 1886 he visited all the chief towns of Russia, investigating the condition of the Jews there and discouraging emigration. He was well received, until on his arrival at Moscow the Russian government's suspicions were aroused and 'the Jew Montagu' was ordered to leave the country in 48 hours (*Hansard*, 1886, ccviii. 263-4). The Mansion House Fund developed into the Russo-Jewish Committee, of which Montagu was president from 1896 until 1909. The fund rendered inestimable services to persecuted Russian Jews.

Montagu, who was a collector of works of art, was a member of the Burlington Fine Arts Club, and was elected F.S.A. on 14 Jan. 1897. He was a frequent exhibitor at the Old Masters' Exhibitions of the Royal Academy, the Burlington Fine Arts Club, Guildhall, Whitechapel, and elsewhere. Besides possessing many choice pictures, he was a discriminating purchaser of old English silver. His notable collection included the earliest known 'font-shaped' cup, two mazer bowls, early silver-mounted stoneware flagons, Tudor and Jacobean tankards, salts, steeple cups, and Lamerie plate.

Montagu, who was made a baronet on 23 June 1894, retired from the representation of Whitechapel in the House of Commons in 1900, and was succeeded there by his nephew and partner, Mr. Stuart Montagu Samuel, who was created a baronet in 1912. Montagu, however, unsuccessfully contested the central division of Leeds against Mr. Gerald Balfour at the general election of 1900. On 18 July 1907, on Campbell-Bannerman's recommendation, he was raised to the peerage as Baron Swaythling, taking his title from Swaythling near Southampton, where he had a country residence.

A man of great tenacity of purpose and opinion, Swaythling was long a pillar of conservative Judaism and warmly deprecated any breach of Jewish custom on the part of his family or of the Jewish community. At the same time he was a vigorous opponent of the Zionist movement for the formation of a Jewish state in Palestine. He retired from active business life in September 1909, and died

on 12 Jan. 1911 at his London residence, 12 Kensington Palace Gardens. He was buried with full Jewish ritual at the cemetery of the Federation of Synagogues, Edmonton.

He married on 5 March 1862 Ellen, youngest daughter of Louis Cohen of Gloucester Place, Portman Square, and the Stock Exchange, sister of Sir Benjamin Louis Cohen, first baronet; her grand-aunt Judith was wife of Sir Moses Montefiore. She survived him with four sons and six daughters. Louis Samuel Montagu, the eldest son, succeeded to the peerage, and Edwin Samuel Montagu, the second son, has been M.P. for the Chesterton division of Cambridgeshire since 1906, and became under-secretary for India in 1910. By a provision of his will Swaythling debarred his children and those claiming through them from participation in his estate (beyond a life annuity of 100*l.*) should they at his death not themselves be professing, or be married to a person not professing, the Jewish religion.

The congregation of the New West End Synagogue presented him in 1902 with his portrait by Sir W. Q. Orchardson [q.v. Suppl. II]; it belongs to the family, and was reproduced in the 'Magazine of Art' (new series, ii. 361). A cartoon appeared in 'Vanity Fair' in November 1886 (No. 505).

Besides contributions to 'Palgrave's Dictionary of Political Economy' and to the 'Encyclopædia Britannica,' and articles to periodicals on finance and decimal currency, Swaythling published 'A Plea for a British Dollar' (reprinted from 'Murray's Magazine'), 1888.

[The Times, 11, 13, 16, 17 and 22 Jan., 6 March 1911; Jewish Chronicle, 13 and 20 Jan. 1911 (with portrait); Bankers' Magazine, 1888, xlviii. 963-5 (with early portrait), Nov. 1909, lxxxviii. 667-70 (with later portrait), Feb. 1911, xci. 282-6; Who's Who, 1911; Lodge's Peerage; Pike's London in the 20th century, p. 113; Character Sketch by Lily Montague, 1913; private information.] C. W.

MONTAGU-DOUGLAS-SCOTT, LORD
CHARLES THOMAS (1839-1911), admiral.
[See SCOTT.]

MONTGOMERIE, ROBERT ARCHIBALD JAMES (1855-1908), rear admiral, born at Rothesay, Isle of Bute, on 11 Sept. 1855, was son of James Montgomerie, M.D., of Edinburgh, by his wife Mary Campbell of Lochnell, and entered the navy on board the Britannia in Aug. 1869. He became sub-lieutenant in September 1875, and

while serving in that rank on board the Immortalité in the detached squadron, jumped overboard to save life on 6 April 1877. It was a dark night, the sea was rough, the ship before the wind, and the latitude was infested with sharks; Montgomerie therefore, in addition to the Albert medal and the silver medal of the Royal Humane Society, was awarded the Stanhope gold medal for the act of greatest gallantry during the year, and shortly afterwards was appointed to the royal yacht. From her he was promoted to lieutenant on 13 Sept. 1878. He was serving in the Carysfort, Captain H. F. Stephenson, during the Egyptian war of 1882, and, being landed with the naval brigade, was present at the battle of Tel-el-Kebir on 13 Sept. He received the medal with clasp for Tel-el-Kebir, and the Khedive's bronze star. In Jan. 1885 the naval brigade under Lord Charles Beresford was organised to attempt the relief of Gordon, and Montgomerie, then a lieutenant of the Inflexible, joined it at Gubat and served in the gunboat Safieh in some of the operations above Metemneh. From March to July 1885 he was naval transport officer at Dongola, and was specially mentioned in Lord Wolseley's despatches; from Aug. 1885 to June 1886 he served on the staff of Gen. Sir Frederick Stephenson [q. v. Suppl. II], and was placed in command of all the armed steamers on the Nile, and appointed to superintend the river transport. He received the Nile clasp, and was appointed to the royal yacht, an appointment almost invariably awarded for services which otherwise would go unrequited. From the yacht he was promoted to commander on 24 Aug. 1887. In that rank he served on the East Indies station in the Boadicea, flagship of Sir E. R. Fremantle, and in Oct. 1890 took part in the Vitu expedition, being placed in command of the field battery, which was actively engaged (FREMANTLE, *The Navy as I have known it*, 381 et seq.). He received the medal with Vitu clasp, was mentioned in despatches, and in May 1892 was nominated a C.B. In Sept. 1891 he was appointed to command the Lion, training ship, and on 1 Jan. 1894 was promoted to captain. After commanding the Bonaventure, cruiser, on the China station, and the Prince George, battleship, in the Channel, he was appointed to the Charybdis in Nov. 1901 for the North American station, and was commodore in Newfoundland waters during the fishery season. He served as commodore under Sir Archibald Douglas during the Venezuelan operations of Dec. 1902, and

conducted the blockade of the coast and the bombardment of Puerto Cabello (*Blue Book: Venezuela*, No. 1 (1903), Cd. 1399). In April 1904 he was appointed a naval aide-de-camp to King Edward VII, and in May became inspecting captain of boys' training ships. In the birthday honours of 1904 he was awarded the C.M.G., and on 5 July 1905 was promoted to rear-admiral. He hoisted his flag on 1 Jan. 1907 in command of the destroyers and submarines in commission with nucleus crews, and held the appointment for a year. On the occasion of the review of the home fleet in the Solent in Aug. 1907 he received the C.V.O. He died in London on 1 Sept. 1908, and was buried at Hunsdon.

Montgomerie was a distinguished athlete, and at one time was heavy-weight champion boxer of the navy; a keen sportsman, he hunted big game in many parts of the world. He married in 1886 Alethe Marian, eldest daughter of Spencer Charrington of Hunsdon House, Hertfordshire, and for many years M.P. for the Tower Hamlets. He had issue one son. A portrait, painted in 1908 by Mr. J. Kay Robertson, belongs to his widow.

[The Times, 3 Sept. 1908]. L. G. C. L.

MONTMORENCY, RAYMOND HARVEY DE, third Viscount Frankfort de Montmorency (1835-1902), major-general. [See DE MONTMORENCY.]

MOOR, Sir Ralph Denham Raymond (1860-1909), first high commissioner of Southern Nigeria, born on 31 July 1860 at The Lodge, Furneux Pelham, Buntingford, Hertfordshire, was son of William Henry Moor, surgeon, by his wife Sarah Pears. Educated privately, and destined for business, he engaged in 1880-1 as a learner in the tea trade. On 26 Oct. 1882 he entered the royal Irish constabulary as a cadet, and becoming in due course a district inspector resigned on private grounds on 9 Feb. 1891.

In March 1891 Moor took service under Sir Claude Macdonald, the consul-general of the Oil Rivers Protectorate, as commandant of constabulary in the protectorate. Of a striking personality, he soon made his mark. In July 1892 he was appointed by the foreign office vice-consul for the Oil Rivers district, and from 6 Sept. 1892 to 15 Feb. 1893 acted as commissioner. During January 1896 he served the office of consul, and on 1 Feb. 1896, when the district was formed into the Niger Coast Protectorate, he was made commissioner and consul-general for the territory, and consul for the Cameroons and Fernando Po.

When in 1900 the protectorate passed from the foreign office to the colonial office, Moor became high commissioner of Southern Nigeria and laid the foundations of the new administration, which developed into the present flourishing colony; his health failing, he retired on pension on 1 Oct. 1903. He then allied himself with Sir Alfred Jones [q. v. Suppl. II]; he gave valuable advice on West African affairs, and aided in the development of the British Cotton Growing Association. He also served on certain committees at the nomination of the secretary of state.

He was found dead in bed at his residence, the Homestead, Barnes, on 14 Sept. 1909; the inquest pointed to suicide during temporary insanity. He was buried at the new Barnes cemetery.

Moor became C.M.G. in 1895 and K.C.M.G. in 1897. He married in 1898 Adrienne, widow of J. Burns.

[The Times, 15, 16, 17 Sept. 1909; Foreign Office List, 1908; official information; personal knowledge.] C. A. H.

MOORE, ARTHUR WILLIAM (1853-1909), Manx antiquary, born on 6 Feb. 1853 at Cronkbourne, Douglas, Isle of Man, was one of ten children (five sons and five daughters) of William Fine Moore, J.P., owner and controller of the Tromode Sail-cloth Mills and a member of the self-elected House of Keys. His mother was Hannah, daughter of Henry Curwen Christian Curwen, of a Cumberland family. William Christian, 'Iliam Dhône' [q. v.], was an ancestor. Entering Rugby under Dr. Temple on 6 Feb. 1867, he passed to Trinity College, Cambridge, where he was bracketed second in the historical tripos of 1875 with Mr. Gordon Duff and graduated B.A. in 1876, proceeding M.A. in 1879. He distinguished himself in athletics at Cambridge and won his blue for Rugby football.

Moore devoted his adult activities to the welfare of his native island in all its phases. Succeeding his father as head of the sail-cloth firm, he managed it with success until steamship competition destroyed the business. He was also director of the Isle of Man Steam Packet Co., of which he published an historical account, and of the Isle of Man Banking Co. Placed on the commission of the peace in 1877, he became member of the House of Keys in 1881, and being elected speaker in 1898, held the office till death. He ably championed the rights and privileges of the house, when the house came into conflict with

the governor and council. He took part in drawing up the petition for a reform of the Manx Constitution in 1907. He was also a member of the council of education for the island (1888), of the harbour board (1899), and of the Manx Diocesan Church Commissioners, and became deputy receiver-general in 1905. He interested himself in meteorology, publishing a pamphlet on the climate of the island in 1899 and a record of 'Earth Temperatures at Cronkbourn, 1880-9,' in the 'Royal Meteorological Soc. Quarterly Journal' (xx., Oct. 1894). He was president of the Isle of Man Agricultural Society in 1883. In 1902 he received King Edward VII on his visit to the island, and was created C.V.O. in the same year.

On Manx antiquities Moore was the chief authority in the island, and was one of the museum and ancient monuments trustees from the formation of that body in 1886. Moore's chief title to fame is as the promoter of the study of the Manx language and of Manx history. He only learned the language in early manhood, at a time when it and its literature were despised by his educated fellow countrymen and threatened with extinction. He sketched the history of the language and the sources of knowledge respecting it in a paper printed by the Natural History and Antiquarian Society of the isle in 1887. In 1899 he founded the Manx Language Society and became its first president. Assisted by (Sir) John Rhys, he in 1893 edited for the Manx Society for the Publication of National Documents 'The Book of Common Prayer in Manx Gaelic,' the earliest and longest MS. in the language. He sought to conserve not only the language but the music, lore, and tradition of the island, and published the results of his labours in such volumes as 'The Surnames and Place Names of the Isle of Man' (1890); 'Folk-Lore of the Isle of Man' (1891); 'Manx Carols' (1891); 'Further Notes on Manx Folk-Lore' in 'The Antiquary' (1895); and 'Manx Ballads and Music' (1896). Moore's 'History of the Isle of Man' (1900) is the one authoritative book on the subject. He also published 'The Diocese of Sodor and Man' (1893); 'Manx Worthies' (1901); 'Bishop Hildesley's Letters' (1904); 'Douglas 100 Years Ago' (1904); and 'Extracts from the Records of the Isle of Man' (1905). He edited the periodical 'The Manx Note Book' (1885-7), and contributed many articles to that and other learned magazines.

Moore, who was appointed official trans-

lator of the Acts of Tynwald into Manx, was a vice-president of the Celtic Association, and at the eisteddfod held at Cardiff in 1899 the degree of Druid was conferred upon him in recognition of his services to Manx literature. He collected materials for a book on Anglo-Manx dialect, which was not completed at his death. He died at Woodbourne House, Douglas, on 12 Nov. 1909, and was buried at Kirk Braddan cemetery.

On 24 Feb. 1887 he married Louisa Elizabeth Wynn, daughter of Dr. Hughes-Games, then Archdeacon of Man and subsequently vicar of Hull. He left one son and two daughters. A bust executed by Mr. Taubman, a Manx sculptor resident in London, and unveiled at Douglas by Lord Raglan on 10 Oct. 1911, stands in the chamber of the House of Keys; and a portrait by the Liverpool artist, R. E. Morrison, President of the Liverpool Manx Society, was presented by the artist to the House of Keys.

[Celtic Review, 15 Jan. 1910; Isle of Man Weekly Times, 13 Nov. 1909; Isle of Man Examiner, 20 Nov. 1909; information from the Misses Moore.] S. M.

MOORE, STUART ARCHIBALD (1842-1907), legal antiquary, born in Sept. 1842, was fourth son of Barlow Brass Moore of The Lawn, South Lambeth, Surrey, by his wife Harriet Adcock. Educated at the Philological School, Marylebone Road, he became secretary to Sir Thomas Duffus Hardy [q. v.], deputy keeper of the public records, and afterwards practised as a record agent. Elected F.S.A. on 2 May 1869, he contributed to 'Archæologia' in 1886 a paper on the 'Death and Burial of King Edward II.' Moore quickly obtained distinction as an antiquarian lawyer and an authority on questions relating to foreshore, fishery, and cognate matters. On 24 Jan. 1880, somewhat late in life, he became a student of the Inner Temple, and being called to the bar on 25 June 1884, at once obtained a lucrative practice. He fought with great pertinacity and success the claims of the crown to foreshore, arguing that the crown parted long ago with its foreshore rights to the lords of manors bounded by the sea. His 'History of the Foreshore and the Law relating thereto' (1888) is full of interesting extracts from ancient records, and constitutes the subject's brief against the crown.

Moore loved yachting, and was one of the finest amateur seamen of his time; he commanded his own 80-ton fishing ketch,

in which he carried the vice-commodore's flag of the Royal Cruising Club all round Great Britain and the greater part of Ireland, with little regard for weather. He was a frequent correspondent of 'The Times,' chiefly on yachting and other seafaring matters. About two years before his death he was seized with paralysis of the lower limbs and retired to his vessel, in which he continued to live, bearing his affliction with courage and cheerfulness. Shortly before his death he wrote two letters to 'The Times' on secret commissions (8 Jan.) and on the Channel tunnel (8 Feb.). He died somewhat suddenly on 29 June 1907, on board his yacht at Southwick, and was buried there. He married Isabel Kate, daughter of John Knight Higgins of Southampton, and had issue two sons.

Besides the work mentioned, he published: 1. 'The Thames Estuary: its Tides, Channels, &c., a Practical Guide for Yachts,' 1894. 2. 'History and Law of Fisheries' (with his son Hubert Stuart Moore), 1903. He also edited 'Letters and Papers of J. Shillingford, 1447-50,' for the Camden Society (1871), and 'Cartularium Monasterii Sancti Johannis Baptiste in Colecestria,' for the Roxburghe Club (1897), as well as 'Domesday Book for Northamptonshire, extended and translated,' 1863.

[The Times, 6 July 1907; Foster, Men at the Bar; Law Times, 13 July 1907, p. 264; personal information.] C. W.

MORAN, PATRICK FRANCIS (1830-1911), cardinal archbishop of Sydney, born at Leighlinbridge, co. Carlow, Ireland, on 16 Sept. 1830, was the son of Patrick Moran by his wife Alicia, sister of Cardinal Cullen [q. v.], whom at the age of twelve he accompanied to Rome. There educated at the Irish College of St. Agatha, he gave early proof of capacity, was ordained priest by special dispensation as to age on 19 March 1853, and was from 1856 to 1866 vice-principal under Monsignor Kirby of the College of St. Agatha, and professor of Hebrew at the College of Propaganda. Enjoying a right of access to the Vatican archives, he made a special study of Celtic ecclesiastical history, and published at Dublin 'An Historical Sketch of the Persecution suffered by the Catholics of Ireland under Cromwell and the Puritans' (1862; new edit. 1884), 'Essays on the Origin, Doctrines, and Discipline of the Early Irish Church' (1864), and other scholarly works.

Returning to Ireland in 1866, Moran

became private secretary to his uncle, Cardinal Cullen, then archbishop of Dublin. He held the post till 1872. He became coadjutor to the bishop of Ossory in 1872, and bishop of Ossory in 1873. In 1884 he succeeded Roger William Bede Vaughan [q. v.] as archbishop of Sydney. Early in 1885 he was summoned by Leo XIII, a college comrade and lifelong friend, on a secret mission to Rome, 'The Times' announcing that he was to be made archbishop of Dublin, an office he was known to covet. The rival claims of Dr. Walsh, the popular favourite, would appear to have occasioned a papal dilemma, which was finally surmounted by making Walsh archbishop of Dublin and Moran a cardinal. He was consecrated at Rome in Aug. 1885, returning to Sydney immediately afterwards. Subsequently, as primate of Australia, Moran presided at the plenary councils in 1885, 1895, and 1905. He visited Rome in 1888, 1893, 1898, 1902, and again in 1903 to attend the papal conclave which resulted in the election of Pope Pius X. He celebrated his silver jubilee as archbishop of Sydney in 1909. He died suddenly on 16 Aug. 1911 at Manby Palace, Sydney, and was buried in St. Mary's cathedral.

Moran was most exact in the performance of his episcopal duties, a strict disciplinarian, and a most militant churchman, holding apathy to be the worst enemy to his faith. He appeared to love religious strife, and opposed with vigour the strong and aggressive Orange element in Eastern Australia. He advocated undenominational education by the state, protested unceasingly against any possible Roman catholic disabilities, and by brusque declarations in the press and on the platform provoked hostility and religious controversy. He was, however, a wise educational reformer, and on his arrival in Australia a severe critic of existing Roman catholic schools and seminaries. His zeal in building new schools, churches, and hospitals was remarkable, at least 1,500,000*l.* being spent on these objects during his primacy. Among other buildings in New South Wales which owe their origin to him are St. Ignatius' college, Riverview, St. Columba's Seminary, Springwood, St. Vincent's Hospital, Darlinghurst, St. Joseph's College, Hunter's Hill, the Franciscan Friary, Waverley, Rose Bay Convent, St. Vincent's Girls' College, Waitara Foundling Hospital, and the Mater Misericordiae Hospital in North Sydney. His ambition to complete St. Mary's Cathedral, which had been begun by Archbishop John Bede Polding [q. v.] and continued by

Archbishop Vaughan, remained unfulfilled, though enough was done to render it a lasting memorial to Moran's activity.

In Australian politics Moran was a prominent and at times disturbing figure, who shared with ministers the attentions of parliamentary cartoonists. Although a strenuous advocate of home rule, he had as bishop of Ossory in 1880 spoken boldly in opposition to the Land League agitation. In Australia he received, and gave every assistance to, delegates from the Irish Nationalist party. Possessed of democratic sympathies, he was on friendly terms with the Australian labour leaders, and received during the maritime strike in 1890 deputations of workmen at St. Mary's presbytery. He enthusiastically supported Australian federation, took part, by invitation, in a preliminary discussion of the project at an informal assembly of Australian statesmen at Bathurst, and was an unsuccessful candidate, though by a small number of votes only, for the National convention elected in 1907 to draft the commonwealth constitution. He was in favour of sending an Australian contingent to take part in the Sudan campaign of 1898.

Moran was deeply read in history, particularly Irish ecclesiastical history, hagiology, and archæology. His best-known works were his 'History of the Catholic Archbishops of Dublin' (Dublin, 1864) and 'Spicilegium Ossoriense' (3 series, Dublin, 1874-84), a collection of documents illustrating Irish church history from the Reformation till 1800. An article in 1880 in the 'Dublin Review' identifying Old Kilpatrick in Scotland as the 'Birthplace of St. Patrick, Apostle of Ireland,' excited wide comment at the time. He also published, mostly at Dublin: 1. 'Memoirs of the Most Rev. Oliver Plunkett,' 1861. 2. 'Acta Sancti Brendani,' 1872. 3. 'Monasticon Hibernicum,' 1873. 4. 'The Bull of Adrian IV,' 1873. 5. 'Irish Saints in Great Britain,' 1879. 6. 'Occasional Papers,' 1890. 7. 'Letters on the Anglican Reformation,' 1890. 8. 'History of the Catholic Church in Australasia,' 1896; 2nd edit. 1897. 9. 'Reunion of Christendom and its Critics,' 1896. 10. 'The Mission Field of the Nineteenth Century,' 1896. 11. 'The Catholics of Ireland under the Penal Laws in the Eighteenth Century,' 1899. Moran also edited 'Pastoral Letters of Cardinal Cullen' (1882); 'The Catholic Prayer Book and Manual of Meditations' (16mo, 1883); David Rothes's 'Analecta . . . de rebus Catholicorum in Hibernia (1616)' (1884).

E. F.

MORE-MOLYNEUX, SIR ROBERT HENRY (1838-1904), admiral, born on 7 Aug. 1838, was third and youngest son of James More-Molyneux of Loseley Park, Guildford, by his wife Caroline Isabella, eldest daughter of William F. Lowndes-Stone of Brightwell Park, Oxfordshire. After being privately educated he entered the navy in 1852. As a cadet and midshipman of the Sans Pareil he served in the Black Sea during the campaign of 1854, and was present at the bombardment of Odessa and the attack on Sevastopol on 17 Oct. 1854; and as a midshipman of the Russell took part in the Baltic expedition of 1855. He received the Crimean medal with clasp for Sevastopol, the Turkish and the Baltic medals. In 1859 he was a mate of the Vesuvius, employed on the west coast of Africa in the suppression of the slave trade, and was mentioned in despatches for services in a colonial gun-boat up the Great Scarcies river; in the same year, with two boats, he captured an armed slaver brig off the Congo, and for this service received his promotion to lieutenant, dated 28 June 1859. In that rank he served from Jan. 1860 to 1865 on the Mediterranean station, first in the St. Jean d'Acre, afterwards in the flagship Edgar, and on 18 Dec. 1865 was promoted to commander. In June 1866 he was appointed executive officer of the Doris, frigate, on the North America and West Indies station, and while serving in her received the thanks of the admiralty and of the French government for valuable services rendered to the Gironde, transport, wrecked in a dangerous position off Jamaica; also the thanks of the admiralty for other services rendered after the great hurricane at St. Thomas in 1867. In July 1869 he was appointed to command the St. Vincent, training ship for boys, and on 6 Feb. 1872 was promoted to be captain. In May 1877 he was appointed to command the Ruby, in which he served in the Levant during the Russian war of 1877-8, and afterwards in Burma. He was captain of the Invincible at the bombardment of Alexandria, and afterwards during the war, and received the Egyptian medal with clasp for Alexandria, the Khedive's bronze star, the 3rd class

of the Osmanie, and was also awarded the C.B. In May 1884 he was appointed commodore commanding the ships in the Red Sea, and protected Suakin till the arrival of Sir Gerald Graham's expedition in 1885. Special reference was made to this service by the secretary to the admiralty in parliament, and More-Molyneux was mentioned in despatches by the commander-in-chief and by Lord Wolseley, received the clasps for Suakin and the Nile, and was advanced to the K.C.B. He next served as captain-superintendent of Sheerness dockyard till promoted to his flag on 1 May 1888. He was an aide-de-camp to Queen Victoria from 1885 to 1888.

His further service was administrative and advisory. In 1889 he was one of the British representatives at the International Marine Conference held at Washington; from Aug. 1891 to Aug. 1894 he was admiral-superintendent at Devonport; on 28 May 1894 he became vice-admiral, and on 13 July 1899 reached the rank of admiral. From Oct. 1900 he was president of the Royal Naval College at Greenwich, until his retirement in Aug. 1903. He was promoted G.C.B. in Nov. 1902, and died at Cairo on 29 Feb. 1904. His body was embalmed, sent home, and buried at St. Nicholas's church, Guildford.

More-Molyneux married in 1874 Annie Mary Carew, daughter of Captain Matthew Charles Forster, R.N.; she died in 1898, leaving a daughter, Gwendolen.

[The Times, 5 and 28 March 1904; Burke's Landed Gentry; portraits from photographs were published in the Illustrated London News in 1886, 1900, 1902, and 1904; and an engraving was issued by Messrs. Walton of Shaftesbury Avenue.] L. G. C. L.

MORFILL, WILLIAM RICHARD (1834-1909), Slavonic scholar, born at Maidstone, Kent, on 17 Nov. 1834, was eldest son of William Morfill, professional musician, of Huguenot origin. Educated first at the grammar school of his native town, he was sent in 1848 to Tonbridge school, where he rose to be head boy in 1853, winning a Judd exhibition to the university. In the same year he was elected to a scholarship at Oriel College, Oxford. He was placed in the first class in classical moderations, but a break-down in health compelled him to take a pass degree (B.A. 1857; M.A. 1860). During the remainder of his life he stayed at Oxford, first as a 'coach' or private tutor. For some time he lectured on English literature at Wren's in London, and was always busy

reading, writing, and reviewing. His long vacations were spent in travelling on the Continent, especially in Slavonic countries, where he made many friends. In very early life he acquired an interest in the literature, languages, and history of the Slav and his neighbours in the Near East, which became the main study of his life; he owed almost everything to self-teaching. His knowledge of Russian is said to date from his school days, when one of the masters presented him with a Russian grammar. In 1870, and again on two subsequent occasions, he was nominated by the curators of the Taylorian Institution to deliver the lectures on the Ilchester foundation upon Slavonic literature. In 1889 he was appointed, on the recommendation of the same body, to be university reader in Russian, a position which was raised in 1900 to that of professor of Russian and of the Slavonic languages. He was a corresponding member of many learned societies on the Continent, and Ph.D. of the Czech university of Prague. In 1903 he was elected fellow of the British Academy, in the philological section.

Morfill was a voluminous author in the subjects that he had made his own. He wrote grammars of Polish (1884), Serbian (1887), and Bulgarian (1897) for Trübner's series of 'Simplified Grammars'; of Russian (1889) and Czech (1889) for the Clarendon press; for 'The Story of the Nations' histories of Russia (1885; 6th edit. 1904) and Poland (1893); for 'Religious Systems of the World' a sketch of Slavonic religion; besides many articles in the 'Encyclopædia Britannica.' He also published 'Slavonic Literature' (1883) and 'A History of Russia from Peter the Great to Alexander II.' (1902). In conjunction with Dr. R. H. Charles he translated the Slavonic version of the 'Book of the Secrets of Enoch' (1896) and other Apocryphal literature. At the time of his death he was engaged on a translation of the ancient 'Novgorod Chronicle.' His interests, however, were by no means confined to Slavonic. From a boy he had read widely in English literature, and he possessed a most retentive memory. His first publication was an edition of ballads from MSS. of the reign of Elizabeth for the Ballad Society (1873). He kept up his classics to the last, and found time to make himself acquainted with Welsh and Old Irish, and also with Georgian and Turkish. This fortunate gift of tongues was valued by him, not so much for linguistic purposes, as affording a key to the knowledge of national character

and history. He was an old-fashioned humanist, rather than a philologist of the modern type. So too in social intercourse he was no scholastic recluse but a genial man of the world. His house at Oxford was the meeting place of a small but brilliant circle, who may not have been prominent in academical business, but who there sharpened one another's wits for the distinction they gained in the outer world.

Morfill married, about 1862, Charlotte Maria Lee, of a Northamptonshire family, who died in 1881, leaving no children. After he had passed his seventieth year, his health gradually failed, though he retained his vivacity and his devotion to work almost to the end. He died peacefully in his chair at his house in Oxford on 9 Nov. 1909. He bequeathed his valuable collection of Slavonic books to Queen's College, which elected him in 1885 an honorary member of its common room.

[Personal knowledge; memoir by Sir J. A. H. Murray in *Proc. Brit. Acad.*, vol. iv.; Oxford Mag., Nov. 1909.] J. S. C.

MORGAN, EDWARD DELMAR (1840-1909), linguist and traveller, born at Stratford, Essex, on 19 April 1840, was only son of Edward John Morgan, an officer in the Madras artillery and later a member of the English factory or merchants' company in St. Petersburg, by his wife Mary Anne Parland. Educated at Eton, he early became a brilliant linguist. After leaving school he resided with his parents in St. Petersburg, and completely mastered the Russian language.

In 1872 he travelled first in Asia, making a journey in Persia with Sir John Underwood Bateman-Champain [q. v.], a director of the Indo-European telegraph. Morgan subsequently visited Kulja and the neighbouring parts of Central Asia. In 1876 he translated from the Russian the Central Asian explorer Przhevalsky's 'Mongolia, the Tangut Country and the Solitudes of Northern Tibet' (1876, 2 vols., with an introduction and notes by Colonel Henry Yule, C.B.). He also joined Sir Thomas Douglas Forsyth [q. v.] in translating the same author's 'From Kulja across the Tian-Shan to Lobnor' (1879). Morgan made later expeditions to Little Russia, in the language and literature of which he was learned, to the lower part of the Congo (1883), which gave him an intimate interest in the affairs of the Free State, to East Africa, and to the Baku oil region of Caucasia. Morgan, who was a fellow of the Royal Geographical Society for forty

years, and served on its council, contributed much to its 'Journal.' He was also honorary secretary of the Hakluyt Society (1886-92), and collaborated with C. H. Coote in editing for it (1886) the 'Early Voyages and Travels to Russia and Persia, by Anthony Jenkinson and other Englishmen.' He was honorary treasurer for the Ninth International Congress of Orientalists (1892), in London, under Max Müller's presidency, and edited its transactions (1893). He died in London on 18 May 1909, and was buried at Copthorne, Sussex, where he chiefly resided in his later years. He married on 25 Sept. 1873 Bertha, daughter of Richard Thomas, by his wife Louisa de Visme, who died on 18 Feb. 1911 aged 101. Morgan had issue four sons and three daughters; the eldest son, Edward Louis Delmar Morgan, lieutenant R.N., died in 1900.

Besides the works mentioned, Morgan contributed a chapter on Askja to J. Cole's 'Summer Travelling in Iceland' (1882), and wrote a critical survey of the state of knowledge in 1894 of the Central Asian mountain systems, in the 'Scottish Geographical Magazine,' x. 337.

[Geographical Journal, xxxiv. 94; private information.] O. J. R. H.

MORIARTY, HENRY AUGUSTUS (1815-1906), captain in the navy, the second son of Commander James Moriarty, R.N., by his wife Catherine Webb, was born on 19 May 1815 in the signal tower on Dursey Island, co. Cork. He was educated at Portsmouth, and entered the navy on 18 Dec. 1829 on board the North Star, frigate. In 1837 he was promoted to second master and appointed to the Caledonia, flagship, in the Mediterranean, and during the war on the coast of Syria in 1840 served on board the Ganges, of 84 guns, receiving the English and Turkish medals. He was promoted to master in June 1844, and in 1848, while master of the Penelope, flagship on the west coast of Africa, had command of a paddle-box boat in an expedition to destroy the slave barracoons on the river Gallinas. In the Russian war he was master of the Duke of Wellington, flagship of Sir Charles Napier [q. v.], in the Baltic; he was mentioned in despatches for surveying work done under fire, and was employed under Captain Sullivan [see SULLIVAN, SIR BARTHOLOMEW J.] in placing the mortar vessels preparatory to the bombardment of Sveaborg on 9 Aug. 1855. In 1857 and in 1858 Moriarty was appointed to navigate the line-of-battle ship Agamemnon, lent by the

admiralty to lay the first Atlantic telegraph cable. In June 1863 he was promoted to staff commander, and in August was appointed to the *Marlborough*, of 121 guns, flagship in the Mediterranean. He navigated the *Great Eastern* in 1865 and 1866 when she was employed in laying the second and third Transatlantic cables; and, when the cable broke in mid ocean in 1865, he fixed the position so accurately as to ensure the subsequent recovery of the broken end. When the *Great Eastern* had hooked the lost cable and was heaving it up to her bows, the mark-buoy placed by Moriarty was bumping against the ship's side. He was in 1866 awarded the C.B. for this success, and received a valuable testimonial from his brother officers. In Dec. 1867 he reached the rank of staff-captain, and was appointed to Portsmouth dockyard as assistant master attendant, becoming master attendant and Queen's harbour-master in Nov. 1869. Moriarty held this post until 3 Dec. 1874, when he was placed on the retired list with the rank of captain. After his retirement he was occasionally employed as nautical assessor to the judicial committee of the privy council, and frequently as nautical expert before parliamentary committees, among which those on Barry Docks, the Tay Bridge, the Forth Bridge, and the Tower Bridge may be mentioned. His chief publications were four volumes of sailing directions (1887-93), compiled for the admiralty, and the articles on 'Log,' 'Navigation,' and 'Seamanship' in the *'Encyclopædia Britannica'* (9th edit.)

Moriarty died at Lee, Kent, on 18 Aug. 1906, and was buried in the cemetery there. Moriarty married (1) on 30 July 1852 Lavinia Charlotte (*d.* Sept. 1874), daughter of William Page Foster, by whom he had two sons and two daughters; (2) in 1875 Harriet Elizabeth, daughter of Robert Avent of St. Budeaux, Devonshire; she died without issue in March 1892.

MORLEY, third EARL OF. [See PARKER, ALBERT EDMUND (1843-1905), politician.]

MORRIS AND KILLANIN, LORD. [See MORRIS, Sir MICHAEL (1826-1901), lord chief justice of Ireland.]

MORRIS, Sir LEWIS (1833-1907), poet and Welsh educationist, eldest surviving son of Lewis (Edward Williams) Morris, solicitor of Carmarthen, by Sophia, daughter of John Hughes, shipowner and merchant of the same town, was born in Spilman

Street, Carmarthen, on 23 Jan. 1833. His father, who was grandson of Lewis Morris (1703-1765) [q. v.], Welsh poet, originally of Anglesey and later of Penbryn, near Aberystwyth, was first registrar of the Glamorgan circuit of county courts, and from the subdivision of the office till his death on 30 June 1872 registrar of the Swansea court. He possessed 'great political influence (on the liberal side) in the town and county of Carmarthen' (J. LLOYD MORGAN, *Life of Prof. Morgan*, p. 39). Besides an elder brother and a sister who died in infancy, Morris had three brothers, William Hughes (*d.* 1903) and Charles Edward, both solicitors, and John, rector of Narberth since 1885.

Morris was educated at Queen Elizabeth's grammar school, Carmarthen (1841-7), and at Cowbridge (1847-50) under Hugo D. Harper, whom he followed, with a number of other Welsh boys, to Sherborne, where he remained one year (1850-1). With Harper he formed a lifelong friendship. At Cowbridge he wrote a prize poem on Pompeii; at Sherborne he won the Leweston prize for classics and a prize for an English poem, 'A Legend of Thermopylæ.' He proceeded to Jesus College, Oxford, matriculating on 26 June 1851, and took first class in both classical moderations in 1853 and *literæ humaniores* in 1855 (HARRIET THOMAS, *Father and Son*, p. 51). He graduated B.A. in 1856, proceeding M.A. in 1858, and was awarded the chancellor's prize for the English essay on 'The Greatness and Decline of Venice' in 1858. 'Nothing but the possession of more than the statutable amount of property prevented his election to a fellowship' (HARDY, *Jesus College*, p. 201). For the same reason he had been ineligible for an entrance scholarship, but had been granted the rank of an honorary scholar. A college literary club, including among its members John Richard Green (who entered as a scholar in 1855), jointly produced a poem entitled 'The Gentiad,' satirising the more exclusive and wealthier set to which Morris belonged (*Letters of J. R. Green*, p. 15). One of its most caustic lines, attributed by Morris to Green, though it is authoritatively stated it was not written by him, gave great offence to Morris owing to a subtle imputation on his father's professional conduct. The breach between Morris and Green was never healed, not even in 1877, when both were simultaneously elected fellows of the college, shortly after the appointment, as principal, of Morris's old master (Dr. Harper).

Morris was admitted a student of Lincoln's Inn on 21 Nov. 1856, was awarded a certificate of honour on 7 Jan. 1861, was called to the bar on 18 Nov. 1861, and practised, chiefly as a conveyancer, till 1880. Two poems, 'At Chambers' and 'A Separation Deed,' are based on incidents in his professional life.

In 1871 there appeared anonymously the first series of his 'Songs of Two Worlds, by a new writer.' It consisted chiefly of lyrical poems contributed from 1865 downwards to a small literary and artistic society, 'The Pen and Pencil Club,' meeting at the house of Peter Taylor [q. v.] (*The New Rambler*, p. 112). The sonorous verse and placid optimism won for these 'Songs' great popularity, and a second series which followed in 1874, and a third issued in 1875, proved equally attractive. Though published anonymously, the last poem in the third series, 'To My Motherland,' indicated the writer's identity (cf. *Athenæum*, 23 Sept. 1876). A new edition of the three series in one volume was issued in 1878.

Meanwhile Tennyson's 'Tithonus' had suggested to Morris (*New Rambler*, p. 121) a series of blank verse monologues put into the mouths of the chief characters of Greek mythology. His three earliest poems on this plan—'Marsyas,' 'Eurydice,' and 'Endymion'—were rejected by various magazines (*ibid.* 112). Other poems expressed in a like spirit the preconceptions and moral ideals of his own age. The pieces were linked together by the device of a pilgrimage to the Shades. Finally all were collected under the general title of 'The Epic of Hades' in three sections named Hades, Tartarus, and Olympus. The Hades section appeared as book ii. of the 'Epic' early in 1876; this was followed by books i. and iii. in the subsequent year, when a complete edition in one volume was also issued. The work, which was mostly written 'amid the not inappropriate sounds and gloom of the (London) Underground Railway' (*ibid.* p. 117), was described as 'by the author of "Songs of Two Worlds."' The success of the volume was surprising: it ran through three editions of 1000 copies each in its first year, and some forty-five editions (exceeding fifty thousand copies) during the author's lifetime. A quarto edition with illustrations by George R. Chapman appeared in 1879. The lucidity of expression, the many idyllic pictures, the passages of spiritual exaltation, coupled with a strongly didactic character, made the work specially popular with the middle class, whose appreciation was voiced by

John Bright when in his speech on Cobden at Bradford, 25 July 1877, he described it as 'another gem added to the wealth of the poetry of our language.'

Morris owed his vogue as a poet, which lasted throughout his lifetime, to his enforcement of simple truths in simple language and metre. He earnestly taught in verse a cheerful optimism, and if he often excited critical scorn for his lack of subtlety, he exerted a wide moral influence. Much of his work betokens discipleship to Tennyson. After 'The Epic of Hades' came in 1879 'Gwen: a Drama in Monologue, in Six Acts.' The theme was the tragedy of a secret marriage. Its form may have been suggested by Tennyson's 'Maud.' There is an interesting picture of Llangunnor church, where the author was himself buried. 'The Ode of Life' (1880), consisting of a series of poems descriptive of various stages and phases of life, maintained the 'Epic's' note of high moral purpose.

'Songs Unsung' (1883) was the first volume issued under the author's name. It was described on the title-page as 'by Lewis Morris of Penbryn.' He had used the same designation in 1876, when he first published a poem under his own name, namely, an elegiac poem in memory of his great-grandfather's poet-friend Goronwy Owen [q. v.], in 'Y Cymmrodor,' vol. i., and in the 'Poetical Works of G. Owen,' ed. by R. Jones (1876), ii. 309-312, but this was never included in any edition of Morris's works. Penbryn was the name of the house near Aberystwyth where his great-grandfather had spent his later years, and Morris bestowed it on a house on the outskirts of Carmarthen bought by his father about 1840. This 'territorial' description of the author was the main theme of a savage attack on him in the 'Saturday Review' for 24 Nov. 1883. Lewis Morris was contrasted with 'William Morris of Parnassus.' Yet the 'Saturday Review' had already hailed 'The Epic of Hades' as 'one of the most considerable and original feats of recent English poetry' (*ibid.* 31 March 1877).

'Gycia: a Tragedy, in Five Acts' (1886), written 'with a view to stage representation,' and based on a story (*circa* 970 A.D.) recorded by Constantine Porphyrogenitus in his 'De Administratione Imperii,' displays more of a Greek spirit than any other of Morris's works. 'Songs of Britain' (1887) contains some patriotic odes like that on Queen Victoria's Jubilee (1887); three long poems based on Welsh legends are inferior in treatment to his verse on classical subjects.

Collected editions of Morris's works were issued in three volumes in 1882, and in one volume in 1890. 'A Vision of Saints' (1890) was Morris's last poem of first-rate importance, and was intended to be the Christian counterpart of his pagan 'Epic of Hades,' consisting of a series of monologues of nineteen saintly characters, concluding with Elizabeth Fry and Father Damien. His remaining volumes were three collections of lyrics—'Songs without Notes' (1894); 'Idylls and Lyrics' (1896); and 'Harvest Tide' (1901)—and 'The Life and Death of Leo the Armenian (Emperor of Rome): a Tragedy, in Five Acts' (1904). When in 1907 Morris carefully revised his collected works for a sixteenth edition, he announced in the preface that he 'brought to a definite close his long career as a writer of verse.' An authorised selection of his poems was issued in 1904, and after his death a volume of selections, 'reprinted under the author's supervision' from the fourteenth edition of the collected works, appeared in 'The Muses' Library.'

In 1905 Morris issued a volume of essays, appreciations, and addresses under the title 'The New Rambler: from Desk to Platform' (Longmans, Green & Co.). The work, in which he discusses his ideals as a poet, and answers some of his severest critics, is largely autobiographical. Most of the addresses deal with problems of Welsh education, which was the second great interest of his life. Until 1876, Morris, who then lived chiefly in London, took no active interest in Welsh affairs. He had not mastered the Welsh language (cf. his poem, *The Eisteddfod*: 'Hardly the fair tongue I know'), nor did he know much of the history and literature of Wales, while Welsh archæology did not appeal to him. Hugh Owen [q. v.] first interested him in Welsh education (*New Rambler*, 262). In Oct. 1878 he became one of the joint honorary secretaries to the University College of Wales, Aberystwyth, which from its opening in 1872 depended entirely on voluntary contributions. Thenceforth he was concerned with all its varying fortunes, drafting various appeals on its behalf and (with another) its amended constitution in 1885 (after its receipt of a government grant). He was joint treasurer of the college from March 1889 to March 1896, and from the latter date till his death one of its two vice-presidents.

He was one of the five members of a departmental committee appointed in

Aug. 1880, with Lord Aberdare as chairman, to inquire into the state of intermediate and higher education in Wales. The committee's report (C. 3047), issued in August 1881, resulted in the establishment of two new colleges and eventually of the University of Wales, and the passing of the Intermediate Education (Wales) Act of 1888, 'the educational charter of modern Wales.' During the inquiry Morris specially interested himself in the higher education of women, to which he was 'early a convert' (*New Rambler*, 280, 301). He threw himself with vigour into the propaganda and constructive effort which followed the issue of the report.

After the establishment of the university in 1893 he became its junior deputy chancellor for 1901-3, and received from it the honorary degree of D.Litt. in 1906. He was a member of the council of the Cymmrodorion Society from 1877 to Dec. 1892, and thenceforth one of its vice-presidents. He served as a member of the Carmarthen-shire intermediate education committee, and was a justice of the peace for Carmarthen. When Sir Hugh Owen's proposals for the reform of the eisteddfod by the formation of a National Eisteddfod Association were adopted, Morris was in Sept. 1880 appointed chairman of the council of the executive committee of the new body. That office he held till his death.

During Tennyson's later years Morris was a frequent guest of his (*Lord Tennyson, by his Son*, ii. 389), and on Tennyson's death in 1892 he was disappointed of the poet-laureateship (cf. *New Rambler*, p. 180). In 1893 he wrote the odes on the marriage of the Duke of York (now George V) and on the opening of the Imperial Institute, and in 1895, during Lord Rosebery's premiership, he was knighted.

Next to the laureateship his main ambition was a seat in parliament, which he also failed to win. An advanced liberal in politics, and from 1887 till his death a member of the political committee of the Reform Club, he was in favour of home rule and Welsh disestablishment. But his chief interest lay in social reform (see his odes for the first co-operative festival in 1888, for the trade union congress at Swansea in 1901, and on the opening of the West Wales Sanatorium in 1905). In 1868, and again in 1881 and 1883, he was invited to contest the Carmarthen Boroughs, but withdrew in favour of another liberal. In July 1886 he unsuccessfully contested the Pembroke Boroughs (cf. his idyll, *In*

Pembrokeshire, 1886). In 1892 Morris and another liberal submitted to arbitration their respective claims to be the official liberal candidate for Carmarthen Boroughs, but the award went against Morris (*Western Mail*, 14 April 1892). He was not a popular speaker, and suffered from a shyness often mistaken for hauteur.

He died at Penbryn on 12 Nov. 1907, and was buried at Llangunnor. By his will he left to the Aberystwyth College, for the Welsh national library (in the promotion of which he had been interested), the autograph letters of the Morris brothers, 1728-65 (edited by J. H. Davies, 2 vols. Oxford, 1906-9), and certain books. He married in 1868 Florence Julia, widow of Franklin C. Pollard, and by her, who survived him, he had two daughters and one son, Arthur Lewis, a naval constructor at Elswick. He did not announce his marriage till 1902. His portrait, painted in 1906 by Mr. Carey Morris (of Llandilo), is at Penbryn. A bust by Sir William Goscombe John, R.A., was exhibited at the Royal Academy in 1899.

MORRIS, SIR MICHAEL, LORD MORRIS AND KILLANIN (1826-1901), lord chief justice of Ireland and member of the judicial committee of the privy council in England, belonged to an ancient Roman catholic family which formed one of 'the fourteen tribes of Galway' and acquired the estate of Spiddal, co. Galway, by marriage in 1684. Michael Morris was elder son of Martin Morris, J.P. (1784-1862), who was high sheriff of co. Galway

in 1841, being the first Roman catholic to hold that office since 1690. His mother, Julia, daughter of Dr. Charles Blake, of Galway, died of cholera in 1837. His younger brother, George (1833-1912), high sheriff of co. Galway (1860-1) and M.P. for Galway city (1867-8 and 1874-80), was an official of the Irish local government board (1880-98), being made a K.C.B. on his retirement.

Born at Spiddal on 14 Nov. 1826, Michael Morris, after education at Erasmus Smith School, in Galway, entered Trinity College, Dublin, as an exhibitioner in 1842. His religion disqualified him from competing for a scholarship. In 1846 he graduated brilliantly as first senior moderator in ethics and logic and won a gold medal. At Trinity his chief recreation was racquet-playing, and he acquired a skill which he retained to an advanced age. After a year's foreign travel he was called to the Irish Bar in Trinity term 1849, joining the Connaught circuit. His rise in his profession was rapid, his abounding common-sense, his wit, and strong Galway brogue, which never diminished, attracted clients. Following his father's example, he was high sheriff of his county for 1849-50. From 1857 to 1865 he held the post of recorder of Galway. In February 1863 he took silk.

In July 1865 Morris was returned to parliament as member for Galway. He issued no address and identified himself with no party, yet 90 per cent. of the electors voted for him owing to the local popularity of himself and his family. He at once made his mark in the House of Commons, where he sat with the conservative party. Although of independent temperament and impatient of party ties he was distrustful of democracy, was devoted to the union and hostile to the cry of home rule. In July 1866 he was appointed solicitor-general for Ireland by Lord Derby, and was the first Roman catholic to hold that office in a conservative government. He was re-elected unopposed by his constituents. In November he was promoted to the attorney-generalship. In 1866 he was sworn of the Irish privy council; and his intimate knowledge of local affairs enabled him to do useful work on the judicial committee.

In 1867 Morris was raised to the Irish bench as puisne judge of the court of common pleas. He was succeeded in the representation of Galway by his brother George. He became chief of his court in 1876, and lord chief justice of Ireland in 1887. On the bench his good-humour and

shrewd wisdom stood him in good stead. He managed juries with admirable bonhomie, and even at the height of the land league agitation (1880-3) rarely failed to secure a right verdict. He was created a baronet in 1885, and on 25 Nov. 1889 was promoted to the judicial committee of the English privy council, receiving a life peerage by the title of Lord Morris. Although his new duties compelled his removal to London, his permanent residence and substantial interests, as he said on taking leave of the Irish bar, remained in his native country.

As appellate judge of the privy council Morris distinguished himself by his good-humoured contempt for legal subtleties, and his witty shrewdness. He not infrequently dissented from the majority of the committee, but well held his own in argument with his colleagues. In the suit *McLeod v. St. Aubyn*, which raised in 1899 a question of contempt on account of scandalous reflections on a court of justice, he delivered a characteristically robust judgment in pronouncing committals for such contempt obsolete, because 'courts are satisfied to leave to public opinion attacks or comment derogatory or scandalous to them' (*Law Reports*, Appeal Cases, 1899, p. 561). Morris was a popular figure in English society. He became a member of Grillion's Club, and in 1890 he received the unprecedented honour of being elected a bencher of Lincoln's Inn, though he had never been called to the English bar.

Morris always took a keen interest in Irish education. From 1868 to 1870 he was a member of the Powis commission on primary education in Ireland; in 1868 he became a commissioner of national education and, later, chairman of the board. On the foundation of the Royal University in 1880 he was appointed a senator, and in 1899 was elected vice-chancellor. He was a visitor of Trinity College, Dublin, and in 1887 received the honorary degree of LL.D. from his old university.

Morris retired from the privy council and from public life in 1900, when he accepted the hereditary barony of Killanin in the peerage of the United Kingdom. He was thenceforth known as Lord Morris and Killanin. He died at Spiddal on 8 Sept. 1901.

On 18 Sept. 1860 Morris married Anna, daughter of Henry George Hughes [q. v.], baron of the court of exchequer in Ireland. His wife died on 17 Oct. 1906. Of a family of four sons and six daughters, two sons and

a daughter predeceased their father. He was succeeded in the barony of Killanin by his eldest son, Martin Henry Fitzpatrick, in whose triumphant election, in defiance of the home rule organisation, as conservative member for Galway in 1900, Morris played a conspicuous part.

Morris's judicial decisions were vigorously phrased and were marked by greater regard for the spirit than for the letter of the law. He made no pretence to legal erudition and boldly scorned precedent. Yet his insight into human nature compensated for most of his defects of legal learning. His popularity with his fellow-countrymen, and especially with his Galway tenantry, never waned. He ridiculed the political views of the nationalists; but he could jest in the Irish language, and his strong Celtic sympathies reduced political differences to a minimum. During his whole career, which covered the Fenian outbreak and the land league movement, he never received a threatening letter. He rather cynically assigned Ireland's distresses to natural causes—to a wet climate and the absence of coal. Local developments or improvements, which laid fresh expenses on poor localities, he deprecated. He was at one with the nationalists in regarding the existing financial relations between England and Ireland as unfair to Ireland, and spoke to that effect in the House of Lords on 23 March 1894 (*Hansard* [38], 1582). Though he always treated home rule as a wild and impracticable dream, he was impatient of much of the routine which England practised in its government of Ireland. His epigram on the Irish political problem—'a quick-witted nation was being governed against its will by a stupid people'—was quoted by his friend Lord Randolph Churchill in the home rule debate on 17 April 1893, and is characteristic of his caustic sagacity (*Luce*, *Diary of the Home Rule Parliament*, p. 108). His witticisms, if at times coarse and extravagant, usually hit the mark.

There is no good portrait of Lord Morris. A drawing by Henry Tanworth Wells [q. v. Suppl. II] was made for Grillion's Club, and a large photograph hangs in the reception room of the King's Inns at Dublin. A caricature portrait by 'Spy' appeared in 'Vanity Fair' in 1893. An engraving from photographs was made after Morris's death by Messrs. Walton & Co., of Shaftesbury Avenue.

[The Law Mag. and Rev., Nov. 1901 (art. by Richard J. Kelly); The Times, 9 Sept. 1901; Annual Register, 1901.] G. S. W.

MORRIS, PHILIP RICHARD (1836-1902), painter, born at Devonport, Devonshire, on 4 Dec. 1836, was the youngest of the five children of John Simmons Morris, an iron founder, by his wife Anne Saunders. He was taken to London at the age of fourteen, with a view to being trained for his father's profession. But his mind was set upon an artist's career, and, largely owing to Holman Hunt's advice, his father overcame a rooted objection to his pursuit of art. Philip was soon allowed to work at the British Museum, where he applied himself particularly to drawing from the Elgin marbles. Having entered the Royal Academy Schools, Morris made striking progress, gaining three silver medals for drawing, painting, and portrait. In 1858 he won the gold medal and a travelling studentship which enabled him to visit Italy. He exhibited at the Royal Academy for the first time in the same year, and, save for five years, was represented there annually till 1901. He exhibited at the British Institution from 1857 to 1865. The beginning of his professional career was brilliantly successful and raised hopes in his brother artists and in the public that were destined to be disappointed by the achievement of his maturity. After Morris's election as A.R.A. in 1877 his powers began to wane, and in 1900 he retired voluntarily from the association. He died in London on 22 April 1902, and was buried at Kensal Green. He was married to a widow, Mrs. Sargeantson, daughter of J. Evans of Llangollen, and had two sons and three daughters.

For his earliest work Phil Morris chose his subjects from the drama of the sea and the sailor's life. It was his instinct for dramatic effectiveness and sentiment that made his art popular, both on the walls of exhibitions and in the form of engraved plates, and atoned to a certain extent for his shortcomings as a colourist. His landscape backgrounds were almost invariably the feeblest part of his pictures. Among his early sea pictures were: 'Voices from the Sea' (R.A. 1860); 'Drift-wreck from the Armada' (1867); and 'Cradled in his Calling' (B.I. 1864). Then came a period during which he was almost exclusively attracted by religious subjects, such as 'The Shadow of the Cross' (acquired by the Baroness Burdett-Coutts and never exhibited); 'Where they Crucified Him' (B.I. 1864); 'Jesus Salvator' (1865); 'The Summit of Calvary' (1871); 'The Shepherd of Jerusalem.' None of his pictures, however, attained to more popularity than

'Sons of the Brave' (1880), depicting the orphan boys of soldiers, Royal Military Asylum, Chelsea. Among other well-known works by him are 'The Knightly Mirror,' 'Good-bye, God Bless You' (1873), 'The Mowers' (1875), 'The Sailor's Wedding' (1876), 'The First Communion,' and 'The Reaper and the Flowers.'

P. G. K.

MORRIS, TOM (1821-1908), golfer, second son of John Morris, a letter-carrier in St. Andrews, and Jean Bruce, a native of Anstruther, was born in North Street, St. Andrews, on 16 June 1821. An elder brother, George, was also an accomplished golfer and was said to have had 'a prettier style than Tom,' though not such a reliable player. Tom received a good elementary education at the Madras College, St. Andrews. He began to play golf, he was accustomed to say, when he was 'six or seven, maybe younger'; and immediately on leaving school he was apprenticed to a golf ball maker, Allan Robertson, perhaps the most finished golfer St. Andrews has produced and then in the height of his fame. Serving under Robertson for four years as an apprentice and five as a journeyman, Morris had many opportunities of practising the game with him, until he was able to meet him on almost equal terms; and the two as partners were more than able to hold their own against any golfers of their time. Shortly after his marriage to Nancy Bayne, the daughter of a coachman, he went in 1851 to Prestwick, Ayrshire, where, besides being keeper of the golf links, he set up as a golf club and ball maker. Having in 1853 beaten his old master, Robertson, in a single round for a small stake, he challenged him to play him for 100*l.*, but Robertson did not respond. Morris, however, found a worthy rival in Willie Park of Musselburgh, who was some years his junior. Park was the more brilliant and stylish player, a longer driver, and also a better putter than Morris; but Morris was the more careful and imperturbable, excelled in approaching, and but for an occasional tendency to be short with his putts would always have had the advantage. Of six matches played in 1854 each won three. Of matches played, each over four different greens, that of 1856 was won by Park by 8 and 6 to play; that of 1862 was won by Morris by 17 holes; that of 1870 was unfinished, the referee, on account of the behaviour of the crowd on the last green (Musselburgh), postponing

the playing of the last six holes until next day, and Park, who was leading by one hole, refusing to abide by the decision; and that of 1882 was won by Morris, then in his sixty-first year, by 5 up and 3 to play. In the first year of its institution, in 1860, the open championship was won by Park, in the next two years by Morris, then by Park, and again by Morris, who also won it in 1866, Park winning it as late as 1875.

From 1863 to 1903 Morris was green keeper to the Royal and Ancient Club, St. Andrews, and during the forty years his sturdy, blackbearded figure—in his later years gradually whitening—might be seen regulating the starting of the players in all the principal tournaments. From the time that the modern furore for golf began he was also largely employed in the planning of golfing greens in all parts of the kingdom, and latterly he occupied a unique position as a kind of golf patriarch. He had, amongst his contemporaries, no superior when in his prime, nor until he was outplayed by his son Tom. So long did he retain his exceptional powers that in 1893, in his 72nd year, he won the first prize and medal in the annual competition of St. Andrews club makers; and, although allowed 5, his score of 83 was the lowest by three. In his eightieth year he went round the links in 86. He was in fairly good health when his death was brought about, on 24 May 1908, by accidentally falling down a stair. He attributed his good health to the fact that he always slept with his bedroom window open, and to his morning swim in the sea, summer and winter. He was a ruling elder in the parish church, St. Andrews, and on one occasion was chosen a representative elder to the general assembly. He had two sons—both in the business with him as club makers—and a daughter.

The elder son, Tom, known as 'Young Tom,' achieved the unique feat of winning the open championship in 1868 when only in his seventeenth year, and of winning it during three successive years, and this with record scores. He died suddenly on 25 Sept. 1875. A monumental tombstone, with his figure three quarter size, was erected, by subscriptions obtained through the different golf clubs of the kingdom, over his grave in the cathedral burying ground, St. Andrews. The second son 'J. O. F.,' a fairly good golfer, died in 1906.

In 1903 the portrait of Morris was painted for the Royal and Ancient Golf Club, St. Andrews, by Sir George Reid.

[Life by W. W. Tulloch, D.D., 1906; the *Badminton Book of Golf*; *Scotsman*, and *Glasgow Herald*, 25 May 1908; personal recollections.] T. F. H.

MORRIS, WILLIAM O'CONNOR (1824-1904), Irish county court judge and historian, born in the city of Kilkenny on 26 Nov. 1824, was son of Benjamin Morris, sometime rector of Rincurran in the diocese of Cork and Cloyne, and Elizabeth, youngest daughter and co-heiress of Maurice Nugent O'Connor of Gartnamona, near Tullamore, King's County. A delicate boy, he was placed when ten years of age under the care of a physician at Bromley in Kent. From 1837 to 1841 he was at a private school at Epsom, and from 1841 at a school in South Wales, where, under the tuition of the rector of Laugharne, in Carmarthenshire, he studied classics and history, and enjoyed ample opportunity for outdoor sports—shooting, fishing, and hunting. In Michaelmas term 1843 he entered Oriel College, Oxford, and in the summer of 1844 he was elected a scholar. Straitened circumstances, due to the great famine in Ireland, compelled a year and a half's absence (1846-7) from the university, but returning in the autumn of 1847 he obtained a second class in *literæ humaniores* in 1848. His father had died in 1846, and Morris, having abandoned an early predilection for a military career, raised three years after leaving Oxford the necessary fees of 100*l.* wherewith to enter the King's Inns, Dublin, as a law student. In Michaelmas term 1852 he was admitted a member of Lincoln's Inn and he was called to the Irish bar in 1854. Choosing the home circuit, he gradually worked his way upwards, and in 1862 he was elected a professor of common and criminal law in the King's Inns. Next year he was appointed a commissioner to investigate the rights of owners of fixed nets for salmon in Ireland, but owing to a difference of opinion between him and Sir Robert Peel, the third baronet, then chief secretary, he was compelled to resign. The county court judgeship given him later he regarded as reparation for this injustice.

Meanwhile he married, established himself at Blackrock, and became owner, through his wife, of Gartnamona. He began to contribute articles on historical, legal, social, and political subjects to the '*Edinburgh Review*,' whose editor, Henry Reeve [q. v.], he had come to know. For '*The Times*' he reviewed books, chiefly on military history—a favourite subject

of study. As a landlord he paid close attention to the conditions of land tenure in Ireland, and when Gladstone, after the disestablishment of the Irish Church, announced his intention of dealing with the Irish land question, Morris, at the request of John Thadeus Delane [q. v.], contributed a series of special articles on the subject to 'The Times.' Travelling through the country he collected his information at first hand. His letters in 'The Times' (reprinted in 1870 with a map), advising the legal recognition of Ulster tenant-right wherever it existed, attracted attention, and the Land Act of 1870, though not entirely to his satisfaction, embodied many of his ideas. In 1869-70 Morris served on a commission to inquire into the corrupt practices attending the election of freemen of the city of Dublin, and his report throws light on municipal government in Ireland. In 1872 he was appointed county court judge for the county of Louth, and after six years was transferred to county Kerry. The change did not prove agreeable. He had no sympathy with the home rule movement and detested the accompanying agrarian agitation, which was violent in Kerry. Of the Land Act of 1881, which he administered, he disapproved, and he never lost an opportunity of denouncing it. He reduced rents from 15 to 20 per cent. on well-managed estates, and from 30 to 40 per cent. on badly managed ones; but his refusal to submit to local opinion led to many stormy scenes between him and the bar. In 1880 he removed with his family from Dublin to Gartnamona, and was, at his own request, transferred in 1886 to the county judgeship of the united counties of Sligo and Roscommon. His position there was easier, but his attitude towards the de Freyne tenants in 1901, and his pungent remarks on men and measures in connection with recent Irish legislation, drew down on him hostile criticism.

Thenceforth Morris devoted himself largely to literary work, and published in quick succession 'Hannibal . . . and the Crisis of the Struggle between Carthage and Rome,' and 'Napoleon . . . and the Military Supremacy of Revolutionary France,' both in the 'Heroes of the Nations' series (1890); 'Great Commanders of Modern Times,' reprinted from the 'Illustrated Naval and Military Magazine' (1891); 'Moltke: a Biographical and Critical Study' (1893); 'Ireland from 1494 to 1868,' in the 'Cambridge Historical' series (1894); 'Memories and Thoughts

of a Life,' being his autobiography (1895); 'The Great Campaign of Nelson' (1898); 'Ireland from '98 to '98' (1898); 'The Campaign of 1815' (1900); 'Present Irish Questions' (1901); 'Wellington . . . and the Revival of the Military Power of England,' in the 'Heroes of the Nations' series (1904); besides numerous articles in the 'Edinburgh' and several in the 'English Historical Review' on Turenne, Sedan, Waterloo, and Ireland from 1793 to 1800. He wrote too much and too superficially to become an authority of first rank on either military or Irish history. He had no personal experience of military affairs, and except in the case of Ireland of his own day his knowledge of Irish history was largely second-hand. His style was that of an accomplished journalist, content for the most part to build on other men's foundations; but such writings as his 'Napoleon' and 'Ireland from '98 to '98' possess permanent interest from their strongly personal character and independent judgment. But he often failed to take the trouble to collect all the facts on which a sound or impartial judgment could be passed. He admired Napoleon and O'Connell, but unduly depreciated their contemporaries, and formed low estimates of Moltke and Parnell. A liberal unionist of the type of W. E. H. Lecky, he united the best characteristics of the English and Irish races. Morris was in private life honest, courageous, imaginative, fond of outdoor sports, an admirable raconteur, and a just landlord.

Morris died on 3 Aug. 1904 at Gartnamona. He married in 1858 Georgiana, eldest daughter of 'handsome' George Lindsay, by whom he had five daughters and a son, Maurice Lindsay O'Connor Morris.

[Morris's autobiography and writings; Burke's Landed Gentry; The Times, 4 Aug. 1904.] R. D.

MOUNTFORD, EDWARD WILLIAM (1855-1908), architect, born on 22 Sept. 1855 at Shipston-on-Stour, Worcestershire, was son of Edward Mountford by his wife Eliza Devonshire, daughter of William and Mary Richards of Northampton. After private education at Clevedon, Somersetshire, he was articled in 1872 to Habershon & Pite, architects, Bloomsbury Square, London. Starting independent practice in 1881, he achieved distinction by winning in 1890 the open competition for the Sheffield town hall. Throughout his career Mountford was exceptionally successful in competitions. The Museum and Tech-

nical School at Liverpool, an important group of buildings near St. George's Hall, followed shortly after the Sheffield work.

In Battersea he erected the town hall and the Polytechnic, and among other London buildings he designed St. Olave's grammar school, Southwark (1893); the Northampton Institute, Clerkenwell (1898); and finally his chief work, the Central Criminal Court at Old Bailey, occupying the site of Newgate Prison (1907) [see DANCE, GEORGE, the younger].

Mountford believed in the association of first-rate sculpture and painting with architecture, and the Central Criminal Court affords a good example of such a union of the arts. His style developed from a free Renaissance method as exhibited at Sheffield to the more normal classic of the Old Bailey. He became an associate of the Royal Institute of British Architects in 1881 and a fellow in 1890. He was for fourteen years a member of the council. In 1893-5 he was president of the Architectural Association. Though failing in health he was in January 1908 one of the eight specially selected competitors for the designing of the London County Council Hall. He died at his residence, 11 Craven Hill, London, W., on 7 Feb. 1908.

Mountford was twice married: (1) on 28 June 1888 to Jessie Elizabeth, daughter of John Saunders Smith of Northampton; (2) on 11 July 1903 to Dorothy, daughter of A. G. Hounsham of Hampstead Heath. He had a son by his first marriage, and a daughter by his second.

[R.I.B.A. Journal, vol. xv. 3rd ser. 1908, p. 274; Builder, 15 Feb. 1908; Architectural Rev., March 1908, xxiii. 136; information from Mr. F. Dare Clapham.] P. W.

MOWAT, SIR OLIVER (1820-1903), Canadian statesman, born at Kingston, Upper Canada (now Ontario), on 22 July 1820, was eldest son in a family of three sons and two daughters of John Mowat of Canisbay, Caithness-shire, who had come out to Canada as sergeant with the 3rd Buffs in 1814, had taken his discharge to occupy a grant of land near Kingston, and had married Helen Levaack of Caithness in 1819. A younger brother, John B. Mowat, D.D., was professor of Hebrew in Queen's University, Kingston, from 1857 until his death in 1900.

After education at private schools in Kingston, Mowat, who was brought up and remained a presbyterian, was articled in 1836 to (Sir) John Alexander Macdonald [q. v.] as a student-at-law. In Nov. 1840

he left Mr. Macdonald's office for Toronto. When, in May 1841, the governor, Lord Sydenham, temporarily moved the seat of government from Toronto to Kingston, Mowat followed the court of chancery to that place, and being there called to the bar of Upper Canada in Nov. 1841, was at once admitted into partnership with his principal, Robert Easton Burns. In Nov. 1842 the firm moved back to Toronto with the court of chancery, and from that time until his death Mowat lived almost continuously in Toronto. He rapidly gained distinction in equity practice, and was for many years the acknowledged leader of the chancery bar. He was a bencher of the Law Society of Canada from 1853 until his death, save from 1864 to 1872, and was made Q.C. in 1856. In January 1856, on the motion of Macdonald, he was appointed by the Taché-Macdonald government one of the commissioners to revise and consolidate the statutes of Upper Canada, and such of the other statutes as affected the upper province. At a later date he was also a commissioner for the consolidation of the statutes of Ontario.

Mowat's first incursion into public life was in Dec. 1856, when he was elected an alderman for the city of Toronto; his first entry into the political field was at the general election of 1857, when he was elected to the legislative assembly by the riding of South Ontario. Mowat supported the radical party, which was led by George Brown [q. v. Suppl. I], and advocated a reform of parliamentary representation by population and the secularisation of state schools.

In July 1858 the Macdonald-Cartier ministry resigned on a vote censuring the selection of Ottawa as the proposed capital, and Mowat became provincial secretary in the George Brown cabinet, which lived only forty-eight hours. The new ministers had resigned their seats to seek re-election, and the opposition snatched the opportunity to carry a vote of want of confidence. Within a few hours the old Macdonald-Cartier administration was installed in office as the Cartier-Macdonald government, and carried on the government until their defeat in the house shortly after the general elections of 1862. It was meanwhile becoming increasingly evident that some method must be devised to simplify the machinery of government of Canada, which the division between the two provinces hampered. At a great convention of reformers held at Toronto in 1859, which discussed the situation, Mowat

forcibly presented what appeared to him to be the only possible alternatives, viz. a dissolution of the union between the two provinces, which he would deprecate, or the federation of the two provinces with a local legislature established in each, whereby alone, he held, could representation by population be attained, and the wealthy and more populous province be relieved from the domination of the French minority. He declined office in the John Sandfield Macdonald-Sicotte ministry of 1862, which refused to countenance the principle of representation by population. When the seventh parliament of Canada assembled in 1863, the J. S. Macdonald-Dorion ministry in control left representation by population an open question, and Mowat accepted the office of postmaster-general in the administration. His chief reforms were acts of retrenchment. He cancelled the existing Allan contract for ocean mails, renewing it on much more favourable terms, and he fixed the Grand Trunk railway postal subsidy at \$60 a mile in lieu of the \$300 to \$800 a mile which the company claimed. In 1864, after the accession to office and early defeat of the Taché-John A. Macdonald government, George Brown's proposal of a coalition government for the purpose of 'settling for ever the constitutional difficulties between Upper and Lower Canada' was adopted. Mowat joined the coalition and took part in the conference on federation which met at Quebec (10 to 28 October 1864). Mowat advocated a senate elected for a fixed term, instead of an appointed senate which might prove a mere mechanical device for registering the acts of the party in power.

Mowat's labours on confederation were cut short by his appointment, on 14 Nov. 1864, as one of the vice-chancellors of Ontario. He held that office until Oct. 1872. In 1872, when Edward Blake and Alexander Mackenzie [q. v.], leaders of the Ontario legislature, abandoned, in accordance with the new constitution, local for federal politics, Mowat at their request resigned his judgeship and, re-joining the local legislature as member for North Oxford, became premier of Ontario on 29 Nov. 1872. He remained at the head of the province until 1896, when he entered Dominion politics as a supporter of Sir Wilfrid Laurier.

The enactments for which Mowat was responsible during his twenty-four years' premiership of Ontario aimed, as in the Ballot Act of 1874 and the Manhood Suffrage Act of 1888, at democratising Ontario

institutions. At the same time he sought to simplify and cheapen the operation of justice. By the Administration of Justice Acts (1873 and 1874) and the Judicature Acts of 1880 and 1881 he effectively assimilated the practice and procedure of the common law and equity courts. Finally Mowat was responsible for an important series of measures which, checked by the federal veto and sanctioned in six instances on appeal to the privy council, served to define the proper limits of provincial rights under the constitution and rendered Mowat the victorious champion of provincial rights. In the first year of his premiership Mowat claimed the right of the lieutenant-governor-in-council to appoint queen's counsel with precedence in Ontario courts. In 1876 the province secured the right to regulate by legislation companies incorporated whether under a Dominion, British, or foreign charter. Again in 1883 the privy council pronounced, after much litigation, in favour of Mowat's claims on behalf of the province to enact liquor legislation in spite of the general control of trade and commerce vested in the Dominion parliament, and the judgment at the same time declared the power of the provincial legislature to be within prescribed limits 'as plenary and as ample as the imperial parliament in the plenitude of its power possessed and could bestow.' Among other of Mowat's victories was the final delimitation by a decision of the privy council in 1884 of the boundaries of Upper Canada (in Ontario) after a long and heated struggle with the Dominion parliament and with the neighbouring province of Manitoba. The ownership and control of 144,000 square miles of territory were thereby secured to Ontario. Mowat was made K.C.M.G. in 1892 and G.C.M.G. in 1893.

In 1896 Mr. Laurier, the liberal leader of the Dominion, induced Mowat to resign the premiership of Ontario and assist the liberal party in the general elections of that year. The dominant issue was the Manitoba school question, touching the claims of Roman Catholics to separate state education, which the Manitoba legislature declined to admit. Mowat was in accord with his leader in advocating a compromise between the Catholics and the Manitoba legislature which should not prejudice liberal and unsectarian principles. The result was a victory for Mr. Laurier and his party, and Mowat accepted a seat in the senate, and the office of minister of justice in the Laurier cabinet. In 1897 he retired to

accept the office of lieutenant-governor of Ontario. In 1898 his health began to fail, but in spite of a partial paralysis he continued his official duties. He died at Government House, Toronto, on 19 April 1903, and was accorded a public funeral in Mount Pleasant cemetery.

Mowat's consistent success as a party leader was due to his tact, political sagacity, and integrity. The province recognised that to him its affairs were safely entrusted. The conservative opposition was powerless in the presence of the popularity and prestige which Mowat gained by his successful championship of provincial rights. In Dominion politics Mowat advocated the policy of unrestricted reciprocity with the United States, while he was an ardent supporter of the British connection. He denounced as 'veiled annexation' Goldwin Smith's proposal that Canada and the United States should maintain a uniform tariff against the world, and free trade between themselves. He was a member of the senate of the university of Toronto (1852-72), president of the Canadian Institute (1864-6), president of the Evangelical Alliance (1867-87), vice-president of the Upper Canada Bible Society (1859-1903), and hon. president of the Canadian Bar Association (1897). He held honorary degrees from Queen's university, Trinity university, and the university of Toronto.

On 19 May 1846 Mowat married Jane, daughter of John and Helen Ewart of Toronto. There were two sons and three daughters from this marriage. The eldest son, Frederick Mowat, is sheriff of the city of Toronto.

There are portraits in the Ontario Legislative Buildings by Robert Harris, C.B.; in Government House, Toronto, by Dixon Patterson; in the National Club, Toronto, and in the board room of the Imperial Life Assurance Company by E. Wyly Grier; and in Sheriff Mowat's house by J. Colin Forbes.

[Sir Oliver Mowat, a biographical sketch by C. R. W. Biggar, K.C., Toronto, 1905; private information.] P. E.

MUIR, SIR WILLIAM (1819-1905), Indian administrator and principal of Edinburgh University, born in Glasgow on 27 April 1819, was youngest of four sons of William Muir, merchant in Glasgow, by his wife Helen Macfie, of an Ayrshire family. John Muir [q.v.], the Sanskrit scholar, was his eldest brother. The eldest sister, Margaret, married the painter, Sir George Harvey [q.v.]. Left a widow two years after

William's birth, his mother took her four sons and four daughters to Kilmarnock, where William attended the grammar school. On the removal of the family to Manor Place, Edinburgh, he entered the university there, and subsequently the university of Glasgow. Before he had the opportunity of graduating, his grand-uncle, Sir James Shaw [q. v.], chamberlain of the City of London, previously lord mayor, gave Mrs. Muir four writerships for the East India Company's civil service, and all her four sons went successively to Haileybury College and to the North-West Provinces of India. The second and third sons, James and Mungo, died there after short service.

On 16 Dec. 1837 William Muir landed in Bombay. There he at once entered on the work of settling the periodical assessments of land revenue, and with that work his service of thirty-nine years was mainly identified. He was stationed successively in the districts of Cawnpore, Bundelkhand, and Fatehpur. Following in the footsteps of Robert Merttins Bird [q.v.] and of James Thomason [q. v.], the creators of the land revenue system, he passed into the board of revenue, and then became secretary to Thomason's government of the North-West Provinces at Agra in 1847.

The sepoy Mutiny broke out at Meerut on 10 May 1857 and spread rapidly. Muir, at Agra, where the situation was soon critical, advised vigorous action from the first. Akbar's great fort of Agra became the refuge of the Christians, and John Russell Colvin [q. v.], the lieutenant-governor, just before his death there on 9 Sept. 1857, nominated Muir and two others to keep the wheels of government in motion. Muir vividly told the story of his experience for his children in his 'Agra in the Mutiny' (1896). Soon there was neither government nor revenue; but as head of the intelligence department Muir held the dangerous position of centre of communication between the viceroy, Lord Canning, and the civil and military authorities right across India to Delhi, Lahore, and Peshawar, to Gwalior, Indore, and Bombay. The invaluable correspondence which he controlled, after being partially utilised by Kaye in his history, was published in Edinburgh in two volumes in 1902, edited by W. Coldstream.

On the virtual suppression (save in Oudh) of the rebellion at the end of 1857 Lord Canning personally undertook the lieutenant-governorship of the North-West Provinces, and removed the headquarters from Agra to Allahabad. At the end of

January 1858 he summoned Muir to join him there as secretary to his government. Muir's experience and influence became all-important in the reorganisation of the provinces through 1858. To form after the Mutiny a permanent settlement of the North-West Provinces which should at once content the people and satisfy the revenue was the problem which Muir solved in his masterly minute of 5 Dec. 1861, when he was senior member of the board of revenue. He showed how the desired result could be reached gradually, on the basis of corn rents. That great state paper convinced the government of India. Political changes at the India office in London first delayed sanction and then indefinitely postponed the decision. To that delay was largely due the loss of life, property, and revenue since caused by famines in northern and central India.

After acting as provisional member of the governor-general's legislative council from 1864 Muir became foreign secretary under John first Lord Lawrence in 1867, when he was created K.C.S.I. Next year he became lieutenant-governor of the North-West Provinces, and held office till 1874. The sympathy and the efficiency which he brought to his administration obliterated the last traces of the rebellion. He mitigated the severity of the land assessment, and passed two acts which consolidated and amended the land laws of the North-West Provinces. He checked, and finally abolished, Hindu female infanticide, without creating political discontent. He promoted the spread of both primary and university education. The Muir college, which bears his name, at Allahabad, and the university which he instituted there, perpetuate his memory, and he devoted his leisure to the welfare of the Christian natives. From 20 Nov. 1874 to Sept. 1876 he held the high office of financial member of Lord Northbrook's council.

When Queen Victoria became Empress of India she adopted, as the translation of that title, the phrase, which Muir suggested, of *Kaisar-i-Hind*. At a later period, when a guest at Balmoral, he assisted Queen Victoria in her Hindustani studies.

On his retirement from India in 1876 he accepted the invitation of Lord Salisbury, secretary of state for India, to join the council of India in London. But he resigned his seat there on 15 Dec. 1885 on being appointed principal of Edinburgh University. That office he held till his death. Finding the official residence insufficient, he acquired Dean Park House, which became

the centre of a gracious hospitality, that soon obliterated the memory of old academic feuds. In the words of Sir Ludovic Grant, son of Sir Alexander Grant [q. v.], his immediate predecessor, he 'cemented cordial relations between the university and all sections of the community.' He proved a generous benefactor to the university, and was generally known as 'the students' principal.'

Meanwhile Muir amid his official labours made a universal reputation as an Arabic scholar and an historian of Islam. To the 'Calcutta Review,' while it was edited by the present writer from 1857 onwards, Muir contributed fifteen articles, and on these he based his standard 'Life of Mahomet—History of Islam to the Era of the Hegira' (4 vols. 1858–61). He acquired the MSS. of the first authorities, Wākidi, Hishāmi, and Tabari, and subsequently presented his valuable MS. of Wākidi to the India office, after giving a transcript to the Edinburgh University library. A third edition of Muir's 'Life,' in one volume, omitting the introductory chapters and most of the notes, appeared in 1894 and was out of print at his death. In 1881 Muir delivered the Rede lecture at Cambridge on 'The Early Caliphate and Rise of Islam.' In 1883 his 'Annals of the Early Caliphate' and in 1896 his 'Mameluke or Slave Dynasty of Egypt' completed his great history down to the assumption of the title of Caliph by the Osmanli Sultanate. To the last volume Muir prefixed a lecture which he delivered to the Edinburgh students in 1894 on the Crusades, 'that great armament of misguided Christianity.' Meanwhile he also published 'The Corān: its Composition and Teaching, and the Testimony it bears to the Holy Scriptures' (1878); 'Extracts from the Corān, in the Original, with English rendering' (1880); 'The Apology of al-Kindy' (1881 and 1887); 'The Old and New Testaments, Tourat, Zubūr and Gospel; Moslems invited to see and read them' (1899), and other small treatises. 'Ancient Arabic Poetry: its Genuineness and Authenticity,' in Royal Asiatic Society's 'Journal' in 1879, is of high value.

He was elected president of the Royal Asiatic Society of Great Britain and Ireland in 1884, and in 1903, in recognition of 'the great value, importance, and volume' of his work on Islamic history and literature, was awarded the triennial jubilee gold medal, previous holders being E. B. Cowell [q. v. Suppl. II] and E. W. West [q. v. Suppl. II]. He was made hon. D.C.L. of Oxford in 1882, LL.D. of Edinburgh and Glasgow,

and in 1888 Doctor of Philosophy of Bologna University, at the eighth centenary of the foundation of which he represented Edinburgh.

Muir died at Edinburgh on 11 July 1905, and was buried in Dean cemetery. He married in 1840 Elizabeth Huntly (*d.* Oct. 1897), daughter of James Wemyss, collector of Cawnpore and a cadet of the family of Wemyss Castle in Fifeshire. She was identified with her husband in all his undertakings. Of the fifteen children of the marriage, the eldest son is Colonel William James Wemyss Muir, Bengal artillery and political department.

In 1862 Muir joined his brother John in endowing the Shaw professorship of Sanskrit and comparative literature at Edinburgh in memory of their grand-uncle, Sir James Shaw. Busts of Muir are in the Muir College, Allahabad, and in Edinburgh University. A crayon portrait belongs to the eldest son.

[The Friend of India, 1873-1874; The Times, 12 July 1905; the Royal Asiatic Society's Journal, 1905, by Sir Charles J. Lyall (a good estimate of Muir's Arabic scholarship and general character); the Student, Edinburgh University Magazine, Sir William Muir Number, 1905; Sir William Muir Memorial Service, an address by Rev. John Kelman, M.A., D.D., in the McEwan Hall, Sunday, 16 July 1905.] G. S.

MÜLLER. [See IWAN-MÜLLER, ERNEST BRUCE (1853-1910), journalist.]

MULLINS, EDWIN ROSCOE (1848-1907), sculptor, born in London on 22 Aug. 1848, was a younger son and sixth child in a family of five sons and three daughters of Edward Mullins of Box, Wiltshire, solicitor, by his wife Elizabeth Baker. After being educated at Louth grammar school and Marlborough College (1863-5), Mullins was trained in the art schools of Lambeth and the Royal Academy, and subsequently under John Birnie Philip [q. v.]. In 1866 he went to Munich, where he studied under Professor Wagnmüller, and in 1872 gained a silver medal at Munich and a bronze medal at Vienna for a group entitled 'Sympathy.' In 1874 he returned to London and became a constant exhibitor at the Royal Academy and other galleries. He devoted himself preferably to ideal work, which was marked by simplicity and restraint. The best of his works of this kind was probably 'Cain: My punishment is greater than I can bear' (New Gallery, 1896). The bronze statue of a 'Boy with a top' (R.A. 1895) was shown at the

International Exhibition at Brussels in 1897; while other works possessing both charm and simplicity were the marble figure of a girl personifying 'Innocence' (R.A. 1876), 'Rest' (Grosvenor Gallery, 1881; acquired by Miss Hoole), 'Morn waked by the Circling Hours' (Grosvenor Gallery, 1884), 'Autolycus' (R.A. 1885), a bronze group entitled 'The Conquerors' (R.A. 1887), 'Love's Token' (R.A. 1891), and 'The Sisters' (1905).

Mullins also possessed considerable powers of portraiture. He exhibited at the Royal Academy busts of, among others, Dr. Martineau (1878), Mr. W. G. Grace (1887), Rt. Hon. C. T. Ritchie (1889), and Sir Evelyn Wood (1896). He also executed statuettes of Gladstone (1878), Val Prinsep, A.R.A. (R.A. 1880), Sir Rowland Hill, and Edmund Yates (1878), a marble effigy of Queen Victoria for Port Elizabeth (1900), a bronze equestrian statue of the Thakore Saheb of Morvi (1899), and statues of General Barrow (marble, 1882) for the Senate House of Lucknow, of Henry VII (stone, 1883), for King's College, Cambridge, and William Barnes, the Dorsetshire poet (1887), for Dorchester. His most curious work was the circus-horse in Brighton cemetery, executed in 1893 as a memorial to Mr. Ginnett, a well-known circus-owner.

Mullins embellished many prominent London buildings by carvings, panels, and other effective decorative work. He executed the carvings for the buildings of the Fine Arts Society, Bond Street (1881), a pediment for the Harris Free Library, Preston, representing 'The Age of Pericles' (1886), and the frieze, representing the entry of Charles II into London, for the drawing-room of the Grocers' Hall (1892).

In 1889 Mullins published 'A Primer of Sculpture.' He died at Walberswick, Suffolk, on 9 Jan. 1907. His remains after cremation at Golders' Green were buried at Hendon Park. He married on 4 June 1884 Alice, daughter of John Pelton, J.P., of Croydon, and had issue three sons and one daughter.

[The Times, 14 Jan. 1907; Spielmann's British Sculpture, 1901; Encyc. Brit. 11th edit. art. on Sculpture; Century Mag., July 1883; Portfolio, Aug. 1889 (art. by Sir Walter Armstrong); Builder, 21 Jan. 1888; Art Journ. 1907; private information from Mr. W. E. Mullins.] S. E. F.

MUNBY, ARTHUR JOSEPH (1828-1910), poet and civil servant, born in 1828, was eldest of six sons and one daughter of Joseph Munby of Clifton Holme, Yorkshire, solicitor, a member of an old York-

shire family, by his wife Caroline Eleanor Forth (see *Memorial of Joseph Munby*, by A. J. MUNBY, 1876). He was educated at St. Peter's School, York, and Trinity College, Cambridge, where he graduated B.A. in 1851, proceeding M.A. in 1856. He entered Lincoln's Inn on 11 June 1851, and was called to the bar on 17 Nov. 1855. From 1858 to 1888 he held a post in the ecclesiastical commissioners' office, retiring at the age of sixty. A competent and conscientious official, he was known to his friends as an accomplished poet and man of letters. His first volume, entitled 'Benoni,' was issued in 1852. Seven years later he was a competitor for the fifty-guinea prize offered by the Crystal Palace Company for a poem on the Burns centenary of 1859, when he was one of six competitors whose excellence was held to be not far short of that of the winner, Miss Isa Craig, afterwards Mrs. Craig-Knox [q. v. Suppl. II]. Others of the six were Gerald Massey [q. v. Suppl. II] and Frederic William Henry Myers [q. v. Suppl. I]. To 'Benoni' succeeded, in 1865, 'Verses New and Old,' a collection of contributions to 'Fraser,' 'Macmillan,' 'Temple Bar,' 'Once a Week,' and other magazines. In 1880 came 'Dorothy,' a 'country story,' in the elegiac verse which its writer had employed for his Burns poem. Published anonymously, and dedicated to a lifelong friend, the novelist, Richard Doddridge Blackmore [q. v. Suppl. I], its idyllic grace and vivid pictures of country scenes and life obtained for it a recognition which had not been accorded to its acknowledged predecessors. Robert Browning, to whom a copy had been forwarded through the publisher, received it with the warmest admiration, praising especially its signal 'exquisitenesses of observation' and consummate craftsmanship; and it was speedily reprinted in America, going into three editions in 1882. 'Vestigia Retrorsum' (Rosslyn series of poets) followed in 1891. This included a sonnet which in the previous year had received the diploma of the committee of the Beatrice Exposition at Florence. 'Vulgar Verses' (that is, 'verses of common life') 'in dialect and out of it,' written under the pseudonym of 'Jones Brown' (1891); 'Susan, a Poem of Degrees' (1893); 'Ann Morgan's Love, a Pedestrian Poem' (1896); 'Poems, chiefly Lyric and Elegiac' (1901); and a final volume, 'Relicta' (1909), make up the sum of Munby's metrical output. To this last collection he prefixed the following Landor-like quatrain:

'There was a morning when I follow'd Fame:
There was a noonday when I caught her
eye:

There is an evening when I hold my name
Calmly aloof from all her hue and cry.'

He also produced a few magazine articles and a compilation entitled 'Faithful Servants: Epitaphs and Obituaries' (based on an earlier anthology of 1826), which included 'A Historical Preface and a Prefatory Sonnet.

Munby's poetry is characterised by its absolute sincerity, its scholarship, its technical skill, its descriptive power, and its keen feeling for and close observation of nature and rural life. Outside this, his dominant note may be said to have been what has been called 'the glorification of the working woman,' with especial insistence on the dignity of manual labour.

Munby travelled widely, was a clever raconteur, and an F.S.A. with a genuine love of antiquity. For many years he was a regular contributor to 'Notes and Queries'; and he was a warm supporter of the Working Men's College, then in Great Ormond Street, where, between 1860 and 1870, he taught a Latin class. He was a member of the Pen and Pencil Club which assembled, *circa* 1864-74, at Aubrey House, Notting Hill, under the auspices of Mrs. Peter Taylor. A selection from its proceedings, entitled 'Auld Lang Syne,' was printed privately in 1877, and includes verses by Munby.

Munby died at his little cottage at Pyrford, near Ripley in Surrey, on 29 Jan. 1910, and was buried at Pyrford. The publication of his will in the following July disclosed the fact that on 14 January 1873 he had married his servant, Hannah Cullwick, who had died in July 1909. Owing to the refusal of his wife to quit her station, the marriage (ran the will), though known to her relations and to three of her husband's friends, had never been made known to his own family. The circumstances supply an explanation of many passages in Munby's poems which must otherwise remain obscure to his readers; and several of the pieces contained in his last volume, 'Relicta,' issued after his wife's death, read in this light, have great beauty and pathos. He left no issue.

He bequeathed many of his books to Trinity College, Cambridge; and to the British Museum two deed-boxes containing photographs, MSS., diaries, &c., on condition that they were not to be opened or examined before 1 Jan. 1950.

[Personal knowledge; *The Times*, 5 Feb. 1910; *Daily Telegraph*, and *Daily Mail*, 4 July 1910; art. in *Gent. Mag.* cxcvii. 503-514, by Thomas Bayne; *Working Men's College Journal*, March 1910, and works.]

A. D.

MUNRO, JAMES (1832-1908), premier of Victoria, Australia, born on 7 Jan. 1832 at Glen Dubh in the parish of Eddrachillis, Sutherlandshire, was second son of Donald Munro of Glen Dubh, by his wife Georgina Scobie Mackay. Educated at the village school of Armadale, Sutherlandshire, he began life as a printer, serving his apprenticeship in Messrs. Constable's printing-works at Edinburgh. He emigrated to Victoria in 1858 and worked as a printer until 1865, when he founded the Victorian Permanent Property Investment and Building Society, of which for seventeen years he acted as secretary. He was also instrumental in starting the Melbourne woollen mills and the Victorian Permanent Fire Insurance Co. Taking advantage of the steady appreciation in land values, Munro founded in 1882 the Federal Banking Company and for three years conducted its operations as managing director. In 1887 he established the Real Estate Bank.

In 1863 he turned his attention to politics. After an unsuccessful attempt to enter the legislative assembly for Dundas, he was elected in 1874 for North Melbourne as a supporter of James Goodall Francis [q. v.], and in 1877 for Carlton. He was defeated in 1880, but re-entered parliament for North Melbourne in April 1881. In March 1886 and March 1889 he was returned for Geelong.

Always a staunch liberal, Munro was minister of public instruction in the first Berry ministry from 10 Aug. to 20 Oct. 1875. He declined office in the second Berry administration in 1877, and joined with J. J. Casey in forming a 'corner party' on the liberal side. He led the opposition to the Gillies-Deakin government, and in 1890, on his return from a visit to England, he attacked the financial policy of that cabinet and carried a vote of want of confidence. As a result he took office as treasurer and premier on 5 Nov. 1890. At the meeting of the federal convention in Sydney in 1891, Munro was one of the representatives of Victoria. Financial pressure due to the depreciation of land values led Munro to resign the premiership in February 1902 and become agent-general of the colony in London. Returning to Melbourne in November following, amid financial difficulties and

failing health, he resigned that office and retired from public life.

Apart from politics Munro's chief interest lay in temperance work. For many years he was the leader of the temperance party in the Victorian parliament, and was at one time president of the Victorian Alliance and the Melbourne Total Abstinence Society and chief officer of the Order of Rechabites.

He was an executive commissioner at the Melbourne exhibitions of 1880-1 and 1888-9, and at the Philadelphia, the Sydney, and Paris exhibitions.

Munro died at his daughter's residence at Malvern, a suburb of Melbourne, on 25 Feb. 1908. He married, on 31 Dec. 1853, Jane, only daughter of Donald Macdonald of Edinburgh, and had four sons and three daughters.

C. A.

MURDOCH, WILLIAM LLOYD (1855-1911), Australian cricketer, born at Sandhurst, Victoria, Australia, on 18 Oct. 1855, fourteen days after his father's death, was son of Gilbert William Lloyd Murdoch, at one time an officer in the American army, by his wife Edith Susan Hogg.

Educated at Dr. Bromley's school in Ballarat, he removed in youth to New South Wales. Having been articled at Sydney to G. Davis, a solicitor, he practised at Cootamundra. Showing early aptitude for cricket, he was a member of the Albert cricket club at Sydney, and at the age of twenty he began to play for New South Wales, and from 1875 to 1884, in eleven inter-colonial matches, he had the fine average of 47 runs for 20 innings. The score by which his name is chiefly remembered was that of 321 (out of a total of 775) made for New South Wales v. Victoria at Sydney in Feb. 1882. He also scored 279 not out for the Fourth Australian team v. Rest of Australia at Melbourne in 1883. In the colonies he was known as the 'W. G. Grace of Australia,' and was the earliest of a long series of great Australian batsmen. Originally his fame was partly due, however, to his merits as a wicket-keeper. He claimed to be the first to dispense with the longstop, a course which Blackham, the best of all wicket-keepers, subsequently popularised in Australia and

England. But he soon gave up wicket-keeping to his colleague Blackham, and thenceforth generally fielded at point.

Murdoch first came to England as a member of the first Australian eleven (captained by D. W. Gregory) which visited England in 1878. He owed his selection to his capacity as a wicket-keeper. During this tour he learned much in the art of batting, and became one of the leading batsmen of the world. He captained the Australian teams which visited England in 1880, 1882, 1884, and 1890, heading the Australian batting averages on each of these tours. At Kennington Oval in Sept. 1880, in the match in which Australia met for the first time the full strength of England, Murdoch showed his calibre by carrying his bat in an uphill game through the second innings for 153 (Dr. W. G. Grace scored 152 for England in the first innings). The teams of 1882 and 1884 were the strongest ever sent to England, and as a batsman Murdoch was at that period surpassed only by Dr. Grace. His outstanding innings of 1882 was that of 286 not out *v.* Sussex at Brighton, a score which was until 1899 unbeaten by an Australian in England. In the match *v.* England at the Oval in Aug. 1884 he scored 211 out of a total of 551, still the highest score made by an Australian in England in a representative match. He also scored 132 *v.* Cambridge University in June of that year. After an absence from the game for six years he returned to England in 1890 as captain of a weak Australian team, which met with little success. He also visited America in 1878, and went with W. W. Read's team to South Africa in 1891-2.

Settling in England in 1891, he qualified for Sussex, and captained that county between 1893 and 1899. For Sussex his best scores during this period were 172 *v.* Hampshire at Southampton (1894), 144 *v.* Somersetshire at Brighton (1896), 130 *v.* Gloucestershire at Bristol (1897), and 121 not out *v.* Notts at Nottingham (1898); but with increasing years and weight his batting deteriorated. He subsequently played (1901-4) for the London County Cricket Club founded by Dr. W. G. Grace at the Crystal Palace, Sydenham, making many good scores against first-class counties. His last memorable score was 140 at the Oval in 1904, when he played as substitute for the Gentlemen *v.* Players. Of fine physique, Murdoch was an orthodox and consistent batsman, playing with a straight bat and a perfect defence; a master of the off drive and the cut, he was quick to jump

out to slow bowling and hit hard and clean. As a batsman he was excelled by Dr. W. G. Grace only on hard true pitches, and by few in defence on soft treacherous wickets. As a captain he was a master of tactics, full of pluck and resource, and showed great nerve in uphill games.

Murdoch, who visited Australia on business in 1910, died of apoplexy at Melbourne cricket ground on 18 Feb. 1911, while a spectator of the test match there between South Africa and Australia. His remains were embalmed and brought to England, and were interred at Kensal Green. He married in 1884, at Melbourne, Jemima, daughter of John Boyd Watson, a wealthy goldminer of Bendigo, and had issue two sons and three daughters.

Murdoch published in 1893 a little handbook on cricket. There is a small steel engraving portrait of Murdoch on the title-page of vol. 42 of 'Baily's Magazine' (1884).

[The Times, 20 Feb. 1911; Mennell's Dict. of Australasian Biog. 1892; W. G. Grace, Cricketing Reminiscences, 1899; Wisden's Cricketers' Almanack, 1912; private information.] W. B. O.

MURRAY, ALEXANDER STUART (1841-1904), keeper of Greek and Roman antiquities in the British Museum, born at Arbirlot, near Arbroath in Forfarshire, on 8 Jan. 1841, was eldest son in a family of four brothers and four sisters of George Murray, a tradesman, and of his wife Helen Margaret Sayles. His younger brother, George Robert Milne Murray [q. v. Suppl. II], was keeper of the department of botany at the British Museum (1895-1905), this being the only instance in the history of the British Museum of two brothers being keepers at the same time.

After being educated at the Royal High School, Edinburgh, Murray attended Edinburgh University during 1863-4, and graduated M.A. He also studied at Berlin University in 1865, where he worked at philological and archaeological subjects under Böckh, Hübner, and Zumpt, and had Henry Nettleship for a fellow student.

Murray was appointed assistant in the department of Greek and Roman antiquities at the British Museum on 14 Feb. 1867. (Sir) Charles Newton [q. v. Suppl. I] was then keeper. The Blacas and Castellani collections had just been purchased, and Wood's excavations were in progress at Ephesus. Between 1867 and 1886 Murray worked actively under Newton's direction, and acquired minute familiarity with the whole collection of Greek and Roman

antiquities. On 13 Feb. 1886 he succeeded Newton as keeper of the department of Greek and Roman antiquities. The recent removal of the natural history collections to the new buildings in Cromwell Road, Kensington, the completion of the new building known as the 'White Wing' at Bloomsbury, and other alterations, had greatly increased the available space for the exhibition of the collections. Hence a thorough reorganisation of the galleries devoted to Greek and Roman antiquities was rendered at once practicable, and this was for many years Murray's chief pre-occupation. The specimens were set out with greater consideration than before for general effect and space, and at the same time all the fittings and labels were improved. He was always helpful to visitors to his department, and patiently answered inquiries of correspondents from a distance. Although he carried through the press no departmental catalogue of his own, he was a careful reader and critic of all that was published by assistants in his department, and contributed introductions to several volumes by them. He wrote the letterpress to the 'Terracotta Sarcophagi, Greek and Etruscan, in the British Museum' (1898), and most of the Enkomi section of the 'Excavations in Cyprus' (Brit. Mus.).

For many years he made it a practice to visit the Continent, especially Greece, Italy, Sicily, or Spain, and so was familiar with the chief classical sites and foreign collections, and with foreign archaeologists. The only occasions on which he took part in work in the field were in 1870, when he visited the site of Priene with Newton, and in 1896, when he was temporarily in charge of the excavations at Enkomi (Salamis) in Cyprus.

He died of pneumonia, supervening on influenza, at his house in the museum precincts, on 5 March 1904, and was buried at Kensal Green.

He was twice married: (1) to Jenny Hancock (who died on 3 Nov. 1874, and is buried at Weybridge); (2) on 5 April 1881, to Anne Murray, youngest daughter of David Welsh, of Tillytoghills, Kincardineshire, who survived. There was no family by either marriage.

Murray was made LL.D. of Glasgow in 1891. He was a corresponding member of the Royal Prussian Academy and of the Académie des Inscriptions of the French Institute; a member of the German Archaeological Institute, a fellow of the Society of Antiquaries (1889), of the

British Academy (1903), and a vice-president of the Society for the Promotion of Hellenic Studies.

He was through life an adherent of the Scottish presbyterian church. Although somewhat quick-tempered, he was courteous and warm-hearted.

Murray wrote much on classical archaeology independently of his official work. His writings showed the width of his knowledge, and were full of curious observations on points of detail; but his power of broad elementary exposition was limited, and though he was always interesting and suggestive, it was by no means easy to follow the general drift of his thought. From 1879 onwards all his writings dealing with early Greece were coloured by his reluctance to accept the early date, which was gradually being established beyond controversy, for Mycenaean culture.

His chief independent works were: 1. 'A Manual of Mythology,' 1873. 2. 'A History of Greek Sculpture,' vol. i. 'From the Earliest Times down to the Age of Pheidias,' 1880; vol. ii. 'Under Pheidias and his Successors,' 1883; 2nd edit. of both volumes, 1890. 3. 'Handbook of Archaeology: Vases, Bronzes, Gems, Sculpture, Terracottas, Mural Paintings, Architecture, &c.,' 1892. 4. 'Greek Bronzes,' 1898. 5. 'The Sculptures of the Parthenon,' 1903.

Murray was also a frequent writer in the leading archaeological organs and in the ninth edition of the 'Encyclopædia Britannica,' as well as in the 'Contemporary' and 'Quarterly' reviews (cf. *Bursiane-Kroll*, p. 102).

[Proc. Brit. Acad. 1903-4, p. 321 (by Sir E. Maunde Thompson); *Bursiane-Kroll*, Biograph. Jahrb. für die Altertumswiss. 1907, p. 100 (A. H. Smith); personal knowledge and private information.] A. H. S.

MURRAY, CHARLES ADOLPHUS, seventh EARL OF DUNMORE (1841-1907), born in Grafton Street, London, on 24 March 1841, was only son of Alexander Edward Murray, sixth earl of Dunmore, by his wife Catherine, fourth daughter of George Augustus Herbert, eleventh earl of Pembroke [q. v.]. He succeeded his father as seventh earl on 15 July 1845.

Educated at Eton, he entered the Scots fusilier guards on 18 May 1860, and remained with the regiment till 1864. A conservative in politics, he was lord-in-waiting to Queen Victoria throughout Disraeli's second government from 1874 till 1880. He was also lord-lieutenant of

Stirlingshire from 1874 till 1885, and hon. colonel of the 1st volunteer battalion of the Cameron Highlanders from 1896 till 1907.

A man of powerful physique, Dunmore travelled in many parts of the world, including Africa and the Arctic regions; but his chief fame as an explorer rests on a year's journey made in 1892 in company with Major Roche of the third dragoon guards through Kashmir, Western Tibet, Chinese Tartary and Russian Central Asia. They started from Rawal Pindi on 9 April 1892, and remained together till 12 Dec., when they parted at Kashgar in Chinese Turkestan. Major Roche, having no passport for the Central Asian frontier, then returned to India, while Dunmore continued his route westward through Ferghana and Transcaspiia, reaching Samarcand towards the end of January 1893. He had ridden and walked 2500 miles, traversing forty-one mountain passes and sixty-nine rivers. On 3 July 1893 he read a paper on his experiences before the Royal Geographical Society (*Geog. Journ.* ii. 385), and in the same year published an account of his exploration in 'The Pamirs.' Though interesting and written in a simple and manly style, the book had small geographical value. Dunmore's scientific outfit was meagre. Indications for altitude were based on the readings of ordinary aneroids, and were not trustworthy. The ground had been covered by previous explorers and, according to experts, Dunmore lacked the necessary training for making fresh observations of value (*Geog. Journal*, iii. 115). Dunmore was also the author of 'Ormisdale,' a novel, published in 1893.

A few years before his death he, together with other members of his family, joined the Christian Scientists' Association. He attended the dedication of the mother church of the community at Boston, U.S.A., in June 1906. In 1907, at a Christian science meeting at Aldershot, he declared that his daughter had cured him of rupture by methods of Christian science. He died suddenly on 27 Aug. 1907 at Manor House, Frimley, near Camberley, and was buried at Dunmore, near Larbert, Stirlingshire. At an inquest, on 28 Aug. 1907, death was pronounced to be due to syncope caused by heart failure.

Lord Dunmore married on 5 April 1866 Lady Gertrude, third daughter of Thomas William Coke, second earl of Leicester, K.G. An only son, Alexander Edward, succeeded as eighth earl of Dunmore.

[The Times, 28 Aug. 1907; Who's Who; Burke's Peerage; *Geog. Journ.*, Oct. 1907.]
S. E. F.

MURRAY, DAVID CHRISTIE (1847-1907), novelist and journalist, born on 13 April 1847 in High Street, West Bromwich, was one of a family of six sons and five daughters of William Murray, printer and stationer of that town, by his wife Mary Withers. David attended private schools at West Bromwich and Spon Lane, Staffordshire, but at the age of twelve was set to work in his father's printing office. He early entered on a journalistic career by writing leaders for the 'Wednesbury Advertiser.' He was soon on the staff of the 'Birmingham Morning News' under George Dawson, reporting police court cases at twenty-five shillings a week, and rapidly winning the approval of his employer as an admirable descriptive writer. In Jan. 1865 Murray went to London without friends, funds, or prospects, and found casual employment at Messrs. Unwin Brothers' printing works. In May he enlisted as a private in the fourth royal Irish dragoon guards, and accompanied his regiment to Ireland, but after a year a great-aunt purchased his discharge. Thenceforth journalism or foreign correspondence was his profession, varied by novel-writing. When in London, he passed his time in Bohemian society. In 1871 he became parliamentary reporter for the 'Daily News.' In 1892 he was editor of the 'Morning,' a short-lived conservative daily London paper. A few years later he contributed to the 'Referee' ethical, literary and political articles, which were collected as 'Guesses at Truth' (1908).

Murray travelled much, and was constantly absent from London for long periods. He represented 'The Times' and the 'Scotsman' in the Russo-Turkish war of 1877-8. On his return he described in a series of articles for 'Mayfair' a tour through England in the disguise of a tramp. From 1881 to 1886 he lived mainly in Belgium and France, and from 1889 to 1891 Nice was his headquarters. Subsequently he resided for a time in North Wales. He made some success as a popular lecturer, touring through Australia and New Zealand in that capacity in 1889-91, and through the United States and Canada in 1894-5. He described Australia in articles in the 'Contemporary Review' (1891). In 'The Cockney Columbus' (1898) he collected letters on America from the 'New York Herald.' From 1898 onwards he devoted much energy to the

support by writing and lecturing of Emile Zola's plea in behalf of Captain Dreyfus, a French officer, who had been wrongfully condemned for espionage.

Meanwhile Murray used his literary power to best effect in fiction. In 1879 he contributed his first novel, 'A Life's Atonement,' periodically to 'Chambers's Journal.' From that date until his death scarcely a year passed without the publication of one and at times two novels. Between 1887 and 1907 he occasionally collaborated with Henry Herman [q. v. Suppl. I] or Mr. Alfred Egmont Hake. Murray's novels 'Joseph's Coat' (1881) and 'Val Strange' (1882) achieved a notable success. 'By the Gate of the Sea' (1883) and 'Rainbow Gold' (1885), which first appeared in serial form in the 'Cornhill Magazine' under the editorship of James Payn [q. v. Suppl. I], fully maintained Murray's repute. 'Aunt Rachel' (1886) was equally attractive. Murray's fiction abounded in vigour. His plots are loosely constructed and he drew his incidents freely from his journalistic experiences. His style shows the hand of the journalist, but he is effective in describing the neighbourhood and inhabitants of Cannock Chase.

Murray died on 1 Aug. 1907 in London after a long illness, during which he endured much privation. He was buried at Hampstead. A memorial tablet in copper with pewter medallion was unveiled at West Bromwich public library in December 1908. He was twice married. By his first wife, Sophie Harris of Rowley Regis, whom he married in 1871, he had a daughter, who died young; by his second wife, Alice, whom he married about 1879, he had one son, Archibald. Two sons and two daughters were born out of wedlock.

Besides his novels, Murray was author of several rambling volumes of autobiography. Such were: 'A Novelist's Notebook' (1887); 'The Making of a Novelist, an Experiment in Autobiography' (1894); and 'Recollections' (1908).

[Who's Who, 1907; The Times, 2 Aug. 1907; Allibone, Suppl. II., 1891; Henry Murray, A Stepson of Fortune, 1909, p. 445 (autobiographic recollections by D. C. Murray's brother); Murray's Recollections, 1908 (with photogravure portrait), and other autobiographic works, which are deficient in dates; private information.] E. L.

MURRAY, GEORGE ROBERT MILNE (1858-1911), botanist, younger brother of Alexander Stuart Murray [q. v.

Suppl. II], was born at Arbroath, Forfarshire, on 11 Nov. 1858. He was educated at Arbroath High School, and in 1875 studied under Anton de Bary at Strasburg. In 1876 he became an assistant in the botanical department of the British Museum, having charge of the cryptogamic collections, and in 1895, on the retirement of Dr. William Carruthers, he became keeper of the department, a post which he was compelled by ill-health to resign in 1905. He was lecturer on botany at St. George's Hospital medical school from 1882 to 1886, and to the Royal Veterinary College from 1890 to 1895. In 1886 Murray acted as naturalist to the solar eclipse expedition to the West Indies; and again visited the same area on a dredging expedition in 1897; in 1898 he chartered a tug for a dredging expedition in the Atlantic, 300 miles west of Ireland, on which he was accompanied by a party of naturalists; and in 1901 he became director of the civilian scientific staff of the national Antarctic expedition in H.M.S. Discovery, under Captain R. F. Scott. He was, however, only able to accompany the expedition as far as Cape Town. For some years he devoted much of his vacation to the collection of diatoms and algæ in the Scottish lochs from the fishery board's yacht Garland. Murray was elected a fellow of the Linnean Society in 1878, apparently in contravention of the bye-laws, as he was then under age. He became a vice-president in 1899, and was elected a fellow of the Royal Society in 1897. He died at Stonehaven on 16 Dec. 1911.

He married in 1884 Helen, daughter of William Welsh of Walker's Barns and Boggieshallow, Brechin, and left one son and one daughter. His wife died in 1902.

Murray's contributions to botany refer mainly to marine algæ, but he wrote the section on fungi in Henfrey's 'Elementary Course of Botany' (3rd edit. 1878); he contributed the articles on Fungi and Vegetable Parasitism to the ninth edition of the 'Encyclopædia Britannica' (1879 and 1885); and between 1882 and 1886 he published three reports upon his investigations of the salmon disease, undertaken at the instance of Professor Huxley. In 1889 he published a 'Handbook of Cryptogamic Botany,' together with Alfred William Bennett [q. v. Suppl. II]; from 1892 to 1895 he edited 'Phycological Memoirs, being Researches made in the Botanical Department of the British Museum,' of which three parts appeared, each containing papers by him; and in 1895 he published

an 'Introduction to the Study of Seaweeds.' He also edited 'The Antarctic Manual' for the expedition of 1901, arranging the contents and securing contributors, but only writing some four pages of instructions on plant-collecting.

[The Times, 19 and 21 Dec. 1911; Gardeners' Chronicle, i. (1911) 466; Journal of Botany (1912), 73 (with photographic portrait).]

G. S. B.

MUSGRAVE, SIR JAMES, first baronet (1826-1904), benefactor of Belfast, born at Lisburn, co. Antrim, on 30 Dec. 1826, was seventh of nine sons (and one of the twelve children) of Dr. Samuel Musgrave (1770-1836), a leading physician of Lisburn, by his wife Mary (*d.* 1862), daughter of William Riddel, Comber, co. Down. The Ulster branch of the Musgraves came thither from Cumberland in the seventeenth century. Musgrave's father, who sympathised with the United Irishmen, was arrested on 16 Sept. 1796 on a charge of high treason and imprisoned in 'The New Gaol,' Dublin (*Belfast News-Letter*, 19 Sept. 1796). Released in 1798, he resumed professional work in Lisburn; but in 1803 he was again arrested and imprisoned for a time on a similar charge.

After attending local schools and receiving private tuition, James began early a business career in Belfast, and ultimately, with two of his brothers, John Riddel and Robert, he established the important firm of Musgrave Brothers, iron founders and engineers. Soon, taking part in the public life of Belfast, he was in 1876 elected at the head of the poll one of the Belfast harbour commissioners, and was thenceforth regularly re-elected. From 1887 to 1903 he was chairman, in succession to Sir Edward J. Harland, M.P.; under his direction the harbour was greatly improved, and new docks, quays, and deep water channels constructed for the increasing trade, one of these being named the 'Musgrave Channel' in his honour. He resigned the chairmanship in 1903. In 1877 he was elected president of the Belfast chamber of commerce. He was the moving spirit in the establishment of the Belfast technical school, helped greatly in the erection of the Royal Victoria Hospital in Belfast, in commemoration of the jubilee of Queen Victoria, and founded in 1901 the Musgrave chair of pathology in Queen's College, Belfast. Musgrave worked hard as a member of the 'Recess Committee' which was formed in 1895 by Sir Horace Plunkett to devise means for the amelioration of the agricultural and economic condition of

Ireland, and whose proposals were embodied in 1899 in an act of parliament. In 1866 he and his brother John had purchased an estate of some 60,000 acres in co. Donegal. During part of every year he resided on the estate at Carrick Lodge, Glencolumbkille, taking a deep interest in the welfare of the tenantry. He was appointed J.P. and D.L. of co. Donegal, and served as high sheriff 1885-6. He was chairman of the Donegal railway company, in the establishment of which he had a large share. In 1897 he was created a baronet of the United Kingdom. Musgrave died unmarried at Drumglass House, his Belfast residence, on 22 Feb. 1904, and was buried in the cathedral churchyard, Lisburn. A stained-glass window to his memory, and to that of other members of the family, is in the First Lisburn presbyterian church, to which his ancestors belonged. A marble bust by A. M^F. Shannan, A.R.S.A., and an oil painting by Walter Frederic Osborne [q. v. Suppl. II], were placed in the Belfast Harbour Office in memory of his services.

[Personal knowledge; information kindly supplied by Mr. Henry Musgrave, D.L.; *Belfast News-Letter*, 23 Feb. 1904.] T. H.

MUYBRIDGE, EADWEARD (1830-1904), investigator of animal locomotion, born at Kingston-on-Thames on 9 April 1830, was the son of John Muggeridge, corn-chandler, of Kingston, by his wife Susannah. His original names of Edward James Muggeridge he soon converted into Eadweard Muybridge. Migrating to America in early life, he at first adopted a commercial career, and then, turning his attention to photography, he became director of the photographic surveys of the United States government. In 1872, whilst engaged in his official duties on the Pacific coast, he was consulted as to an old controversy in regard to animal locomotion, viz. whether a trotting horse at any portion of its stride has all its feet entirely off the ground. On the race-course at Sacramento, California, in May 1872, he made several negatives of Occident, a celebrated horse, while trotting laterally in front of his camera at speeds varying from 2 mins. 25 secs. to 2 mins. 18 secs. per mile. These experiments showed that the horse's four feet were at times all off the ground. He continued his experiments with a view to determining the actual visual appearance of various kinds of animal locomotion and their proper representation.

The photographs for his earliest experiments were made with a single camera, and required a separate trotting for each exposure. His next experiments were made in 1877 on the stud-farm of Mr. Leland Stanford at Palo Alto, San Francisco, where he employed a number of cameras placed in a line, thus obtaining a succession of exposures at regulated intervals of time or distance. The cameras were arranged to obtain photographs of the subject from three different points of view; each movement was taken by a different camera on extremely rapid wet plates, the exposure at times being only one six-thousandth part of a second. The shutters of the cameras were operated by means of thin thread stretched across the path of the animal the record of whose movements was to be taken. Some of the results of these early experiments illustrating the action of horses whilst walking, trotting, or galloping were published in 1878 under the title of 'The Horse in Motion.' In his analysis of the quadrupedal walk, Muybridge arrived at the conclusion that the successive foot-fallings are invariable and are probably common to all quadrupeds. His investigations led to much modification of the treatment of animal movements in the works of painters and sculptors.

In order to project the pictures upon a screen so that they would appear to move, Muybridge invented, in 1881, a machine which he called the 'zoopraxiscope,' and which he claimed to be the first instrument devised for demonstrating, by synthetical reconstruction, movements originally photographed from life. The 'zoetrope,' or 'wheel of life,' which was invented about 1833 and had long been in popular use as a toy, had no like scientific pretension. Muybridge's 'zoopraxiscope' was widely employed. By its means horse-races were reproduced on a screen with such fidelity as to show the individual characteristics of the motion of each animal, flocks of birds flew with every movement of their wings clearly perceptible, two gladiators contended for victory, athletes turned somersaults, and the like. At the electrical congress in Paris in September 1881 Muybridge lectured before the assembled men of science with his newly animated illustrations for the first time in Europe at the laboratory of Dr. E. J. Marey (who was independently experimenting on Muybridge's lines). He also lectured in London, before the Royal Institution, in March 1882 and in March 1889 and

at a conversazione given by the Royal Society.

A wider investigation of animal movements was undertaken by Muybridge in 1884-5 under the auspices and at the charge of the university of Pennsylvania. More than 100,000 photographic plates were obtained and embodied in a work published at Philadelphia in 1887 as 'Animal Locomotion, an Electro-photographic Investigation of Consecutive Phases of Animal Movement, 1872-1885.' The work contains over 2000 figures of moving men, women, children, beasts, and birds, in 781 photo-engravings, bound in eleven folio volumes. The great cost of preparing and printing this work restricted its sale to a very few complete sets, and a selection of the most important plates on a reduced scale was published in London in 1899 as 'Animals in Motion.'

Muybridge's efforts led the way to the invention of the cinematograph, which was the immediate result of Dr. Marey's invention of the celluloid roll film in 1890.

When in England Muybridge resided at his birthplace, Kingston-on-Thames. He was there in 1895, but returned more than once to the United States before finally settling at Kingston in 1900. There he lived at 2 Liverpool Road with Mr. George Lawrence, whom he appointed his executor. In the grounds there he dug out a miniature reproduction to scale of the Great Lakes of America.

Muybridge died on 8 May 1904, and his remains were cremated at Woking. He bequeathed to the Kingston public library 3000*l.*, in reversion after the death of a lady relative, the income to be applied to the purchase of works of reference, together with his lantern slides, zoopraxiscope, and a selection from the plates of his 'Animal Locomotion.'

Besides the works above mentioned, Muybridge published: 1. 'Descriptive Zoopraxography, or the Science of Animal Locomotion made Popular,' 1893 (abridged edition same year). 2. 'The Human Figure in Motion' (abridged from 'Animal Locomotion'), 1901. 3. 'The Science of Animal Locomotion (Zoopraxography),' n.d.

PREFATORY NOTE

In the present volume which is designed to furnish biographies of noteworthy persons dying between 22 Jan. 1901 and 31 Dec. 1911, the memoirs reach a total of 557. The contributors number 177. The callings of those whose careers are recorded may be broadly catalogued under ten general headings thus :

	NAMES
Administration of Government at home, in India, and the colonies	68
Army and navy	39
Art (including architecture, music, and the stage)	75
Commerce and agriculture	17
Law	26
Literature (including journalism, philology, and philosophy)	132
Religion	51
Science (including engineering, medicine, surgery, exploration, and economics)	115
Social Reform (including philanthropy and education)	24
Sport	10

The names of twenty-eight women appear in this volume on account of services rendered in art, literature, science, and social or educational reform.

Articles bear the initials of their writers save in a very few cases where material has been furnished to the Editor on an ampler scale than the purpose of the undertaking permitted him to use. In such instances the Editor and his staff are solely responsible for the shape which the article has taken, and no signature is appended.

* * In the lists of authors' publications only the date of issue is appended to the titles of works which were published in London in 8vo. In other cases the place of issue and size are specified in addition.

Cross references are given thus : to names in the substantive work [q.v.]; to names in the First Supplement¹ [q.v. Suppl. I]; and to names in the present Supplement² [q.v. Suppl. II].

¹ i.e. Vol. XXII (of the thin paper edition).

² i.e. 1901-1911.

Neil

I

Neil

NEIL, ROBERT ALEXANDER (1852-1901), classical and Oriental scholar, the second son of Robert Neil, minister of the *quoad sacra* parish of Glengairn near Ballater, Aberdeenshire, by his wife Mary Reid, was born at Glengairn Manse on 26 Dec. 1852. Both parents were sprung from Aberdeenshire families which had produced many clergymen and medical men. Robert, who was always interested in books, was educated under Mr. Coutts, the master of the local school, but was taught classics by his father. In 1866, while still under fourteen, he entered Aberdeen University, having obtained a small scholarship at the annual bursary competition. At the end of the session he was first prizeman in the class of Prof. (Sir) William Geddes [q. v. Suppl. I]. In 1870 he graduated at Aberdeen with first-class honours in classics, the Greek prize being divided between him and Mr. A. Shewan, now well known as an Homeric scholar. The following winter Neil acted as an assistant in the university library and next year studied anatomy and chemistry with the intention of graduating in the medical faculty. He soon changed his mind and was elected a classical scholar of Peterhouse, Cambridge. Meantime he had been reading omnivorously; but his early training, in which classical composition had played but a small part, handicapped him for the Cambridge course. Under the tuition, however, of Dr. J. S. Reid, of Dr. Verrall for a short time, and later of Richard Shilleto [q. v.], he made such rapid progress that in 1875 against strong competition he won

the Craven scholarship and in 1876 graduated as second classic. Soon after he was elected a fellow of Pembroke College, where till his death twenty-five years later he was a classical lecturer, though his public lectures were given for many years at his old college, Peterhouse. Soon after taking his degree he published 'Notes on Liddell and Scott' in the 'Journal of Philology' (viii. 200 seq.); but his teaching work left him little leisure for writing, which his caution and fastidious taste made a somewhat laborious task, while his wide range of literary interests rendered reading more congenial. Almost immediately after his degree Neil began to read Sanskrit with Prof. Edward Byles Cowell [q. v. Suppl. II]. For the rest of his life Neil spent one or two afternoons a week in term time working with Cowell. In the earlier years they read parts of the 'Rig Veda,' of Indian drama, grammar, and philosophy, but gradually turned their attention more and more to Buddhist literature. In 1886, under their joint names, appeared an edition of the 'Divyāvadāna,' a Buddhist work in Sanskrit. The edition was founded on the collation of a number of MSS. which were supplied to the editors from various libraries, including those of Paris and St. Petersburg. After the publication of this work Neil, though still reading the 'Veda' with Cowell, took up seriously the study of Pāli, and formed one of the little band of scholars who under Cowell's superintendence translated the 'Jātaka,' or Birth Stories, into English (6 volumes, Cambridge University Press,

1895-1907). Neil's own contribution forms part of vol. iii. During these years Neil was also busy with much classical work. For many years he had in the press an edition of Aristophanes' 'Knights', which but for the introduction was completed at his death and was issued soon afterwards by the Cambridge University Press. Here in brief space is concentrated a great amount of sound scholarship and delicate observation of Aristophanic Greek. The history of Greek comedy, Pindar, and Plato were subjects on which Neil frequently lectured and on which he accumulated great stores of knowledge. He was also thoroughly familiar with all work done in the comparative philology of the classical languages, Sanskrit, and Celtic. His emendation of a corrupt word, ἀραγεύοντα, in Bacchylides into ἀραγεύοντα was at once accepted by Prof. (Sir) Richard Jebb [q. v. Suppl. II]. Besides his professional work as a classical lecturer and as university lecturer on Sanskrit—a post to which he was appointed in 1884—Neil took much interest in architecture both ancient and mediæval, and had a wide and intimate knowledge of the cathedrals of the western countries of Europe. He was interested in women's education, and before his college work became very heavy lectured at both Girton and Newnham. But his greatest influence was manifested in work with individual students, where his kindliness, care, and quiet humour attracted even the less scholarly. He was popular in Cambridge society, and amid his multifarious duties could always spare time to solve difficulties for his friends. He was for long a syndic of the University Press, where he helped many young scholars with advice and oversight of their work as it passed through the press. He served for four years upon the council of the senate, but the work was not congenial to him, and he refused to be nominated a second time.

In 1891 Aberdeen University conferred upon him the honorary degree of LL.D. Neil took a keen interest in Scottish history and literature, and was for long a member of the Franco-Scottish Society. In 1900, on the death of Mr. C. H. Prior, he took with some hesitation the work of senior tutor of Pembroke. He died after a brief illness on 19 June 1901, and was buried in the churchyard at Bridge of Gairn, not far from his birthplace. He was unmarried. In appearance Neil was a little over the average height and strongly built, with brown hair and large expressive eyes.

There are several good photographs of him.

[Obituary notices by personal friends in Cambridge Review (Dr. Adam, October 1901); British Weekly, 27 June 1901 (Sir W. Robertson Nicoll, a class mate at Aberdeen); Alma Mater, the Aberdeen University Mag., 20 Nov. 1901 (Dr. J. F. White); information from the family, and personal knowledge for nineteen years.] P. G.

NEIL, SAMUEL (1825-1901), author, born at Edinburgh on 4 August 1825, was second of three sons of James Neil, an Edinburgh bookseller, by his wife Sarah Lindsay, a connection of the Lindsays, earls of Crawford. On the death of the father from cholera in 1832, the family went to live at Glasgow. After education at the old grammar school at Glasgow, Neil entered the university; while an undergraduate he assisted the English master in the high school and worked for the 'Glasgow Argus' (of which Charles Mackay [q. v.] the poet was editor) and other newspapers. For a time he was a private tutor and then master successively of Falkirk charity school in 1850, of Southern Collegiate School, Glasgow, in 1852, and of St. Andrew's school, Glasgow, in 1853. Finally he was rector of Moffat Academy from 1855 to 1873.

With his school work Neil combined much literary activity. He promoted in 1857, and edited during its existence, the 'Moffat Register and Annandale Observer,' the first newspaper published in Moffat, and wrote regularly for other Scottish periodicals and educational journals.

In 1850 Neil planned, and from that date until 1873 edited, the 'British Controversialist' (40 vols. in all), a monthly magazine published in London for the discussion of literary, social, and philosophic questions. He himself contributed numerous philosophical articles, many of which he subsequently collected in separate volumes. Of these his 'Art of Reasoning' (1853) was praised for its clarity and conciseness by John Stuart Mill, George Henry Lewes, Archbishop Whately, and Alexander Bain. Other of his contributions to the 'British Controversialist' were published independently, under the titles of 'Elements of Rhetoric' (1856), 'Composition and Elocution' (1857; 2nd edit. 1857, 12mo), 'Public Meetings and how to conduct them' (1867, 12mo).

On resigning his rectorship of Moffat Academy in 1873 Neil settled in Edinburgh, devoting himself to English literature, and especially to Shakespeare. He founded

and was president of the Edinburgh Shakespeare Society, and gave the annual lecture from 1874 till his death. To the 'British Controversialist' in 1860 he had contributed a series of papers which he reissued in 1861 as 'Shakespeare: a Critical Biography.' The work enjoyed a vogue as a useful epitome of the facts, although Neil accepted without demur the forgeries of John Payne Collier. It was translated into French and German. Neil, who was a frequent visitor to Warwickshire, issued a guide to Shakespeare's birthplace at Stratford-on-Avon as 'Home of Shakspeare described' (Warwick, 1871, 12mo), and he edited the 'Library Shakespeare' (3 vols.) in 1875, besides several separate plays for school use.

Neil took a leading part in educational and philanthropic affairs in Edinburgh, where he was on intimate terms with Professors John Stuart Blackie, Henry Calderwood, John Veitch, and David Masson. He helped to found the Educational Institute of Scotland for granting fellowships to teachers. For the Craigmillar School for the Blind there, which he managed for some years, he compiled a book of poems on the blind and by the blind, entitled 'Dark Days brightened.'

In 1900 his health failed. He died on 28 Aug. 1901, while on a visit at Sullom Manse, Shetland, and was buried in Sullom churchyard. He married on 7 April 1848 Christina, youngest daughter of Archibald Gibson, who served in the navy and was with Nelson on the Victory at the battle of Trafalgar. She predeceased him on 26 Jan. 1901. He had issue three sons and five daughters, of whom one son and three daughters, all married, survive.

A painted portrait by George Barclay is in possession of his daughter at 53 Craiglea Drive, Edinburgh. His head was done in white alabaster by a sculptor of Glasgow in 1853.

Other of Neil's works include: 1. 'Cyclopædia of Universal History,' 1855; 2nd edit. 1857 (with I. McBurney). 2. 'Synopsis of British History,' 1856, 12mo. 3. 'Student's Handbook of Modern History,' 1857. 4. 'The Young Debater,' 1863. 5. 'Culture and Self-culture,' 1863. 6. 'Martin Luther,' 1863, 12mo. 7. 'Epoch Men and the Results of their Lives,' 1865, 12mo. 8. 'The Art of Public Speaking,' 1867, 12mo. 9. 'The Debater's Handbook and Controversialist Manual,' 1874, 12mo; new edit. 1880. Neil edited and compiled the larger part of 'The Home Teacher,

a Cyclopædia of Self-instruction' (1886, 6 vols. 4to).

[James Love's *Schools and Schoolmasters* of Falkirk, 1898, pp. 232-8; Ardrossan and Saltcoats Herald, 20 Sept. 1901 (memoir by Neil's son-in-law, Rev. Charles Davidson); Moffat Express, 5 Sept. 1901; Educational News, 7 Sept. 1901; private information; notes from Mr. James Downie.] W. B. O.

NELSON, ELIZA (1827-1908), actress.
[See under CRAVEN, HENRY THORNTON.]

NELSON, SIR HUGH MUIR (1835-1906), premier of Queensland, born at Kilmarnock on 31 Dec. 1835, was son of the Rev. William Lambie Nelson, LL.D. Educated first at Edinburgh High School, and then at the university, where he came under the influence of Prof. John Wilson (Christopher North), he did not graduate, his father having decided in 1853 to go to Queensland, which was then attracting a number of enterprising Scotsmen.

The father settled in the colony at Ipswich, and Nelson entered a merchant's office; but, of fine physique, he soon sought open-air work on a farm at Nelson's Ridges, some six miles from Ipswich; thence he went to manage the Eton Vale station at Darling Downs. When he married in 1870, he settled with good results on the London estate in the Dalby district.

In 1880 Nelson entered the local public life as a member of the Wambo district under a new scheme of divisional boards. In 1883, while absent on a visit to Scotland, he was elected member of the house of assembly for Northern Downs. When in 1887 this electoral district was split up, he became member for the portion known as Murilla, which he represented continuously for the rest of his public life.

On 13 March 1888 Nelson for the first time took office, as minister for railways, under Sir Thomas McIlwraith [q. v. Suppl. I], continuing when the ministry was reconstituted under Boyd Dunlop Morehead till 7 August 1890. Throughout 1891, he was leader of the opposition. Although he seems to have been a supporter of Sir Samuel Griffith, it was not till Griffith's resignation on 27 March 1893 that he took office, joining McIlwraith as colonial treasurer. On 27 October 1893 he became premier and vice-president of the executive council, combining in his own hands the offices of chief secretary and treasurer. The colony was in the throes of the anxiety and depression which followed the bank crisis of

1893; in no part of Australia was that crisis worse than in Queensland. Thus the task before the new premier was no light one; but his broad grasp of finance, coupled with extensive knowledge of the circumstances and requirements of the people, enabled him to render excellent service to Queensland during a most critical period of its history (*Queensland Hansard*, 1906, vol. xvi. pp. 1-16).

In 1896 Nelson was created K.C.M.G., and in 1897 came to England to represent his colony at the Diamond Jubilee of Queen Victoria. On this occasion he was made a privy councillor and received the honorary degree of D.C.L. at Oxford. After his return he continued his dual office till 13 April 1898, when he sought a less arduous position as president of the legislative council. On 4 Jan. 1904 he received a dormant commission as lieutenant-governor of Queensland.

In 1905 he visited New Guinea, in which he was much interested: there he contracted fever, from which he never really recovered (see *Queensland Parly. Deb.*, 1906, xvi. 15), and he died at his residence, Gabbinar, near Toowoomba, on 1 Jan. 1906. His death was the signal for general mourning, and he was accorded a public funeral. He was buried at Toowoomba cemetery.

Nelson was a strong man, and the greatest authority on constitutional questions that the colony had had up to that time, although he was opposed to the federation of the Australian states (*Daily Record, Rockhampton*, 1 Jan. 1906). He founded the Royal Agricultural Society of Toowoomba and the Austral Association. He was president of the Royal Geographical Society of Queensland.

Nelson married in 1870 Janet, daughter of Duncan McIntyre, who survived him. They had issue two sons and three daughters.

[Brisbane Courier, 2 Jan. 1906; Mennell's Dict. of Australas. Biog.; John's Notable Australians; Who's Who, 1905.] C. A. H.

NERUDA, WILMA. [See HALLÉ, LADY (1839-1911), violinist.]

NETTLESHIP, JOHN TRIVETT (1841-1902), animal painter and author, born at Kettering, Northamptonshire, on 11 Feb. 1841, was second son of Henry John Nettleship, solicitor there, and brother of Henry [q. v.], of Richard Lewis [q. v.], and of Edward, the ophthalmic surgeon. His mother was Isabella Ann, daughter of James Hogg, vicar of Geddington and master of Kettering grammar school. Music was

hereditary in the family, and Nettleship was for some time a chorister at New College, Oxford. Afterwards he was sent to the cathedral school at Durham, where his brother Henry had preceded him. Having won the English verse prize on 'Venice' in 1856, he was taken away comparatively young, in order to enter his father's office. There he remained for two or three years, finishing his articles in London. Though admitted a solicitor and in practice for a brief period, he now resolved to devote himself to art, in which he had shown proficiency from childhood. Accordingly he entered himself as a student at Heatherley's and at the Slade School in London, but to the last he was largely independent and self-taught. His first work was in black and white, not for publication, but to satisfy his natural temperament, which always led him to the imaginative and the grandiose. It is to be regretted that none of the designs conceived during this early period was ever properly finished. They include biblical scenes, such as 'Jacob wrestling with the Angel' and 'A Sower went forth to sow,' which have been deservedly compared with the work of William Blake. Nothing was published under his own name, except a poor reproduction of a 'Head of Minos,' in the 'Yellow Book' (April 1904). But the illustrations to 'An Epic of Women' (1870), by his friend, Arthur William Edgar O'Shaughnessy [q. v.], are his; and his handiwork may likewise be traced in a little volume of 'Emblems' by Mrs. A. Cholmondeley (1875), where his name erroneously appears on the title-page as 'J. J. Nettleship.'

These designs reveal one aspect of his character, a delight in the manifestations of physical vigour. He was himself in his youth a model of virility. As a boy he was a bold rider in the hunting field. When he came to London he took lessons in boxing from a famous prize-fighter, and more than once walked to Brighton in a day. He accompanied a friend, (Sir) Henry Cotton, on a mountaineering expedition to the Alps, for which they trained together bare-footed in the early morning round Regent's Park. It was this delight in physical prowess and in wild life that now induced him to become a painter of animals. His studies were made almost daily in the Zoological Gardens; and for twenty-seven years (1874-1901) he exhibited spacious oil pictures of lions, tigers, etc., at the Royal Academy and for most of the period at the Grosvenor Gallery. Though always noble

in conception and often effective in grouping and in colour, these pictures failed somewhat in technique and were not simple enough for the popular taste. At one time more than a dozen of them were exhibited together in the Corn Exchange at Gloucester; but a scheme for purchasing the collection fell through, and they are now dispersed. In 1880 Nettleship was invited to India by the Gaekwar of Baroda, for whom he painted a cheetah hunt as well as an equestrian portrait, and was thus enabled to see something of wild animals in their native haunts. In his later years he took to the medium of pastel, and, painting his old subjects on a smaller scale, acquired a wider measure of popularity.

Nettleship was far more than a painter. His intellectual sympathies were unusually wide. In 1868, when only twenty-seven, he published a volume of 'Essays on Robert Browning's Poetry,' which was probably the first serious study of the poet, and has passed through three editions with considerable enlargements, of which the latest is entitled 'Robert Browning: Essays and Thoughts' (1895). The book brought about an intimate friendship between the poet and his critic. Another book that shows both his mature power of literary expression and his opinions about his own art is 'George Morland and the Evolution from him of some Later Painters' (1898). Here there are touches of self-portraiture. Among the books illustrated by him may be mentioned 'Natural History Sketches among the Carnivora,' by A. Nicols (1885), and 'Icebound on Kolguev,' by A. B. R. Trevor Battye (1895).

After a long and painful illness, Nettleship died in London on 31 Aug. 1902, and was buried at Kensal Green cemetery. He married in 1876 Ada, daughter of James Hinton [q. v.], the aural surgeon; she survived him with three daughters, the eldest of whom was married to Augustus E. John, and died in Paris in 1909.

A memorial tablet in bronze, designed by Sir George Frampton, with the aid of two brother artists, who were born in the same town, Sir Alfred East and Thomas Cooper Gotch, has been placed in the parish church at Kettering.

[Personal knowledge; Sir Henry Cotton, Indian and Home Memories, 1911; Graves's Royal Academy Contributors.] J. S. C.

NEUBAUER, ADOLF (1832-1907), orientalist, was born at Kottesó, in the county of Trentsen, in the north of Hun-

gary, on 7 March 1832. His father, Jacob Neubauer, a Jewish merchant, who was a good Talmudic scholar, belonged to a family which had received the right of residence in the same neighbourhood in 1610; his mother was Amalie Langfelder.

Designed by his father for the rabbinate, Neubauer received his first education from his cousin, Moses Neubauer, also a good Talmudist. About 1850 he became a teacher in the Jewish School at Kottesó. Soon afterwards he went to Prague, where he attended the lectures of the critical rabbinical scholar, S. J. L. Rapoport, learnt French, Italian, and Arabic, studied mathematics, and finally (15 Dec. 1853) matriculated in the university. Between 1854 and 1856 he studied oriental languages at the University of Munich. In 1857 he went to Paris, where he resided till 1868, except for visits to libraries to examine manuscripts, and a somewhat long sojourn in Jerusalem, where he held a post at the Austrian consulate. At Paris he was attracted by the rich MS. treasures of the imperial library, and made the acquaintance of Salomon Munk, who was engaged in the study of the Judeo-Arabic literature of the middle ages, of Joseph Derenbourg, of Ernest Renan, and other orientalist. The influence of his Paris surroundings led Neubauer to adopt as his life's work the study, description, and, where circumstances permitted, the publication, of mediæval Jewish manuscripts. Thus in 1861-2 he published in the 'Journal Asiatique' (vols. 18-20) numerous extracts and translations from a lexical work of David ben Abraham of Fez (10th century), the MS. of which he had discovered in a Karaite synagogue in Jerusalem; and in 1866, after a visit to St. Petersburg, he published a volume 'Aus der Petersburger Bibliothek,' consisting of excerpts from MSS. preserved there, relating to the history and literature of the Karaites. He did not altogether lay aside other studies, and in 1863 won the prize offered by the Académie des Inscriptions et Belles-Lettres for a critical exposition of the geography of Palestine, as set forth in the two Talmuds and other post-Biblical Jewish writings. His work 'La Géographie du Talmud: Mémoire couronné par l'Académie' appeared in 1868. Though not free from errors, it displayed a remarkable thoroughness and mastery of facts; and at once placed its author in the first rank of Rabbinical scholars.

Already in 1866 Neubauer had visited Oxford, for the purpose of examining the large collection of Hebrew MSS. in the

Bodleian Library. The printed Hebrew books in the library had been catalogued shortly before (1852-60) by Moritz Steinschneider; and in 1868 the curators entrusted to Neubauer the task of cataloguing the Hebrew MSS. in the library. Oxford became henceforth Neubauer's home till 1901. The work of cataloguing and properly describing the MSS. was long and arduous. In the end the catalogue appeared in 1886—a large quarto volume of 1168 columns, containing descriptions of 2602 MSS. (many consisting of from 20 to 50 distinct works), and accompanied by an atlas of forty facsimile plates, illustrating the Hebrew palaeography of different countries and periods. In spite of his engrossing labours on the catalogue, Neubauer found time for much important literary work besides. In 1873 he was appointed sub-librarian of the Bodleian Library. His knowledge, not merely of Hebrew, but of foreign literature generally, was extensive; and while he was sub-librarian both the foreign and the Oriental departments of the library were maintained with great efficiency. The first to recognise, in 1890, the value for Jewish literature of the 'Genizah,' or depositary attached to a synagogue, in which MSS. no longer in use were put away, he obtained for the library, in course of time, from the 'Genizah' at Old Cairo, as many as 2675 items, consisting frequently of several leaves, and including many of considerable interest and value. The catalogue of these fragments, with very detailed descriptions, was begun by Neubauer (vol. i. 1886); but it was completed and published by (Dr.) A. E. Cowley, his successor in the library, in 1906.

Neubauer also, during 1875, edited from a Bodleian and a Rouen MS. the Arabic text of the Hebrew dictionary (the 'Book of Hebrew Roots') of Abu-'l-Walid (11th century), a work of extreme importance in the history of Hebrew lexicography, which was known before only from excerpts and quotations. In 1876 he published, at the instance of Dr. Pusey, an interesting catena of more than fifty Jewish expositions of Isaiah liii., which was followed in 1877 by a volume of translations, the joint work of himself and the present writer. In the same year (1877) there appeared, in vol. xxvii. of 'L'Histoire littéraire de la France,' a long section (pp. 431-753) entitled 'Les Rabbins Français du commencement du XIV^e siècle,' which, though its literary form was due to Renan, was based throughout

upon materials collected by Neubauer. A continuation of this work, called 'Les Ecrivains Juifs français du XIV^e siècle' (vol. 31 of 'L'Histoire littéraire,' pp. 351-802) based similarly on materials supplied by Neubauer, appeared in 1893. These two volumes on the French rabbis, stored as they are with abundant and minute information, drawn from the most varied and recondite sources, including not only Hebrew and German journals, but unpublished MSS. in the libraries of Oxford, Paris, the south of France, Spain, Italy, and other countries, form perhaps the most remarkable monument of Neubauer's industry and learning. In 1884 he was appointed reader in Rabbinic Hebrew in the University of Oxford. In 1887 he published (in the series called 'Anecdota Oxoniensia') a volume (in Hebrew) of 'Mediaeval Jewish Chronicles and Chronological Notes,' which was followed in 1895 by a second volume bearing the same title. He also issued, in 1878, a previously unknown Aramaic text of the Book of Tobit, from a MS. acquired in Constantinople for the Bodleian Library; and in 1897 edited, with much valuable illustrative matter, the original Hebrew of ten chapters of Ecclesiasticus from some manuscript leaves, which had been discovered in a box of fragments from the Cairo Genizah. A constant contributor to learned periodicals both at home and abroad, he published in the 'Jewish Quarterly Review' (1888-9, vol. i.) four able articles entitled 'Where are the Ten Tribes?' and valuable essays in the Oxford 'Studia Biblica' in 1885, 1890, and 1891.

Neubauer's unremitting labours told upon his health. About 1890 his eyesight began to fail him. In 1899 he resigned his librarianship, and in 1900 his readership. He resided in Oxford, in broken health, till 1901, when he went to live under the care of his nephew, Dr. Adolf Büchler, a distinguished Rabbinical scholar, at Vienna. When Büchler was appointed vice-president of Jews' College, London, in 1906, Neubauer returned with him to England, and died unmarried at his nephew's house on 6 April 1907.

Neubauer was created M.A. of Oxford by diploma in 1873, and he was elected an hon. fellow of Exeter College in 1890. He was an hon. Ph.D. of Heidelberg, an hon. member of the Real Academia de la Historia at Madrid, and a corresponding member of the Académie des Inscriptions et Belles-Lettres in Paris. A portrait, painted by L. Campbell Taylor in 1900, is in the Bodleian Library.

Neubauer was nowhere more at home

than among the manuscripts of a library. He quickly discovered what manuscripts of value a library contained, and habitually excerpted passages of interest. As a Hebrew bibliographer, he was second only to Steinschneider (1816-1907). At Oxford he stimulated and encouraged the studies of younger scholars. By example and precept he taught the importance of independent research. He retained his racial shrewdness and his quaint humour almost to the last. Though he did not practise Jewish observances, he was strongly Jewish in sympathy. He wrote an excellent Hebrew style.

S. R. D.

NEVILLE, HENRY (1837-1910), actor, whose full name was THOMAS HENRY GARTSIDE NEVILLE, born at Manchester on 20 June 1837, was son of John Neville (1787-1874), manager of the Queen's Theatre, Spring Gardens, and of his second wife, Marianne, daughter of Capt. Gartside of Woodbrow, Saddleworth, Lancashire. He was the twentieth child of a twentieth child, both being the issue of a second marriage. A brother George was also an actor.

At three he was brought on the stage in his father's arms as the child in 'Pizarro'; but he forfeited all help from his father by refusing to join the army like other members of the family. In 1857, at Preston, he took to the stage as a profession. When John Vandenhoff bade leave to the stage on 29 Oct. 1858, at the Theatre Royal, Liverpool, Neville played Cromwell to the tragedian's Cardinal Wolsey in 'King Henry VIII,' act iii. After a stern novitiate in the north of England and in Scotland, he first appeared in London at the Lyceum Theatre, under Madame Celeste, on 8 Oct. 1860, as Percy Ardent in a revival of Boucicault's 'The Irish Heiress.' Prof. Henry Morley hailed him as 'a new actor of real mark.' After other provincial engagements he spent four years at the Olympic under Robson and Emden (1862-6), and the experience proved the turning-point in his career. On 2 May 1863 he was the original Bob Brierley in Tom Taylor's 'The Ticket of Leave Man,' a character in which he made the success of his life. He played it in all some 2000 times. In May 1864, while Tom Taylor's play was still running, Neville also appeared as Petruchio in the afterpiece of

'Catherine and Petruchio,' and was highly praised for his speaking of blank verse. On 27 Oct. 1866 he was the first professional exponent of Richard Wardour in Wilkie Collins's 'The Frozen Deep,' a character originally performed by Charles Dickens.

Neville's impassioned and romantic style of acting, which gave a character to the Olympic productions, contrasted with the over-charged, highly coloured style then current at the Adelphi. But early in 1867 he migrated to the Adelphi, where, on 16 March, he was the original Job Armroyd in Watts Phillips's 'Lost in London,' and on 1 June the original Farmer Allen in Charles Reade's version of Tennyson's 'Dora.' On 31 Aug., on Miss Kate Terry's farewell, he played Romeo to her Juliet, and on 26 Dec. he was the original George Vendale in Dickens and Collins's 'No Thoroughfare.' On 7 Nov. 1868 'The Yellow Passport,' Neville's own version of Victor Hugo's 'Les Misérables,' was produced at the Olympic with himself as Jean Valjean. At the Gaiety on 19 July 1869 he played an important rôle in Gilbert's first comedy, 'An Old Score,' and at the Adelphi in June 1870 he originated the leading character of the industrious Sheffield mechanic in Charles Reade's 'Put Yourself in his Place.'

From 1873 to 1879 Neville was lessee and manager of the Olympic Theatre. After experiencing failure with Byron's comedy 'Sour Grapes' (4 Nov. 1873) and Mortimer's 'The School for Intrigue' (1 Dec.) he scored success through his acting of Lord Clancarty in Tom Taylor's 'Lady Clancarty' (March 1874), and with Oxenford's 'The Two Orphans' (14 Sept.), which enjoyed a great vogue and was revived at the end of his tenancy. Other of his original parts which were popular were the badly drawn title-part in Wills's 'Buckingham' (4 Dec. 1875), the hunchback in his own version of Coppée's 'The Violin-maker of Cremona' (2 July 1877), Franklin Blake in Wilkie Collins's 'The Moonstone' (22 Sept.), and Jeffrey Rolleston in Gilbert's 'The Ne'er-do-Weel' (2 March 1878). Subsequently he played at the Adelphi for two years, opening there on 27 Feb. 1879 as Perrinet Leclerc in Clement Scott and E. Mavriol's 'The Crimson Cross,' and acting to advantage on 7 Feb. 1880 St. Cyr in Wills's new drama, 'Ninon.' In a successful revival of 'The School for Scandal' at the Vaudeville, on 4 Feb. 1882, he proved a popular, if somewhat heavy, Charles Surface. A little later he was supporting Madame Modjeska

in the provinces as the Earl of Leicester in Wingfield's 'Mary Stuart' and as Jacques in 'As You Like It.' On 25 Oct. 1884 he was the original George Kingsmill in Mr. Henry Arthur Jones's 'Saints and Sinners' at the Vaudeville.

Thenceforth Neville chiefly confined himself to romantic heroes in melodrama. On 12 Sept. 1885 he was the original Captain Temple in Pettitt and Harris's 'Human Nature' at Drury Lane, and after playing in many like pieces he went to America in 1890 with Sir Augustus Harris's company to sustain that character. He opened at the Boston Theatre, Boston, and appeared as Captain Temple for 200 nights, the play then being re-named 'The Soudan.' On his return to London he appeared at the Princess's on 11 Feb. 1892 as Jack Holt in 'The Great Metropolis,' a nautical melodrama, of which he was part author. During the succeeding fourteen years he continued with occasional interruptions to originate prominent characters in the autumn melodramas at Drury Lane. His last appearance on the stage was at His Majesty's at a matinee on 29 April 1910, when he played Sir Oliver in a scene from 'The School for Scandal.'

Neville's art reflected his buoyant, breezy nature and his generous mind. A romantic actor of the old flamboyant school, he succeeded in prolonging his popularity by an adroit compromise with latter-day conditions. He believed that the principles of acting could be taught, and in 1878 established a dramatic studio in Oxford Street, in whose fortunes he continued for many years to take a vivid interest. In 1875 he published a pamphlet giving the substance of a lecture on 'The Stage, its Past and Present in Relation to Fine Art.'

Although he lived for the theatre, Neville was a man of varied accomplishments. He painted, carved, and modelled with taste, took a keen interest in sport, was a volunteer and crack rifle shot, and once placed the St. George's Vase to the credit of his corps. He was also a man of sound business capacity, and long conducted the George Hotel at Reading.

Neville died at the Esplanade, Seaford, Sussex, on 19 June 1910, from heart failure as the result of an accident, and was buried at Denshaw, Saddleworth, Lancashire. By his marriage with Henrietta Waddell, a non-professional, he left four sons, none of them on the stage. The gross value of his estate was estimated at 18,671l.

(see his will in *Evening Standard* of 23 Nov. 1910). A full-length portrait in oils of him as Count Almaviva in Mortimer's 'The School for Intrigue' (1874), by J. Walton, is in the Garrick Club.

J. L.

NEWMARCH, CHARLES HENRY (1824-1903), divine and author, born at Burford, Oxfordshire, on 30 March 1824, was second son of George Newmarch, solicitor, of Cirencester, by Mary his wife. He traced his descent as far back as the Norman Conquest. After education from March 1837 at Rugby, whither his elder brother, George Frederick, had gone in 1830, he spent some time in the merchant shipping service and in Eastern travel. Of his Eastern experience he gave an account in 'Five Years in the East,' published in 1847 under the pseudonym of R. N. Hutton, which attracted favourable attention. In 1848 appeared anonymously his interesting 'Recollections of Rugby, by an old Rugbeian' (12mo), and in the same year a novel, 'Jealousy' (3 vols.). Settling in Cirencester, Newmarch showed keen interest in the antiquities of the neighbourhood, and in 1850 wrote with Professor James Buckman [q. v.] 'Illustrations of the Remains of Roman Art in Cirencester' (4to; 2nd edit. 1851). He was chiefly instrumental in founding in 1851 the 'Cirencester and Swindon Express,' which was soon amalgamated with the 'Wilts and Gloucester Standard.' He was joint editor of the paper, and till the end of his life was a regular contributor under the name of 'Rambler.' He issued with his brother in 1868 a brief account of the 'Newmarch pedigree.'

Newmarch matriculated at Corpus Christi College, Cambridge, in 1851, graduating B.A. in 1855. Taking holy orders in 1854, he was from 1856 to 1893 rector of Wardley-cum-Belton, Rutland, and rural dean of the district from 1857 to 1867. He was greatly interested in agricultural matters, contributing much to 'Bell's Life' on the subject; he championed the cause of the village labourers, who stoutly defended him against the attacks of Joseph Arch, when Arch visited Belton in his tour of the village districts in 1872. He took an

active part in church building in Rutland, and restored the chancel of his parish church. Increasing deafness led to his retirement in 1893 to 37 Upper Grosvenor Road, Tunbridge Wells, where he died on 14 June 1903.

Newmarch married on 6 Feb. 1855, at Leekhampton, Anne Straford of Cheltenham and Charlton Kings, and had issue two sons and three daughters. One daughter survived him. A tablet to his memory was erected in Belton church in 1912.

[The Times, 20 June 1903; Guardian, 1 July 1903; Rugby School Register, 1901, ii. 293; information from son-in-law, the Rev. J. B. Booth.] W. B. O.

NEWNES, SIR GEORGE, first baronet (1851-1910), newspaper and magazine projector, born at Glenorchy House, Matlock, on 13 March 1851, was youngest son of three sons and three daughters of Thomas Mold Newnes (*d.* 1883), a congregational minister at Matlock, by his wife Sarah (*d.* 1885), daughter of Daniel Urquhart of Dundee. Educated at Silcoates, Yorkshire, and at the City of London School, he was apprenticed when sixteen to a wholesale firm in the City of London. Three years after completing his apprenticeship he was placed by another London firm of dealers in fancy goods in charge of a branch business in Manchester, and there suddenly conceived the idea of a journal which should consist wholly of popularly entertaining and interesting anecdotes, or, as he termed, them 'tit-bits,' extracted from all available sources. This idea proved the foundation of his fortune. Within twelve months he made plans for producing such a periodical. Negotiations in Manchester for financial help to the extent of 500% failed. Scraping together all the money he could, Newnes accordingly produced with his own resources on 2 Oct. 1881 the first number of the weekly paper which he christened 'Tit-Bits.' He engaged the Newsboys' Brigade to sell it in the streets. Within two hours 5000 copies were sold.

The paper grew in popularity, and after producing it in Manchester for three years with increasing success, Newnes transferred the publication to London, where he opened offices first in Farringdon Street, and later in Burleigh Street and Southampton Street. Other bold innovations upon a publisher's business followed. By instituting the 'Tit-Bits' prize competitions, including the offer (on 17 Nov. 1883) of a house, 'Tit-Bits Villa,' at Dulwich, of the value of 800%.

as one of the first prizes, he appealed in a new fashion to a widespread popular instinct which has since been developed to immense profit and in endless ways by the proprietors of other publications. Equally original and successful was his insurance plan, which constituted each copy of 'Tit-Bits' a railway accident policy for the purchaser. These expensive schemes, which were launched by Newnes only after most careful consideration, and in spite of general predictions of failure, gave excellent returns. One of his prizes, a situation in the office of 'Tit-Bits,' was won in Sept. 1884 by Mr. Cyril Arthur Pearson, who rose to be manager of the paper, and left in July 1890 to start 'Pearson's Weekly.' A frequent contributor to the page 'Answers to Correspondents' was Mr. Alfred Harmsworth (now Lord Northcliffe), who as a result founded in 1888 'Answers,' a rival paper to Tit-Bits. The popularity of the competitions became so great that in one day no less than two hundred sacks of letters were received. The paper meanwhile improved. It ceased to be a collection of extracts only and included in increasing proportion contributions by authors of note.

In 1890 Newnes, at the suggestion of his schoolfellow, William Thomas Stead, brought out the first number of the 'Review of Reviews,' with Stead as editor; but after a few months Stead and Newnes separated, Stead taking sole charge of the 'Review,' while Newnes in 1891 started the 'Strand Magazine,' combining on a large scale popular illustration with popular literary matter at the price of sixpence. In January 1893 he made a still bolder venture. At the close of 1892 the 'Pall Mall Gazette,' an evening daily newspaper, which was then a liberal journal, edited by (Sir) E. T. Cook, suddenly changed hands and politics. Newnes promptly engaged the services of the whole superseded literary staff of the 'Pall Mall Gazette' and started on 31 Jan. 1893 the 'Westminster Gazette' as a new organ of the liberal party. Newnes's friends in the party were nervous about investing their money, but Newnes had full confidence in himself, and succeeded in giving the paper financial stability. His publishing firm was incorporated in 1891 as a limited company with a capital of 400,000% and reconstructed in 1897, when the capital was increased to 1,000,000%. Among the new ventures which followed from the house of George Newnes, Ltd., were: 'Country Life' (1897), the 'Ladies' Field,' the 'Wide World Magazine' (both

in 1898), and 'C. B. Fry's Magazine' (1904).

Newnes entered Parliament in 1885 as member for the Newmarket division of Cambridgeshire, which he represented in the liberal interest until 1895, when he lost his seat, and was rewarded for his services to his party by a baronetcy. The prime minister, Lord Rosebery, stated that the honour was conferred on him as a pioneer of clean popular literature. Newnes was returned for Swansea Town in 1900, and represented that constituency until the general election of 1910.

Newnes applied much of his wealth to public purposes. His London residence was on Putney Heath, and he took great interest in the welfare of Putney. In 1897, the year of the diamond jubilee, he presented a new and spacious library at a cost of 16,000*l.*, the building being opened by Lord Russell of Killowen, the lord chief justice, in May 1899. In 1898 he fitted out at his own expense the South Polar Expedition, under the guidance of the Norwegian explorer C. E. Borchgrevink. His sympathy with suffering was always strong. The painful sight of horses toiling up the steep ascent from Lynnmouth to Lynton in Devon, where he acquired a country residence, led him to build a cliff railway there. Similarly he met the difficulty which was felt by invalids in mounting to the heights at his birthplace, Matlock, by building a cable railway for their use, which he presented to the town on 28 March 1893. He died at his residence in Lynton on 9 June 1910, and was buried at Lynton.

Newnes married in 1875 Priscilla Jenney, daughter of the Rev. James Hillyard of Leicester, by whom he had two sons, of whom the younger, Arthur, died in childhood. The elder son, Frank Hillyard Newnes, his successor in the baronetcy, has been since 1906 M.P. for Bassetlaw, Nottinghamshire.

A memorial tablet in the corridor near the entrance to the Putney library was unveiled on 23 May 1911; it consists of a bronze bust of Newnes in relief against a white marble background, designed by Mr. Oliver Wheatley. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1894.

[Life of Sir George Newnes, by Hulda Friederichs (with portrait), 1911; T. H. S. C. W.

NEWTON, ALFRED (1829-1907), zoologist, born at Geneva on 11 June 1829, was fifth son of William Newton of Elveden, Suffolk, sometime M.P. for Ipswich, and Elizabeth, daughter of Richard Slater Milnes of Fryston, Yorkshire, and aunt of Richard Monckton Milnes first Baron Houghton [q. v.]. In 1848 Newton left home for Magdalene College, Cambridge. He obtained the English essay prize there in two successive years and graduated B.A. in 1853. From 1854 until 1863 he held the Drury travelling fellowship, making use of the endowment in the study of ornithology, a subject to which he had been attached from boyhood. He visited Lapland with John Wolley, the ornithologist, in the summer of 1855, and in 1858 they went together to Iceland and sought out the last nesting-place of the great auk. Newton stayed in the West Indies in 1857 and went thence to North America. In 1864 he paid a visit to Spitzbergen on the yacht of Sir Edmund Birkbeck, and he made several summer voyages round the British Isles with the ornithologist Henry Evans of Derby, so that he was acquainted with almost all the breeding-places of their sea-birds. All these travels he accomplished in spite of lameness due to hip-joint disease in childhood, which later in life was aggravated by an injury to the other leg. Newton made no complaint, though he had to use two sticks instead of one, and went about his work with undiminished assiduity. He wrote the 'Zoology of Ancient Europe' in 1862 and the 'Ornithology of Iceland' in 1863. A chair of zoology and comparative anatomy was founded at Cambridge, and Newton was appointed the first professor in March 1866; he held office till his death. His lectures were the least important part of his work as professor. The subject was almost unknown in the university, whether among the undergraduates or the ruling authorities, and the professor had to create a general interest in it and to improve the museum and other apparatus for its study. Newton did his best to make the acquaintance of every undergraduate who had any taste for natural history and to encourage him. Every Sunday evening at his rooms in the old lodge of Magdalene such undergraduates found a cheery welcome and pleasant talk, and many of them became lifelong friends of the professor and of one another. Charles Kingsley was sometimes there and talked on the land tortoise and the red deer or on the natural history of the New Forest. George Robert Crotch, the first coleopterist of his time, was generally present,

and started fresh paradoxes on every possible subject every evening. Newton's own talk, which was most often on birds or on the countries to which he had travelled, was always full, exact, and interesting, and exhibited a pleasant sense of humour. The rooms in which this circle met contained a fine ornithological library, and where the walls were vacant a few pictures of birds, of which the finest was a drawing of gerfalcons by Wolff, the celebrated artist of birds. The accuracy which Newton encouraged in others he required from himself, and for this reason his works often took long to complete. His large book 'Ootheca Wolleyana,' an account of the collection of birds' eggs made by his friend John Wolley, appeared from 1864 to 1902, and contains an interesting biography of the collector. The collection of eggs was given to Newton by Wolley's father, and Newton presented it, with his own large collection, to the University of Cambridge. The 'Dictionary of Birds,' which appeared 1893-6, is probably his greatest work. He had prepared himself for such a book by his 'Ornithology of Iceland,' published in Baring Gould's 'Iceland' in 1863; his 'Aves' in the 'Record of Zoological Literature,' vols. i.-vi.; his 'Birds of Greenland,' printed in the 'Arctic Manual'; and by many papers in the 'Ibis' and other scientific journals. He wrote the article on ornithology in the ninth edition of the 'Encyclopædia Britannica,' and that on Gilbert White in this Dictionary; he edited the 'Ibis' from 1865 to 1870, the 'Zoological Record' from 1870 to 1872, and the first two volumes of the fourth edition of Yarrell's 'British Birds,' 1871-82. He was elected F.R.S. in 1870, and received the royal medal of the society in 1900, and the gold medal of the Linnæan Society in the same year. He used to attend the meetings of the British Association, and it was due to its action, stimulated by him, that the first three acts of parliament for the protection of birds were passed. He was for several years chairman of the committee for studying the migration of birds appointed by that association, and he was constantly referred to by the public and by individual students as the chief authority of his time on ornithology, and always promptly endeavoured to answer the questions put to him. He was one of the founders of the British Ornithologists' Union and was a frequent contributor to its journal, the 'Ibis.' The dodo and the great auk were birds in which he took particular interest, and when his brother,

Edward Newton, brought him from Mauritius a fine series of dodo bones Newton generously sent some as a gift to Professor Schlegel of Leyden, who had been one of his chief opponents as regards the columbine affinities of the bird. Towards the end of his life he appointed Mr. William Bateson to lecture for him, but continued to show active interest in all the other work of his professorship, and was always a constant resident during term-time at Cambridge. Throughout his career he took a large part in university affairs, and conducted with his own hand a very heavy public and private correspondence. In his last years some of the fellows of Magdalene thought him too arbitrary in his attachment to simple food and old usages, but outside their microcosm the Johnsonian force with which he expressed his convictions only added to the charm of his society. His final illness was a cardiac failure, and when the Master of Magdalene paid a last visit to him Newton said 'God bless all my friends, God bless the college, and may the study of zoology continue to flourish in this university!' He died unmarried on 7 June 1907. He was buried in the Huntingdon Road cemetery at Cambridge.

His portrait, by Lowes Dickinson, is at Magdalene College, Cambridge.

NICHOLSON, SIR CHARLES, first baronet (1808-1903), chancellor of the University of Sydney, New South Wales, born at Bedale, Yorkshire, on 23 Nov. 1808, was only surviving child of Charles Nicholson of London, by Barbara, youngest daughter of John Ascoug of Bedale. Graduating M.D. at Edinburgh University in 1833, he emigrated to Australia, and settled on some property belonging to his uncle near Sydney in May 1834. Here for some time he practised as a physician with success. A good classical scholar, well read in history and science, an able writer and lucid speaker, he soon prominently identified himself with the social and political interests of the colony. In June 1843 he

was returned to the first legislative council of New South Wales as one of the five members for the Port Phillip district (now the state of Victoria). In July 1848, and again in Sept. 1851, he was elected member for the county of Argyle. From 2 May 1844 to 19 May 1846 he was chairman of committees of the legislative council, and on 20 May 1847, in May 1849, and October 1851, he was chosen speaker, retaining the office until the grant to the colony of responsible government in 1855-6, when he became for a short time a member of the executive council.

When in 1859 the district of Moreton Bay was separated from New South Wales and formed into the colony of Queensland, Nicholson was nominated on 1 May 1860 a member of the legislative council of the new colony, and was president during the first session, resigning the office on 28 Aug. 1860.

Nicholson was from the first a powerful advocate of popular education in New South Wales. He was a member of the select committee to inquire into the state of education in the colony moved for by Robert Lowe (afterwards Lord Sherbrooke), on whose report the educational systems of the Australian colonies have in the main been based. But his name is more intimately associated with the foundation of the University of Sydney. He watched over its early fortunes with unremitting care, was a generous donor to its funds, and endowed it with many valuable gifts, including the museum of Egyptian, Etruscan, Greek, and Roman antiquities which he collected with much personal exertion and at considerable cost. He was instrumental in obtaining a grant of arms from the Heralds' College in 1857, and the royal charter from Queen Victoria in 1858. On 3 March 1851 he was unanimously elected vice-provost, and delivered an inaugural address at the opening of the university on 11 Oct. 1852. He was chancellor from 13 March 1854 till 1862, when he left Australia permanently for England. There he chiefly resided in the country near London, actively occupied as a magistrate, as chairman of the Liverpool and London and Globe Insurance Co., and as director of other undertakings, at the same time interesting himself in Egyptian and classical and Hebrew scholarship. Gardening was his chief source of recreation. Preserving his vigour till the end, he died on 8 Nov. 1903 at his residence, The Grange, Totteridge, Hertfordshire, and was buried in Totteridge churchyard.

Nicholson was knighted by patent on 1 March 1852, and was the first Australian to be created a baronet (of Luddenham, N.S.W.) (8 April 1859). He was made hon. D.C.L. of Oxford in 1857, hon. LL.D. of Cambridge in 1868, and hon. LL.D. of Edinburgh in 1886.

Nicholson married on 8 Aug. 1865 Sarah Elizabeth, eldest daughter of Archibald Keightley, registrar of the Charterhouse, London, and had three sons, of whom the eldest, Charles, succeeded to the baronetcy. A portrait by H. W. Phillips hangs in the hall of the university at Sydney; another by H. A. Olivier belongs to his widow.

Bowen's Thirty Years of Colonial Government, 1889; Barff's Short Historical Account of Sydney University, 1902; Lancet, 21 Nov. 1903; Colonial Office Records; information from relatives.] C. A.

NICHOLSON, GEORGE (1847-1908), botanist, born at Ripon, Yorkshire, on 4 Dec. 1847, was son of a nurseryman, and was brought up to his father's calling. After spending some time in the gardens of Messrs. Fisher Holmes at Sheffield, he went for two years to the municipal nurseries of La Muette, Paris, and then to those of Messrs. Low at Clapton. In 1873 he was appointed, after competitive examination, clerk to John Smith, the curator at Kew; in 1886 he succeeded Smith as curator. He retired owing to ill-health in 1901, but continued his botanical researches at Kew as far as his strength allowed.

A fluent speaker in French and German, Nicholson paid holiday visits to France and Switzerland, and travelled in Germany, Northern Italy, and Spain. Impressed with the value of a knowledge of foreign languages to young gardeners, he devoted much of his leisure to teaching some of them French. In 1893 he went officially to the Chicago Exhibition, as one of the judges in the horticultural section; and he took the opportunity to study the forest trees of the United States. In 1902, the year after his retirement, he visited New York as delegate of the Royal Horticultural Society to the Plant-Breeding Conference.

Until 1886 Nicholson devoted much attention to the critical study of British flowering plants. His first published work, 'Wild Flora of Kew Gardens,' appeared in the 'Journal of Botany' for 1875. In the same year he joined the Botanical Exchange Club, and to its 'Reports' and to

the 'Journal of Botany' he contributed notes on such segregates as those of *Rosa* and of *Cardamine pratensis*. The 'Wild Fauna and Flora of Kew Gardens,' issued in the 'Kew Bulletin' in 1906, which expanded his paper of 1875, was largely his work. Out of 2000 fungi enumerated, 500 were found by Nicholson. His herbarium of British plants was presented, towards the close of his life, to the University of Aberdeen, through his friend James Trail, professor of botany there.

When Sir Joseph Hooker [q. v. Suppl. II] was reorganising and extending the arboretum at Kew, he found an able coadjutor in Nicholson, who wrote monographs on the genera *Acer* and *Quercus* and twenty articles on the Kew Arboretum in the 'Gardeners' Chronicle,' during 1881-3. A valuable herbarium which he formed of trees and shrubs was purchased by the trustees of the Bentham fund in 1889 and presented to Kew. His 'Hand-list of Trees and Shrubs grown at Kew' (anon. 2 pts. 1894-6) attested the fulness of his knowledge of this class of plants. Nicholson's *magnum opus* was 'The Dictionary of Gardening' (4 vols. 1885-9; enlarged edit. in French, by his friend M. Mottet, 1892-9; two supplementary vols. to the English edition, 1900-1). This standard work of reference, most of which was not only edited but written by Nicholson, did for the extended horticulture of the nineteenth century what Philip Miller's Dictionary did for that of the eighteenth.

Of gentle, unselfish character, he was chosen first president on the foundation of the Kew Guild in 1894. Elected an associate of the Linnean Society in 1886, Nicholson became a fellow in 1898, and he was awarded the Veitchian medal of the Royal Horticultural Society in 1894, and the Victoria medal in 1897. To him was dedicated in 1895 the 48th volume of the 'Garden,' a paper to which he was a large contributor. Dr. Udo Dammer in 1901 named a Central American palm *Neonicholsonia Georgei*. Fond of athletic exercises, he brought on, by his devotion to mountaineering, heart trouble, of which he died at Richmond, on 20 Sept. 1908. His remains were cremated. He married in 1875 Elizabeth Naylor Bell; but she died soon after, leaving a son, James Bell Nicholson, now a lieutenant in the navy.

[Gardeners' Chron. 1908, ii. 239 (with portrait); Journal of Botany, 1908, p. 337 (with the same portrait); Proc. Linnean Soc. 1908-9, pp. 48-9; Journal of the Kew Guild.]

G. S. B.

NICOL, ERSKINE (1825-1904), painter, born in Leith on 3 July 1825, was eldest son (in a family of five sons and one daughter) of James Main Nicol of that city by his wife Margaret Alexander. After a brief commercial education he became a house-painter, but quickly turned to art. He was an unusually youthful student at the Trustees' Academy, Edinburgh, where he came under the joint instruction of Sir William Allan [q. v.] and Thomas Duncan [q. v.]. At fifteen he exhibited a landscape at the Royal Scottish Academy, and two years later two (one painted in England) and a chalk portrait. For a time he filled the post of drawing-master in Leith Academy.

After a hard struggle at Leith to earn a living by his pencil, he went to Dublin in 1846, and for the next four or five years taught privately there, and not, as is frequently said, under the Science and Art Department. At Dublin he discovered the humours of Irish peasant life, the unvarying subject for his brush for a quarter of a century. From Ireland, where he had a patron in his friend Mr. Armstrong of Rathmines, he sent two examples of this kind to the Scottish Academy exhibitions of 1849-50. In 1850 he settled in Edinburgh, where his reputation was already established. Most of the work he exhibited at the R.S.A. was purchased by well-known collectors like Mr. John Miller of Liverpool and Mr. John Tennant of Glasgow. He was elected an associate of the Scottish Academy in 1851 and a full member in 1859. His diploma work for the Scottish Academy, 'The Day after the Fair,' is in the National Gallery, Edinburgh.

In 1862 Nicol left Edinburgh for London, at first renting a studio in St. John's Wood, and from 1864 till the end of his painting career residing at 24 Dawson Place, Pembroke Square, W. Though he finished his canvases in Edinburgh or London, Nicol for several months of each year studied his Irish subjects at first hand in co. Westmeath, where he built himself a studio at Clonave, Deravaragh. When his health no longer permitted the journey to Ireland, he abandoned Irish humble life for that of Scotland, which he studied at Pitlochry, where he fitted up a disused church as a studio.

Nicol contributed to the Royal Academy first in 1851, and then in 1857-8; from 1861 to 1879, there was only a break in 1870. Elected an associate in 1866, he joined the retired list after an acute illness in 1885. His portrait of Dr. George Skene Keith, which was exhibited at the R.A.

in 1893, is dated the previous year, but he practically ceased to paint in oils in 1885. He excelled also in water-colours, and occasionally painted in that medium at a later date. One of his water-colours, 'Clout the auld' (1886), is in the Ashbee collection in the Victoria and Albert Museum.

Although Nicol's humour was broader in his earlier than in his later canvases, he was always successful as a comic storyteller whose first-rate craftsmanship was never sacrificed to the pursuit of popularity. His mature drawing was generally sound and quick, and his colour was pleasing and sometimes rich and even subtle. After 1885 he lived in retirement, dividing his time between Crieff, Torduff House, Colinton, Midlothian, and The Dell, Feltham, where he died on 8 March 1904. He was buried in the burial-ground of his second wife's family at Rottingdean.

The jovial element in Nicol's canvases had no place in his life. His disposition was grave, shy, and reserved. Nicol was twice married: (1) in 1851 to Janet Watson, who died in 1863, leaving a son (Mr. John Watson Nicol, a painter) and a daughter; (2) in 1865 to Margaret Mary Wood, who survived him, and by whom he had two sons (the elder, Mr. Erskine Edwin Nicol, a painter) and a daughter.

Nicol's principal works, many of which were engraved, were: 'Irish Merry Making' (R.S.A. 1856); 'Donnybrook Fair' (1859); 'Renewal of the Lease Refused' (R.A. 1863); 'Waiting for the Train' (R.A. 1864); 'A Deputation' (R.A. 1865); 'Paying the Rent,' 'Missed it,' and 'Both Puzzled' (R.A. 1866, the last engraved by W. H. Simmons); 'A Country Booking-office' (R.A. 1867); 'A China Merchant' and 'The Cross-roads' (R.A. 1868); 'A Disputed Boundary' (R.A. 1869); 'The Fisher's Knot' (R.A. 1871); 'Steady, Johnnie, Steady' (R.A. 1873, engraved by Simmons); 'The New Vintage' (R.A. 1875); 'The Sabbath Day' (R.A. 1875, engraved by Simmons); 'Looking out for a Safe Investment' (engraved by Simmons) and 'A Storm at Sea' (R.A. 1876); 'Unwillingly to School' (R.A. 1877); 'The Missing Boat' (R.A. 1878); 'Interviewing their Member' (R.A. 1879, engraved by C. E. Deblouis).

For the first volume of 'Good Words,' 1860-1, Nicol did three drawings. He is represented in the Glasgow Corporation Galleries by an oil painting, 'Beggar my Neighbour,' and in the Aberdeen Gallery by a water-colour. His oil paintings 'Wayside

Prayers' (1852) and 'The Emigrants' (1864) in the Tate Gallery are poor examples.

Nicol's portrait, by Sir William Fettes Douglas, exhibited at the R.S.A. in 1862, belongs to the Scottish Academy.

NICOLSON, MRS. ADELA FLORENCE, 'LAURENCE HOPE' (1865-1904), poetess, born at Stoke House, Stoke Bishop, Gloucestershire, on 9 April 1865, was daughter of Arthur Cory, colonel in the Indian army, by his wife Fanny Elizabeth Griffin. She was educated at a private school in Richmond, and afterwards went to reside with her parents in India. In 1889 she married Colonel Malcolm Hassels Nicolson of the Bengal army [see below] and settled at Madras. The name Violet, by which her husband called her, was not baptismal. Mrs. Nicolson devoted her leisure to poetry. Her first volume, in which she first adopted the pseudonym of 'Laurence Hope,' 'The Garden of Kama and other Love Lyrics from India, arranged in Verse by Laurence Hope,' was published in 1901. Generally reviewed as the work of a man, it attracted considerable attention and was reissued as 'Songs from the Garden of Kama' in 1908. How far the substance of the poems was drawn from Indian originals was a matter of doubt. They are marked by an oriental luxuriance of passion, but the influence of Swinburne and other modern English poets is evident in diction and versification. Two other volumes under the same pseudonym, 'Stars of the Desert' (1903) and 'Indian Love,' published posthumously in 1905, display similar characteristics and confirmed without enhancing their author's reputation. Some of her shorter poems have become popular in musical settings. Mrs. Nicolson died by her own hand, of poisoning by perchloride of mercury, on 4 Oct. 1904, at Dunmore House, Madras. She had suffered acute depression since her husband's death two months before. She was buried, like General Nicolson, in St. Mary's cemetery, Madras. She left one son, Malcolm Josceline Nicolson.

MALCOLM HASSELS NICOLSON (1843-1904), general, son of Major Malcolm Nicolson of the Bengal army, was born on 11 June 1843. He entered the army in 1859 as ensign in the Bombay infantry, and was promoted lieutenant in 1862. Serving in the Abyssinian campaign of 1867-8, he was present at the action at Azogel and at the capture

of Magdala, and received the Abyssinian medal. He attained the rank of captain in 1869. During the Afghan war of 1878-80 he saw much active service. He took part in the occupation of Kandahar and fought at Ahmed Khel and Urzoo. He was mentioned in despatches, and in 1879, while the war was in progress, he was promoted major. After the war he received the Afghan medal with one clasp, and in March 1881 the brevet rank of lieutenant-colonel. He became army colonel in 1885 and substantive colonel in 1894. For his services in the Zhob Valley campaign of 1890 he was again mentioned in despatches, and he was made C.B. in 1891. From 1891 to 1894 he was aide-de-camp to Queen Victoria, being promoted major-general in the latter year and lieutenant-general in 1899. A good service pension was conferred on him in 1893. He died on 7 Aug. 1904 at Mackay's Gardens nursing home, Madras, and was buried in St. Mary's cemetery. General Nicolson was an expert linguist, having passed the interpreter's test in Baluchi, Brahui, and Persian, and the higher standard in Pushtu.

[Madras Mail, 5 Oct. 1904; Athenæum, 29 Oct. 1904; Gent. Mag., N.S. viii. 634; The Times, 11 Aug. 1904; Army Lists; information supplied by friends.] F. L. B.

NIGHTINGALE, FLORENCE (1820-1910), reformer of hospital nursing, born at the Villa La Columbaia, Florence, on 12 May 1820, was named after the city of her birth. Her father, William Edward Nightingale (1794-1874), was son of William Shore, long a banker at Sheffield; he was a highly cultured country gentleman of ample means, and a great lover of travel. When he came of age on 21 Feb. 1815 he assumed by royal sign-manual the surname of Nightingale on inheriting the Derbyshire estates of Lea Hurst and Woodend of his mother's uncle, Peter Nightingale (*d.* unmarried 1803). On 1 June 1818 he married Frances, daughter of William Smith (1756-1835) [q. v.], a strong supporter of the abolition of slavery. The issue was two daughters, of whom Florence was the younger. Her elder sister, Frances Parthenope (*d.* 1890), so called from the classical name of Naples, her birthplace, married in 1858, as his second wife, Sir Harry Verney [q. v.], second baronet, of Claydon, Buckinghamshire.

Florence Nightingale's first home was at her father's house, Lea Hall, in Derbyshire. About 1825 the family moved to Lea Hurst, which Nightingale had just built. In 1826 he also bought Embley Park, in Hampshire,

serving the office of high sheriff of that county in 1828. It became the custom of the family to spend the summer at Lea Hurst and the winter at Embley Park, with an occasional visit to London. Miss Nightingale enjoyed under her father's roof a liberal education, but she chafed at the narrow opportunities of activity offered to girls of her station in life. She engaged in cottage visiting, and developed a love of animals. But her chief interest lay in tending the sick. Anxious to undertake more important responsibilities than home offered her she visited hospitals in London and the country with a view to finding what scope for activity offered there. Nursing was then reckoned in England a menial employment needing neither study nor intelligence; nor was it viewed as a work of mercy or philanthropy. Sidney Herbert, afterwards Lord Herbert of Lea [q. v.], and his wife were Miss Nightingale's neighbours at Wilton House, not far from Embley Park. A close friendship with them stimulated her philanthropic and intellectual instincts. Her horizon was widened, too, by intercourse with enlightened members of her mother's family, by acquaintance with Madame Mohl and her husband, and possibly by a chance meeting in girlhood with Mrs. Elizabeth Fry.

Miss Nightingale's hospital visits seem to have begun in 1844, and were continued at home and abroad for eleven years. She spent the winter and spring of 1849-50 with friends of her family, Mr. and Mrs. Bracebridge, in a long tour through Egypt. On the journey from Paris she met two sisters of St. Vincent de Paul, who gave her an introduction to the house of their order at Alexandria, where she carefully inspected their schools and 'Miséricorde.' She recognised that the Roman Catholic sisterhoods in France, with their discipline and their organisation, made better nurses than she found in her own country (*cf.* MISS NIGHTINGALE, *Letters from Egypt*, privately printed). On her way back to England she paid a first visit (31 July to 13 Aug. 1850) to the Institute of Protestant Deaconesses at Kaiserswerth on the Rhine near Düsseldorf. The institute had been founded on a very humble scale in 1833 for the care of the destitute by Theodor Fliedner, protestant pastor of Kaiserswerth, and had since grown into a training school for women teachers and for nurses of the sick. The institution was run on the lines of poverty, simplicity, and common sense. A very brief experience of the Kaiserswerth

Institute convinced Miss Nightingale of the possibilities of making nursing a 'calling' for ladies and no mere desultory occupation. Next year she spent some four months at Kaiserswerth (July to October), and went through a regular course of training as a sick nurse. On her return to her home at Embley Park she published a short account of Kaiserswerth, in which she spoke frankly of the dullness of the ordinary home life of English girls. Late in life she wrote of her visits to Kaiserswerth, 'Never have I met with a higher love, a purer devotion, than there. There was no neglect. It was the more remarkable, because many of the deaconesses had been only peasants: none were gentlewomen when I was there.' There followed further visits to London hospitals, and in the autumn of 1852 she inspected those of Edinburgh and Dublin. Great part of 1853 was devoted to various types of hospitals at Paris. Late in the same year she accepted her first administrative post. On 12 Aug. 1853 she became superintendent of the Hospital for Invalid Gentlewomen, which was established in 1850 in Chandos Street by Lady Canning. Miss Nightingale moved the institution to No. 1 Upper (now 90) Harley Street. In 1910 it was resettled at 19 Lisson Grove, N.W., and was then renamed after Miss Nightingale.

In March 1854 the Crimean war broke out, and the reports of the sufferings of the sick and wounded in the English camps stirred English feeling to its depths. In letters to 'The Times' (Sir) William Howard Russell [q. v. Suppl. II], the correspondent, described the terrible neglect of the wounded, and the 'disgraceful antithesis' between the neglect of our men and the careful nursing of the French wounded. 'Are there no devoted women among us,' he wrote, 'able and willing to go forth to minister to the sick and suffering soldiers of the East in the hospitals of Scutari? Are none of the daughters of England, at this extreme hour of need, ready for such a work of mercy? Must we fall so far below the French in self-sacrifice and devotedness?' (cf. *The Times*, 15 and 22 Sept. 1854). On 14 Oct. Miss Nightingale offered her services to the War Office; but before her offer reached her friend, Sidney Herbert, then secretary of state for war, he himself had written to her on the same day, and proposed that she should go out to the Crimea: 'I receive numbers of offers from ladies to go out' (he told Miss Nightingale), 'but they are ladies who have no conception of what a hospital is, nor of the nature of its duties. . . .

My question simply is, Would you listen to the request to go out and supervise the whole thing? You would, of course, have plenary authority over all the nurses, and I think I could secure you the fullest assistance and co-operation from the medical staff, and you would also have an unlimited power of drawing on the government for whatever you think requisite for the success of your mission.' Miss Nightingale made her plans with extraordinary speed. On 17 Oct. Lady Canning, who helped her in the choice of nurses, wrote of her, 'She has such nerve and skill, and is so gentle and wise and quiet; even now she is in no bustle or hurry, though so much is on her hands, and such numbers of people volunteer their services' (*HARE'S Story of two Noble Lives*). On 21 Oct., within a week of receiving Herbert's letter, Miss Nightingale embarked for the Crimea, with thirty-eight nurses (ten Roman Catholic sisters, eight sisters of mercy of the Church of England, six nurses from St. John's Institute, and fourteen from various hospitals); her friends, Mr. and Mrs. Bracebridge, also went with her. Scutari was reached on 4 Nov., the eve of the battle of Inkerman. Miss Nightingale's official title was 'Superintendent of the Female Nurses in the Hospitals in the East'; but she came to be known generally as 'The Lady-in-Chief.'

Her headquarters were in the barrack hospital at Scutari, a huge dismal place, reeking with dirt and infection. Stores, urgently needed, had not got beyond Varna, or were lost at sea. 'There were no vessels for water or utensils of any kind; no soap, towels, or clothes, no hospital clothes; the men lying in their uniforms, stiff with gore and covered with filth to a degree and of a kind no one could write about; their persons covered with vermin.' One of the nurses, a week after arrival, wrote home, 'We have not seen a drop of milk, and the bread is extremely sour. The butter is most filthy; it is Irish butter in a state of decomposition; and the meat is more like moist leather than food. Potatoes we are waiting for, until they arrive from France.' Sidney Godolphin Osborne went out to visit Scutari soon after Miss Nightingale's arrival, and in a report on the hospital accommodation described the complete absence of 'the commonest provision for the exigencies' of the hour (cf. OSBORNE'S *Scutari and its Hospitals*, 1855). Miss Nightingale's difficulties are incapable of exaggeration. The military and medical authorities already on the spot viewed her intervention as a

reflection on themselves. Many of her own volunteers were inexperienced, and the roughness of the orderlies was offensive to women of refinement. But Miss Nightingale's quiet resolution and dignity, her powers of organisation and discipline rapidly worked a revolution.

Before the end of the year Miss Nightingale and her companions had put the Scutari barrack hospital in fairly good order. The relief fund organised by 'The Times' newspaper sent out stores, and other voluntary associations at home were helpful. In December Mary Stanley, daughter of the bishop of Norwich, and sister of Dean Stanley, came out with a reinforcement of forty-six nurses. Miss Nightingale quickly established a vast kitchen and a laundry; she made time to look after the soldiers' wives and children, and to provide ordinary decencies for them. She ruled, but at the same time she slaved: it is said that she was on her feet for twenty hours daily. Although her nurses were also overworked, she allowed no woman but herself to be in the wards after eight at night, when the other nurses' places were taken by orderlies. She alone bore the weight of responsibility. Among the wounded men she naturally moved an ardent devotion. They christened her 'The Lady of the Lamp.' Longfellow in his poem, 'Santa Filomena,' tried to express the veneration which her endurance and courage excited.

But the battle for the reform of the war hospitals was not rapidly won. Early in 1855, owing to defects of sanitation, there was a great increase in the number of cases of cholera and of typhus fever among Miss Nightingale's patients. Seven of the army doctors died, and three of the nurses. Frost-bite and dysentery from exposure in the trenches before Sevastopol made the wards fuller than before. The sick and wounded in the barrack hospital numbered 2000. The death-rate rose in February 1855 to 42 per cent. At Miss Nightingale's persistent entreaties the war office at home ordered the sanitary commissioners at Scutari to carry out at once sanitary reforms. Then the death-rate rapidly declined until in June it had dropped to 2 per cent. The improved conditions at Scutari allowed Miss Nightingale in May to visit the hospitals at and near Balaclava. Her companions on the journey included Mr. Bracebridge and the French cook, Alexis Benoît Soyer [q. v.], who had lately done good service at Scutari. The fatigues attending this visit of inspection brought on an attack of Crimean

fever, and for twelve days she lay dangerously ill in the Balaclava sanatorium. Early in June she was able to return to Scutari, and resumed her work there. To her nursing work she added efforts to provide reading and recreation rooms for the men and their families. In March 1856, when peace was concluded, she returned to Balaclava, and she remained there till July, when the hospitals were closed. She then went back for the last time to Scutari. It was not till August 1856 that she came home.

A ship of war was offered Miss Nightingale for her passage, but she returned privately in a French vessel and, crossing to England unnoticed, made her way quietly to Lea Hurst, her home in Derbyshire, although the whole nation was waiting to demonstrate their admiration of her. Queen Victoria, who abounded in expressions of devotion, had in Jan. 1856 sent her an autograph letter of thanks with an enamelled and jewelled brooch designed by the Prince Consort (*Queen Victoria's Letters*, iii. 215), and the Sultan of Turkey had given her a diamond bracelet. In Sept. 1856 she visited Queen Victoria at Balmoral. 'She put before us,' wrote the Prince Consort, 'all that affects our present military hospital system and the reforms that are needed: we are much pleased with her. She is extremely modest' (SIR THEODORE MARTIN, *Prince Consort*, iii. 503). In Nov. 1855, at a meeting in London, a Nightingale fund had been inaugurated for the purpose of founding a training school for nurses, the only recognition of her services which Miss Nightingale would sanction. By 1860 50,000*l.* was collected, and the Nightingale School and Home for Nurses was established at St. Thomas's Hospital. Although Miss Nightingale's health and other occupations did not allow her to accept the post of superintendent, she watched the progress of the new institution with practical interest and was indefatigable in counsel. Her annual addresses to the nurses, which embody her wisest views, were printed for private circulation. The example thus set was followed by other great hospitals, to the great advantage both of hospital nurses and of hospital patients.

In spite of the strain of work and anxiety in the Crimea, which seriously affected her health, Miss Nightingale thenceforth pursued her labours unceasingly, and sought to turn to permanent advantage for the world at large the authoritative position and experience which she had attained in matters of nursing and sanitation. She settled in

London, and, although she lived the retired life of an invalid, she was always busy with her pen or was offering verbally encouragement and direction. In 1857, after publishing a full report of the voluntary contributions which had passed through her hands in the Crimea, she issued an exhaustive and confidential report on the workings of the army medical departments in the Crimea. Next year she printed 'Notes on Matters affecting the Health, Efficiency and Hospital Administration of the British Army.' The commission appointed in 1857 to inquire into the sanitary condition of the army set a high value on her interesting evidence. With her approval an army medical college was opened in 1859 at Ghatham; a first military hospital was established in Woolwich in 1861; and an army sanitary commission was established in permanence in 1862. Everywhere her expert reputation was paramount. During the American civil war of 1862-4 and the Franco-German war of 1870-1 her advice was sought by the foreign governments concerned.

In regard to civil hospitals, home nursing, care of poor women in childbirth, and sanitation, Miss Nightingale's authority stood equally high. In 1862, in Liverpool Infirmary, a nursing home was founded with special reference to district nursing, and was placed under the care of Agnes Elizabeth Jones (1832-1868), who had been trained at Kaiserswerth. In 1867, at the request of the poor law board, she wrote a paper of 'Suggestions for the improvement of the nursing service in hospitals and on the methods of training nurses for the sick poor.' Miss Nightingale had a hand in establishing in 1868 the East London Nursing Society, in 1874 the Workhouse Nursing Association and the National Society for providing Trained Nurses for the Poor, and in 1890 the Queen's Jubilee Nursing Institute.

In 1857, on the outbreak of the Indian Mutiny, Miss Nightingale had written from Malvern to her friend Lady Canning, wife of the governor-general, offering in spite of her bad health 'to come out at twenty-four hours' notice, if there were anything for her to do in her line of business' (HARE, *op. cit.*). She never went to India. But the sanitary condition of the army and people there became one of the chief interests of her later life. The government submitted to her the report of the royal commission on the sanitary state of the army in India in 1863, and she embodied her comments in a paper entitled 'How

People may live and not die in India,' in which she urged the initiation of sanitary reform. She corresponded actively with Sir Bartle Frere, governor of Bombay, and in August 1867 was in constant communication with Sir Stafford Northcote, then secretary of state for India, as to the establishment of a sanitary department of the Indian government. With every side of Indian social life she made herself thoroughly familiar, exchanging views personally or by correspondence with natives, viceroys, and secretaries of state, and constantly writing on native education and village sanitation. She wrote to the 'Poona Sarvajanik Sabha' in 1889: 'There must be as it were missionaries and preachers of health and cleansing, if any real progress is to be made.' In other published papers and pamphlets she discussed the causes of famine, the need of irrigation, the poverty of the peasantry, and the domination of the money-lender. She urged native Indians to take part in the seventh international congress of hygiene and demography held in London in 1887, and to the eighth congress at Buda-Pesth in 1890 she contributed a paper on village sanitation in India, a subject which, as she wrote in a memorandum addressed to Lord Cross, secretary of state for India, in 1892, she regarded as especially her own.

Miss Nightingale wrote well, in a direct and intimate way, and her papers and pamphlets, which covered all the subjects of her activity, greatly extended her influence. Her most famous book, 'Notes on Nursing,' which first appeared in 1860, went through many editions in her lifetime.

Miss Nightingale, in spite of her withdrawal from society, was honoured until her death. Among the latest distinctions which she received was the Order of Merit in 1907, which was then for the first time bestowed on a woman, and in 1908 she was awarded the freedom of the City of London, which had hitherto only been bestowed on one woman, the Baroness Burdett-Coutts [q. v. Suppl. II]. She had already received, among many similar honours, the German order of the Cross of Merit and the French gold medal of *Secours aux blessés militaires*. On 10 May 1910 she was presented with the badge of honour of the Norwegian Red Cross Society.

She died at her house in South Street, Park Lane, London, on 13 Aug. 1910, at the age of ninety. An offer of burial in Westminster Abbey was in accordance with her wishes refused by her relatives. She was buried in the burial place of her family at

East Wellow, Hampshire, on 20 August. Memorial services took place in St. Paul's Cathedral, where the government was officially represented, at Liverpool Cathedral, and many other places of worship.

Miss Nightingale raised the art of nursing in this country from a menial employment to an honoured vocation; she taught nurses to be ladies, and she brought ladies out of the bondage of idleness to be nurses. This, which was the aim of her life, was no fruit of her Crimean experience, although that experience enabled her to give effect to her purpose more readily than were otherwise possible. Long before she went to the Crimea she felt deeply the 'disgraceful antithesis' between Mrs. Gamp and a sister of mercy. The picture of her at Scutari is of a strong-willed, strong-nerved energetic woman, gentle and pitiful to the wounded, but always masterful among those with whom she worked. After the war she worked with no less zeal or resolution, and realised many of her early dreams. She was not only the reformer of nursing but a leader of women.

After her death a memorial fund was instituted for the purpose of providing pensions for disabled or aged nurses and for erecting a statue in Waterloo Place. Memorial tablets have been fixed on her birthplace at Florence as well as in the cloisters of Santa Croce there.

A marble bust executed by Sir John Steell in 1862 and presented to Miss Nightingale by the non-commissioned officers and men of the British army was bequeathed by her to the Royal United Service Museum, together with her various presentation jewels and orders. A plaster statuette by Miss J. H. Bonham-Carter (c. 1856) (standing figure with lamp in right hand) is at Lea Hurst; of five replicas, one is at St. Thomas's Hospital, another is at the Johns Hopkins Hospital School for Nurses, Baltimore, and the others belong to members of the family. Of two portraits in oils, one by Augustus Leopold Egg, R.A., executed about 1836, is in the National Portrait Gallery; another, by Sir William B. Richmond, R.A., dated about 1886, is at Claydon House. A chalk drawing by Countess Feodora Gleichen, made in 1908, is at Windsor Castle among portraits of members of the Order of Merit. Several water-colour and chalk drawings are either at Lea Hurst or at Claydon House: one (with Miss Nightingale's mother and sister) by A. E. Chalon is dated about 1835; another by Lady Eastlake; a third, dated about 1850, by her sister, Lady Verney, was

lithographed. Others were executed by Miss F. A. de B. Footner in 1907. A picture of Miss Nightingale receiving the wounded at Scutari hospital in 1856 is by Jerry Barrett.

NODAL, JOHN HOWARD (1831-1909), journalist and writer on dialect, was son of Aaron Nodal (1798-1855), of the Society of Friends, a grocer and member of the Manchester town council. Born in Downing Street, Ardwick, Manchester, on 19 Sept. 1831, he was educated at the Quaker school at Ackworth, Yorkshire (1841-5). At seventeen he became a clerk of the old Electric Telegraph Company, and rose to be manager of the news department in Manchester. From the age of nineteen he also acted as secretary of the Manchester Working Men's College, which, formed on the lines of the similar institution in London, was subsequently absorbed in Owens College.

Nodal began early to contribute to the local press. During the volunteer movement of 1860-2 he edited the 'Volunteer Journal,' and in January 1864 he gave himself up to journalism on being appointed sub-editor of the 'Manchester Courier' on its first appearance as a daily paper. From 1867 to 1870 he was engaged on the 'Manchester Examiner and Times.' Meanwhile he edited the 'Free Lance,' an able literary and humorous weekly (1866-8), and a similar paper called the 'Sphinx' (1868-71). For thirty-three years (1871-1904) he was editor of the 'Manchester City News.' Under his control the 'City News' besides chronicling all local topics was the recognised organ of the literary and scientific societies of Lancashire. Many notable series of articles were reprinted from it in volume form. Two of these, 'Manchester Notes and Queries' (1878-89, 8 vols.) and 'Country Notes: a Journal of Natural History and Out-Door Observation' (1882-3, 2 vols.), developed into independent periodicals. Nodal was also a frequent contributor to 'Notes and Queries,' and from 1875 to 1885 was on the staff of the 'Saturday Review.'

Two prominent Manchester institutions owed much to Nodal's energies: the Manchester Literary Club, of which he was president (1873-9) and whose annual volumes of 'Papers' he started and edited for those years, and the Manchester Arts Club, which he was mainly instrumental in founding in 1878. For the glossary committee of the Literary Club he wrote in 1873 a paper on the 'Dialect and Archaisms of Lancashire,' and, in conjunction with George Milner, compiled a 'Glossary of the Lancashire Dialect' (2 parts, 1875-82). When the headquarters of the English Dialect Society were removed in 1874 from Cambridge to Manchester, Nodal became honorary secretary and director. He continued in office to the dissolution of the society in 1896. With Prof. W. W. Skeat (1835-1912) he compiled a 'Bibliographical List of Works illustrative of the various English Dialects,' 1877. His other works include: 1. 'Special Collections of Books in Lancashire and Cheshire,' prepared for the Library Association, 1880. 2. 'Art in Lancashire and Cheshire: a List of Deceased Artists,' 1884. 3. 'A Pictorial Record of the Royal Jubilee Exhibition, Manchester,' 1887. 4. 'Bibliography of Ackworth School,' 1889.

He died at the Grange, Heaton Moor, near Manchester, on 13 Nov, 1909, and was interred at the Friends' burial-ground, Ashton-on-Mersey. He married (1) Helen, daughter of Lawrence Wilkinson, by whom he had two sons and three daughters; (2) Edith, daughter of Edmund and Anne Robinson of Warrington.

NORMAN, CONOLLY (1853-1908), alienist, born at All Saints' Glebe, Newtown Cunningham, on 12 March 1853, was fifth of six sons of Hugh Norman, rector of All Saints', Newtown Cunningham, and afterwards of Barnhill, both in co. Donegal, by his wife Anne, daughter of Captain William Ball of Buncrana, co. Donegal. Between 1672 and 1733 several members of the Norman family served as mayors of Derry, and two represented the city in parliament. Educated at home owing to delicate health, Norman began at seventeen the study of medicine in Dublin, working at Trinity College, the Carmichael Medical School, and the House of Industry

Hospitals. In 1874 he received the licences of the King's and Queen's College of Physicians and the Royal College of Surgeons of Ireland, becoming a fellow of the latter college in 1878, and of the former in 1890.

Norman's professional life was spent in the care of the insane. In 1874, on receiving his qualifications, he was appointed assistant medical officer in the Monaghan Asylum, and he remained there till 1881. After study at the Royal Bethlem Hospital, London, under (Sir) George Savage (1881-2) he was successively medical superintendent of Castlebar Asylum, co. Mayo (1882-5), and of Monaghan asylum (1885-6). From 1886 till his death he was medical superintendent of the most important asylum in Ireland, the Richmond Asylum, Dublin, where he proved his capacity for management and reform. When he took charge of the Richmond Asylum it was insanitary and overcrowded, and more like a prison than a hospital. He introduced a humane régime, made the wards bright and comfortable, and found regular occupation for some 75 per cent. of the patients. By his advice a large branch asylum was built a few miles away in the country. In 1894, and again in 1896, 1897, and 1898, the asylum was visited by beriberi, the outbreak in 1894 being specially severe. He wrote a very complete article on the clinical features of the disease in 1899 (*Trans. Royal Acad. of Medicine in Ireland*, vol. xvii.). In later years he was interested in the problem of the care of the insane outside asylums. He studied the methods adopted in Ghel in Flanders and elsewhere, and advocated in many papers the inauguration in the United Kingdom of a system of boarding out.

Norman was president of the Medico-Psychological Association of Great Britain and Ireland in 1894, when the annual meeting was held in Dublin. In 1907 he was president of a section of the Medico-Psychological Congress at Amsterdam. At the time of his death he was vice-president of the Royal College of Physicians of Ireland. In 1907 the honorary degree of M.D. was conferred on him by the University of Dublin. He was long an editor of the 'Journal of Medical Science,' contributed many papers on insanity to medical periodicals, and was an occasional contributor to this Dictionary.

Norman had many interests outside his speciality. He read widely, and collected books, engravings, and pewter. He was an indefatigable letter-writer, and a

humorous and whimsical conversationalist.

Norman died suddenly on 23 Feb. 1908, while out walking in Dublin. He was buried in Mount Jerome cemetery, Dublin. He married, on 6 June 1882, Mary Emily, daughter of Randal Young Kenny, M.D., of Killeshandra, co. Cavan. There were no children of the marriage. On St. Luke's Day, 18 Oct. 1910, a memorial with medallion portrait by Mr. J. M. S. Carré, erected by public subscription in the north aisle of St. Patrick's Cathedral, was unveiled by the lord-lieutenant, the earl of Aberdeen. On the same day the subscribers presented to the Royal College of Physicians of Ireland a portrait in oils by Miss Harrison. Neither artist knew Norman, and both portraits are faulty.

[Journal of Mental Science, April 1908; Medical Press and Circular, 4 March 1908; Burke's Landed Gentry of Ireland; private sources and personal knowledge.] R. J. R.

NORMAN, SIR FRANCIS BOOTH (1830-1901), lieutenant-general, younger brother of Sir Henry Wylie Norman [q. v. Suppl. II], was born on 25 April 1830 in London. He entered Addiscombe, and obtained his commission in the Bengal army 8 Dec. 1848. On the mutiny of his regiment he was attached to the 14th (the Ferozepore Sikh) regiment of the Bengal infantry, and remained at Ferozepore during subsequent operations. In 1863 he took part in the second expedition against the Yusafzais at Ambela, and was present at the storming of the Conical hill and at the destruction of Laloo. He was mentioned in despatches, and added the frontier medal with clasp to the Mutiny medal. In the three following years he was engaged during the Bhutan campaign in the capture of Dewangiri and of the stockades in the Gurugaon Pass, serving as assistant quartermaster-general and receiving the clasp and brevet majority. In 1868 he took part in the Hazara campaign as second in command of the 24th (Punjab) regiment, again receiving the clasp. After an interval of ten years the Afghan war (1878-80) brought him fresh opportunities of distinction. He commanded the 24th regiment in the Bazar valley and the defence of Jagdallak, marching with Roberts's force from Kabul to Kandahar and taking part in the battle of Kandahar. Mentioned in several despatches, he received the medal with clasp, the bronze star, a C.B., and brevet colonelcy. During the war with Burma in 1885-6, he commanded the

Bengal brigade of the Upper Burma field force, assisting in the occupation of Mandalay and Bhamo. He was thanked by the government of India and promoted to be K.C.B. He attained the rank of major-general on 1 Sept. 1889, and left India in 1891.

He died on 25 June 1901 at Dulwich; and was buried in West Norwood cemetery. He was twice married: (1) in 1852 to Eliza Ellen, daughter of lieutenant Nisbett, Bengal army, who died at Rawal Pindi in 1870; and (2) in March 1892 to Caroline Matilda, daughter of the Rev. W. W. Cazalet and widow of Major E. F. J. Rennick, Bengal staff corps, who survived him. He left three sons and three daughters, one of the latter, Edith, being the wife of Sir Louis W. Dane, G.C.I.E., C.S.I., lieutenant-governor of the Punjab.

[The Times, 27 June 1901; Indian army lists, and official reports.] W. L.-W.

NORMAN, SIR HENRY WYLIE (1826-1904), field-marshal and administrator, was born in London on 2 Dec. 1826. His father, James Norman, exchanged an adventurous life at sea for business at Havana in Cuba, and then married Charlotte Wylie of Dumfries. He subsequently moved to Calcutta, carrying on his business there until his death in March 1853. His widow died at an advanced age at Sandgate on 13 Sept. 1902. Henry Norman did not enter Addiscombe College (as stated in *The Times*, 27 Oct. 1904), but after a very imperfect education joined his father in Calcutta in 1842 with a strong desire to go to sea, meanwhile taking such clerical work as offered itself. Even at this age, however, he impressed others with the qualities which Earl Roberts regarded as his special gifts, 'extraordinary memory' and 'a natural liking and aptitude for work.' The 'soldierly instincts' within him were kindled by news of Sir Charles Napier's campaign in Sind in 1843, and of Sir Hugh Gough's victories at Maharajpur and Gwalior, and fortune favoured him by bringing him a direct appointment as cadet in the infantry of the Company's Bengal army (1 March 1844). In April he joined the 1st Bengal native infantry as ensign, devoting his whole heart to his regimental duties; and in March 1845 he was transferred to the 31st native infantry (afterwards 2nd Queen's own Rajput light infantry), which remained loyal in 1857. He thus escaped the cruel fate of his brother officers in the 1st native infantry. Throughout his active service he seemed to

possess a charmed life, and was constantly unhurt when men were struck down by his side.

His regiment was stationed at Lahore after the first Sikh war in 1846, as part of the force under Colin Campbell (afterwards Lord Clyde) [q. v.]. He became lieutenant on 25 Dec. 1847, and was soon made adjutant. When Vans Agnew and Anderson were murdered at Multan on 20 April 1848, Norman was on sick leave at Simla, but was at once recalled to his regiment, then stationed at Ferozepore. In the 'war with a vengeance' that followed Norman shared in every incident and battle. He witnessed the opening scene at Ramnagar, took part in Thackwell's inconclusive operations at Sadulapur on 3 Dec. 1848, joined in the confused and bloody mêlée at Chilianwala on 13 Jan. 1849, and shared the conspicuous honour won by his regiment in the decisive attack on Kalra at the crowning victory of Gujarat on 21 Feb. 1849. He was present at the grand surrender of the Sikh army at Rawalpindi, and helped to chase the Afghans back to their hills, finally receiving the Sikh war medal and two clasps. In December 1849 he was brigade-major at Peshawar to Sir Colin Campbell. In 1850 he accompanied Sir Charles Napier on the Kohat pass expedition, and afterwards took part in expeditions against the Afridis, the Mohmands, and the Utman Kheyls. While he was at Panjpao on 15 April 1852 he was specially mentioned in despatches. Becoming deputy assistant adjutant-general and A.D.C. to General Sir Abraham Roberts [q. v.], he was credited in divisional orders (15 Dec. 1853) with 'all the qualifications for a good soldier and first-rate staff officer.'

A brief interlude in Norman's service on the staff occurred when the Santals in 1855 rose against the extortionate money-lenders. He at once joined his regiment, taking part in the suppression of disturbances. In May 1856 he was at headquarters in Calcutta as assistant adjutant-general, and in the following year he reached Simla with the commander-in-chief, General George Anson [q. v.], a few days before news of the outbreak at Meerut and of the arrival of the mutineers at Delhi simultaneously reached headquarters. General Sir Henry Barnard [q. v.] took command of the relief force on the death of Anson (27 May 1857), united his forces at Alipur with those of Sir Archdale Wilson [q. v.] on 7 June, and next day defeated the rebels at Badli-ki-Serai, establishing himself on the Ridge of Delhi in sight of the walled city filled

with some 10,000 mutineers and soon receiving 20,000 more trained sepoys. Chester, the adjutant-general, lay dead amongst the 183 killed and wounded, and upon Norman devolved his duties. From 8 June to 8 Sept., when the arrival and establishment in position of the siege guns enabled the assault to be delivered, Norman was invaluable to the several commanders of the Delhi field force: first to Barnard until he died of cholera on 5 July, then to (Sir) Thomas Reed [q. v.] until he left with the sick and wounded on 17 July, and then to Archdale Wilson until he established his headquarters in the palace of captured Delhi on 21 Sept. Neville Chamberlain [q. v. Suppl. II] arrived on 24 June to assume the duties of adjutant-general, but on 14 July he was severely wounded. Notwithstanding the strain and sufferings of the siege, Norman without any hesitation left Delhi with Greathead's column, and took part in the fighting at Bulandshahr, Aligarh, and Agra. He was able early in November to report his arrival to Sir Colin Campbell, commander-in-chief, and proceed with him as deputy adjutant-general to the relief of Lucknow. In the attack on the Shah Nujeeb on 16 Nov. his horse was shot under him, but he rallied and led some soldiers on the point of retreating; and when the relief was accomplished he was present at the battle of Cawnpore and took part in the defeat of the Gwalior troops (6 Dec. 1857). Then followed the final capture of Lucknow in March 1858, the Rohilkhand campaign (April to May), and the battle of Bareilly (5 May), at which he received his only wound. The cold season campaign in Oudh, 1858-9, found him present at the engagements of Buxar Ghat, Burgudia, Majudia, and on the Rapti, and at the close of these operations the commander-in-chief brought his merits to the notice of the viceroy. Up to this time, indeed, he had been mentioned twenty-three times in despatches or in general orders. But his rewards lagged, because his years were fewer than his services. Even so late as 2 Dec. 1860 he was gazetted as a captain in the new staff corps, on the heels of which followed a brevet majority, 3 Dec., and then a brevet lieutenant-colonelcy on 4 Dec. He became C.B. on 16 August 1859, and A.D.C. to Queen Victoria on 8 Sept. 1863, an honour which he held until 22 March 1869, when he was promoted major-general. Worn out by all he had endured, he proceeded home in December 1859, and was at once welcomed by the press and invited to

Windsor Castle. On 1 Oct. 1860 he was made assistant military secretary to the Duke of Cambridge, who always entertained a high regard for him. In the following year he was ordered back to India to take part in the great scheme of army reorganisation.

From this time his career, which promised so much success in the military service, was gradually diverted to civil administration. As first secretary to the government of India in the military department (12 Jan. 1862–31 May 1870), he had to endure the criticism and attacks of many vested interests affected by the financial stress and the reorganisation schemes of the period following the Mutiny. Stricken with fever, he was sent home in December 1865. Returning to India in 1867, he resumed his secretarial duties and became a major-general on 23 March 1869. From 1 June 1870 to 18 March 1877 he was member of the council of the governor-general of India, and took a prominent part in the discussion of Afghan affairs and the scientific frontier. He advocated on every occasion friendly relations with Russia, forbearance towards the Amir, and scrupulous avoidance of any advance beyond existing frontiers. He never forgot 'the dangers of our position in India,' and urged measures of economy and internal administration in order to keep our forces concentrated and our subjects contented. These views were not in harmony with Lord Lytton's forward policy, and he resigned his office in March 1877. He had been made K.C.B. on 24 May 1873, and was promoted lieutenant-general on 1 Oct. 1877. On 25 Feb. 1878 he was appointed member of the council of India, and when Lord Hartington [q. v. Suppl. II] became secretary of state for India on 28 April 1880 his strenuous opposition to the retention of Kandahar was rewarded with success. On 1 April 1882 he became general, and he was deputed to Egypt to settle various financial questions as to the liability of Indian and British revenues for the Indian contingent. On 30 Nov. 1883 he resigned his post at the India office to take up a colonial appointment as governor of Jamaica, where Lord Derby warned him that 'there will be a great deal to do' (*Letter*, 27 Sept. 1883).

Norman was received coldly on arrival. He bore unknown instructions on the constitutional crisis which had succeeded the resignation of the non-official members of the legislative council owing to the obligation imposed on the island

for paying damages arising out of the seizure of the Florida. Queen Victoria's order in council of 19 May 1884 at least terminated uncertainty if it failed to satisfy hopes. But the introduction of the new representative scheme of legislation was so firmly and tactfully effected that 'the people were satisfied with even the little they had received' (speeches of the chairman of the standing committee for raising funds and others March 1886). For his services he received in May 1887 the G.C.M.G., and the military distinction of G.C.B. in the following month. In 1889 he disinterestedly accepted the governorship of Queensland in order to relieve the home government of a difficulty caused by their unpopular appointment of Sir Henry Blake. In Queensland quiet times succeeded to angry constitutional controversies. The colony was, however, soon involved in financial troubles, and Norman showed his public spirit in offering to share the reduction of salary to which the members of the legislative assembly had to submit. The responsible ministers freely sought his advice, and when he retired after the close of 1895 Mr. Chamberlain expressed his high appreciation of the governor's long and valuable services.

During Norman's term of office in Queensland Lord Kimberley, secretary of state for India, offered him, through Lord Ripon, secretary of state for the colonies, on 1 Sept. 1893, the post of governor-general of India on the resignation of that office by Lord Lansdowne. On 3 Sept. Norman accepted the office, but in the course of the next few days he found that the excitement and anxieties so upset him at the age of nearly sixty-seven years, that he could not expect to endure the strain of so arduous an office for five years. On 19 Sept. he withdrew his acceptance. After his return to England he was employed on various duties and commissions of a less onerous but important character. In December 1896 he was appointed president of a royal commission to inquire into the conditions of the sugar-growing colonies in West India. This involved a cruise round the islands and gratified his taste for the sea, cruising and voyaging having been Norman's chief recreation during his life. His views in favour of countervailing duties on bounty-fed sugar imported into the United Kingdom were not shared by his colleagues. In 1901 he was made governor of Chelsea Hospital, being raised to the rank of field-marshal on 26 June 1902. In the

following year, despite his failing health, he took part in the South African war *commission*. On 26 Oct. 1904 he died at Chelsea Hospital, and was buried with full military honours at Brompton cemetery.

Norman was thrice married: (1) in 1853 to Selina Eliza, daughter of Dr. A. Davidson, inspector-general of hospitals; she died on 3 Oct. 1862 at Calcutta, having had issue four daughters, and one son, Henry Alexander, who died at sea in March 1858; (2) in September 1864 to Jemima Anne (*d.* 1865), daughter of Capt. Knowles and widow of Capt. A. B. Temple; and (3) in March 1870 to Alice Claudine, daughter of Teignmouth Sandys of the Bengal civil service. By her he had two sons, Walter and Claude, who both entered the army, and one daughter. Mural memorial tablets were erected by public subscription in Chelsea Hospital, at Delhi, and in the crypt of St. Paul's cathedral. This last, unveiled on 3 June 1907 by Lord Roberts, bore the simple legend 'Soldier and administrator in India, governor of Jamaica and Queensland, through life a loyal and devoted servant to the state.'

A portrait in oils, painted by Lowes Dickinson for the city of Calcutta, was exhibited at the Royal Academy in 1879. A cartoon portrait of Norman by 'Spy' appeared in 'Vanity Fair' in 1903.

NORMAN-NERUDA, WILMA MARIA FRANCISCA (1839-1911), violinist. [See HALLÉ, LADY.]

NORTHBROOK, first EARL OF. [See BARING, THOMAS GEORGE (1826-1904), viceroy of India.]

NORTHCOTE, HENRY STAFFORD, BARON NORTHCOTE OF EXETER (1846-1911), governor-general of the Australian commonwealth, born on 18 Nov. 1846 at 13 Devonshire St., Portland Place, London, was second son of Sir Stafford Henry Northcote, first earl of Idlesleigh [q.v.]; his mother was Cecilia Frances, daughter of Thomas Farrer, and sister of Thomas Farrer, first Lord Farrer. He went to Eton in 1858 and Merton

College, Oxford, in 1865, graduating B.A. in 1869 and proceeding M.A. in 1873. On leaving Oxford he was appointed to a clerkship in the foreign office on 18 March 1868. In Feb. 1871 he was attached to the joint high commission, of which his father was one of the members and which sat at Washington from Feb. to May 1871, to consider the Alabama claims and other outstanding questions between Great Britain and the United States. The negotiation having resulted in the Treaty of Washington of 8 May 1871, he became secretary to the British member of the claims commission which was constituted under the 12th article of that treaty, and assistant to the British claims agent in the general business of the commission. The commission sat at Washington from Sept. 1871 to Sept. 1873. In Nov. 1876 Northcote became an acting third secretary in the diplomatic service. When Lord Salisbury went as British plenipotentiary to the Constantinople conference at the end of 1876, Northcote accompanied him as private secretary. In Feb. 1877 he was made assistant private secretary to his father, who was then chancellor of the exchequer, and he was private secretary from October 1877 to 15 Mar. 1880. On that date he resigned the public service to stand in the conservative interest for Exeter, the city near which the home of his family lay. He was duly elected and represented Exeter in the House of Commons from 1880 till 1899. From June 1885 till Feb. 1886, in Lord Salisbury's short first government, he was financial secretary to the war office. In Lord Salisbury's second government he held the post of surveyor-general of ordnance from August 1886 to Dec. 1887, resigning his appointment in order to facilitate changes at the war office. He had been given the C.B. in 1880, and in Nov. 1887, after his father's death, he was made a baronet. He was a charity commissioner in 1891-2, and in 1898 was appointed a royal commissioner for the Paris Exhibition of 1900. He was also for a time chairman of the Associated Chambers of Commerce, and became well known and much trusted in business circles. In 1899 he was appointed to be governor of Bombay, and in Jan. 1900 he was raised to the peerage with the title of Baron Northcote of the city of Exeter, next month being made G.C.I.E.

On 17 Feb. 1900 Lord Northcote landed at Bombay, where he served as governor for three and a half years. His tenure of office was marked by 'a famine of unprecedented severity, incessant plague, an empty ex-

chequer, and bad business years generally' (*Times of India*, 5 Sept. 1903). Famine did not completely disappear till 1902-3, and plague was still rife when Northcote left India. He faced the situation with self-denying energy. Immediately on arrival at Bombay he inspected the hospitals, including the plague hospitals, and within a month of his landing went to Gujarat, where the peasantry were in sore straits from the effects of the famine. The district of Gujarat depended largely upon its fine breed of cattle which was in danger of dying out from scarcity of fodder, and one great result of the governor's visit was the establishment, largely on his initiative, of the cattle farm at Charodi, known as the Northcote Gowshala, to preserve and improve the breed. His sympathy with and interest in the small cultivators of the Bombay Presidency were shown by what was perhaps the chief legislative measure of his government, the passing of the Bombay Land Revenue Code Amendment Act, which aroused much criticism on its introduction in 1901. The object of the act was to protect the cultivators in certain famine-stricken districts of the Presidency against the money-lenders, by wiping out the arrears of revenue due from the holder on condition of his holding being forfeited to the government, and then restored to him as occupier on an inalienable tenure. He took other steps in the direction of land revenue reform, doing much to bring the somewhat rigid traditional policy of the Bombay government into harmony with the views of the government of India. In municipal matters, too, he made improvements, though the most important municipal act passed in his time—the District Municipalities Act, by which local self-government in the Mofussil was much enlarged—was a legacy from his predecessor, Lord Sandhurst. Northcote travelled widely through the Bombay Presidency, and he paid a visit to Aden. He was a warm supporter of schools and hospitals, but his efforts were hampered by the impoverished state of the public finances. 'So far as he was able, Lord Northcote drew on his privy purse for money which the State should have furnished, and especially in the administration of relief and in the assistance of charitable undertakings was he able to take a more personally active part than any of his predecessors' (*Bombay Gazette Budget*, 29 Aug. 1903). He was present in 1903 at the Coronation Durbar which celebrated the accession of King Edward VII. When he left India on 5 Sept. 1903 the viceroy,

Lord Curzon, expressed the general feeling, in the message 'Bombay and India are losing one of the most sympathetic and sagacious governors that they have known.'

On 29 Aug. 1903 Northcote had been appointed Governor-General of the commonwealth of Australia. On 21 Jan. 1904, when he was made a G.C.M.G., he was sworn in at Sydney, and he remained in Australia for nearly four years and eight months. Northcote's task in Australia was no easy one. The Commonwealth came into existence on 1 Jan. 1901, and Northcote had had two predecessors (Lords Hopetoun and Tennyson) in three years. He was thus the first to hold his office for an appreciable length of time, and it fell to him largely to establish the position, and to create traditions. Federation was in its infancy. A national feeling as apart from state interests hardly existed, and the difficulties of the governor-general consisted at the outset in the relations of the states to the Commonwealth with resulting friction and jealousies, and in the absence of two clearly defined parties in Australian politics. Mr. Alfred Deakin was prime minister when Northcote reached Australia, but in April (1904) he was succeeded by the labour prime minister of Australia, Mr. John Christian Watson. In the following August Mr. (now Sir) George Reid became prime minister, and in July 1905 Mr. Deakin once more came into office and held it for the rest of Lord Northcote's term. In India Northcote had learnt the difficulty of harmonising the views of the government of a province with those of the central government, and his Indian experience therefore stood him in good stead when called upon to reconcile the claims of Commonwealth and states in Australia, while his earlier foreign office and political training qualified him to deal with political life. In Australia, as in India, he travelled widely. He was determined, as the head of a self-governing Commonwealth, to identify himself with the people in all parts of Australia. During his term of office he travelled through the greater part of every state, visited most county towns, every mining centre, the great pastoral and agricultural districts; and succeeded in obtaining a grasp of the industrial work and life of the people. He averaged in travelling over 10,000 miles a year by land and sea. Especially he made a tour in the Northern Territory and called public attention to this little known and somewhat neglected part of the continent. In Sydney and Melbourne he visited every factory of importance, while in social

life, and in the support of institutions and movements for the public good, he won respect and affection. He laid stress on the importance of defence and of encouraging immigration for the development of the land. Thus amid somewhat shifting politics, by his sincerity and straightforwardness, he attached to the office of governor-general a high standard of public usefulness. His speeches were dignified, enlivened by humour, and excellently delivered. His ample means enabled him to exercise a generous hospitality and a wide benevolence.

After his return from Australia in the autumn of 1908 Northcote took a considerable though not a very prominent part in public life up to the time of his death. He spoke on occasion in the House of Lords, and welcomed to his home visitors from the dominions beyond the seas. He had a singular power of attracting affection, and his good judgment, coupled with entire absence of self-interest, made him a man of many friends. In 1909 he was made a privy councillor, and at the Coronation of King George V he carried the banner of Australia. He died at Eastwell Park, Ashford, Kent, on 29 Sept. 1911, and was buried at Upton Pynes, near Exeter. He married on 2 Oct. 1873 Alice, the adopted daughter of Lord Mount Stephen. He had no issue and the peerage became extinct. A portrait of Northcote, painted by A. S. Cope, R.A., is in possession of Lady Northcote at 25 St. James's Place, London, S.W.

[The Times, 30 Sept. 1911; Foreign Office List; Lovat Fraser, *India under Curzon and after*, 1911; private sources.] C. P. L.

NORTHCOTE, JAMES SPENCER (1821-1907), president of Oscott College and archæologist, born at Feniton Court, Devonshire, on 26 May 1821, was second son of George Barons Northcote of Feniton Court and of Somerset Court, Somerset, by his wife Maria, daughter and coheir of Gabriel Stone of South Brent, Somerset. Educated at Ilmington grammar school (1830-7), he matriculated in 1837 as a scholar from Corpus Christi College, Oxford, where he readily yielded to Newman's influence. Graduating B.A. in 1841 with a first class in the final classical school, and marrying next year, he took holy orders in 1844, and proceeded M.A. Serving as curate in Ilfracombe, he there became intimate with Dr. Pusey, and his doubts of the Anglican position increased.

In 1845 his wife with three of her sisters joined the Roman communion.

Thereupon Northcote resigned his curacy, and he followed their example next year. He was at once appointed master at Prior Park College, Bath, and explained his spiritual perplexities in 'The Fourfold Difficulty of Anglicanism' (Derby, 1846; reprinted 1891; French translation by J. Gordon, 1847). A three years' stay in Italy (1847-50), where Northcote became intimate with G. B. de Rossi, the historian of the catacombs, developed a warm interest in the archæology of Christian Rome.

The next three years were spent at Clifton, and were devoted mainly to literary work. From June 1852 to September 1854 he acted as editor of the 'Rambler,' to which he had contributed since its foundation by his lifelong friend, John Moore Capes, in January 1848, and he helped to edit the 'Clifton Tracts.' On the death of his wife in 1853 Northcote studied for the priesthood at the Oratory, Birmingham, in 1854 and later at the Collegio Pio, Rome, where he pursued his study of Christian antiquities. Ordained priest on 29 July 1855 at St. Dominic's, Stone, near Stafford, he spent the greater part of 1856 in theological studies in Rome, and on his return to England took charge in 1857 of the mission at Stoke-on-Trent. In 1860 he was made canon of St. Chad's Cathedral Church, canon theologian of the diocese of Birmingham in 1862, and on 2 March 1884 he was installed provost of the cathedral chapter of Birmingham. In January 1861 he received from Pope Pius IX the degree of D.D.

Meanwhile in January 1860 Northcote was appointed vice-president of St. Mary's College, Oscott, becoming president in July following. Through the early years of his presidency Oscott College prospered. Imbued with Oxford culture, and holding wise views of education, he remodelled the studies and the life on the lines of the chief English public schools. A swimming bath was provided in 1867, and a gymnasium erected in 1869; and a cricket ground and pavilion were added. In July 1863 he entertained at Oscott Cardinal Wiseman and Monsignor (afterwards Cardinal) Manning at the twenty-fifth anniversary of the college. But difficulties beset the later period of Northcote's career at Oscott. The competition of the Oratory School, Birmingham (opened in May 1859), two epidemics in 1862 and 1868, and the success of Fitzgerald, a dismissed student, in a lawsuit brought against Northcote in 1865 for technical assault, depressed the fortunes of the college. Northcote retired through ill-health

in 1877, and from 1889 the institution was used as an ecclesiastical seminary. Northcote went back on leaving Oscott to his first mission at Stone, removing in 1881 to the mission at Stoke-on-Trent. After 1887 creeping paralysis withdrew him from active work, and he died at the Presbytery, Stoke-on-Trent, on 3 March 1907, being buried at Oscott cemetery, which he had opened in 1863. Northcote married on 10 Dec. 1842 his cousin Susanah Spencer (*d.* June 1853), daughter of Joseph Ruscombe Poole, solicitor, of Bridgewater, and had issue three sons and three daughters, all of whom predeceased him.

Northcote published much on the early Christian antiquities in Rome. Articles on the Catacombs in the 'Rambler' (Jan. and July 1860) gave rise to much discussion. His 'Roma Sotterranea; or an Account of the Roman Catacombs' (1869; 2nd edit. 1878) (with Bishop William Robert Brownlow) was compiled from G. B. de Rossi's Italian work 'Roma Sotterranea'; it remains the standard work in English on the subject. It was translated into German in 1873 (2nd edit. 1879) and into French. Other works by Northcote on the subject are: 1. 'The Roman Catacombs,' 1857; 2nd edit. 1859. 2. 'A Visit to the Roman Catacombs,' 1877; reprinted 1891. 3. 'Epitaphs of the Catacombs,' 1878. He also published: 4. 'A Pilgrimage to La Salette,' 1852. 5. 'Mary in the Gospels' (sermons and lectures), 1867; 2nd edit. 1885; new revised edit. 1906. 6. 'Celebrated Sanctuaries of the Madonna,' 1868 (articles reprinted from the 'Rambler,' 1850-2). 7. 'Sermons,' 1876. With Charles Meynell he published in 1863 'The "Colenso" Controversy from the Catholic Standpoint.' A portrait in oils, executed by J. R. Herbert, R.A., in 1873, hangs in the breakfast parlour at Oscott College. Northcote is commemorated by the 'Northcote Hall' at Oscott, which he inaugurated in 1866.

Northcote, 1866; Catholic Encyclopædia (s.vv. Northcote and Oscott); Cath. Univ. Bulletin, Washington, March-April 1909; Gasquet's Acton and his Circle, pp. xxi and 300-1.] W. B. O.

NORTON, first BARON. [See ADDERLEY, CHARLES BOWYER (1814-1905), president of the board of trade.]

NORTON, JOHN (1823-1904), architect, born on 28 Sept. 1823 at Bristol, was son of John Norton by his wife Sarah Russell. After education at Bristol grammar school he entered as a pupil in 1846 the office in London of Benjamin Ferrey [q. v.] and attended classes of Prof. Thomas Leverton Donaldson [q. v.] at the University of London, where he received in 1848 the first prize from Lord Brougham.

Norton became an associate of the Royal Institute of British Architects in 1850 and fellow in 1857; he was for a time a member of its council, and became president of the Architectural Association for the session 1858-9. He was honorary secretary of the Arundel Society (for producing printed copies of paintings by old masters) throughout its existence (1848-98).

Norton quickly built up a large and lucrative architectural practice in both domestic and ecclesiastical buildings. He was fortunate in finding many patrons of distinction and wealth. For the Maharajah Duleep Singh he built Elveden Hall, Suffolk; for William Gibbs he rebuilt Tyntesfield, Somerset; and for Sir Alexander Acland-Hood, first Baron St. Audries, he designed a house at St. Audries in the same county, as well as a church there. Other works were Badgemore, Oxfordshire, for Richard Ovey; Ferney Hall, Shropshire, for W. Hurt-Sitwell; Horstead Hall, Norfolk, for Sir E. Birkbeck; Nutfield, Surrey, for H. E. Gurney; Monkham, Essex, for H. Ford Barclay; Euston Hall, Suffolk, for the Duke of Grafton; public works and buildings of the new boulevard, Florence; International College, Isleworth; Winter Gardens, &c., at Great Yarmouth and Tynemouth; Langland Bay Hotel, South Wales; South Western Terminus Hotel, Southampton; Fickle Castle, Esthonia; Framlingham Hall, Norfolk; Brent Knoll, Somerset; Summers Place, Sussex; Chew Magna Manor House, Somerset; Town Hall and Constitutional Club, Neath; Training College for the diocese of Gloucester and Bristol.

Among his London designs were the Turf Club, Piccadilly; the Submarine Telegraph Co.'s office, Throgmorton Avenue; the Canada Government Buildings and Victoria Mansions, Westminster; residential mansions, Mandeville Place, W., with several hotels, business premises, and residential flats.

Though not working exclusively in the Gothic style, Norton designed much ecclesiastical work in the Gothic style of the mid-nineteenth century. He designed the

churches of Stapleton, Stoke Bishop, and Frampton Cotterell in Gloucestershire; those at Bourton, High Bridge, and Congresbury in Somersetshire. At Bristol he was responsible for St. Luke's, St. Matthias, Emmanuel (Clifton), and the parish church of Bedminster; and in Wales and Monmouthshire for those at Pontypridd, Neath, Rheola, Ebbw Vale, Blaina, Abertillery, Ystrad Mynach, Penmaen, Llwyn Madoc, Dyffryn, Cwm, and Ysfra. Norton designed St. Matthew's, Brighton; Christ Church, Finchley; St. John's, Middlesbrough; churches at Croxley Green (since increased in size); Lundy Island; Powerscourt, Wicklow; Chevington, near Howick; Bagnères de Bigorre; and Bishop Hannington's Memorial Church, Frere Town, Africa. The C.M.S. Children's Home at Limpsfield, the Royal Normal College for the Blind at Norwood, the County Courts at Williton, Dunster, and Long Ashton in Somerset, and the High Cross at Bristol were also Norton's work.

Norton died on 10 Nov. 1904, and was buried at Bournemouth. He married in 1857 Helen Mary, only daughter of Peter Le Neve Aldous Arnold, by whom he had eight daughters and two sons. The younger son, Mr. C. Harrold Norton, succeeded to his father's practice.

[The Builder, lxxxvii. 526; R.I.B.A. Journal, vol. xii. 3rd series, p. 63; information by Mr. C. Harrold Norton.] P. W.

NOVELLO, CLARA ANASTASIA, COUNTESS GIGLIUCCI (1818-1908), oratorio and operatic prima donna, born in Oxford Street, London, on 10 June 1818, was fourth daughter of Vincent Novello [q. v.] by his wife Mary Sabilla Hehl. Mrs. Mary Victoria Cowden Clarke [q. v. Suppl. I] was her eldest sister. Clara was taken in childhood to York, and was placed under Miss Hill, the leading singer, and John Robinson, organist of the Roman catholic chapel there. Her talents were at once displayed; and on Easter Sunday, when Miss Hill was suddenly indisposed, Clara offered to sing all her solos from memory, and succeeded. In 1829 she became a pupil of Choron's academy in Paris. She always retained the strongest appreciation of her training there; Palestrina's music was much sung, and Clara ascribed her perfect sostenuto to having sung in his motets, and being obliged to hold the suspensions. The academy declined after the revolution of 1830, and Clara, who had had unpleasant experiences of the fighting, returned to England. On 22 Oct. 1832 she

made her first public appearance, in a concert at Windsor, with full success; and in December she took the soprano part in Beethoven's 'Missa Solennis,' a remarkable feat for a girl of fourteen. She was soon among the first singers of the day, being engaged at the whole series of Ancient Concerts, at the Philharmonic Concerts, and the Three Choirs Festival. She sang in a sestet, Grisi leading, at the Handel commemoration in June 1834; Lord Mount-Edgumbe (*Musical Reminiscences*, p. 278) describes her as 'a very young girl with a clear good voice.' Her father's friend, Charles Lamb, though quite unmusical, wrote the lines 'To Clara N.' published in the 'Athenæum,' 26 July 1834. She was left without a rival on the retirement of Catherine Stephens, afterwards countess of Essex [q. v.], in 1835, and took the leading soprano part at all important English concerts. Her voice was a pure clear soprano, extending to D in alt, perfectly trained, perfectly under control, and used with musical science as well as with feeling expression. Handel's music was particularly adapted to her style. Her appearance was attractive; she had exceptionally luxuriant hair, and to lessen the load she cut off half a yard. At the Manchester Festival in September 1836 she had much useful advice from the dying Malibran. Next year Mendelssohn invited her to the Gewandhaus Concerts, Leipzig, where she appeared on 2 Nov. 1837, and several times later. She was well received, and succeeded in making German audiences appreciate Handel's solos. Schumann declared that nothing for years past had given him so much pleasure as Miss Novello's voice, 'every note sharply defined as on the keyboard.' (*Neue Zeitschrift für Musik: Das Musikleben* . . . 1837-8). Mendelssohn wrote that Clara Novello and Mrs. Shaw (her successor next winter) 'are the best concert singers we have heard in Germany for a long time.' She sang also at Berlin, Dresden, Prague (Kühn, *My Musical Recollections*, p. 26), Vienna (Schumann, *Letter to Fischhof*), and Munich. Then visiting Rossini at Bologna, she was advised to study opera for a year; she took lessons of Micheroux at Milan. In 1839 she once more made a concert tour, travelling down the Rhine to Düsseldorf, through North Germany to Berlin, and thence to St. Petersburg. Her first appearance on the stage was at Padua in Rossini's 'Semiramide,' on 6 July 1841. Unqualified successes in Rome, Genoa, and other large Italian cities followed; Rossini sent

specially for her to take the soprano part in his just completed 'Stabat Mater.' Owing to the mismanagement of agents, she was announced to sing at two places—at Rome and Genoa—during the carnival of 1843; the Roman authorities refused a permit to leave the territory and detained her under arrest at Fermo. On her appealing as a British subject to Lord Aberdeen, then English foreign secretary, the matter was arranged by arbitration. Count Gigliucci, the governor of Fermo, fell in love with his prisoner; she agreed to marry him as soon as professional engagements permitted. At Clara Novello's last appearance in Rome she was recalled twenty-nine times; there was some disturbance at Genoa.

In March she returned to England, and appeared in English opera at Drury Lane; also in Handel's 'Acis and Galatea,' and at the Sacred Harmonic Society and other concerts. On 22 Nov. she was married to Count Gigliucci at Paddington parish church, and retired with him to Italy. During the troubles of 1848 their property was confiscated, and the countess resolved to resume her public appearances. In 1850 she sang in opera at Rome; then at Lisbon, and on 18 July 1851 re-appeared in London, singing in Handel's 'Messiah' at Exeter Hall. Her embellishments brought some disapprobation, though her voice was pronounced to have gained in strength, and to have lost nothing of its beauty. She took the place of leading English concert soprano, appearing only once again in England in opera, in 'I Puritani' at Drury Lane on 5 July 1853. At Milan she sang in opera during the carnivals from 1854-6. In England her singing was regarded as the embodiment of the best traditions of the Handelian style; like Mara and Catalani before, and Lemmens-Sherrington after, she was specially distinguished in her rendering of 'I know that my Redeemer liveth,' and she sang the opening phrase in one breath. On the opening of the Crystal Palace, on 10 June 1854, her singing, 'heard to remote corners of the building' (*Athenæum*, 17 June 1854), seemed grander than ever before; probably the finest revelation of her powers was at the Handel Festival there in June 1859. She then determined to retire. After singing in Handel's 'Messiah' at the Crystal Palace, she made her last appearance at a benefit concert at St. James's Hall on 21 Nov. 1860, the final strain being the National Anthem.

In her retirement she lived with her husband at Rome and Fermo. He died on 29 March 1893; she died in her ninetieth

year, on 12 March 1908, at Rome, leaving a daughter, Valeria. Her portrait was twice painted, by her brother Edward Petre Novello, and by Edward Magnus of Berlin. These pictures were reproduced, with photographs, in Clayton's 'Queens of Song,' the memorial article by 'F. G. E.' in 'Musical Times,' April 1908, the Novello centenary number, June 1911, and in her volume of 'Reminiscences' (1910).

[Her posthumous *Reminiscences* (1910), compiled by her daughter Valeria; works and periodicals quoted.] H. D.

NUNBURNHOLME, first BARON.
[See WILSON, CHARLES HENRY (1833-1907), shipowner and politician.]

NUNN, JOSHUA ARTHUR (1853-1908), colonel, army veterinary service, born on 10 May 1853 at Hill Castle, co. Wexford, Ireland, was son of Edward W. Nunn, J.P., D.L. He was educated at Wimbledon school, and served in the royal Monmouthshire engineer militia from 1871 to 1877. In 1874 he entered the Royal Veterinary College at Camden Town, and was admitted M.R.C.V.S. on 4 Jan. 1877, being elected F.R.C.V.S. on 29 April 1886. In 1877 he obtained a certificate in cattle pathology from the Royal Agricultural Society. He was gazetted veterinary surgeon on probation in the army veterinary service on 21 April 1877 and veterinary surgeon to the royal artillery on 24 April 1877, being the last officer to obtain a commission under the old regimental system.

Nunn proceeded to India at the end of 1877, and from September 1879 to August 1880 he took part in the Afghan war as the veterinary officer in charge of transport on the Khyber line of communication. Later, accompanying the expeditionary column in the Lughman valley, he was in charge of the transport base hospital at Gandamak. For these services he gained the war medal.

He was employed on special duty from 1880 to 1885 as a civil servant under the Punjab government, first in the suppression of glanders under the Glanders and Farcy Act, afterwards in connection with the agricultural department of the Punjab as the veterinary inspector. In this capacity he travelled widely to collect all manner of information and statistics about cattle, including folklore and disease. This he embodied in a series of valuable reports: 'Animal Diseases in Rohtak' (1882); 'Diseases in Sialkote and Hazara' (1883); 'Diseases in the Montgomery and Shapur Districts' (1884 and 1885). At the same time he lectured to native students at the

Lahore veterinary college. He left India in 1886, and the government of the Punjab recognised his valuable services in a special minute.

Immediately after leaving India he was ordered to South Africa to investigate 'horse sickness,' which was thought to be due to anthrax. After taking short courses of bacteriology at Cambridge and Paris, he reached South Africa in January 1887 and remained there until October 1888. He proved that the sickness was malarial in type. Engaging meanwhile in the campaign against the Zulus in 1888, he was at the surrender of the chief Somkali at St. Lucia Lagoon.

He returned to India in January 1889, and was appointed inspecting veterinary officer of the Chittagong column during the Chin Lushai expedition. He was mentioned in despatches and was decorated with the Distinguished Service Order, being the first member of the army veterinary service to receive this distinction. At the end of the Chin Lushai campaign he was appointed in 1890 principal of the Lahore veterinary school, where he laboured for six years and laid the foundations of the native veterinary service, being rewarded with the C.I.E. in 1895. Nunn did much to advance the cause of veterinary science in India. Of untiring energy, he was personally popular with varied classes of his comrades.

From December 1896 to August 1905 Nunn was in England, spending part of his time in studying law. He was called to the bar at Lincoln's Inn in November 1899, and was afterwards nominated an advocate of the supreme court of the Transvaal. Again in England, he was from 1901 to 1904 deputy director-general of the army veterinary department, and was principal veterinary officer (eastern command) in 1904-5. From August 1905 he filled a similar position in South Africa, but was transferred to India in June 1906 and was made a C.B. He served in spite of illness till 1907, when he was forced to return to England. He died at Oxford on 23 Feb. 1908. He married in 1907 Gertrude Ann, widow of W. Chamberlain and daughter of E. Kellner, C.I.E.

Nunn, who was joint editor of the 'Veterinary Journal' from 1893 to 1906, published, in addition to the reports noticed above: 1. 'Report on South African Horse Sickness,' 1888. 2. Notes on 'Stable Management in India,' 1896; 2nd edit. 1897. 3. 'Lectures on Saddlery and Harness,' 1902. 4. 'Veterinary First Aid in Cases of Accident or Sudden Illness,' 1903. 5. 'The Use of

Molasses as a Feeding Material,' from the French of Edouard Curot, 1903. 6. 'Diseases of the Mammary Gland of the Domestic Animals,' from the French of P. Leblanc, 1904. 7. 'Veterinary Toxicology,' 1907.

[Veterinary Record, 7 March 1908, p. 649; Veterinary Journal, March 1908, p. 105 (with portrait).] D'A. P.

NUTT, ALFRED TRÜBNER (1856-1910), publisher, folklorist, and Celtic scholar, born in London on 22 Nov. 1856, was eldest and only surviving son of David Nutt (*d.* 1863), a foreign bookseller and publisher, by his wife Ellen, daughter of Robert Carter and grand-daughter of William Miller, publisher, of Albemarle Street, predecessor of John Murray II. His second name commemorated his father's partnership with Nicholas Trübner [*q. v.*]. He was educated first at University College School and afterwards at the College at Vitry le François in the Marne. Having served three years' business apprenticeship in Leipzig, Berlin, and Paris, he in 1878 took his place as head of his father's firm, which, founded in 1829 at 58 Fleet Street, was moved in 1848 to 270-271 Strand. The business, which had been mainly confined to foreign bookselling, soon benefited by young Nutt's energy and enterprise, especially in the publishing department, which he mainly devoted to folklore and antiquities. Among his chief publications were the collection of unedited Scottish Gaelic texts known as 'Waifs and Strays of Celtic Tradition,' the 'Northern Library' of old Norse texts, the 'Tudor Library' of rare sixteenth-century works, the Tudor translations (in sixteenth-century prose), the 'Grimm Library,' the 'Bibliothèque de Carabas,' a critical edition of 'Don Quixote' in Spanish, 'Nutt's Juvenile Library,' the works of W. E. Henley, and the collection of English, Celtic, and Indian fairy tales. He also produced a number of excellent school books. The business was carried on at 57-59 Long Acre, 'At the sign of the Phoenix,' from 1890 to 1912, when it was removed to Grape St., New Oxford St.

Besides possessing much business capacity Nutt was a lifelong student of folklore and of the Celtic languages, and showed scholarship and power of original research in a number of valuable contributions which he made to both studies. His name will be 'definitely associated with the plea for the insular, Celtic, and popular *provenance* of the Arthurian cycle' (*Folklore*, 1910, p. 513). He founded the 'Folklore Journal' (afterwards 'Folk-lore'), was

one of the earliest members of the Folk-lore Society (1879), and was elected president in 1897 and 1898. Besides presidential addresses he contributed many valuable articles to the society's journal, the 'Folk-lore Record,' and in 1892 he edited a volume of 'Transactions' of the International Folk-lore Congress (1891). In 1886 he helped to establish the English Goethe Society. He was one of the founders of the movement which led in 1898 to the formation of the Irish Texts Society. His most important literary productions were: 'Studies on the Legend of the Holy Grail with Special Reference to the Hypothesis of its Celtic Origin' (1888, *Folk-lore Soc.* vol. 23), and two essays on The Irish Vision of the Happy Otherworld and The Celtic Doctrine of Rebirth, appended to 'The Voyage of Bran, son of Ebal, to the Land of the Living, an Old Irish Saga now first edited with Translation by Kuno Meyer' (*Grimm Library*, vols. 4 and 6, 1895-7).

On 21 May 1910, while on a holiday at Melun on the Seine, he was out driving with an invalid son, who fell into the river; Nutt bravely plunged to the rescue but was unfortunately drowned. His wife, Mrs. M. L. Nutt, who had been his secretary for several years, succeeded him as head of the firm. Two sons survived him.

Nutt also wrote: 1. 'The Aryan Expulsion and Return Formula in the Folk and Hero Tales of the Celts' (*Folk-lore Record*, vol. iv. 1881). 2. 'Mabinogion Studies, I. The Mabinogi of Branwen, Daughter of Llyr' (*ib.* vol. v. 1882). 3. 'Celtic and Mediæval Romance,' 1899 (*Popular Studies*, no. 1). 4. 'Ossian and Ossianic Literature,' 1899 (*ib.* no. 3). 5. 'The Fairy Mythology of Shakespeare,' 1900 (*ib.* no. 6). 6. 'Cuchulainn, the Irish Achilles,' 1900 (*ib.* no. 8). 7. 'The Legends of the Holy Grail,' 1902 (*ib.* no. 14). He added notes to Douglas Hyde's 'Beside the Fire, a Collection of Irish Gaelic Folk Stories' (1890); introductions and notes to several volumes of Lord A. Campbell's 'Waifs and Strays of Celtic Tradition'; a preface to Jeremiah Curtin's 'Tales of the Fairies and of the Ghost World'; a chapter on Folk-lore to 'Field and Folk-lore,' by H. Lowerison (1899); introduction, notes, and appendix to Matthew Arnold's 'Study of Celtic Literature' (1910), and notes to Lady Charlotte Guest's 'Mabinogion' (1902; revised and enlarged 1904).

[Obituary notice by E. Clodd in *Folk-lore*, 30 Sept. 1910, pp. 335-7 (with lithograph portrait) and pp. 512-14; *The Times*, 24 May 1910; *Athenæum*, and *Publishers' Circular*, 28 May 1910; *Bookseller*, 27 May 1910; *Who's Who*, 1910.] H. R. T.

O

OAKELEY, SIR HERBERT STANLEY (1830-1903), musical composer, born at Ealing on 22 July 1830, was second son of Sir Herbert Oakeley, third baronet [q. v.]. Educated at Rugby and at Christ Church, Oxford, he graduated B.A. in 1853 and proceeded M.A. in 1856. Oakeley showed an early taste for music, studied harmony with Stephen Elvey while at Oxford, and later visited Leipzig, Dresden, and Bonn, having organ lessons from Johann Schneider, and theory and piano lessons from Moscheles, Plaidy, and others. In 1865 he was elected Reid professor of music in Edinburgh University. He did much to improve the position of the chair; converted the annual 'Reid concert' into a three days' festival; engaged the Hallé orchestra to take part in concerts; gave frequent organ recitals in the music class room; and organised and conducted a University Musical Society. He was also director of music at St. Paul's episcopal church, Edinburgh, and in 1876 he directed

the music at the inauguration of the Scottish national monument to the Prince Consort. He was then knighted by Queen Victoria at Holyrood, and was appointed 'composer to the Queen in Scotland.' To Queen Victoria, who appreciated his work, he dedicated many of his compositions. He received numerous honorary degrees, Mus.Doc. (Oxford, Dublin, St. Andrews, Edinburgh and Adelaide) and LL.D. (Aberdeen, Edinburgh, and Glasgow). He retired from his professorship in 1891, and died unmarried at Eastbourne on 26 Oct. 1903.

Oakeley was an excellent organist, with a marked gift for improvisation. He gave frequent popular lectures on musical subjects, was musical critic to the 'Guardian' 1858-68, and contributed to other journals. He was a prolific composer of vocal and instrumental music. Twenty of his songs were published in a 'Jubilee Album' (1887) dedicated to Queen Victoria. He wrote also twelve part-songs for mixed choir, choruses for male voices and students' songs, and made

choral arrangements of many Scottish national airs. Among his church works are a motet, a 'Morning and Evening Service,' some dozen anthems, a 'Jubilee Cantata' (1887), and several hymn tunes. It is by two of the latter, 'Edina' and 'Abends,' associated respectively with the words 'Saviour, blessed Saviour,' and 'Sun of my Soul, Thou Saviour dear,' that he is best known. 'Edina,' composed in 1862, appeared first in the Appendix to 'Hymns Ancient and Modern,' 1868; 'Abends,' composed in 1871, in the Irish 'Church Hymnal,' edited by Sir R. P. Stewart, Dublin, 1874.

[Life by his brother, Mr. E. M. Oakeley (with portrait), 1904; Hole's Quasi Cursors, 1884 (with portrait); Musical Times, Dec. 1903; Brit. Musical Biog.; Grove's Dict. of Music; Love's Scottish Church Music; personal knowledge.] J. C. H.

O'BRIEN, CHARLOTTE GRACE (1845-1909), Irish author and social reformer, born on 23 Nov. 1845 at Cahirmoyle, co. Limerick, was younger daughter in a family of five sons and two daughters of William Smith O'Brien [q. v.], Irish nationalist, by his wife Lucy Caroline, eldest daughter of Joseph Gabbett, of High Park, co. Limerick. On her father's return in 1854 from the penal settlement in Tasmania, Grace rejoined him in Brussels, and stayed there until his removal to Cahirmoyle in 1856. On her mother's death in 1861 she removed with her father to Killiney, near Dublin, and was his constant companion till his death at Bangor in 1864. From 1864 she lived at Cahirmoyle with her brother Edward, tending his motherless children, until his remarriage in 1880. She then went to live at Foynes on the Shannon, and there devoted herself to literary pursuits. She had already published in 1878 (2 vols. Edinburgh) her first novel, 'Light and Shade,' a tale of the Fenian rising of 1869, the material for which had been gathered from Fenian leaders. 'A Tale of Venice,' a drama, and 'Lyrics' appeared in 1880.

From 1880-1 her interests and pen were absorbed in Irish political affairs, in which she shared her father's opinions. She contributed articles to the 'Nineteenth Century' on 'The Irish Poor Man' (December 1880) and 'Eighty Years' (March 1881). In the spring of 1881 the attitude of the liberal government towards Ireland led her to address many fiery letters to the 'Pall Mall Gazette,' then edited by Mr. John (afterwards Viscount) Morley. Another

interest, however, soon absorbed her activities. The disastrous harvest in Ireland in 1879, combined with Irish political turmoil, led to much emigration to America. At Queenstown, the port of embarkation, female emigrants suffered much from overcrowded lodgings and robbery (see article by Miss O'Brien in *Pall Mall Gazette*, 6 May 1881). Miss O'Brien not only induced the board of trade to exercise greater vigilance but also founded in 1881 a large boarding-house at Queenstown for the reception and protection of girls on the point of emigrating. In order to improve the steamship accommodation for female emigrants, and to study their prospects in America, Miss O'Brien made several steerage passages to America (see her privately printed letter on *The separation of the sexes on emigrant vessels*, addressed to Mr. Joseph Chamberlain, president of the board of trade, 1881). She also established in New York a similar institution to that in Queenstown for the protection of girls. Many experiences during this period found expression in her 'Lyrics' (Dublin, 1886), a small volume of poems, which gives simple pictures of the emigrants and contains some stirring nationalist ballads.

On her retirement from active public work in 1886 Miss O'Brien returned to Ardanoir, Foynes, on the bank of the Shannon, devoting her leisure to writing and to study of plant life; she contributed much on the flora of the Shannon district to the 'Irish Naturalist.' She had joined the Roman communion in 1887. She died on 3 June 1909 at Foynes, and was buried at Knockpatrick. 'Selections from her Writings and Correspondence' was published at Dublin in 1909. Her verses have dignity and grace; her polemical essays are vigorous and direct, and her essays on nature charm by their simple style.

[Charlotte Grace O'Brien, selections from her writings and correspondence, ed. by her nephew, Stephen Gwynn, M.P., 1909 (with memoir and portraits); *The Times*, 5 and 26 June, 1909. Miss O'Brien's works are to be distinguished from those written from 1855 onwards by Mrs. Charlotte O'Brien, which are wrongly attributed in the Brit. Mus. Cat. to Charlotte Grace O'Brien.] W. B. O.

O'BRIEN, CORNELIUS (1843-1906), catholic archbishop of Halifax, Nova Scotia, born near New Glasgow, Prince Edward Island, on 4 May 1843, was seventh of the nine children of Terence O'Brien of Munster by his wife Catherine O'Driscoll of Cork. After school training

he obtained, as a boy, mercantile employment, but at nineteen entered St. Dunstan's College, Charlottetown, to study for the priesthood. In 1864 he passed to the College of the Propaganda in Rome, and concluded his seven years' course in 1871 by winning the prize for general excellence in the whole college. While he was in Rome Garibaldi attacked the city, the Vatican Council was held, and the temporal power fell. O'Brien, who had literary ambition and a taste for verse, founded on these stirring events an historical novel which he published later under the title 'After Weary Years' (Baltimore, 1886). On his return to Canada he was appointed a professor in St. Dunstan's College and rector of the cathedral of Charlottetown, but failing health led to his transfer in 1874 to the country parish of Indian River. There he devoted his leisure to writing, issuing 'The Philosophy of the Bible vindicated' (Charlottetown, 1876); 'Early Stages of Christianity in England' (Charlottetown, 1880); and 'Mater Admirabilis,' in praise of the Virgin (Montreal, 1882). He twice revisited Rome, and in 1882 O'Brien, on the death of Archbishop Hannan, was appointed his successor in the see of Halifax. O'Brien administered the diocese with great energy, building churches and schools, founding religious and benevolent institutions, and taking an active part in public affairs whenever he considered the good of the community demanded it. His hope of seeing a catholic university in Halifax was not realised, but he established a French College for the Acadians at Church Point, and founded a collegiate school, St. Mary's College, in Halifax, which was to be the germ of the future university. He died suddenly in Halifax on 9 March 1906, and was buried in the cemetery of the Holy Cross. A painted portrait is in the archiepiscopal palace in Halifax.

O'Brien, who was elected president of the Royal Society of Canada in 1896, was a representative Irish-Canadian prelate, combining force of character with depth of sentiment and winning the esteem of his protestant fellow-subjects while insisting on what he believed to be the rights of the Roman catholic minority. Advocating home rule for Ireland, he was at the same time a staunch imperialist and a strong Canadian. In addition to the books named he wrote 'St. Agnes, Virgin and Martyr' (Halifax, 1887), his patroness; 'Aminta,' a modern life drama (1890), a metrical novel after the model of 'Aurora Leigh'; and

'Memoirs of Edmund Burke (1753-1820), the first Bishop of Halifax' (1894). The last work called forth a reply, 'Mémoires sur les Missions de la Nouvelle Ecosse' (Quebec, 1895).

[Archbishop O'Brien: Man and Churchman, by Katherine Hughes (his niece), Ottawa, 1906 (with portraits); Morgan, Canadian Men and Women of the Time, 1898; Toronto Globe, 10 March 1906.] D. R. K.

O'BRIEN, JAMES FRANCIS XAVIER (1828-1905), Irish politician, born in Dungarvan, co. Waterford, Ireland, on 16 October 1828, was son of Timothy O'Brien, a merchant there, who owned some vessels which traded between England and Ireland and South Wales. His mother, Catherine, also belonged to an O'Brien family. When Father Mathew, the total abstinence missionary, visited Dungarvan, O'Brien, then aged eight, took the pledge, which he kept till he was twenty-one. He was educated successively at a private school in Dungarvan and at St. John's College, Waterford. In boyhood he adopted Irish nationalist principles of an advanced type. During the disturbances of 1848 he took part in the abortive attack of James Finton Lalor [q. v.] upon the police barrack of Cappoquin. A warrant was issued for O'Brien's arrest, but he escaped to Wales in one of his father's vessels. On his return to Ireland he engaged, at first at Lismore and then at Clonmel, in the purchase of grain for the export business carried on by his father and family. After his father's death in 1853 he gave up this occupation in order to study medicine. In 1854 he gained a scholarship at the Queen's College, Galway, but soon left to accompany a political friend, John O'Leary [q. v. Suppl. II], to Paris, where he continued his medical studies. He attended lectures at the École de Médecine, and visited hospitals—La Pitié, La Charité, Hôtel Dieu. Among the acquaintances he formed in Paris were the artist James MacNeill Whistler [q. v. Suppl. II], John Martin [q. v.], and Kevin Izod O'Doherty [q. v. Suppl. II], members of the Young Ireland party. A failure of health broke off his medical studies. After returning to Ireland in 1856 he sailed for New Orleans, with the intention of seeking a new experience by taking part in William Walker's expedition to Nicaragua. Through the influence of Pierre Soule, then attorney-general for the state of Louisiana, O'Brien joined Walker's staff. He sailed with the expedition to San Juan and up that river

to Fort San Carlos, but Walker made terms without fighting. Returning to New Orleans, O'Brien became a book-keeper there. In 1858 he met James Stephens [q. v. Suppl. II], one of the founders of the Fenian organisation, and Stephens led him to join the local branch. On the outbreak of the American civil war in 1861 he served as assistant-surgeon in a volunteer militia regiment, consisting mainly of Irishmen.

In 1862 he returned to Ireland, and joined the Fenian organisation in Cork, and here he met Stephens again in 1865. He deemed the Fenian rising in 1867 to be premature, but on the night of 3 March 1867 he loyally joined his comrades at the rendezvous on Prayer Hill outside Cork, and led an attack upon the Ballynockan police barracks, which surrendered. The party seized the arms there, and marched on towards Bottle Hill, but scattered on the approach of a body of infantry. O'Brien was arrested near Kilmallock, and taken to Limerick jail. He was subsequently taken to Cork county gaol, and in May tried for high treason. He was convicted, and was sentenced in accordance with the existing law to be hanged, drawn, and quartered. The sentence was commuted to penal servitude for life. O'Brien is said to have been the last survivor of those sentenced to the barbarous punishment provided by the old law of treason. By a new act of 1870, hanging or beheading was appointed to be the sole penalty of the extreme kind. From Mountjoy Prison, Dublin, O'Brien was soon taken with some twenty-nine other political prisoners, chained together in gangs, to Holyhead on a gunboat, whence he was removed to Millbank, where he was kept in solitary confinement for fourteen months. Next he was removed to Portland with others, chained in sets of six. In Portland he worked at stone-dressing. He was finally released on 4 March 1869. On visiting Waterford, and subsequently Cork, he received popular ovations.

Before his arrest O'Brien was manager of a wholesale tea and wine business at Cork. He resumed the post on his release, and was soon appointed a traveller for his firm. Having rejoined the Fenian organisation (finally becoming a member of the supreme council of that body) he combined throughout Ireland the work of Fenian missionary and commercial traveller until 1873. Subsequently he carried on the business of a tea and wine merchant in Dublin, and was at a later period secretary to the gas company at Cork.

Meanwhile he was gradually drawn into the parliamentary home rule movement under Parnell's leadership. In 1885 he became nationalist M.P. for South Mayo, and acted as one of the party treasurers till his death. In the schism of 1891 he seceded from Parnell. Afterwards he became general secretary of the United Irish League of Great Britain, an office which he held for life. He continued member for South Mayo till 1895, when he became member for Cork City and retained the seat till his death. He died at Clapham on 28 May 1905, and was buried in Glasnevin cemetery, Dublin. He was twice married: (1) in 1859 to Mary Louisa Cullimore (*d.* 1866), of Wexford; and (2) in 1870 to Mary Teresa O'Malley. By his first wife he had one son; by his second, three daughters and two sons. A portrait painted by an artist named Connolly belongs to the family.

[Private information; John O'Leary's *Recollections*, 2 vols. 1896.] R. B. O'B.

O'CALLAGHAN, SIR FRANCIS LANGFORD (1839-1909), civil engineer, born on 22 July 1839, was second son of James O'Callaghan, J.P., of Drisheen, co. Cork, by his wife Agnes, daughter of the Rev. Francis Langford. Educated at private schools and at Queen's College, Cork, he received practical engineering training under H. Conybears between 1859 and 1862, when he was employed on railway construction in Ireland and in South Wales. He then entered the public works department of India by competitive examination, and was appointed probationary assistant engineer on 13 June 1862. He became an executive engineer on 1 April 1866, and reached the first grade of that rank in March 1871, becoming superintending engineer, third class, on 1 Jan. 1880, and first class in March 1886. On 9 May 1889 he was appointed chief engineer, first class, and consulting engineer to the government of India for state railways, and on 8 Aug. 1892 he was appointed secretary to the public works department, from which he retired in 1894.

In the course of his thirty-two years' service O'Callaghan was engaged on the Northern Road in the Central Provinces (including the Kanhan bridge); on surveys for the Chanda, Nagpur and Raipur, Nagpur and Chhattisgarh, Sind-Sagor, and Khwaja-Amran railways; and on the construction of the Tirhoot, Punjab Northern (Pindi-Peshawar section), Bolan, and Sind-Pishin railways. He was thanked by the government of India in May 1883 for his work on the Attock

bridge across the Indus, on the completion of which he was made C.I.E. On four subsequent occasions the government tendered O'Callaghan its thanks, viz. for services connected with the question of frontier railways (Feb. 1886), for the construction of the Bolan railway (June 1886), for the erection of the Victoria bridge at Chak Nizam on the Sind-Sagor railway (special thanks, June 1887), and for the construction of the Khojak tunnel and extension of the railway to New Chaman. In 1887 he was commended by the secretary of state for work on the Sind-Sagor state railway. Next year, for the construction of the railway through the Bolan Pass to Quetta, he was made C.S.I. His technical abilities were linked with tact, judgment, and genial temper. On his retirement he returned to England, and was appointed in Sept. 1895 by the colonial office to be the managing member of the Uganda railway committee; and he held the position until the committee was dissolved on 30 Sept. 1903. In 1902 he received the recognition of K.C.M.G.

O'Callaghan was elected an associate of the Institution of Civil Engineers on 12 Jan. 1869, and became a full member on 23 April 1872. He was also a fellow of the Royal Geographical Society. He published in 1865 'Bidder's Earthwork Tables, intended and adapted for the Use of the Public Works Department in India.'

He died suddenly at his residence, Clonmeen, Epsom Road, Guildford, on 14 Nov. 1909, and was buried at Holy Trinity Church, Guildford. He married, on 22 Sept. 1875, Anna Maria Mary (*d.* 1911), second daughter of Lieut.-colonel Henry Claringbold Powell, of Banlahan, co. Cork, and left an only son, Francis Reginald Powell (1880-1910), captain R.E.

[History of Services of Officers of the Indian Public Works Department; Proc. Inst. Civ. Eng., clxxix. 364.] W. F. S.

O'CONNOR, CHARLES YELVERTON (1843-1902), civil engineer, son of John O'Connor of Ardlonan and Gravelmount, co. Meath, was born at Gravelmount on 14 Jan. 1843. He was educated at the Waterford endowed school, was articled at the age of seventeen to John Challoner Smith, and after three years' experience on railway work in Ireland emigrated to New Zealand in 1865. There he was employed as an assistant engineer on the construction of the coach road from Christchurch to the Hokitika goldfields. Gradually promoted, he was appointed in 1870

engineer of the western portion of the province of Canterbury. From 1874 to 1880 he was district engineer for the combined Westland and Nelson districts, and from 1880 to 1883 inspecting engineer for the whole of the Middle Island. In 1883 he was appointed under secretary for public works for New Zealand, and he held that position until May 1890, when he was made marine engineer for the colony.

In April 1891 O'Connor was appointed engineer-in-chief to the state of Western Australia; the office carried with it the acting general managership of the railways, but of this he was relieved at his own request in December 1896, in order that he might devote all his time to engineering work. He remained engineer-in-chief until his death, and in that capacity was responsible for all new railway work. He was a strong advocate of constructing railways quite cheaply in new countries.

The discovery of the Coolgardie goldfield in 1892 led to an extraordinary and rapid development of the state of Western Australia, and in that development O'Connor, as engineer-in-chief, played a part probably second only to that of the premier, Sir John Forrest. In the short period of eleven years he undertook two works of the utmost importance to the colony, namely Fremantle harbour and the Coolgardie water-supply, besides constructing all new railways. He also executed a large number of smaller works, such as bridges, harbours, and jetties, and improvements in the permanent way, alignment, and gradients of the railways.

The Fremantle harbour works, carried out from 1892 to 1902, at a cost of 1,459,000*l.*, made Fremantle, instead of Albany, the first or last calling-place in Australia for liners outward or homeward bound. A safe and commodious harbour, capable of receiving and berthing the largest ocean steamships at all states of the tide and in all weather, was formed by constructing north and south moles of limestone rock and rubble; while an inner harbour with wharves and jetties was provided by dredging the mouth of the Swan river. The Coolgardie water scheme, carried out between 1898 and 1903 at a cost of 2,660,000*l.*, was designed to afford a supply of water to the principal goldfields of the colony. The source is the Helena river, on which, about twenty-three miles from Perth, a reservoir was constructed whence five million gallons of water could be pumped daily through a steel main thirty inches in diameter to Coolgardie,

a distance of 328 miles. O'Connor visited England in 1897 on business connected with this and other work for the colony, and while at home he was made a C.M.G.

The execution of works of this magnitude threw on O'Connor heavy labour and responsibility for which his professional ability and high principle well fitted him, but conflicting influences in the administration and polity of the new colony caused him at the same time anxieties and worries, which ultimately destroyed his mental balance. On 10 March 1902 he shot himself through the head on the beach at Robb's Jetty, Fremantle. He married in 1875 a daughter of William Ness of Christchurch, New Zealand. She survived him, with seven children.

O'Connor was elected a member of the Institution of Civil Engineers 6 April 1880. He wrote numerous reports on engineering matters in the colony, among which may be mentioned two on the Coolgardie water-supply scheme (Perth, 1896) and the projected Australian trans-continental railway (Perth, 1901). The Fremantle harbour works and the Coolgardie water-supply were described in the 'Proceedings of the Institution of Civil Engineers' (clxxiv. 157 and clxii. 50) by O'Connor's successor, Mr. C. S. R. Palmer.

A bronze statue of O'Connor by Pietro Porcelli was erected at Fremantle in 1911.

[Minutes of Proceedings, Inst. Civ. Eng., cl. 444; Engineer, 18 April 1902.] W. F. S.

O'CONNOR, JAMES (1836-1910), Irish journalist and politician, was born on 10 Feb. 1836 in the Glen of Imaal, co. Wicklow, where his father, Patrick O'Connor, was a farmer. His mother's maiden surname was Kearney. After education at an Irish national school, he entered early on a commercial career. He was one of the first to join the Fenian organisation, and when its organ, the 'Irish People,' was established in 1863, he joined the staff as book-keeper. With John O'Leary [q. v. Suppl. II], Thomas Clarke Luby [q. v. Suppl. II], O'Donovan Rossa, and C. J. Kickham [q. v.], and the other officials and contributors, O'Connor was arrested on 15 Sept. 1865 at the time of the seizure and suppression of the paper. Convicted with his associates, he was sentenced to seven years' imprisonment. After five years, spent chiefly in Millbank and Portland prisons, he was released, and became sub-editor to the 'Irishman' and the 'Flag of Ireland,' advanced nationalist papers conducted by Richard Pigott [q. v.]. When Pigott sold these papers to Parnell and the Land League in 1880 and

they were given up, O'Connor was made sub-editor of 'United Ireland,' which was founded in 1881. In December of that year O'Connor was imprisoned with Parnell and other political leaders in Kilmainham.

After the Parnellite split in 1887, 'United Ireland,' which opposed Parnell, was seized by the Irish leader and O'Connor left. He was shortly after appointed editor of the 'Weekly National Press,' a journal started in the interests of the anti-Parnellites. In 1892 he became nationalist M.P. for West Wicklow, and he retained the seat till his death at Kingstown on 12 March 1910.

Though an active journalist, O'Connor published little independently of his newspapers. A pamphlet, 'Recollections of Richard Pigott' (Dublin, 1889), supplies the most authentic account of Pigott's career.

O'Connor was married twice; his first wife with four children died in 1890 from eating poisonous mussels at Monkstown, co. Dublin. A public monument was erected over their grave in Glasnevin. By his second wife, whose maiden name was McBride, he had one daughter.

[Recollections of an Irish National Journalist, by Richard Pigott; Recollections of Pigott, by James O'Connor, 1889 New Ireland, by A. M. Sullivan, p. 263, 10th edition; Recollections of Fenians and Fenianism, by John O'Leary; Recollections, by William O'Brien; Freeman's Journal, Irish Independent, and The Times, 13 March 1910.] D. J. O'D.

O'CONOR, CHARLES OWEN, styled O'CONOR DON (1838-1906), Irish politician, born on 7 May 1838 in Dublin, was eldest son of Denis O'Conor of Belanagore and Clonallis, co. Roscommon, by Mary, daughter of Major Blake of Towerhill, co. Mayo. His family was Roman catholic. A younger son, Denis Maurice O'Conor, LL.D. (1840-1883), was M.P. in the liberal and home rule interest for Sligo county (1868-83).

Charles Owen, after education at St. Gregory's College, Downside, near Bath, matriculated at London University in 1855, but did not graduate. He early entered public life, being elected M.P. for Roscommon county as a liberal at a bye-election in 1860. He sat for that constituency till the general election of 1880. In 1874 he was returned as a home ruler, but, refusing to take the party pledge exacted by Parnell, was ousted by a nationalist in 1880. In 1883 he was defeated by Mr. William Redmond in a contest for Wexford. An active member of parliament, he was an effective though not an eloquent speaker and a leading

exponent of Roman catholic opinion. He frequently spoke on Irish education and land tenure. He criticised unfavourably the Queen's Colleges established in 1845 and the model schools, and advocated separate education for Roman catholics. In 1867 he introduced a measure to extend the Industrial Schools Act to Ireland, which became law next year. He opposed Gladstone's university bill of 1873, and in May 1879 brought forward a measure, which had the support of almost every section of Irish political opinion, for the creation of a new examining university, 'St. Patrick's,' with power to make grants based on the results of examination to students of denominational colleges affiliated to it. This was withdrawn on 23 July on the announcement of the government bill creating the Royal University of Ireland. Of the senate of that body he was for many years an active member, and received the honorary degree of LL.D. in 1892. He was also on the intermediate education board established in 1878.

O'Connor steadily urged a reform of the Irish land laws. During the discussion of the land bill of 1870 he advocated the extension of the Ulster tenant right to the other provinces. He sat on the select committee appointed in 1877 to inquire into the working of the purchase clauses of the Land Act of 1870.

On social and industrial questions he also spoke with authority. He was a member of the royal commissions on the Penal Servitude Acts (1863), and on factories and workshops (1875); and the passing of the Irish Sunday Closing Act of 1879 was principally due to his persevering activity. He seconded Lord Claud Hamilton's motion (29 April 1873) for the purchase by the state of Irish railways.

From 1872 onwards O'Connor professed his adherence to home rule and supported Butt in his motion for inquiry into the parliamentary relations of Great Britain and Ireland in 1874, though admitting that federal home rule would not satisfy nationalist aspirations. He also acted with the Irish leader in his endeavours to mitigate the severity of coercive legislation, though declaring himself not in all circumstances opposed to exceptional laws.

After his parliamentary career ceased in 1880 O'Connor was a member of the registration of deeds commission of 1880, and took an active part in the Bessborough land commission of the same year (see PONSONBY, **FREDERICK GEORGE BRABAZON**). He was a member of both the parliamentary com-

mittee of 1885 and the royal commission of 1894 on the financial relations between Great Britain and Ireland, and became chairman of the commission on the death of Hugh Culling Eardley Childers [q. v. Suppl. I], in 1896. O'Connor held that Ireland was unfairly treated under the existing arrangements. In local government he was also active. He had presided over parliamentary committees on Irish grand jury laws and land valuation in 1868 and 1869, and was elected to the first county council of Roscommon in 1898. He was lord-lieutenant of the county from 1888 till his death. He had been sworn of the Irish privy council in 1881.

O'Connor was much interested in antiquarian studies, and published in 1891 'The O'Connors of Connaught: an Historical Memoir compiled from a MS. of the late John O'Donovan, LL.D., with Additions from the State Papers and Public Records.' He was for many years president of the Antiquarian Society of Ireland, as well as of the Royal Irish Academy. He was president of the Irish Language Society, and procured the insertion of Irish into the curriculum of the intermediate education board.

O'Connor died at Clonallis, Castlereagh, on 30 June 1906, and was buried in the new cemetery, Castlereagh. He married (1) on 21 April 1868, Georgina Mary (*d.* 1872), daughter of Thomas Aloysius Perry, of Bitham House, Warwickshire; and (2) in 1879, Ellen, third daughter of John Lewis More O'Ferrall of Lisard, Edgeworthstown, co. Longford. He had four sons by the first marriage.

[Burke's Landed Gentry of Ireland; Walford's County Families; Men of the Time, 1899; Who's Who, 1906; The Times, 2 and 5 July 1906; Roscommon Journal, 7 July (containing obituaries from Freeman's Journal, Irish Times, &c.); Hansard's Parl. Debates.] G. L. G. N.

O'CONNOR, SIR NICHOLAS RODERICK (1843-1908), diplomatist, born at Dundermott, co. Roscommon, on 3 July 1843, was youngest of three sons of Patrick A. C. O'Connor of Dundermott by his wife Jane, second daughter of Christopher Ffrench of Frenchlawn, co. Roscommon. Educated at Stonyhurst College, and afterwards at Munich under Dr. Döllinger, he entered the diplomatic service in 1866, passed the necessary examination, and after some months of employment in the foreign office was appointed attaché at Berlin, where he attained in 1870 the rank of third secretary. After service at Washington

and Madrid, he returned to Washington on promotion to be second secretary in 1874, and was transferred in 1875 to Brazil, where he was employed on special duty in the province of Rio Grande do Sul in November 1876. In October 1877 he was removed to Paris, where he had the advantage of serving for six years under Lord Lyons. In December 1883 he was appointed secretary of legation at Peking, and on the death of the minister, Sir Harry Parkes [q. v.], in March 1885, assumed charge of the legation for a period of fifteen months. He found himself almost immediately involved in somewhat awkward discussions with the Chinese and Korean governments in regard to the temporary occupation of Port Hamilton, a harbour formed by three islands at the entrance to the Gulf of Pechili, of which the British admiral had taken possession as a coaling station, in view of the apparent imminence of an outbreak of war between Great Britain and Russia. The Chinese and Korean governments were not unwilling to agree to the occupation for a pecuniary consideration on receiving assurances that no permanent acquisition was contemplated, but were threatened by Russia with similar occupations elsewhere if they gave their consent. The question was eventually settled, after the apprehension of war with Russia had disappeared, by the withdrawal of the British occupation in consideration of a guarantee by China that no part of Korean territory, including Port Hamilton, would be occupied by any foreign power. The annexation of Upper Burma to the British Indian empire, proclaimed by Lord Dufferin in 1886, gave rise to an equally embarrassing question. The Chinese government viewed the annexation with great jealousy. The new British possession was, along a great portion of the eastern frontier, continuous with that of China, while on the north it abutted on the vassal state of Tibet. China claimed indeterminate and somewhat obsolete rights of suzerainty over the Burmese, which were still evidenced by a decennial mission from Burma charged with presents to the Emperor. The country contained a considerable and influential Chinese population, and China could easily create trouble by raids into the frontier districts. A friendly arrangement was almost imperative. After a tedious negotiation O'Connor succeeded in concluding an agreement on 24 July 1886, making provision for the delimitation of frontier by a joint commission, for as

future convention to settle the conditions of frontier trade, and agreeing to the continuance of the decennial Burmese mission, in return for a waiver of any right of interference with British authority and rule. Though this agreement was only the preliminary to a series of long and toilsome negotiations, it placed the question in the way of friendly solution. On its conclusion O'Connor, who had been made C.M.G. in Feb. 1886, was created C.B.

After a brief tenure of the post of secretary of legation at Washington, he in Jan. 1887 succeeded (Sir) Frank Lascelles as agent and consul-general in Bulgaria. The principality was at the time in a critical situation. Prince Alexander, whose nerve had been shaken by his forcible abduction, having failed to obtain the Czar's approval of his resumption of power, had abdicated in September 1886, and the government was left in the hands of three regents, of whom the principal was the former prime minister, Stambuloff. For the next few months, in the face of manoeuvres on the part of Russia to prolong the interregnum or procure the selection of a nominee who would be a mere vassal of Russia, vigorous endeavours were made by the regency to obtain a candidate of greater independence, and on 7 July 1887 Prince Ferdinand of Saxe-Coburg was elected, and Stambuloff again became prime minister. O'Connor, who united great shrewdness with a blunt directness of speech, which, although not generally regarded as a diplomatic trait, had the effect of inspiring confidence, exercised a steady influence on the energetic premier. Excellent relations were maintained between them in the course of five years' residence. Among other results was the conclusion in 1889 of a provisional commercial agreement between Great Britain and Bulgaria.

In April 1892 O'Connor was again appointed to Peking, this time in the position of envoy to the Emperor of China, and to the King of Korea. A notable change in the etiquette towards foreign representatives was made by the court in his reception at Peking; he was formally received with the staff of the legation at the principal entrance by the court officials and conducted to a personal audience with the Emperor in the Cheng Kuan Tien Palace. In July 1894 the disputes between China and Japan as to the introduction of reforms in the administration of Korea led to open war between the two countries, and O'Connor's responsi-

bilities were heavy. The Chinese forces were routed by land and sea, and in April 1895 the veteran statesman Li-Hung-Chang concluded the treaty of Shimonoseki, by which the Liao-Tung Peninsula, the island of Formosa, and the Pescadores group were ceded to Japan, China agreeing further to pay an indemnity of 200 millions of taels. Popular excitement in China ran high during these events. The Chinese government provided the foreign legations with guards of native soldiers, who, though perfectly well behaved, did not inspire complete confidence as efficient protectors. The British admiral gave the British legation the additional safeguard of a party of marines. Almost immediately after the ratification of the treaty of Shimonoseki a fresh complication occurred. The French, German, and Russian governments presented to Japan a collective note, urging the restoration to China of the Liao-Tung Peninsula on the ground that its possession, with Port Arthur, by a foreign power would be a permanent menace to the Chinese capital. The course pursued by the British government was not calculated to earn the gratitude of either of the parties principally interested. They declined to join in the representation of the three European powers, but they did not conceal from Japan their opinion that she might do wisely to give way. Japan with much wisdom assented to the retrocession in consideration of an additional indemnity of 30 millions of taels. In recognition of O'Connor's arduous labours he received the honour of K.C.B. in May 1895. Meanwhile the signature of peace was followed by anti-foreign outbreaks in several provinces of China, in one of which, at Kucheng, British missionaries were massacred. The Chinese government, as usual, while ready to pay compensation and to execute a number of men arrested as having taken part in the riot, interposed every kind of obstacle to investigation of the real origin of the outbreaks and to the condign punishment of the officials who secretly instigated or connived at them. In the end, after exhausting all other arguments, O'Connor plainly intimated to the Tseng-li-Yamen that unless his demands were conceded within two days the British admiral would be compelled to resort to naval measures, and a decree was issued censuring and degrading the ex-viceroy of Szechuen.

In Oct. 1895 O'Connor left China to become ambassador at St. Petersburg. In the following year he attended the coronation of the Emperor Nicholas II, who had

succeeded to the throne in November 1894. He received the grand cross of St. Michael and St. George and was sworn a privy councillor in the same year. He was as popular at St. Petersburg as at his previous posts, but towards the close of his residence our relations with Russia were seriously complicated by the course taken by the Russian government in obtaining from China a lease of Port Arthur and the Liao-Tung Peninsula. The discussions, which at one time became somewhat acute, were carried on by O'Connor with his usual tact; but a disagreeable question arose between him and Count Muravieff, the Russian minister for foreign affairs, as to an assurance which the latter had given but subsequently withdrew that Port Arthur, as well as Taliénwan, should be open to the commerce of all nations. This incident and the manner in which Count Muravieff endeavoured to explain it made it on the whole fortunate that in July 1898 an opportunity offered for O'Connor's transference to Constantinople. He had been promoted G.C.B. in 1897.

O'Connor's last ten years of life, which were passed in Constantinople, were very laborious. He worked under great difficulties for the policy of administrative reform, which was strenuously pressed whenever possible by the British government. He succeeded, however, in winning to a considerable extent the personal goodwill and confidence of the Sultan and of the ministers with whom he had to deal, and by persistent efforts cleared off a large number of long outstanding claims and subordinate questions which had been a permanent burden to his predecessors. Among more important questions which he succeeded in bringing to a settlement were those of the Turco-Egyptian boundary in the Sinai Peninsula, and of the British frontier in the hinterland of Aden. His health had never been strong since his residence in China, and in 1907 he came to England for advice, and underwent a serious operation. The strain of work on his return overtaxed his strength, and he died at his post on 19 March 1908. He was buried with every mark of affection and respect in the cemetery at Haidar Pasha, where a monument erected by his widow bears with the date the inscription 'Nicolaus Rodericus O'Connor, Britanniae Regis apud Ottomanorum Imperatorem Legatus, pie obiit.' O'Connor succeeded in May 1897, on the death of his surviving elder brother, Patrick Hugh, to the family estate of Dundermott. He married on 13 April

1887 Minna, eldest daughter of James Robert Hope-Scott [q. v.], the celebrated parliamentary advocate, and of Lady Victoria Alexandrina, eldest daughter of Henry Granville Howard, 14th duke of Norfolk; by her O'Connor had three daughters.

[Burke's Landed Gentry; The Times, 20 March 1908; Foreign Office List, 1909, p. 403; Cambridge Modern History, vol. xii. p. 509; papers laid before Parliament; Annual Register, 1895.] S.

O'DOHERTY, KEVIN IZOD (1823-1905), Irish and Australian politician, born in Gloucester Street, Dublin, on 7 Sept. 1823, was son of William Izod O'Doherty, solicitor, by his wife Anne McEvoy. After a good preliminary education at Dr. Wall's school in Hume Street, Dublin, he entered the School of Medicine of the Catholic university there in 1843. While pursuing his medical studies he identified himself with the Young Ireland movement and contributed to its organ, the 'Nation,' and was one of the founders of the Students' and Polytechnic Clubs, which opposed the constitutional leaders under O'Connell. When John Mitchel [q. v.] seceded from the 'Nation,' and openly advocated revolution, O'Doherty leaned to his views, and when Mitchel's paper, the 'Weekly Irishman,' was suppressed and himself arrested, O'Doherty helped to carry on Mitchel's campaign, chiefly in the 'Irish Tribune,' which he started with Richard Dalton Williams, the first number appearing on 10 June 1848. After five weeks the paper was seized, and O'Doherty and his colleagues were arrested and charged with treason-felony. After two juries had disagreed as to their verdict, he was convicted by a third jury, and sentenced to transportation for ten years to Van Diemen's Land. He arrived in that colony on the Elphinstone with John Martin (1812-1875) [q. v.] in November 1849.

In 1854 O'Doherty received, with the other Young Irelanders, a pardon on condition that he did not return to the United Kingdom. He went to Paris to continue his medical studies, but managed to pay a flying visit to Ireland in 1855. In 1856 his pardon was made unconditional, and having taken his medical degrees in the Royal Colleges of Surgeons and Physicians of Ireland in 1857 and in 1859 he practised his profession for a while in his native city. In 1862 he emigrated to Sydney, New South Wales, soon proceeding to the new colony of Queensland,

and settled in Brisbane. Here he long practised as a physician. He was elected a member of the Queensland Legislative Assembly. In 1877 he was made a member of the legislative council of the colony, but resigned in 1885, and returned to Europe. He was presented with the freedom of the city of Dublin in that year. At Parnell's invitation he was elected nationalist member for North Meath in 1885. But he had lost touch with home politics and in 1888 went back to Brisbane, where he failed to recover his extensive professional connection. His last years were clouded by pecuniary distress. He died on 15 July 1905, leaving his widow and daughter unprovided for. Four sons had predeceased him.

His wife, MARY ANNE KELLY (1826-1910), Irish poetess, daughter of a Galway gentleman farmer named Kelly by his wife, a Miss O'Flaherty of Galway, was born at Headford in that county in 1826. Early in the career of the 'Nation' newspaper she contributed powerful patriotic verses. Her earliest poem in the paper appeared on 28 Dec. 1844 under her original signature 'Fionnuala.' Subsequently she adopted the signature 'Eva.' Of the three chief poetesses of Irish nationality 'Mary' (Ellen Mary Patrick Downing), and 'Speranza' (Jane Elgee, afterwards Lady Wilde [q. v.]), being the other two), 'Eva' was the most gifted. She also wrote much verse, full of patriotism, feeling, and fancy, for the nationalist papers, 'Irish Tribune,' 'Irish Felon,' the 'Irishman,' and the 'Irish People.'

Before O'Doherty was convicted in 1849 he had become engaged to her, and she declined his offer to release her. In 1855 O'Doherty paid a surreptitious visit to Ireland and married her in Kingstown. After her husband's death in 1905 she was supported by a fund raised for her relief by Irish people. Mrs. O'Doherty died at Brisbane on 21 May 1910, and was buried there by the side of her husband. A monument was placed by public subscription over their graves.

'Poems by "Eva" of "The Nation"' appeared in San Francisco in 1877. A selection of her poems was issued for her benefit in Dublin in 1908, with a preface by Seumas MacManus and a memoir by Justin McCarthy.

D. J. O'D.

OGLE, JOHN WILLIAM (1824-1905), physician, born at Leeds on 30 July 1824, was only child of Samuel Ogle, who was engaged in business in that town, and Sarah Rathmell. His father, who was first cousin to Admiral Thomas Ogle and second cousin to James Adey Ogle [q. v.], regius professor of medicine at Oxford was a member of an old Staffordshire and Shropshire family which originally came from Northumberland. John was educated at Wakefield school, from which he passed in 1844 to Trinity College, Oxford, where he graduated B.A. in 1847, and developed sympathy with the tractarian movement. He entered the medical school in Kinnerton Street attached to St. George's Hospital, and became in 1850 a licentiate (equivalent of present member) and in 1855 a fellow of the Royal College of Physicians. At Oxford he proceeded M.A. and B.M. in 1851 and D.M. in 1857. At St. George's Hospital he worked much at morbid anatomy, and was for years curator of the museum with Henry Grey, after whose death in 1861 he became lecturer on pathology. In 1857 he was elected assistant physician, and in 1866 he became full physician, but resigned owing to mental depression in 1876. Cured shortly afterwards by an attack of enteric fever, he returned to active practice, but not to his work at St. George's Hospital, where, however, he was elected consulting physician in 1877.

He was censor (1873, 1874, 1884) and vice-president (1886) of the Royal College of Physicians, and an associate fellow of the College of Physicians of Philadelphia. Although he was an all-round scholarly physician, his main interest lay in nervous diseases. In a lecture on aphasia, or inability to translate thoughts into words, he made some interesting historical references to the cases of Dr. Johnson and Dean Swift. Always a strong churchman, he was on friendly terms with W. E. Gladstone, Newman, Church, Liddon, Temple, and Benson. He was elected F.S.A. on 7 March 1878.

After some years of increasing paralytic weakness, dating from 1899, he died at Highgate vicarage on 8 Aug. 1905, and was buried at Shelfanger near Diss in Norfolk. He married, on 31 May 1854,

Elizabeth, daughter of Albert Smith of Ecclesall, near Sheffield, whose family subsequently took the name of Blakelock. He had five sons and one daughter.

Ogle was active in medical literature. Together with Timothy Holmes [q. v. Suppl. II] he founded the now extinct 'St. George's Hospital Reports' (1866-79) and edited seven out of the ten volumes. He was also editor of the 'British and Foreign Medico-Chirurgical Review.' He contributed widely to the medical papers and societies, making 160 communications to the 'Transactions of the Pathological Society of London' alone. His independently published works were the Harveian oration for 1880 at the Royal College of Physicians, which contains much scholarly information, and a small work 'On the Relief of Excessive and Dangerous Tympanites by Puncture of the Abdomen,' 1888.

[British Medical Journal, 1905, ii. 416; private information.] H. D. R.

O'HANLON, JOHN (1821-1905), Irish hagiographer and historical writer, born in Stradbally, Queen's Co., on 30 April 1821, was son of Edward and Honor Hanlon of that town. Destined by his parents for the priesthood, he passed at thirteen from a private school at Stradbally to an endowed school at Ballyroan, and in 1840 he entered the ecclesiastical college at Carlow. In May 1842 he emigrated with some relatives to Quebec, Lower Canada, and moved in the following August to the state of Missouri, U.S.A. In 1847 he was ordained by Peter Richard Kenrick, archbishop of St. Louis, and spent the next few years as a missionary priest among the Irish exiles of Missouri. His experiences in America are fully described in his 'Life and Scenery in Missouri' (Dublin, 1890). In Sept. 1853, owing to ill-health, he returned to Ireland. From 1854 to 1859 he was assistant-chaplain of the South Dublin Union, and from 1854 to 1880 curate of St. Michael's and St. John's, Dublin. On the nomination of Cardinal McCabe [q. v.] he became, in May 1880, parish priest of St. Mary's, Irishtown, where he remained till his death. In 1891 he revisited America in connection with the golden jubilee of Archbishop Kenrick. Archbishop Walsh conferred on him the rank of canon in 1886. He died at Irishtown on 15 May 1905.

O'Hanlon was devoted to researches in Irish ecclesiastical history, and especially to the lives of the Irish saints. While

still a curate he travelled on the Continent in order to pursue his researches, and visited nearly all the important libraries of England and southern Europe. In 1856 he began to collect material for his great work, 'The Lives of the Irish Saints.' The first volume appeared in 1875, and before his death he issued nine complete volumes and portion of a tenth, besides collecting and arranging unpublished material. Apart from this storehouse of learning, with its wealth of notes and illustrations, O'Hanlon wrote incessantly in Irish reviews and newspapers, and published the following: 1. 'Abridgment of the History of Ireland from its Final Subjection to the Present Time,' Boston (Mass.), 1849. 2. 'The Irish Emigrant's Guide to the United States,' Boston, 1851; new edit. Dublin, 1890. 3. 'The Life of St. Laurence O'Toole, Archbishop of Dublin,' Dublin, 1857. 4. 'The Life of St. Malachy O'Morgair, Bishop of Down and Connor, Archbishop of Armagh,' Dublin, 1859. 5. 'The Life of St. Dymphna, Virgin Martyr,' Dublin, 1863. 6. 'Catechism of Irish History from the Earliest Events to the Death of O'Connell,' Dublin, 1864. 7. 'Catechism of Greek Grammar,' Dublin, 1865. 8. 'Devotions for Confession and Holy Communion,' 1866. 9. 'The Life and Works of St. Oengus the Culdee, Bishop and Abbot,' Dublin, 1868. 10. 'The Life of St. David, Archbishop of Menevia, Chief Patron of Wales,' Dublin, 1869. 11. 'Legend Lays of Ireland,' in verse (by 'Lageniensis'), Dublin, 1870. 12. 'Irish Folk-Lore, Traditions and Superstitions of the Country, with Numerous Tales' (under the same pseudonym), Glasgow, 1870. 13. 'The Buried Lady, a Legend of Kilronan,' by 'Lageniensis,' Dublin, 1877. 14. 'The Life of St. Grellan, Patron of the O'Kellys,' Dublin, 1881. 15. 'Report of the O'Connell Centenary Committee,' Dublin, 1888. 16. 'The Poetical Works of Lageniensis,' Dublin, 1893. 17. 'Irish-American History of the United States,' Dublin, 1902. 18. 'History of the Queen's County,' vol. i. (completed by Rev. E. O'Leary), Dublin, 1907. He also edited Monck Mason's 'Essay on the Antiquity and Constitution of Parliaments of Ireland' (1891), Molyneux's 'Case of Ireland . . . stated' (1893), and 'Legends and Stories of John Keegan' (to which the present writer prefixed a memoir of Keegan), Dublin, 1908.

[Autobiographical letters to present writer and personal knowledge; O'Donoghue's Poets of Ireland, p. 188; Freeman's Journal, 16 May 1905; Brit. Mus. Cat.; Life and

Scenery in Missouri (as stated in text). Information from Rev. J. Delany, P.P. Stradbally.]
D. J. O'D.

OLDHAM, HENRY (1815-1902), obstetric physician, sixth son and ninth child of Adam Oldham (1781-1839) of Balham, solicitor, was born on 31 Jan. 1815. His father's family claimed kinship with Hugh Oldham [q. v.], bishop of Exeter, the founder of Corpus Christi College, Oxford, and of the Manchester grammar school. His mother, Ann Lane, was a daughter of William Stubbington Penny, whose father, Francis Penny (1714-1759), of a Hampshire family, once edited the 'Gentleman's Magazine.' Oldham's younger brother, James, was a surgeon at Brighton whose son, CHARLES JAMES OLDHAM (1843-1907), also a surgeon in that town, invented a refracting ophthalmoscope, and bequeathed 50,000*l.* to public institutions, including the Manchester grammar school, Corpus Christi College, Oxford, and the universities of both Oxford and Cambridge, for the foundation of Charles Oldham scholarships and prizes for classical and Shakespearean study.

Oldham, educated at Mr. Balaam's school at Clapham and at the London University, entered in 1834 the medical school of Guy's Hospital. In May 1837 he became M.R.C.S. England; in September following a licentiate of the Society of Apothecaries; in 1843 a licentiate (corresponding to the present member), and in 1857 fellow, of the Royal College of Physicians of London. He proceeded M.D. at St. Andrews in 1858. In 1849 he was appointed—with Dr. J. C. W. Lever—physician-accoucheur and lecturer on midwifery and diseases of women at Guy's Hospital. Before this appointment he had studied embryology in the developing chick by means of coloured injections and the microscope. After twenty years' service he became consulting obstetric physician. He was pre-eminent as a lecturer and made seventeen contributions to the 'Guy's Hospital Reports,' besides writing four papers in the 'Transactions of the Obstetrical Society of London,' of which he was one of the founders, an original trustee, and subsequently president (1863-5). He invented the term 'missed labour,' that is, when the child dies in the womb and labour fails to come on; but the specimen on which he based his view has been differently interpreted. His name is also associated with the hypothesis that menstruation is due to periodic excitation of the ovaries.

Oldham had an extensive and lucrative

practice in the City of London, first at 13 Devonshire Square, Bishopsgate Street, and then at 25 Finsbury Square; about 1870 he moved to 4 Cavendish Place, W., and in 1899 retired to Bournemouth, where he died on 19 Nov. 1902, being buried in the cemetery there. He was a great walker, an extremely simple eater, and for the last fifteen years of his life never ate meat, fish, or fowl.

He married in 1838 Sophia (*d.* 1885), eldest daughter of James Smith of Peckham, and had six children, four daughters and two sons, of whom one died in infancy and the other is Colonel Sir Henry Hugh Oldham, C.V.O., lieutenant of the honourable corps of gentlemen-at-arms.

[Obstet. Soc. Trans., 1903, xiv. 71; information from Colonel Sir Henry H. Oldham, C.V.O., and F. Taylor, M.D., F.R.C.P.]

H. D. R.

O'LEARY, JOHN (1830-1907), Fenian journalist and leader, born in Tipperary on 23 July 1830, was eldest son of John O'Leary, a shopkeeper of that city, by his wife Margaret Ryan. His sister Ellen is separately noticed. He inherited small house property in Tipperary. After education at the Erasmus Smith School in his native town, he proceeded to Carlow school. At seventeen he entered Trinity College, Dublin, intending to join the legal profession. While he was an undergraduate he was deeply influenced by the nationalist writings of Thomas Davis [q. v.], and he frequently attended the meetings of the Irish Confederation. He became acquainted with James Finton Lalor [q. v.] and the Rev. John Kenyon, two powerful advocates of the nationalist movement. He threw himself with ardour into the agitation of 1848, and taking part in an attack on the police known as the 'Wilderness affair,' near Clonmel, spent two or three weeks in Clonmel gaol. On discovering that he could not become a barrister without taking an oath of allegiance to the British crown, he turned to medicine, and entered Queen's College, Cork, in January 1850, as a medical student. In 1851 he left Cork and went to Queen's College, Galway, where he obtained a medical scholarship and distinguished himself in examinations. While he was in Galway he contributed occasionally to the 'Nation,' but he left the city in 1853 without passing his final examination. He spent the greater part of the following two years in Dublin, and was then in Paris for a year (1855-6).

Meanwhile O'Leary had fully identified himself with the advanced Irish section

under John Mitchel [q. v.]. In Paris he made the acquaintance of John Martin [q. v.], Kevin Izod O'Doherty [q. v. Suppl. II], and other Irishmen of similar views. Returning to Dublin, he came to know the Fenian leaders James Stephens [q. v. Suppl. II] and Thomas Clarke Luby [q. v. Suppl. II], who formed the Fenian organisation called the Irish Republican Brotherhood on St. Patrick's Day, 17 March 1858 (*Recollections*, i. 82).

O'Leary was still irregularly studying medicine, and although he aided in the development of the Fenian movement, and was in sympathy with its aims, he was never a sworn member of the brotherhood. His younger brother Arthur, who died on 6 June 1861, however, took the oath. John frequently visited Stephens in France, and with some hesitation he went to America in 1859 on business of the organisation. In New York in April 1859 he met John O'Mahony [q. v.] and Colonel Michael Corcoran [q. v.], as well as John Mitchel and Thomas Francis Meagher [q. v.]. He contributed occasional articles to the 'Phoenix,' a small weekly paper published in New York, the first avowedly Fenian organ.

In 1860 O'Leary returned to London. The Fenian movement rapidly grew, although its receipts were, according to O'Leary, wildly exaggerated (*Recollections*, p. 135). During its first six years of existence (1858-64) only 1500*l.* was received; from 1864 to 1866, 31,000*l.*; and from first to last, a sum well under 100,000*l.* O'Leary watched the growth of the movement in London between 1861 and 1863.

In 1863 he was summoned to Dublin to become editor of the 'Irish People,' the newly founded weekly journal of Fenianism, which first appeared on 28 Nov. 1863. O'Leary's incisive style gave the paper its chief character. The other chief contributors were Thomas Clarke Luby and Charles Joseph Kickham [q. v.]. Cardinal Cullen [q. v.] and the catholic bishops warmly denounced the Fenian movement and its organ, and O'Leary and his colleagues replied to the prelates defiantly. Bishop Moriarty declared that 'Hell was not hot enough nor eternity long enough' to punish those who led the youth of the country astray by such teaching. After nearly two years the paper was seized on 14 Sept. 1865 by the government. O'Leary, Kickham, Luby, O'Donovan Rossa (the manager), and other leading Fenians were arrested. An informer named Pierce Nagle, who had been employed in the office

of the paper, gave damaging evidence, and O'Leary and others were sentenced to twenty years' imprisonment. He was released after nine years, chiefly spent in Portland. A condition of the release was banishment from Ireland, and he retired to Paris. There he cultivated his literary tastes, and became acquainted with Whistler and other artists and literary men. In 1885 the Amnesty Act enabled him to settle again in Dublin, where his sister Ellen kept house for him till her death in 1889 and where his fine presence was very familiar. Mainly encouraged by his friends, he devoted himself to writing his reminiscences. The book was published in 1896 under the title of 'Recollections of Fenians and Fenianism.' The work proved unduly long and was a disappointment to his admirers. His critical treatment of his associates seemed to belittle the Fenian movement. To the end of his life he pungently criticised modern leaders, and especially various manifestations of the agrarian movement, while retaining his revolutionary sympathies. In the Irish literary societies of Dublin and London he played a prominent part, but chiefly occupied himself till his death in reading and book collecting.

He died at Dublin unmarried on 16 March 1907, and was buried in Glasnevin cemetery, where a Celtic cross has been placed over his grave. His books, papers, and pictures were bequeathed by him to the National Literary Society of Dublin, which transferred the first portrait of him by John B. Yeats, R.H.A., to the National Gallery of that city. He published, besides his 'Recollections,' the following pamphlets: 'Young Ireland, the Old and the New' (Dublin, 1885), and 'What Irishmen should Read, What Irishmen should Feel' (Dublin, 1886); and he also published a short introduction to 'The Writings of James Finton Lalor,' edited by the present writer in 1895. The article on John O'Mahony in this Dictionary was written by him.

York Powell, 1906; Sullivan's New Ireland; Richard Pigott's Recollections of an Irish Journalist, 1882; Irish press and London Daily Telegraph, 18 March 1907; personal knowledge and private correspondence of O'Leary in present writer's possession.]

D. J. O'D.

OLIVER, SAMUEL PASFIELD (1838-1907), geographer and antiquary, born at Boving, Essex, on 30 Oct. 1838, was eldest and only surviving son of William Macjanley Oliver, rector of Boving, by

his wife Jane Weldon. He entered Eton in 1853, and after passing through the Royal Military Academy, Woolwich, he received a commission in the royal artillery on 1 April 1859. In the following year he went out with his battery to China, where hostilities had been renewed owing to the attempt of the Chinese to prevent Sir Frederick Bruce [q. v.], the British envoy, from proceeding up the Pei-ho. Peace was however signed at Peking soon after Oliver's arrival (24 Oct. 1860), and his service was confined to garrison duty at Canton. On the establishment of a British embassy at Peking in 1861 he accompanied General Sir John Michel [q. v.] on a visit to the capital, and subsequently made a tour through Japan. In the following year he was transferred to Mauritius, and thence he proceeded with Major-general Johnstone on a mission to Madagascar to congratulate King Radama II on his accession. He spent some months exploring the island, and witnessed the king's coronation at Antananarivo (23 Sept.). A second brief visit to the island followed in June 1863, when Oliver, on receipt of the news of King Radama's assassination, was again despatched to Madagascar on board H.M.S. Rapid. The history and ethnology of the island interested him, and he devoted himself subsequently to a close study of them. On his return to Mauritius he studied with attention the flora and fauna of the Mascarene islands. In 1864 the volcanic eruption on the island of Réunion gave him the opportunity of recording some interesting geological phenomena. A curious drawing by Oliver of a stream of lava tumbling over a cliff was reproduced in Professor John Wesley Judd's 'Volcanoes, what they are and what they teach' (1881).

Oliver returned to England with his battery in 1865. But his love of adventure would not allow him to settle down to routine work. In 1867 he joined Captain Pym's exploring expedition to Central America. A route was cut and levelled across Nicaragua from Monkey Point to Port Realejo; and it was anticipated that this route might be more practicable than that projected by M. de Lesseps for the Panama canal. At a meeting of the British Association at Dundee on 5 Sept. 1867 Oliver read a paper in support of this view on 'Two Routes through Nicaragua.' His descriptive diary of this journey, 'Rambles of a Gunner through Nicaragua' (privately printed, 1879), was subsequently embodied in a larger volume of vivacious

reminiscences, entitled 'On and Off Duty' (1881).

Archæology now seriously engaged Oliver's attention. From Guernsey, where he was appointed adjutant in 1868, he visited Brittany, and drew up a valuable report on the prehistoric remains at Carnac and other sites (*Proc. Ethnological Soc.* 1871). In 1872 a tour in the Mediterranean resulted in some first-hand archæological observations in Asia Minor, Greece, and Sardinia, published as 'Nuragghi Sardi, and other Non-Historic Stone Structures of the Mediterranean' (Dublin, 1875). Meanwhile Oliver, who had been promoted captain in 1871, was appointed superintendent of fortifications on the Cornish coast in 1873, and there devoted his leisure to elucidating the history of two Cornish castles, 'Pendennis and St. Mawes' (Truro, 1875). After serving on the staff of the intelligence branch of the quartermaster-general's department he was sent to St. Helena on garrison duty. There he resumed his botanical studies, and made a valuable collection of ferns, which he presented to the Royal Gardens, Kew. Impatience of professional routine induced Oliver to resign his commission in 1878. For a time he acted as special artist and correspondent of 'The Illustrated London News' in Cyprus and Syria. But his health had been seriously affected by his travels in malarial countries, and he soon settled down to literary pursuits at home, first at Gosport and later at Worthing. The value of Oliver's work both as explorer and as antiquary was generally recognised. He was elected F.R.G.S. in 1866, became fellow of the Ethnological Society in 1869, and F.S.A. in 1874. He died at Worthing on 31 July 1907, and was buried at Findon. He married on 10 Sept. 1863 at Port Louis, Mauritius, Clara Georgina, second daughter of Frederic Mylius Dick, by whom he had five sons and four daughters.

Oliver's versatile interests prevented him from achieving eminence in any one subject. But his sympathetic volumes descriptive of Malagasy life remain the standard English authority on the subject. In 1866 he published 'Madagascar and the Malagasy,' a diary of his first visit to the island, which he illustrated with some spirited sketches. This was followed by an ethnological study in French, 'Les Hovas et les autres tribus caractéristiques de Madagascar' (Guernsey, 1869). In 'The True Story of the French Dispute in Madagascar' (1885) Oliver passed adverse criticisms on the treatment of the Malagasy by the French colonial

officials. Finally his two volumes on 'Madagascar' (1886), based on authentic native and European sources, give a detailed and comprehensive account of the island, its history, and its inhabitants.

Oliver also edited: 1. 'Madagascar, or Robert Drury's Journal,' 1890. 2. 'The Voyage of François Leguat,' 1891 (Hakluyt Society). 3. 'The Memoirs and Travels of Mauritius Augustus Count de Benyowsky,' 1893. 4. 'The Voyages made by the Sieur Dubois,' 1897 (translation). In addition to these works he assisted in the preparation of 'The Life of Sir Charles MacGregor,' published by his widow in 1888, and from the notes and documents collected by Sir Charles MacGregor he compiled the abridged official account of 'The Second Afghan War, 1878-80' (posthumous, 1908). 'The Life of Philibert Commerson,' which appeared posthumously in 1909, was edited with a short memoir of Oliver by Mr. G. F. Scott Elliot. To this Dictionary he contributed the articles on François Leguat and Sir Charles MacGregor.

[Memoir of Capt. Oliver prefixed to the Life of Philibert Commerson, 1909; S. P. Oliver, On and Off Duty, 1881; Athenæum, 17 Aug. 1907; Worthing Gazette, 14 Aug. 1907; private information from Miss Oliver.]

G. S. W.

OLPHERTS, SIR WILLIAM (1822-1902), general, born on 8 March 1822 at Dartry near Armagh, was son of William Olpherts of Dartry House, co. Armagh. He was educated at Dungannon School, and in 1837 received a nomination to the East India Military College at Addiscombe. He passed out in the artillery, and joined the headquarters of the Bengal artillery at Dum Dum in Dec. 1839. On the outbreak of disturbances in the Tenasserim province of Burma, Olpherts was detached to Moulmein in Oct. 1841 with four guns. Returning at the end of nine months, he was again ordered on field service to quell an insurrection in the neighbourhood of Saugor, and was thanked in the despatch of the officer commanding the artillery for his conduct in action with the insurgents at Jhirna Ghaut on 12 Nov. 1842. Having passed as interpreter in the native languages, Olpherts was given the command of the 16th Bengal light field battery, and joined Sir Hugh Gough's expedition against Gwalior. Olpherts's battery was posted on the wing of the army commanded by General Grey, Lieutenant (Sir) Henry Tombs, V.C. [q. v.], being his subaltern. He was heavily engaged at Punnar on

29 December 1843, and was mentioned in despatches.

For his services in the Gwalior campaign Olpherts received the bronze decoration. Being specially selected by the governor-general, Lord Ellenborough, to raise and command a battery of horse artillery for the Bundelcund legion, he was at once detached with the newly raised battery to join Sir Charles Napier's army in Sind. His march across India, a distance of 1260 miles, elicited Napier's highest praise. In 1846 Olpherts took part in the operations at Kot Kangra during the first Sikh war, when his conduct attracted the attention of (Sir) Henry Lawrence [q. v.], and he was appointed to raise a battery of artillery from among the disbanded men of the Sikh army. He was then hurried off to the Deccan in command of a battery of artillery in the service of the Nizam of Hyderabad, but was soon recalled to a similar post in the Gwalior contingent. In 1851 Olpherts applied to be posted to a battery at Peshawur, where he was under the command of Sir Colin Campbell [q. v.] and took part in the expedition against the frontier tribes. For this service he afterwards received the Indian general service medal sanctioned in 1869 for frontier wars. In the following year (1852) Olpherts took furlough to England, and was appointed an orderly officer at the Military College of Addiscombe.

On the outbreak of the Russian war in 1854 Olpherts volunteered for service, and was selected to join (Sir) William Fenwick Williams [q. v.] at Kars. On his way thither he visited the Crimea. Crossing the Black Sea, he rode over the Zigana mountains in the deep snow; but soon after reaching Kars he was detached to command a Turkish force of 7000 men to guard against a possible advance of the Russians from Erivan by the Araxes river. Olpherts thus escaped being involved in the surrender of Kars. Recalled to the Crimea, he was nominated to the command of a brigade of bashi bazouks in the Turkish contingent. On the conclusion of peace in 1856 he returned to India, and received the command of a horse battery at Benares.

Olpherts served throughout the suppression of the Indian Mutiny (1857-9). He was with Brigadier James Neill [q. v.] when he defeated the mutineers at Benares on 4 June 1857, and accompanied Havelock during the relief of Lucknow. His conduct in the course of that operation was highly distinguished. On 25 Sept. 1857,

after the troops entered the city of Lucknow, Olpherts charged on horseback with the 90th regiment when under Colonel Campbell two guns were captured in the face of a heavy fire of grape. Olpherts succeeded under a severe fire of musketry in bringing up the limbers and horses to carry off the captured ordnance (extract from *Field Force Orders* by GENERAL HAVELOCK, 17 Oct. 1857). Olpherts almost surpassed this piece of bravery by another two days later. When the main body of Havelock's force penetrated to the Residency, the rearguard consisting of the 90th with some guns and ammunition was entirely cut off. However, Olpherts, with Colonel Robert (afterwards Lord) Napier [q. v.], sallied out with a small party, and by his cool determination brought in the wounded of the rearguard as well as the guns. Sir James Outram [q. v.], then in command of the Residency at Lucknow, wrote: 'My dear heroic Olpherts, bravery is a poor and insufficient epithet to apply to a valour such as yours.' Colonel Napier wrote in his despatch to the same effect. From the entry into Lucknow of Havelock's force until the relief by Sir Colin Campbell on 21 Nov. Olpherts acted as brigadier of artillery, and after the evacuation of the Residency by Sir Colin Campbell he shared in the defence of the advanced position at the Alumbagh under Sir James Outram. He took part in the siege and capture of the city by Sir Colin Campbell in March 1858, being again mentioned in despatches for conspicuous bravery. At the close of the campaign Olpherts received the brevets of major and lieutenant-colonel, as well as the Victoria cross, the Indian Mutiny medal with two clasps, and the companionship of the Bath.

In 1859-60 Olpherts served as a volunteer under Brigadier (Sir) Neville Chamberlain [q. v. Suppl. II] in an expedition against the Waziris on the north-west frontier of the Punjab, thus completing twenty years of continuous active service. Olpherts's dash and daring earned for him the sobriquet of 'Hell-fire Jack,' but he modestly gave all the credit for any action of his to the men under him. From 1861 to 1868 he commanded the artillery in the frontier stations of Peshawur or Rawal Pindi, and in that year he returned home on furlough, when he was presented with a sword of honour by the city and county of Armagh. Returning to India in 1872, he commanded successively the Gwalior, Ambala, and Lucknow brigades, but quitted the country in 1875

on attaining the rank of major-general. He was promoted lieutenant-general on 1 Oct. 1877, general on 31 March 1883, and in 1888 became colonel commandant of the royal artillery. Olpherts was raised to the dignity of K.C.B. in 1886 and of G.C.B. in 1900.

He died at his residence, Wood House, Norwood, on 30 April 1902, and was buried at Richmond, Surrey. Olpherts married in 1861 Alice, daughter of Major-general George Cautley of the Bengal cavalry, by whom he had one son, Major Olpherts, late of the Royal Scots, and three daughters.

[The Times, 1 May 1902; Broad Arrow, 3 May 1902; Army and Navy Gazette, 3 May 1902; H. M. Vibart, Addiscombe and its Heroes, 1894; Lord Roberts, Forty-one Years in India, 30th edit. 1898; W. H. Russell, My Diary in India; Sir James Outram's Life; A. M. Delavoye, History of the Ninetieth Light Infantry; Sir W. Lee-Warner, Memoirs of Sir Henry Norman, 1908, p. 90; J. S. O. Wilkinson, The Gemini Generals, 1896; Selections from State Papers in Military Department, 1857-8, ed. G. W. Forrest, 3 vols. 1902.] C. B. N.

OMMANNEY, SIR ERASMUS (1814-1904), admiral, born in London on 22 May 1814, was seventh son, in a family of eight sons and three daughters, of Sir Francis Molyneux Ommanney, well known as a navy agent and for many years M.P. for Barnstaple, by his wife Georgiana Frances, daughter of Joshua Hawkes. The Ommanneys had long distinguished themselves in the navy. Erasmus' grandfather was Rear-Admiral Cornthwaite Ommanney (d. 1801); Admiral Sir John Acworth Ommanney [q. v.] and Admiral Henry Manaton Ommanney were his uncles, and Major-general Edward Lacon Ommanney, R.E., was his eldest brother, while Prebendary George Druce Wynne Ommanney [q. v. Suppl. II] was a younger brother. Ommanney entered the navy in August 1826 under his uncle John, then captain of the Albion, of seventy-four guns, which in December conveyed to Lisbon the troops sent to protect Portugal against the Spanish invasion. The ship then went to the Mediterranean, and on 20 Oct. 1827 took part in the battle of Navarino [see CODRINGTON, SIR EDWARD], for which Ommanney received the medal. The captured flag of the Turkish commander-in-chief was handed down by seniority among the surviving officers, and came eventually into the possession of Ommanney, who in 1890, being then the sole survivor, presented it to the King of Greece, from

whom he received in return the grand cross of the order of the Saviour. In 1833 he passed his examination, after which he served for a short time as mate in the Symondite brig Pantaloon [see SYMONDS, SIR WILLIAM], employed on packet service. On 10 Dec. 1835 he was promoted to lieutenant, and in the same month was appointed to the Cove, frigate, Captain (afterwards Sir James) Clark Ross [q. v.], which was ordered to Baffin's Bay to release a number of whalers caught in the ice. He received the special commendation of the Admiralty for his conduct during this dangerous service. In October 1836 he joined the Pique, frigate, Captain Henry John Rous [q. v.], an excellent school of seamanship; and a year later was appointed to the Donegal, of seventy-eight guns, as flag lieutenant to his uncle, Sir John, commander-in-chief on the Lisbon and Mediterranean stations. He was promoted to commander on 9 Oct. 1840, and from August 1841 to the end of 1844 served on board the Vesuvius, steam sloop, in the Mediterranean, being employed on the coast of Morocco for the protection of British subjects during the period of French hostilities, which included the bombardment of Tangier by the squadron under the Prince de Joinville. He was advanced to the rank of captain on 9 Nov. 1846, and in 1847-8 was employed under the government commission during the famine in Ireland, carrying into effect relief measures and the new poor law.

When Captain Horatio Austin was appointed to the Resolute for the command of the Franklin search expedition in February 1850 he chose Ommanney, whom he had known intimately in the Mediterranean, to be his second-in-command. The Resolute and Ommanney's ship, the Assistance, each had a steam tender, this being the first occasion on which steam was used for Arctic navigation. This expedition was also the first to organise an extensive system of sledge journeys, by means of which the coast of Prince of Wales Land was laid down. On 25 Aug. 1850 Ommanney discovered the first traces of the fate of Sir John Franklin; these on investigation proved that his ships had wintered at Beechey Island. On the return of the expedition to England in October 1851 Ommanney received the Arctic medal, and several years later, in 1868, he was elected a fellow of the Royal Society in recognition of his scientific work in the Arctic. In 1877 he was knighted for the same service. In December 1851 he was appointed deputy

controller-general of the coast-guard, and held this post until 1854, when, on the outbreak of the Russian war, he commissioned the Eurydice as senior officer of a small squadron for the White Sea, where he blockaded Archangel, stopped the coasting trade, and destroyed government property at several points. In 1855 he was appointed to the Hawke, block ship, for the Baltic, and was employed chiefly as senior officer in the gulf of Riga, where the service was one of rigid blockade, varied by occasional skirmishes with the Russian gunboats and batteries. In October 1857 he was appointed to the Brunswick, of eighty guns, going out to the West Indies, and was senior officer at Colon when the filibuster William Walker attempted to invade Nicaragua. The Brunswick afterwards joined the Channel fleet, and in 1859 was sent as a reinforcement to the Mediterranean during the Franco-Italian war. Ommanney was not again afloat after paying off in 1860, but was senior officer at Gibraltar from 1862 until promoted to flag rank on 12 Nov. 1864. In March 1867 he was awarded the C.B.; on 14 July 1871 he was promoted to vice-admiral, and accepted the retirement on 1 Jan. 1875. He was advanced to admiral on the retired list on 1 Aug. 1877. To the end of his life Ommanney continued to take a great interest in geographical work and service subjects, being a constant attendant at the meetings of the Royal Geographical Society, of the Royal United Service Institution, of both of which bodies he was for many years a councillor, and of the British Association. He was also a J.P. for Hampshire and a member of the Thames conservancy. In June 1902 he was made K.C.B.

Ommanney died on 21 Dec. 1904 at his son's residence, St. Michael's vicarage, Portsmouth, and was buried in Mortlake cemetery. He was twice married: (1) on 27 Feb. 1844 to Emily Mary, daughter of Samuel Smith of H.M. dockyard, Malta; she died in 1857; and (2) in 1862 to Mary, daughter of Thomas A. Stone of Curzon Street, W.; she died on 1 Sept. 1906, aged eighty-one. His son, Erasmus Austin, entered the navy in 1863, retired with the rank of commander in 1879, took orders in 1883, and was vicar of St. Michael's, Portsmouth, from 1892 to 1911.

A portrait by Stephen Pearce is in the National Portrait Gallery.

[The Times, 22, 28, and 29 Dec. 1904; Geog. Journal, Feb. 1905; xxv. 221; Proc. Roy. Soc. lxxxv. 335; O'Byrne's Naval Biography; R. N. List.] L. G. C. L.

OMMANNEY, GEORGE DRUCE WYNNE (1819-1902), theologian, born in Norfolk Street, Strand, on 12 April 1819, was younger brother of Sir Erasmus Ommanney [see above]. After education at Harrow (1831-8), where in 1838 he won the Robert Peel gold medal and the Lyonscholarship, he matriculated as scholar from Trinity College, Cambridge, in 1838; graduated B.A. as senior optime and second class classic in 1842; and proceeded M.A. in 1845. Taking holy orders in 1842, he was curate of Edwinstone, Nottinghamshire (1843-9); of Cameley, Somerset (1849-52); of Oldbourne, Wilts (1852-3); of Woodborough, Wilts (1853-8); vicar of Queen Charlton, near Bristol (1858-62); curate in charge of Whitechurch, Somerset (1862-75); and vicar of Draycot, Somerset (1875-88). He was made prebendary of Whitechurch in Wells Cathedral in 1884. He died on 20 April 1902 at 29 Beaumont Street, Oxford, where he had lived in retirement since 1888, and was buried at St. Sepulchre's cemetery, Oxford. He married Ellen Ricketts of Brislington, Bristol, and had no issue.

Ommanney was a voluminous and lucid writer on the Athanasian creed, to which he devoted a large portion of his later life, studying Arabic and visiting the chief European libraries for purposes of research. He was a vigorous champion of the retention of the creed in the church of England services. He supported its claims to authenticity against the critics who ascribed its composition to the eighth and ninth centuries. His published works include: 1. 'The Athanasian Creed: Examination of Recent Theories respecting its Date and Origin,' 1875; new edit. 1880. 2. 'Early History of the Athanasian Creed,' 1880. 3. 'The S.P.C.K. and the Creed of St. Athanasius,' 1884. 4. 'Critical Dissertation on the Athanasian Creed, its Original Language, Date, Authorship, Titles, Text, Reception, and Use,' 1897.

[The Times, 22 April 1902; Guardian, 23 April 1902; Crockford's Clerical Directory, 1902; private information.] W. B. O.

ON SLOW, WILLIAM HILLIER, fourth EARL OF ONSLOW (1853-1911), governor of New Zealand, born at Bletsoe, Bedfordshire, on 7 March 1853, was only son of George Augustus Cranley Onslow (d. 1855) of Alresford, Hampshire, who was great-grandson of George Onslow, first earl [q. v.], grandson of Thomas Onslow, second earl, and nephew of Arthur George Onslow, third earl. His mother was

Mary Harriet Ann, eldest daughter of Lieut.-general William Fraser Bentinck Loftus of Kilbride, co. Wicklow, Ireland. He succeeded his great-uncle as fourth earl in 1870. Educated at Eton, he entered Exeter College, Oxford, in Easter term 1871, and left after rather more than a year without sitting for the university examinations. A conservative in politics, he was a lord-in-waiting to Queen Victoria in Lord Beaconsfield's administration at the beginning of 1880, and he represented the local government board in the House of Lords; he was again a lord-in-waiting under Lord Salisbury in 1886-7. In February 1887 he was appointed by Lord Salisbury parliamentary under-secretary of state for the colonies, representing the colonial office in the House of Lords. Sir Henry Holland was then secretary of state for the colonies, and when in February 1888 he was raised to the House of Lords as Lord Knutsford, Lord Onslow was transferred as parliamentary secretary to the board of trade. While he was at the colonial office, in April 1887, the first colonial conference took place, of which he was a vice-president. He was also a delegate to the sugar bounties conference in 1887-8, and in 1887 he was made K.C.M.G.

Onslow was not long at the board of trade, for on 24 Nov. 1888 he was appointed governor of New Zealand, and assumed office on 2 May 1889, being made G.C.M.G. soon after. He held the office till the end of February 1892. He was a successful and popular governor, businesslike and straightforward; and the New Zealanders appreciated his frankness of character and his open-air tastes. He encouraged acclimatisation societies, and used his personal influence to establish island preserves for the native birds of New Zealand. There was one change of ministry during his term of office, the administration of Sir Harry Atkinson [q. v. Suppl. I] being at the beginning of 1891 succeeded by that of John Ballance [q. v. Suppl. I], and some appointments to the upper house which the governor made on the advice of the outgoing premier were the subject of criticism by the opposite party (see *H. of C. Return*, No. 198, May 1893). Otherwise his government was free from friction. In New Zealand his younger son was born (13 Nov. 1890), and he paid the Maoris the much appreciated compliment of giving to the child the Maori name of Huia, and presenting him for adoption into the Ngatihua tribe in the North Island in September 1891.

In 1895, when the unionists were returned to power, he became parliamentary under-

secretary of state for India, and remained at the India Office till 1900, when he went back to the colonial office in the same position, Mr. Joseph Chamberlain being secretary of state. He took part in the colonial conference of 1902, and he acted as secretary of state during Mr. Chamberlain's visit to South Africa. In 1903 he obtained cabinet rank as president of the board of agriculture, and was made a privy councillor. As head of an office he proved himself to be hard-working and shrewd. His appointment synchronised with the passing of the Board of Agriculture and Fisheries Act, 1903, which transferred the control of the fishery industry from the board of trade to the board of agriculture. Onslow took a strong personal interest in the new duties which devolved on the board. For the care of agriculture he was well fitted by his own private inclinations and pursuits, and he paid much attention to the question of railway rates so far as they affected farmers.

In 1905 he succeeded Albert Edmund Parker, third earl of Morley [q. v. Suppl. II], as chairman of committees in the House of Lords, and held that post till the Easter recess of 1911, when he retired on account of failing health. Unlike his immediate predecessor in the chairmanship he did not dissociate himself from party politics, but his politics were too genial to give offence, and in his official room there was no political atmosphere. He was rapid yet patient in the transaction of business, took great care in the selection of members and chairmen for committees on bills, and fully maintained the reputation of the House of Lords committees for justice and integrity. Onslow was chairman of the small holdings committee appointed by the board of agriculture in 1905; he was also chairman of the executive committee of the Central Land Association, and in 1905-6 he was president of the Royal Statistical Society. Onslow was an alderman of the London county council (1896-9) and for a time leader of the moderate party in the council; he was also an alderman of the city of Westminster (1900-3), and he had adequate sympathetic knowledge of municipal questions.

At Clandon, Surrey, the family home, Onslow was a good landlord and neighbour. He held the office of high steward of Guildford. He was a keen sportsman and a good whip, being a member of the Coaching and the Four-in-Hand Clubs, and in all respects a good representative of the country gentleman. He died on 23 Oct. 1911 at his son's house at Hampstead, and was buried at Merrow near Guildford, a memorial service

being held at St. Margaret's, Westminster. He married on 3 Feb. 1875 Florence Coulston Gardner, elder daughter of Alan Legge, third Lord Gardner, and had two sons and two daughters.

His portrait, painted by the Hon. John Collier, is at 7 Richmond Terrace, and an engraving of it at Grillion's Club. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1883.

[The Times, 24 Oct. 1911; Gisborne's New Zealand Rulers, 1897 (portrait); Colonial Office List; Who's Who; Burke's Peerage; Walford's County Families; private sources.] C. P. L.

ORCHARDSON, SIR WILLIAM QUILLER (1832-1910), artist, born in Edinburgh on 27 March 1832, was only surviving son of Abram Orchardson, tailor, by his wife Elizabeth Quiller. The artist traced his father's family to a Highland sept named Urquhartson. His mother's family of Quiller was of Austrian origin.

On 1 Oct. 1845, when thirteen and a half, he entered the art school in Edinburgh known as the Trustees' Academy on the recommendation of John Sobieski Stuart [q. v.]. He enrolled himself as an 'artist.' The master of the Academy, Alexander Christie, A.R.S.A., taught ornament and design, and John Ballantyne, R.S.A., took the antique, life and colour classes. They were not inspiring teachers, but Orchardson made rapid progress. Erskine Nicol, Thomas Faed, James Archer, Robert Herdman and Alexander Fraser were amongst his fellow students, and gave him the stimulus of friendly rivalry. In February 1852 Robert Scott Lauder [q. v.] succeeded Christie as master, and Orchardson, whose name remained without a break on the roll until the close of the session 1854-5, enjoyed in his final years of pupilage the benefits of Lauder's fine taste and wide knowledge of art. The younger students who gathered about Lauder—Chalmers, McTaggart, Cameron, Pettie, MacWhirter, Tom and Peter Graham—while they influenced Orchardson's work, regarded him as their leader. At this period Orchardson was neither a very regular attendant nor a very hard worker. It is said that he seldom finished a life-study; but when he did it was masterly and complete, and it evoked the applause of his fellows. He took an active part in the sketch club founded by Lauder's early pupils, and formed enduring friendships with the members, more especially with Tom Graham [q. v. Suppl. II] and John Pettie [q. v.].

Orchardson began to exhibit at the Royal

Scottish Academy as early as 1848, and his pictures showed great promise. 'George Wishart's Last Communion' (exhibited in 1853) was a wonderful performance for a youth of less than twenty-one, yet his work failed to impress academicians. His temperament combined ambition with a certain aloofness; and after a short trial of residence in London, he settled there for good in 1862. Within a few months he was joined by his friend John Pettie, and from 1863 to 1865 these two, with Tom Graham who had also gone south, and Mr. C. E. Johnston, another Edinburgh friend, shared a house, 37 Fitzroy Square.

For some time the art of Orchardson and Pettie, while each possessed qualities of its own, was very similar in character. Both found their subjects in past history, with its picturesque costumes and accessories, and shared the technical qualities due to Scott Lauder's training. Their work soon attracted the attention of connoisseurs, Orchardson's 'Challenged' (1865) being his first popular triumph. Orchardson's pictures proved subtler and more distinguished than Pettie's, and in a greater degree he devoted himself to subjects directly suggested by literature. Shakespeare and Scott were favourite sources, and amongst his work of this kind were 'Hamlet and Ophelia' (1865), 'Christopher Sly' (1866), 'Talbot and the Countess of Auvergne' (1867), 'Poins, Falstaff and Prince Henry' (1868), and 'Ophelia' (1874). Like most of his early associates, Orchardson was no mere illustrator of his text. His pictures had always a true pictorial and æsthetic basis for the dramatic situations they embodied. In 1868 Orchardson was elected A.R.A., and in 1870 he paid a long visit to Venice—his only stay abroad of any duration. The result was a number of pictures, 'The Market Girl from the Lido' (1870), 'On the Grand Canal' (1871), and 'A Venetian Fruit-Seller' (1874), of a more realistic kind than any of his previous paintings. 'Toilers of the Sea' (1870) and 'Flotsam and Jetsam' (1876) showed a like character and suggested a growing independence of literary suggestion. To the Academy of 1877 he sent 'The Queen of the Swords,' which, while originating in a description in 'The Pirate,' belonged in conception and sentiment to the painter alone. In it his earlier style culminated and it inaugurated the work on which his reputation finally rested. Orchardson was at once made R.A. When the picture was exhibited in the Paris Exhibition next year, together with his

'Challenged' (1865), it evoked in the French art public an admiration which his later work made lasting.

Every year now added to Orchardson's reputation. His drawing, always constructive and real, attained a more incisive elegance; his sense of design grew thoroughly architectonic, especially in the use of blank spaces; his colour lost its tendency to grey-ness and became, in M. Chesneau's happy phrase, 'as harmonious as the wrong side of an old tapestry'; and his appreciation of character and dramatic situation acquired an absolute sureness. His technical equipment, if limited in certain directions, was eventually wellnigh perfect in its kind. Henceforth his subjects were divided into incidents in the comedy of manners (sometimes gay but more often grave, and usually touched with a delicate irony) and incidents from the careers of the great. The situation was always an epitomised expression of the interplay of character and circumstance rather than a rendering of a particular event, and the effect was highly dramatic. The first of his social pieces, 'The Social Eddy: Left by the Tide' (1878), was followed a year later by the intensely dramatic 'Hard Hit,' one of his most notable achievements. In 1880, 'Napoleon on board the Bellerophon'—purchased by the Chantrey Trustees—made a deep and enduring impression and became through engravings perhaps the most widely known of his works. Other themes from French manners or history were 'Voltaire' (1883), 'The Salon of Madame Récamier' (1885), 'The Young Duke' (1889), and 'St. Helena, 1816; Napoleon dictating the Account of his Campaigns' (1892). With these may be grouped the dramatically conceived and coloured 'Borgia' (1902), and some lighter pieces such as 'A Tender Chord' (1886), 'If Music be the Food of Love' (1890), and 'Rivalry' (1897), in which the actors wear the costume of the past. During this period the artist also presented with poignant feeling domestic drama in modern clothes and surroundings. Notable examples of such work are the 'Mariage de Convenience' series (1884 and 1886), 'The First Cloud' (1887), 'Her Mother's Voice' (1888), and 'Trouble' (1898).

At the same time Orchardson's insight into character, subtlety of draughtsmanship, and distinction of design made him a fascinating portrait painter. The more important of his portraits belong to the last three decades of his career, and during his latest years he painted little else.

The charming portrait of Mrs. Orchardson (1875); the 'Master Baby'—the artist's wife and child (1886); the spirited rendering of himself standing before his easel, painted for the Uffizi in 1890; 'Sir Walter Gilbey' (1891); and 'H. B. Ferguson, Esq.' in the Dundee Gallery are splendid proofs of his skill in portraiture. Save 'Master Baby,' these were all three-quarter lengths; but the full lengths of 'Sir David Stewart' (1896), in his robes as lord provost of Aberdeen, and of 'Lord Peel' (1898), when speaker of the House of Commons, are hardly less effective. Later portraits like 'Sir Samuel Montagu' (1904) and 'Howard Coles, Esq.' (1905) were often only of the head and shoulders, but if rather weaker and thinner in handling than earlier efforts they revealed an even subtler apprehension of character.

After his marriage in 1873 Orchardson lived successively at Hyndford House, Brompton Road, at 1 Lansdowne Road, Notting Hill, and at 2 Spencer Street, Victoria, and in 1888 or 1889 he settled finally at 13 Portland Place, where he built a splendid studio. For some twenty years from 1877 he had also a country house, Ivyside, at Westgate-on-Sea, Kent, where he built another studio, in which some of his most famous pictures were painted. After 1897 he occupied Hawley House, Dartford, Kent.

Besides honorary membership of the Royal Scottish Academy, which was conferred on him in 1871, Orchardson received many honours from foreign art societies. He was made a D.C.L. of Oxford in 1890, and in 1907 he was knighted. He died at 13 Portland Place, London, on 13 April 1910. Only a fortnight before he had completed, with an effort, the portrait of Lord Blyth, which appeared in the Academy after his death. He was buried at Westgate-on-Sea.

Orchardson married on 8 April 1873, at St. Mary Abbots, Kensington, Ellen, daughter of Charles Moxon of London; she survived him with four sons and two daughters, and was granted a civil list pension of 80*l.* in 1912. The eldest son, Mr. C. M. Q. Orchardson, is an artist.

Of distinguished appearance, if of slight physique, Orchardson was very active and lithe. In early life he hunted, and at Westgate he became a devotee of tennis, for which he had an open court built. He was also a keen angler, especially with the dry fly, and latterly took to golf. Indoors he played billiards and talked with penetrating insight. Apart from the portrait of himself in the Uffizi, there are others by Tom

Graham (seated half length, in Lady Orchardson's possession), by J. H. Lorimer (in Scottish National Portrait Gallery), and by his son, as well as a bronze bust by E. Onslow Ford [q. v. Suppl. II], which belongs to Mrs. Joseph. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1898. By way of memorial, a reproduction of Ford's bust is to be placed by public subscription in the Tate Gallery and a plaque in the crypt of St. Paul's Cathedral.

Four of Orchardson's best pictures are in the Tate Gallery, London, and he is represented by characteristic examples in the permanent collections in Glasgow, Dundee, Aberdeen, and Edinburgh. The 'Voltaire' was included in Mr. Schwabe's gift to Hamburg and the larger version of 'The First Cloud' was acquired for the art gallery at Melbourne, Victoria. Sixty-eight pictures, illustrating every phase of his art, except the charcoal drawings and studies in which his draughtsmanship was often seen at its best, were brought together at the winter exhibition of the Royal Academy in 1911.

ORD, WILLIAM MILLER (1834-1902), physician, born on 23 Sept. 1834 at Brixton Hill, was elder of the two sons of George Ord, F.R.C.S., of an old Border family, by his wife Harriet, daughter of Sir James Clark, a London merchant. After education at King's College school, where he distinguished himself in classics, he entered the medical school of St. Thomas's Hospital in 1852. There he soon came under the influence of (Sir) John Simon [q. v. Suppl. II], surgeon at the hospital and afterwards professor of pathology. They remained professional and personal friends to the end of their days. Ord graduated M.B. at London University in 1857. After being house surgeon, surgical registrar, and demonstrator of anatomy at St. Thomas's Hospital, he became lecturer on zoology and assistant physician and joint lecturer on physiology on 8 Sept. 1870; he was dean of the medical school (1876-87) and largely instrumental in its success. He was physician from 1877 until 1898, when he was elected consulting physician.

In early life Ord had joined his father in general practice, but already in 1869, when he became M.R.C.P., had started as a consultant. In 1875 he became F.R.C.P., and proceeded M.D. of London in 1877.

Ord's name is intimately connected with the elucidation of the disease now known as myxœdema. In 1873 Sir William Gull [q. v.] described its symptoms in a paper 'on a cretinoid state supervening in adult life in women.' In 1877, in a contribution 'on myxœdema, a term proposed to be applied to an essential condition in the "cretinoid" affection occasionally observed in middle-aged women,' Ord showed that the essential cause of the disease was atrophy or fibrosis of the thyroid gland. The name myxœdema which has been adopted was based on the belief that there was an excess of mucin in the tissues; this, however, has been shown not to be constant throughout the disease. Ord was subsequently chairman of the committee of the Clinical Society of London appointed in 1883 to investigate the subject of myxœdema (report issued 1888), and gave the Bradshaw lecture at the Royal College of Physicians in 1898 'On Myxœdema and Allied Conditions.' He was a censor of the college in 1897-8.

Ord was a clinical teacher of the first rank, a busy consultant, and extremely active in medical life in London. He was secretary of the committee which prepared the second edition of the official 'Nomenclature of Diseases' issued by the Royal College of Physicians of London in 1880; in the following year he was secretary of the medical section of the International Medical Congress held in London, and in 1885 he was president of the Medical Society of London. He was also chairman of the committee of the Royal Medical and Chirurgical Society which drew up the 'Report on the Climates and Baths of Great Britain' (vol. i. 1895; vol. ii. 1902).

Failing health obliged him to give up practice and retire to the village of Hurstbourne Tarrant near Andover in 1900. He died at his son's house at Salisbury on 14 May 1902, and was buried there in the London Road cemetery.

Ord married (1) in 1859 Julia, daughter of Joseph Rainbow of Norwood; she died in 1864, leaving two daughters and one son; (2) Jane, daughter of Sir James Arndell Youl [q. v. Suppl. II]. There were two daughters by the second marriage.

Ord edited the collected works of Dr. Francis Sibson [q. v.]. He published 'Influence of Colloids upon Crystalline Forms

and Cohesion' (1879) and 'On some Disorders of Nutrition related with Affections of the Nervous System' (1885), and made many contributions to current medical literature. He also took a keen interest in natural history, as may be seen in his oration to the Medical Society in 1894, entitled 'The Doctor's Holiday.'

[St. Thomas's Hosp. Rep. 1902, xxxi. 349; *Lancet*, 1902, i. 1494; information from his son, W. W. Ord, M.D.] H. D. R.

O'RELL, MAX (pseudonym). [See BLOUET, LÉON PAUL (1848-1903), humorous writer.]

ORMEROD, ELEANOR ANNE (1828-1901), economic entomologist, born at Sedbury Park, West Gloucestershire, on 11 May 1828, was youngest daughter of George Ormerod [q. v.] by his wife Sarah, daughter of John Latham, M.D. (1761-1843) [q. v.]. Three of her seven brothers, George Wareing, William Piers, and Edward Latham, are noticed separately. Of her two sisters, Georgiana enthusiastically co-operated in her work till her death on 19 Aug. 1896.

Eleanor Ormerod was educated at home in elementary subjects by her mother, who instilled in all her children strong religious feeling and artistic tastes. Latin and modern languages, in which she became an adept, Eleanor studied by herself. She early cherished a love of flowers, showed unusual powers of observation, and made free use of her father's library. With her sister Georgiana she studied painting under William Hunt, and both became efficient artists.

As a child Eleanor aided her brother William in his botanical work, and was soon expert in preparing specimens. But it was not, according to her own account, until 12 March 1852, when she obtained a copy of Stephens's 'Manual of British Beetles,' that she began the study of entomology, and laid the foundation for her researches into insect life. In 1868 she actively aided the Royal Horticultural Society in forming a collection illustrative of economic entomology, and for her services received in 1870 the silver Flora medal. To the International Polytechnic Exhibition at Moscow in 1872 she sent a collection of plaster models (prepared by herself) as well as electrotypes of plants, fruits, leaves, and reptiles, for which she was awarded silver medals and also received the gold medal of honour from Moscow University.

After the death of the father, on 9 Oct. 1873, the Ormerod family was broken up.

Eleanor and her sister Georgiana lived together at Torquay, and then at Dunster Lodge, Spring Grove, Isleworth, where they were near Kew Gardens and in close touch with Sir Joseph and Lady Hooker. At Isleworth Miss Ormerod undertook a comprehensive series of meteorological observations. She was the first woman to be elected fellow of the Meteorological Society (1878). The sisters finally removed to Torrington House, St. Albans, in September 1887.

In the spring of 1877 Miss Ormerod issued the pamphlet, 'Notes for Observations of Injurious Insects,' which was the first of twenty-four 'Annual Reports of Observations of Injurious Insects' (1877-1900). With a view to the preparation of these reports she carried on till her death a large correspondence with observers all over the country and in foreign lands. Her reports, fully illustrated, were printed at her own expense and sent free to her correspondents and to all public bodies at home and abroad that were interested in the subject. A 'General Index of the Annual Reports' (1877-1898) was compiled by Mr. Robert Newstead, subsequently lecturer on medical entomology in Liverpool University. At the same time Miss Ormerod was generous in advice, notably on insect pests, to all correspondents who sought her counsel. Many of those from abroad she hospitably entertained on their visits to this country. She led an especially useful crusade against the ox-warble fly and the house sparrow or 'avian rat,' and she showed how these and other farm and forest, garden and orchard pests could best be resisted.

From 1882 to 1892 Miss Ormerod was consulting entomologist to the Royal Agricultural Society of England. On the day of her assuming the office (June 1882) she met with an accident at Waterloo railway station which resulted in permanent lameness. Her first official work was to prepare, with her sister, 'six diagrams illustrating some common injurious insects, with life histories and methods of prevention,' which were issued by the society.

Her work was incessant, and she declined the help of a coadjutor. She greatly valued the co-operation in her scientific efforts of Professor Westwood, life president of the Entomological Society, of Dr. C. V. Riley, entomologist of the department of agriculture, U.S.A., and of Professor Huxley. With Huxley she sat from 1882 to 1886 on the committee of economic entomology appointed by the education department, and

gave important advice as to the improvement of the collections in the South Kensington and Bethnal Green Museums.

Miss Ormerod also lectured with success. From October 1881 to June 1884 she was special lecturer on economic entomology at the Royal Agricultural College, Cirencester, delivering six valuable lectures on insects. Ten lectures delivered at South Kensington Museum were published as 'Guide to the Methods of Insect Life' (1884). In 1889 she lectured at the Farmers' Club, of which she was elected an honorary member.

Miss Ormerod's activities did not lessen in her last years, although the death of her sister in 1896 greatly depressed her. Many honours were awarded her by agricultural societies in all parts of the world. On 14 April 1900 she was made hon. LL.D. of Edinburgh, being the first woman to receive the honour, and being greeted by the vice-chancellor, Sir Ludovic Grant, 'as the protectress of agriculture and the fruits of the earth, a beneficent Demeter of the nineteenth century.' Although so energetic in public work, Miss Ormerod had little sympathy with the agitation for woman's suffrage. She died at Torrington House, St. Albans, of malignant disease of the liver, on 19 July 1901, and was buried at St. Albans.

In addition to the 'Annual Reports' and 'The Cobham Journals,' abstracts and summaries of meteorological observations, made by Miss Caroline Molesworth, 1825-1850 (Stanford, 1880), she published 'A Manual of Remedies and Means of Prevention for the Attacks of Insects on Food Crops, Forest Trees, and Fruit' (1881; 2nd edit. 1890); 'Injurious Fruit and Farm Insects of South Africa' (1889); 'A Text Book of Agricultural Entomology, being a Plain Introduction to the Classification of Insects and Methods of Insect Life' (1892); 'Hand Book of Insects Injurious to Orchard and Bush Fruits' (1898); and several important papers on ox bot or warble fly, all being comprised in 'Flies Injurious to Stock' (i.e. sheep, horse, and ox) (1900) her latest work.

A lifelike oil painting of Miss Ormerod in academic costume (1900) hangs in Edinburgh University court room. To the university she presented a set of insect diagrams, hand-painted by her sister Georgiana, and a collection of insect cases furnished by herself, besides bequeathing unconditionally a sum of 5000*l*. This money has been applied to general purposes. An offer to the university by her executor of her fine working library, on condition that

her bequest should be devoted to scientific objects, was refused.

Soc. Journal*, vol. 62, 1901; *Men and Women of the Time*, 1899.] R. W.

ORR, MRS. ALEXANDRA SUTHERLAND (1828-1903), biographer of Brown- ing, born on 23 Dec. 1828 at St. Petersburg, where her grandfather, (Sir) James Boniface Leighton, was court physician, was second daughter of Frederic Septimus Leighton (1800-1892), a doctor of medicine, by his wife Augusta Susan, daughter of George Augustus Nash of Edmonton. Frederic Leighton, Lord Leighton [q. v. Suppl. I], was her only brother. She was named Alexandra after her god- mother the Empress of Russia. The family travelled much in Europe, and Alexandra was educated mostly abroad. Her health was always delicate. On account of her defective sight, most of her very considerable knowledge was acquired by listening to books read aloud to her. She married on 7 March 1857 Sutherland George Gordon Orr, commandant of the 3rd regiment of cavalry, Hyderabad contingent, and accom- panied him to India. They were there during the Mutiny, and Mrs. Orr had a narrow escape from Aurungabad, her ultimate safety being due to the fidelity of Sheikh Baran Bukh. Orr died on 19 June 1858, worn out by the sufferings and privations endured in the Mutiny. He was gazetted captain and brevet major and C.B. on the day of his death. Mrs. Orr then rejoined her father, who, after sojourns in Bath and Scarborough, finally settled in London in 1869.

Mrs. Orr's main interests lay in art and literature, and in social intercourse with artists and men of letters. Already in the winter of 1855-6 she had met, in Paris, the poet Robert Browning, with whom her brother was on intimate terms from early manhood. The poet's acquaintance with Mrs. Orr was renewed at intervals until 1869, when, both having fixed their residence in London, they became close friends. For many years he read books to her twice a week. Shortly after its formation in 1881, Mrs. Orr joined the Browning Society, became a member of the committee wrote notes on various difficult points in Browning's poems, and was generous in money donations. The most important fruit of the connection was her illuminating

'Handbook to the Works of Robert Browning' (1885; 3rd edit. 1887); written at the request of some members of the society, and with the encouragement and help of the poet, the book is a kind of descriptive index, based partly on the historical order and partly on the natural classification of the various poems' (cf. Pref. 1885). The scheme of classification owed something to the suggestion of John Trivett Nettleship [q. v. Suppl. II]. The sixth edition (1892, often reprinted) embodied Mrs. Orr's final corrections.

In 1891 Mrs. Orr published her well-planned 'Life and Letters of Robert Browning,' largely based on material supplied by Browning's sister. Since 1891 new letters of the poet have come to light, but Mrs. Orr's biography retains the value due to personal knowledge and judgment. A new edition, revised and in part rewritten by (Sir) Frederic G. Kenyon, was published in 1908. Mrs. Orr's estimate of Browning's religious opinions gave rise to discussion, and she answered her critics in an article in the 'Contemporary Review' (Dec. 1891). To that and other periodicals Mrs. Orr contributed occasional articles on art and literature, as well as on 'Women's Suffrage,' of which she was a strong opponent.

After her father's death in 1892 Mrs. Orr continued to live in the house which he had occupied, 11 Kensington Park Gardens, until her death on 23 Aug. 1903. She was buried in Locksbrook cemetery, Bath, beside her parents.

Her portrait as a young widow was painted by her brother Frederic (Lord) Leighton in 1860. It was exhibited at the Royal Academy in 1861. 'Leighton wrote that it was more admired than anything else. It is now at Leighton House, Kensington. There is a reproduction in Mrs. Russell Barrington's 'Life and Letters of Frederic Leighton,' 1906, vol. ii. Another portrait, painted by Leighton about 1889, is in the possession of Mrs. Orr's sister, Mrs. Augusta Matthews. They are both fine pictures of a beautiful woman.

[The Times, 26 and 31 Aug. 1903; Mrs. Russell Barrington, *Life, Letters and Work of Frederic Leighton*, 2 vols. 1906; private information.]

E. L.

OSBORNE, WALTER FREDERICK (1859-1903), painter, was the son of William Osborne, R.H.A., a popular painter of animals, by Anne Woods, his wife. He was born in 1859 at 5 Castlewood Avenue, Rathmines, Dublin, which was his home for the whole of his life. His general education was acquired at Rathmines school, under

the Rev. C. W. Benson. His first training in art was obtained in the schools of the Royal Hibernian Academy, where he won the Albert prize in 1880 with 'A Glade in the Phoenix Park.' In 1881, and again in 1882, he won the Taylor scholarship of 50% per annum, given by the Royal Dublin Society, the chief reward open only to art students of Irish birth. With the help of this scholarship he proceeded to Antwerp, where he studied for two years under Verlat. On his return home he set himself to paint, in water-colour, pastel, and oil, the life of the English and Irish fields and streets. He spent his summers in the rural parts of England, in Sussex, Berkshire, Warwickshire, Norfolk, and other districts where subjects unspoiled by commerce, and farmhouses ready to accept a 'paying guest,' were to be found. These scenes he painted with sincerity, delicacy, and truth, and his pictures soon became widely popular, especially among artists. He painted, too, in Brittany, in the neighbourhood of Quimper, while his pictures of street life in Dublin helped to increase his reputation. He was a regular contributor to the exhibitions of the Royal Hibernian Academy and of the Royal Academy (1886-1903), his contributions to the latter being chiefly portraits. In 1895 he and the writer of this article made a tour in Spain, where he found subjects for several excellent drawings in water-colour and sketches in oil. A year later he travelled in Holland with the same companion and painted canal scenes in Amsterdam. During the last ten years of his life he was much sought after as a portrait painter, a form of art for which he showed a remarkable gift. Among his sitters were Lord Houghton, now marquess of Crewe, K.G., Lord Ashbourne, Lord Powerscourt, K.P., Sir Thomas Moffett, Serjeant Jellett, the duke of Abercorn, K.G., Sir Frederick Falkner, Sir Walter Armstrong, and many ladies. The portrait of the duke of Abercorn, a full length in a duke's parliamentary robes, was left unfinished at the painter's death. It is in the Masonic Hall, Dublin. In 1900 Osborne was offered knighthood in recognition of his distinction as a painter. He was elected an associate of the Royal Hibernian Academy in 1883, and a full member in 1886. He was delightful in every relation of life and enjoyed great popularity with all his friends. To his powers as an artist he added those which go with a vigorous, athletic body, and had fate made him a professional cricketer, he would probably have acquired fame as a bowler.

He died at 5 Castlewood Avenue, Rathmines, Dublin, on 24 April 1903, of double pneumonia, and was buried in Mount Jerome cemetery. He was unmarried, and left considerable savings behind him.

The National Gallery of Ireland owns four of his subject pictures in oil: 'The Lustre Jug,' a cottage interior with children; 'A Galway Cottage'; 'In County Dublin'; and 'A Cottage Garden'; also two water-colour drawings, 'The Dolls' School' and 'The House-builders'; as well as many pencil drawings. 'Life in the Streets: Hard Times' (R.A. 1902) was bought by the Chantry bequest. His own portrait by himself hangs in the collection of Irish national portraits, with his portraits in chalk and pencil of Miss Margaret Stokes and Thomas Henry Burke [q.v.], the under-secretary to the lord-lieutenant.

[Personal knowledge.]

W. A.

O'SHEA, JOHN AUGUSTUS (1839–1905), Irish journalist, born on 24 June 1839 at Nenagh, co. Tipperary, was son of John O'Shea, a well-known journalist in the south of Ireland, who was long connected with the 'Clonmel (afterwards Nenagh) Guardian,' and published a volume of poems entitled 'Nenagh Minstrelsy' (Nenagh, 1838). After receiving his elementary education in his native town, O'Shea was sent on 31 Oct. 1856 to the Catholic University then recently established in Dublin under the direction of John Henry (afterwards cardinal) Newman. In his 'Roundabout Recollections' O'Shea has given an account of his residence at the university, with sketches of its rector, professors, and fellow students. In 1859 O'Shea migrated to London, and sought work as a journalist. His love of adventure led him to become a special correspondent. In 1860 he represented an American journal at the siege of Ancona, defended by the papal troops, and he described part of the Austro-Prussian war. Settling in Paris, he acted for some time as a correspondent of the 'Irishman' newspaper, then conducted by Richard Pigott [q.v.]. For this paper, and for the 'Shamrock,' a small magazine owned by the same proprietor, O'Shea wrote many of his best stories and sketches, especially the 'Memoirs of a White Cravat' (1868). His usual signature was 'The Irish Bohemian.' In 1869 he joined the staff of the London 'Standard,' and for many years was one of its most active special correspondents. In his 'Iron-Bound City' (1886), perhaps the best of his books, he gives a graphic account of his adventures during

the Franco-German war. He was in Paris through the siege. His subsequent services to the 'Standard' included reports of the Carlist war, of the coronation of the king of Norway, and of the famine in Bengal. Many of his articles were republished in independent books. He left the 'Standard' after twenty-five years association. Henceforth he wrote occasional articles in various English and Irish papers, including the 'Freeman's Journal' and 'Evening Telegraph' of Dublin. He was long a regular member of the staff of the 'Universe,' an Irish catholic paper published in London. Keenly interested in his native country he was a prominent member of Irish literary societies and a frequent lecturer. An attack of paralysis disabled him in his last years, and a fund was raised by the Irish Literary Society of London to relieve his wants. He died at his home in Jeffreys Road, Clapham, on 13 March 1905, and was buried in St. Mary's cemetery, Kensal Green. He was twice married, his second wife and a daughter surviving him.

O'Shea's admirable sense of style, his dash and wit, distinguish his writing and suggest a touch of Lever's spirit. He was a witty conversationalist and raconteur and an admirable public speaker. His chief publications are: 1. 'Leaves from the Life of a Special Correspondent,' 2 vols. 1885. 2. 'An Iron-Bound City, or Five Months of Peril and Privation,' 2 vols. 1886. 3. 'Romantic Spain: a Record of Personal Experience,' 2 vols. 1887. 4. 'Military Mosaics: a Set of Tales,' 1888. 5. 'Mated from the Morgue: a Tale of the Second Empire,' 1889. 6. 'Brave Men in Action' (in collaboration with S. J. McKenna), 1890; new edit. 1899. 7. 'Roundabout Recollections,' 2 vols. 1892.

[Men and Women of the Time, 1899; Freeman's Journal, and The Times, 14 March 1905; Brit. Mus. Cat.; Reg. of Catholic University, Dublin; O'Donoghue's Poets of Ireland; works mentioned in text; personal knowledge.]

D. J. O'D.

O'SHEA, WILLIAM HENRY (1840–1905), Irish politician, born in 1840, was only son of Henry O'Shea of Dublin by his wife Catharine, daughter of Edward Craneach Quinlan of Rosana, co. Tipperary. His parents were Roman catholics. Educated at St. Mary's College, Oscott, and at Trinity College, Dublin, he entered the 18th hussars as cornet in 1858, retiring as captain in 1862. On 24 Jan. 1867 he married Katharine, sixth and youngest daughter

of the Rev. Sir John Page Wood, second baronet, of Rivenhall Place, Essex, and sister of Sir Evelyn Wood. In 1880 O'Shea was introduced by The O'Gorman Mahon [q. v.] to Parnell, who shortly afterwards made the acquaintance of Mrs. O'Shea. Suspicions of an undesirable intimacy between them caused O'Shea in 1881 to challenge Parnell to a duel. His fears however were allayed by his wife. Meanwhile in April 1880 O'Shea had been elected M.P. for county Clare, professedly as a home ruler. But his friendly relations with prominent English liberals caused him to be distrusted as a 'whig' by more thorough-going nationalists. In Oct. 1881 the Irish Land League agitation reached a climax in the imprisonment of Parnell and others as 'suspects' in Kilmainham gaol, and in April 1882 O'Shea, at Parnell's request, interviewed, on his behalf, Gladstone, Mr. Joseph Chamberlain, and other leading members of the government, arranging what has since been called the 'Kilmainham Treaty.' The basis of the 'treaty' was an undertaking on Parnell's part, if and when released, to discourage lawlessness in Ireland in return for the promise of a government bill which would stop the eviction of Irish peasants for arrears of rent. This arrangement was opposed by William Edward Forster, the Irish secretary, who resigned in consequence, and it ultimately broke down. In 1884 O'Shea tried without success to arrange with Mr. Chamberlain a more workable compromise between the government and Parnell, with whom O'Shea's social relations remained close.

At the general election in Nov. 1885 O'Shea stood as a liberal without success for the Exchange division of Liverpool. Almost immediately afterwards, in Feb. 1886, he was nominated by Parnell for Galway, where a vacancy occurred through the retirement of Mr. T. P. O'Connor, who, having been elected for both Galway and the Scotland division of Liverpool, had decided to represent the latter constituency. O'Shea had not gained in popularity with advanced nationalists, and his nomination was strongly opposed by both J. G. Biggar and Mr. T. M. Healy, who hurried to Galway and nominated M. A. Lynch, a local man, in opposition. Biggar telegraphed to Parnell 'The O'Sheas will be your ruin,' and in speeches to the people did not conceal his belief that Mrs. O'Shea was Parnell's mistress. Parnell also went to Galway and he quickly re-established his authority. O'Shea's rejection, he declared, would be a blow at his own power, which would

imperil the chances of home rule. O'Shea was elected by an overwhelming majority (942 to 54), but he gave no pledges on the home rule question. He did not vote on the second reading of Gladstone's first home rule bill on 7 June 1886, and next day announced his retirement from the representation of Galway. In 1889 he filed a petition for divorce on the ground of his wife's adultery with Parnell. The case was tried on 15 Nov. 1890. There was no defence, and a 'decree nisi' was granted on 17 Nov. On 25 June 1891 Parnell married Mrs. O'Shea. O'Shea lived during his latter years at Brighton, where he died on 22 April 1905. He had issue one son and two daughters.

[The Times, and the Irish Times, 25 April 1905; O'Brien's Life of Parnell, 1898; Annual Register 1882; Paul's Modern England, vol. v. 1904; Lucy, Diary of the Gladstone Parliament, 1880-5, 1886.] S. E. F.

OSLER, ABRAHAM FOLLETT (1808-1903), meteorologist, born on 22 March 1808 in Birmingham, where his father was a glass manufacturer, was eldest son of Thomas Osler by his wife Fanny Follett. From 1816 to 1824 he was at Hazelwood school, near Birmingham, which was kept by Thomas Wright Hill [q. v.]. On leaving school in 1824 Osler became assistant to his father. In 1831 the business came under his sole management, and through his energy and ability he greatly developed it.

Osler was early interested in meteorology. In 1835 the council of the Birmingham Philosophical Institute purchased a set of such meteorological instruments as were then in use. Osler perceived the need of appliances which should give continuous records of atmospheric changes. He therefore set himself to contrive a novel self-recording pressure-plate anemometer, and a self-recording rain-gauge. The first anemometer and rain-gauge was made by Osler in 1835, and erected at the Philosophical Institution, Cannon Street, Birmingham. A description of its work, illustrated with records obtained from it, was published in the annual report of the Institution for 1836. Osler's self-recording anemometer received the varying wind pressure on a plate of known area, supported on springs and kept at right angles to the direction of the wind by means of a vane. The degree to which this plate was pressed back upon the springs by each gust of wind was registered, in pounds avoirdupois per square foot, by a pencil on a sheet of paper graduated in hours and moved forward at a uniform

rate by means of a clock. On the same sheet the direction of the wind was recorded. This was done by means of a vane, and its movements were conveyed, by an ingenious contrivance, to a pencil which moved transversely upon a scale of horizontal lines representing the points of the compass. The curve thus drawn gave a continuous record of the direction of the wind. The rainfall was also recorded on the same paper. The rain was collected in a funnel, the top of which had a known area, and flowed into a vessel supported on a bent lever with a counterbalancing weight; the accumulating water caused the vessel to descend, and this movement was registered by a pencil, which produced a line on a part of the paper that was ruled with a scale of fractions of an inch. When the limit of the capacity of the counterbalanced vessel was reached, it discharged its contents automatically, and the pencil returned to the zero line.

The importance to meteorological observation of Osler's invention was at once recognised, and his pressure-plate anemometer was soon installed at Greenwich observatory (1841), the Royal Exchange, London, at Plymouth, Inverness, and Liverpool. Osler read a paper in 1837 before the British Association describing his instruments. To Dr. Robinson's cup anemometer for measuring the horizontal motion of the air Osler subsequently applied his own self-recording methods, thus obtaining records of mean hourly velocities as well as total mileage of the wind. Later the curves of pressure, direction, velocity, and rainfall in connection with time were recorded on the same sheet of paper.

As he explained in papers read before the British Association at Birmingham in 1839 and at Glasgow in 1840, Osler at the request and expense of the association soon developed his graphic contrivances. His self-recording methods soon came into very general use.

By means of another series of monthly, quarterly, and annual and mean diurnal wind curves, he illustrated the average distribution of winds during each part of the day, and for the different seasons. Mean diurnal wind velocity curves were made to run parallel to the mean diurnal temperature curve, and on reducing the two maxima and minima to the same values they proved almost identical. Sir David Brewster [q. v.], who came independently to the same conclusion in 1840, paid high tribute to Osler's labours, and described his results respecting the phenomena and

laws of the wind 'as more important than any which have been obtained since meteorology became one of the physical sciences.' Osler persistently urged a more scientific and methodical study of meteorology by the establishment of observatories in different latitudes. To the British Association at Birmingham in 1865 he described 'the horary and diurnal variations in the direction and motion of the air' in the light of a minute comparison of his observations at Wrothesley, Liverpool, and Birmingham. Osler in further researches showed the relation of atmospheric disturbances to the great trade winds, and the effect of the earth's rotation in inducing eastern and western velocities in the northerly and southerly winds. Many other papers on his anemometer and on his meteorological investigations were printed in the reports of the association. He communicated his last paper to the meeting at Birmingham in 1886, the subject being 'The Normal Form of Clouds.'

Other interests occupied Osler's energies. After delivering three lectures on chronometry and its history at the Birmingham Philosophical Institution (Jan. 1842) he collected funds and set up a standard clock for Birmingham in front of the Institution, and on the roof equipped a transit instrument and an astronomical clock. Subsequently he altered the clock from Birmingham to Greenwich time, to which the other public clocks in Birmingham were gradually adjusted. In 1883 he presented to Birmingham a clock and bells, of the same size and model as those at the Law Courts in London, to be placed in the clock tower of the newly built municipal buildings. Craniometry also attracted Osler's attention; he devised and constructed a complete and accurate instrument for brain measurements, which gave full-sized diagrams of the exact form of the skull.

Osler was made F.R.S. in 1855. He retired from business in 1876, devoting himself thenceforth entirely to scientific pursuits. Among many speculative papers was an attempt to account for the distribution of sea and land on the earth's surface by a theory that the earth had once two satellites, one of which returned to it within geological time. He generously supported scientific and literary institutions in Birmingham. His benefactions, always anonymous, included 7500*l.* to the Birmingham and Midland Institute and 10,000*l.* for the purposes of Birmingham University.

Osler died at South Bank, Edgbaston, on 26 April 1903, and was buried at Birmingham. He married in 1832 Mary, daughter of Thomas Clark, a Birmingham merchant and manufacturer, and had issue eight children, of whom three survived him. A daughter Fanny was married to William James Russell [q. v. Suppl. II]. A portrait painted in 1863 by W. T. Roden is in the possession of his son, H. F. Osler, of Burcot Grange, Bromsgrove.

[The Times, 28 April 1903; Proc. Roy. Soc. vol. 75, 1905; personal knowledge.]

P. E. D.

O'SULLIVAN, CORNELIUS (1841-1907), brewers' chemist, born at Bandon, co. Cork, on 20 Dec. 1841, was son of James O'Sullivan, a merchant of that town, by his wife Elizabeth Morgan. His only surviving brother, James O'Sullivan, became head of the chemical laboratory of Messrs. Bass, Ratcliff and Gretton, Burton-on-Trent.

Cornelius, after attending a private school in Bandon known as 'Denny Holland's' and the Cavendish school there, went to evening science classes in the town held under the auspices of the Science and Art Department, winning in September 1862 a scholarship at the Royal School of Mines, London. On the completion of the prescribed three years' course of study he joined the teaching staff of the Royal College of Chemistry, London, as a student assistant under Prof. A. W. von Hofmann, who recognised O'Sullivan's promise, and on becoming professor of chemistry at Berlin in 1865 made O'Sullivan his private assistant. A year later the professor's influence secured him the post of assistant brewer and chemist to Messrs. Bass & Co., Burton-on-Trent. In that capacity he applied his chemical knowledge and aptitude for original research to the scientific and practical issues of brewing. Ultimately he became head of the scientific and analytical staff of Messrs. Bass & Co., holding the appointment till his death.

Pasteur's researches on fermentative action gave O'Sullivan his cue in his earliest investigation. He embodied his contributions to the technology of brewing in a series of papers on physiological and applied chemistry communicated to the Chemical Society. Of these the chief are: 'On the Transformation Products of Starch' (1872 and 1879); 'On Maltose' (1876); 'On the Action of Malt Extract on Starch' (1876); 'Presence of Raffinose in Barley' (1886); 'Researches on the Gums of the Arabin Group' (1884 and 1891);

Invertase: a Contribution to the History of an Enzyme' (with F. W. Tompson, 1890); and (with A. L. Stern) 'The Identity of Dextrose from Different Sources, with Special Reference to the Cupric Oxide Reducing Power' (1896). His name is especially associated with the delicate research which re-established and elucidated the distinct character of maltose, a sugar produced by the action of diastase on starch. O'Sullivan described in detail the properties of this substance, therein confirming earlier but practically forgotten observations (see *Encyclo. Brit.* 11th edit., art. Brewing). He was elected a fellow of the Chemical Society in 1876, served on the council 1882-5, and was awarded the Longstaff medal in 1884 for his researches on the chemistry of the carbohydrates (see remarks by W. H. PERKIN, F.R.S., Anniversary Address, *Chem. Soc. Trans.* vol. xlv.). In 1885 he was elected F.R.S. An original member of the Institute of Chemistry, the Society of Chemical Industry, and the Institute of Brewing, he served on the council of each.

He died at his residence, 148 High Street, Burton-on-Trent, on 8 Jan. 1907, and was buried near Bandon. He married in 1871 Edith, daughter of Joseph Nadin of Barrow Hall, near Derby, and had issue three sons (one died in early youth) and one daughter.

T. E. J.

OTTÉ, ELISE (1818-1903), scholar and historian, was born at Copenhagen on 30 September 1818, of a Danish father and an English mother. In 1820 her parents went to Santa Cruz, in the Danish West Indies, where her father died. Her mother returned to Copenhagen, where she met the English philologist, Benjamin Thorpe [q. v.], while he was studying Anglo-Saxon under Rask in Denmark, and married him. Elise accompanied her mother and step-father to England. From her step-father Elise Otté received an extraordinary education, and at a very tender age knew so much Anglo-Saxon and Icelandic as to be able to help Thorpe in his grammatical work. His tyranny, however, became more than she could bear, and in 1840 she went to Boston, U.S.A., to secure her independence. Here her mind turned from grammar to

science, and she studied physiology at Harvard. Later on she travelled much in Europe, and then resumed her life with her step-father, whom she helped in his version of the 'Edda of Sæmund.' But the bondage was again found intolerable, and in 1849 Elise Otté escaped to St. Andrews, where she worked at scientific translations for the use of Dr. George Edward Day [q. v.], Chandos professor of anatomy and medicine. In 1863 she went to reside with Day and his wife at Torquay, and in 1872, after Day's death, made London her home. Here, for years, she carried on an active literary career, writing largely for scientific periodicals. In 1874 she published a 'History of Scandinavia,' which is her most durable work; she compiled grammars of Danish and of Swedish, and issued translations of standard works by De Quatrefages, R. Pauli, and others. Her translation of Pauli's 'Old England' (1861) was dedicated to her step-father, Thorpe. Miss Otté was one of the most learned women of her time, especially in philology and physical science, but she never acquired ease in literary expression. She lived wholly in the pursuit of knowledge, even in extreme old age, when rendered inactive and tortured by neuralgia. She died at Richmond on 20 Dec. 1903, in her eighty-sixth year.

[Personal knowledge; *Athenæum*, 2 Jan. (by the present writer) and 16 Jan. (by Miss Day), 1904.] E. G.

OUIDA (pseudonym). [See DE LA RAMÉE, MARIE LOUISE (1839-1908), novelist.]

OVERTON, JOHN HENRY (1835-1903), canon of Peterborough and church historian, born at Louth, Lincolnshire, on 4 Jan. 1835, was only son of Francis Overton, surgeon, of Louth, a man of learning and of studious habits, by his wife Helen Martha, daughter of Major John Booth, of Louth. Educated first (1842-5) at the Louth grammar school, and next at a private school at Laleham, Middlesex, under the Rev. John Buckland, Overton went to Rugby in Feb. 1849, and thence obtained an open scholarship at Lincoln College, Oxford. He was placed in the first class in classical moderations in 1855 and in the third class in the final classical school in 1857, was captain of his college boat club, rowed stroke of its 'eight,' was a cricketer and throughout his life retained a keen interest in the game, and in his later

years was addicted to golf. He graduated B.A. in 1858, and proceeded M.A. in 1860. In 1858 he was ordained to the curacy of Quedgeley, Gloucestershire, and in 1860 was presented by J. L. Fytche, a friend of his father, to the vicarage of Legbourne, Lincolnshire. While there he took pupils and studied English church history, specially during the eighteenth century. In 1878, in conjunction with his college friend, Charles John Abbey, rector of Checkendon, Oxfordshire, he published 'The English Church in the Eighteenth Century,' 2 vols., which was designed as a review of 'different features in the religion and church history of England' during that period rather than as 'a regular history' (*Preface to second edition*); it was well received and ranks high among English church histories; a second and abridged edition in one volume was published in 1887. Overton was collated to a prebend in Lincoln cathedral by Bishop Christopher Wordsworth [q. v.] in 1879, and in 1883, on Gladstone's recommendation, was presented by the crown to the rectory of Epworth, Lincolnshire, the birthplace of John Wesley [q. v.], in whose career he took a warm interest. While at Epworth he was rural dean of Axholme. In 1889 he was made hon. D.D. of Edinburgh University. From 1892 to 1898 he was proctor for the clergy in convocation, and took an active part in its proceedings, speaking with weight and judgment. In 1898 he was presented by the dean and chapter of Lincoln to the rectory of Gumley, near Market Harborough, and represented the chapter in convocation. He was a frequent and popular speaker at church congresses. In 1901 he was a select preacher at Oxford, and from 1902 Birkbeck lecturer at Trinity College, Cambridge. Early in 1903 Dr. Carr Glyn, the bishop of Peterborough, made him a residentiary canon of his cathedral; he was installed on 12 Feb., and as the canonry was of small value, he retained his rectory. He kept one period of residence at Peterborough, but did not live to inhabit his prebendal house, for he died at Gumley rectory on 17 Sept. of that year. He was buried in the churchyard of the parish church of Skidbrook near Louth, where many of his family had been interred. A high churchman and a member of the English Church Union, he appreciated the points of view of those who differed from him. He was an excellent parish priest, and was courteous, good-tempered, and humorous.

On 17 July 1862 Overton married

Marianne Ludlam, daughter of John Allott of Hagne Hall, Yorkshire, and rector of Maltby, Lincolnshire; she survived him with one daughter. As memorials of Overtoun a brass tablet was placed in Epworth parish church by the parishioners, a stained glass window and a reredos in Skidbrook church, and a two-light window in the chapter-house of Lincoln Cathedral.

As an historian and biographer Overtoun showed much insight both into general tendencies and into personal character; was well-read, careful, fair in judgment, and pleasing in style. The arrangement of his historical work is not uniformly satisfactory; he was apt to injure his representation of a movement in thought or action by excess of biographical detail. Besides his share in the joint work with Abbey noticed above, he published: 1. 'William Law, Nonjuror and Mystic,' 1881. 2. 'Life in the English Church, 1660-1714,' 1885. 3. 'The Evangelical Revival in the Eighteenth Century' in Bp. Creighton's 'Epochs of Church History,' 1886. 4. 'Life of Christopher Wordsworth, Bp. of Lincoln,' with Miss Wordsworth, 1888, 1890. 5. 'John Hannah, a Clerical Study,' 1890. 6. 'John Wesley,' in 'Leaders of Religion' series, 1891. 7. 'The English Church in the Nineteenth Century,' 1894. 8. 'The Church in England,' 2 vols., in Ditchfield's 'National Churches,' 1897. 9. 'The Anglican Revival' in the 'Victorian Era' series, 1897. 10. An edition of Law's 'Serious Call' in the 'English Theological Library,' 1898. 11. 'The Nonjurors, their Lives, &c.,' 1902. 12. 'Some Post-Reformation Saints,' 1905, posthumous. 13. At his death he left unfinished 'A History of the English Church from the Accession of George I to the End of the Eighteenth Century,' a volume for the 'History of the English Church' edited by Dean Stephens [q. v. Suppl. II] and William Hunt; the book was edited and completed by the Rev. Frederic Relton in 1906. He contributed many memoirs of divines to this Dictionary, and wrote for the 'Dictionary of Hymnology,' the 'Church Quarterly Review,' and other periodicals.

OVERTOUN, first BARON. [See WHITE, JOHN CAMPBELL (1843-1908), Scottish philanthropist.]

OWEN, ROBERT (1820-1902), theologian, born at Dolgelly, Merionethshire, on 13 May 1820, was third son of David Owen,

a surgeon of that town, by Ann, youngest daughter of Hugh Evans of Fronfelen and Esgairgeiliog, near Machynlleth. His brothers died unmarried in early manhood.

Educated at Ruthin grammar school, where he showed much precocity (HARRIET THOMAS, *Father and Son*, p. 60), he matriculated from Jesus College, Oxford, on 22 Nov. 1838; was scholar from 1839 to 1845; graduated B.A. in 1842 with a third class in classical finals, proceeding M.A. in 1845, and B.D. in 1852 (FOSTER, *Al. Oxon.*). He was fellow of his college from 1845 till 1864, and public examiner in law and modern history in 1859-60.

Though he was ordained by Dr. Bethell, bishop of Bangor, in 1843, and served a curacy till 1845 at Tremeirchion, he held no preferment. Coming under the influence of the Tractarians, he maintained an occasional correspondence with Newman long after the latter seceded to Rome. In 1847 Owen edited, for the Anglo-Catholic Library, John Johnson's work on 'The Unbloody Sacrifice,' which had been first issued in 1714. He reached the view that establishment and endowment were all but fatal to the 'catholic' character of the Church of England, and in 1893 he joined a few other Welsh clergymen in discussing such proposed legislation as would restore to the church her independent liberty in the appointment of bishops and secure some voice to the parochial laity.

In 1864, owing to an allegation of immorality, he was called upon to resign his fellowship. He was at that time probably the most learned scholar on the foundation. He shortly afterwards retired to Bronygraig, Barmouth, in which district he owned considerable property. There he died unmarried on 6 April 1902, and was buried at Llanaber.

Owen's original works were: 1. 'An Introduction to the Study of Dogmatic Theology,' 1858; 2nd edit. 1887. 2. 'The Pilgrimage to Rome: a Poem,' Oxford, 1863. 3. 'Sanctorale Catholicum, or Book of Saints,' 1880: 'a sort of Anglican canon of saints, especially strong in local British saints.' 4. 'An Essay on the Communion of Saints, together with an Examination of the Cultus Sanctorum,' 1881; nearly the whole issue perished in a fire at the publishers. 5. 'Institutes of Canon Law,' 1884, written at the instance of Dr. Walter Kerr Hamilton, bishop of Salisbury. 6. 'The Kymry: their Origin, History, and International Relations,' Carmarthen, 1891.

[The Times, 10 April 1902; T. R. Roberts, Dict. of Eminent Welshmen, 1907, p. 386; Brit. Mus. Cat.] D. LL. T.

P

PAGE, H. A. (pseudonym). [See JAPP, ALEXANDER HAY (1837-1905), author.]

PAGET, FRANCIS (1851-1911), bishop of Oxford, second son of Sir James Paget, first baronet [q. v. Suppl. I], surgeon, was born on 20 March 1851 at St. Bartholomew's Hospital, E.C., in his father's official residence as warden (cf. STEPHEN PAGET, *Memoirs and Letters of Sir James Paget*, p. 127). His mother was Lydia, youngest daughter of the Rev. Henry North, and his brothers are Sir John Rahere Paget, K.C., Dr. Henry Luke Paget, bishop suffragan of Stepney, and Stephen Paget, F.R.C.S. He was educated first at St. Mary-lebone and All Souls' grammar school, and then at Shrewsbury under Benjamin Hall Kennedy [q. v.] and Henry Whitehead Moss, contributing elegant Latin verse to 'Sabrinæ Corolla.' He was elected to a junior studentship at Christ Church, Oxford, in 1869. He won the Hertford scholarship, the chancellor's prize for Latin verse, and a first class in classical moderations in 1871. He graduated B.A. with a first class in the final classical school in 1873, proceeding M.A. in 1876 and D.D. in 1885. He was elected senior student in 1873, tutor in 1876 and honorary student in 1901. Ordained deacon in 1875 and priest in 1877, he became a devoted follower of the great Tractarians of the time, Edward Bouverie Pusey [q. v.], who allowed him to read in the university pulpit a sermon of his which ill-health prevented him from delivering himself, Henry Parry Liddon [q. v.], Richard William Church [q. v. Suppl. I], whose eldest daughter he married, and James Russell Woodford [q. v.], bishop of Ely, whom he served as examining chaplain (1878-1885). But, being a witty and stimulating companion, he also established warm friendships with younger and less conservative men of the same school, while his influence over undergraduates grew as they became accustomed to a certain reserve in his manner.

In 1881 Paget was appointed Oxford preacher at the Chapel Royal, Whitehall, and in 1882 accepted the vicarage of Bromsgrove, but returned to Oxford in 1885, having been nominated by Gladstone to succeed Edward King [q. v. Suppl. II], bishop of Lincoln, as regius professor of pastoral

theology and canon of Christ Church. Bromsgrove had given him a brief insight into parochial activities and had considerably widened the range of his sympathy (*Commonwealth*, September 1911, p. 276). Liddon's influence was counteracted by close association with younger men, and in the autumn of 1889 he joined Charles Gore, his successor in the see of Oxford, Henry Scott Holland, and others, in publishing the volume of essays called 'Lux Mundi.' Liddon, who was deeply distressed at parts of Gore's essay, regarded Paget's essay, on 'Sacraments,' as 'a real contribution to Christian theology' (J. O. JOHNSTON, *Life and Letters of H. P. Liddon*, 1904, p. 367; cf. p. 396).

In 1892, on the resignation of Henry George Liddell [q. v. Suppl. I], Paget was promoted by Lord Salisbury to the deanery of Christ Church. His task was difficult, and a certain tendency to extravagant rowdiness among the undergraduates had to be dealt with firmly. Estimates of his popularity vary, for 'he could only open out to a few,' and his 'elaborate courtesy' was apt 'to keep people back behind barriers of civility' (*Commonwealth*, September 1911, p. 277). But he was an anxious and capable administrator (cf. letter from 'Ex Æde Christi,' *The Times*, 7 Aug. 1911). The deanery was more accessible than heretofore. He was chaplain to William Stubbs [q. v. Suppl. II], bishop of Oxford, from 1889 until the bishop's death. Thus in 1901 the cathedral and the diocese were drawn closely together, and Paget learnt much of local episcopal problems.

In 1901, on the death of Bishop Stubbs, Dean Paget was promoted by Lord Salisbury to the bishopric of Oxford, and was consecrated on 29 June following. To the bishopric is attached the chancellorship of the Order of the Garter; Paget's most notable function in that capacity was the admission of Edward, Prince of Wales, to the order at Windsor on 10 June 1911. He was also chosen as 'supporter' bishop at their coronations by both Queen Alexandra in 1902 and Queen Mary in 1911. His administration of the diocese of Oxford was marked by the same anxious care which he had devoted to his college. He was eager to do everything himself; much of the episcopal correspondence was written in his own clear but

characteristic handwriting; and it took some time for the people to feel that they knew him intimately, though his pastoral earnestness was keenly appreciated by humble folk in the rural villages. Early in 1903 he declined Mr. Balfour's offer of the see of Winchester. In 1904, by royal warrant dated 23 April, he became a member of the royal commission on ecclesiastical discipline, and signed its report on 21 June 1906. He was one of the three out of fourteen members who attended at each of the 118 sittings, and he exhibited 'a genius for fairness towards hostile witnesses' (*The Times*, 3 July 1906) and a remarkable gift for fusing opinions in the drafting of the report. His attitude to prevailing excesses in ritual was shown in the charge which he began to deliver to his diocese on 8 Oct. 1906, and by the action which he took against the Rev. Oliver Partridge Henly, vicar of Wolverton St. Mary, in respect of 'reservation' and 'benediction.' The case was taken to the court of arches (*The Times*, 20 and 21 July 1909); the vicar, who was deprived, obtained employment in another diocese, and afterwards joined the Roman church. Paget sought to provide for a sub-division of the diocese. For this purpose he made a vain endeavour to dispose of Cuddesdon Palace. In July 1910 he showed his active zeal for the wider work of the church by becoming chairman of the Archbishops' Western Canada fund.

To his intimate friends, and in particular to Archbishop Davidson, he was not only a wise counsellor but a delightful companion. He had a cultivated sense of beauty in nature, in music, and in words, and his tall, willowy figure and impressive, courtly bearing made him notable in any assembly. He was attacked by serious illness in the summer of 1910, and seemed to recover; but he died of a sudden recurrence of the malady in a nursing home in London on 2 Aug. 1911. He was interred in his wife's grave in the little burying ground to the south of Christ Church Cathedral, Oxford. He married on 28 March 1883 Helen Beatrice, eldest daughter of Richard William Church, dean of St. Paul's. Paget's career was permanently saddened by his wife's death at the deanery on 22 Nov. 1900, aged forty-two. She left four sons and two daughters; one of the latter, wife of the Rev. John Macleod Campbell Crum, predeceased Paget in 1910.

There is a portrait by Orchardson at Christ Church, and a memorial fund is being raised (November 1912) to provide

a portrait for Cuddesdon Palace and an exhibition with a view to clerical service abroad, to be held at an English university. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1894.

As a theological scholar Paget is to be remembered chiefly for his 'Introduction to the Fifth Book of Hooker's Treatise of the Laws of Ecclesiastical Polity' (1899; 2nd edit. 1907); for his 'Lux Mundi' essay mentioned above; and for a masterly essay on *acedia* or accidie, written at Christ Church in 1890 (reprinted separately in 1912), and published with a collection of sermons entitled 'The Spirit of Discipline' in 1891 (7th edit. 1896). He also published 'Faculties and Difficulties for Belief and Disbelief' (1887; 3rd edit. 1894); and two other collections of sermons, entitled respectively 'Studies in Christian Character' (1895) and 'The Redemption of War' (1900).

[Memoir of Paget by Stephen Paget and the Rev. J. M. C. Crum, 1912; *The Times*, 3 Aug. 1911; *Guardian*, and *Church Times*, Aug. 1911; *Crockford*, 1911; Canon H. S. Holland in *Commonwealth* (brilliant character-sketch), Sept. 1911; *Oxford Diocesan Mag.*, Sept. 1911; Stephen Paget, *Memoirs and Letters of Sir James Paget*, 1903; private information.] E. H. P.

PAGET, SIDNEY EDWARD (1860-1908), painter and illustrator, born on 4 Oct. 1860 at 60 Pentonville Road, London, N., was fourth son of Robert Paget, vestry clerk from 1856 to 1892 of Clerkenwell, by his wife Martha Clarke. At the Cowper Street school, London, Paget received his early education, and passing thence to Heatherley's school of art, entered the Royal Academy schools in 1881, where he was preceded by his brothers, Henry Marriott and Walter Stanley, both well-known artists and illustrators. At the Academy schools, among other prizes, he won in the Armitage competition second place in 1885, and first place and medal in 1886 for his 'Balaam blessing the Children of Israel.' Between 1879 and 1905 Paget contributed to the Royal Academy exhibitions eighteen miscellaneous paintings, of which nine were portraits. The best-known of his pictures, 'Lancelot and Elaine,' exhibited in 1891, was presented to the Bristol Art Gallery by Lord Winterstoke. In 1901 Paget exhibited a whole-length portrait of the donor, then Sir William Henry Wills, which is now at Mill Hill school, while a study is in the possession of Miss J. Stancomb-Wills. Among other portraits painted by him were Dr. Weymouth (R.A. 1887), headmaster

of Mill Hill School, a three-quarter length in scarlet robes as D.Litt.; his father, and brother, Robert Ernest (his father's successor as vestry clerk), both in the town hall, Finsbury; and Sir John Aird, as mayor, in Paddington town hall.

It was as an illustrator that Paget won a wide reputation. His vigorous work as a black-and-white artist became well known not only in the United Kingdom but also in America and the colonies, by his drawings for the 'Pictorial World' (1882), the 'Sphere,' and for many of Cassell's publications. He also drew occasionally for the 'Graphic,' 'Illustrated London News,' and the 'Pall Mall Magazine.' Paget's spirited illustrations for Sir A. Conan Doyle's 'Sherlock Holmes' and 'Rodney Stone' in the 'Strand Magazine' greatly assisted to popularise those stories. The assertion that the artist's brother Walter, or any other person, served as model for the portrait of 'Sherlock Holmes' is incorrect.

A few years before his death Paget developed a painful chest complaint, to which he succumbed at Margate on 28 Jan. 1908. He was buried at the Marylebone cemetery, Finchley. He married in 1893 Edith Hounsfield, who survived him with six children.

[The Times, Telegraph, Morning Post and Daily Chronicle, 1 Feb. 1908, and Sphere, 8 Feb. (with portrait and reproductions of drawings); Who's Who, 1908; Graves's Royal Acad. Exhibitors; information from Mr. H. M. Paget, Royal Academy, and the headmaster of Mill Hill School.] J. D. M.

PAKENHAM, SIR FRANCIS JOHN (1832-1905), diplomatist, born on 29 Feb. 1832 in London, was seventh son of Thomas Pakenham, second earl of Longford, by his wife Emma Charlotte, daughter of William Lygon, first Earl Beauchamp. After private education he matriculated from Christ Church, Oxford, on 17 Oct. 1849. On leaving the university he was appointed attaché at Lisbon in 1852, and was promoted paid attaché at Mexico two years later. He was transferred in 1858 to Copenhagen, and in 1863 to Vienna. In June 1864 he was promoted to be secretary of legation at Buenos Ayres. During April, May, and June of the following year he was employed on special service in Paraguay on board of H.M.S. Dotterel, which had been sent up the River Plate and its tributaries for the protection of British subjects during the war between Paraguay, the Argentine

Republic, and Brazil. He acquitted himself of this duty to the entire satisfaction of his superiors. In August of that year he was transferred to Rio de Janeiro, but remained in charge of the legation at Buenos Ayres till December 1865. In December 1866 he was employed on special service at Rio Grande do Sul in connection with an attempt which had been made on the life of the British consul, Mr. (afterwards Sir) R. de Courcy Perry from motives of personal revenge. He was transferred to Stockholm in March 1868, and later in the same year to Brussels, thence to Washington in 1870, and to Copenhagen in 1874. In March 1878 he was promoted to be minister resident and consul-general at Santiago, where he remained till 1885, serving in 1883 as British commissioner for claims arising out of the war between Chile and Bolivia and Peru. In February 1885 he was appointed British envoy at Buenos Ayres, with the additional office of minister plenipotentiary to Paraguay. In February 1896 he was transferred to Stockholm, where he remained till his retirement from the service in 1902. He was made K.C.M.G. in 1898.

While travelling for reasons of health he died at Alameda in California on 26 Jan. 1905. He married on 29 July 1879 Caroline Matilda, seventh daughter of the Hon. Henry Ward, rector of Killinchy, co. Down; she survived him, without issue. A portrait painted in 1900 by Count George de Rosen, member of the Royal Swedish Academy, is at Bernhurst House, Hurst Green, Sussex, the residence of his widow, which Pakenham inherited in 1858 by the will of Comte Pierre Coquet de Tresselles.

Sir Francis was distinguished rather for the British qualities of phlegmatic calmness and sturdy good sense than for those which are generally attributed to the Irish race. His good nature and hospitality made him very popular with the British communities at the various posts in which he served, and he was successful in maintaining excellent personal relations with the governments to which he was accredited, even when, as in his South American posts, the questions to be discussed were of a nature to occasion some heat.

[The Times, 27 Jan. 1905; Foreign Office List, 1906, p. 300.] S.

PALGRAVE, SIR REGINALD FRANCIS DOUCE (1829-1904), clerk of the House of Commons, fourth son of Sir Francis Palgrave [q. v.], was born at Westminster on 28 June 1829. He

entered Charterhouse school in 1841 and left in 1845. He was articled to Messrs. Bailey, Janson & Richardson, solicitors, of Basinghall Street, was admitted solicitor in May 1851, and entered the office of Messrs. Sharpe & Field. All his spare time he employed in sketching and sculpture. Through the influence of Sir Robert Harry Inglis [q. v.] and other friends of his father he was appointed to a clerkship in the House of Commons in 1853. From 1866 to 1868 he was examiner of petitions for private bills; he became second clerk assistant in 1863, clerk assistant in 1870, and from 1886 until his retirement in 1900 was clerk of the House of Commons. In 1887 he was made C.B., and in 1892 K.C.B. He was exact and careful in his official work, was thoroughly familiar with the practice and procedure of the House, and gave interesting evidence before various select committees, especially before that of 1894 on the vacating of a seat by accession to a peerage (Lord Coleridge's case). He was responsible for the 8th, 9th, 10th, and 11th (1886-96) editions of the 'Rules, Orders, and Forms of Procedure of the House of Commons,' first prepared by his predecessor in office, Sir Thomas Erskine May, Lord Farnborough [q. v.], and jointly with Mr. Alfred Bonham Carter for the 10th and much enlarged (1893) edition of May's 'Practical Treatise on the Law, &c., of Parliament.' Samuel Rawson Gardiner [q. v. Suppl. II], in the preface to his 'Fall of the Monarchy of Charles I,' speaks of Palgrave's 'great knowledge of the documents of the time' and of the valuable help which he gave him in revising that work. He was deeply interested in the local antiquities of Westminster and indicated some famous sites.

Palgrave, who before 1870 lived first at Reigate, and then for a short time at Hampstead, had from 1870 to 1900 an official residence in the Palace of Westminster; after his retirement he resided at East Mount, Salisbury. For many years after 1870 he spent his summer vacations at a house built for him at Swanage, Dorset. He had much artistic taste, inherited probably from his maternal grandfather, Dawson Turner [q. v.], and to the end of his life practised water-colour sketching, at which he was fairly proficient, and he was for an amateur an exceptionally skillful modeller in low relief. Officially neutral in politics, he was personally a strong conservative; he was a decided churchman and was churchwarden of St. Martin's, Salisbury; he was generally popular and was an ex-

cellent talker, especially on artistic subjects. He died at his residence, Salisbury, on 13 July 1904, and was buried in the cemetery there. He married in 1857 Grace, daughter of Richard Battley [q. v.], who died at East Mount, Salisbury, on 17 July 1905, and had one son, Augustin Gifford (d. 1910), an electrical engineer, and five daughters. A village cross at Swanage has been erected to the memory of Sir Reginald and Lady Palgrave by members of their family.

Palgrave published: 1. A 'Handbook to Reigate and the adjoining Parishes,' Dorking, 1860; out of print; an excellent little guide-book, especially as regards architecture, with engravings, some of them from his own drawings. 2. 'The House of Commons, Illustrations of its History and Practice,' 1869; revised edit. 1878. 3. 'The Chairman's Handbook, Suggestions and Rules for the Conduct of Chairmen of Public and other Meetings,' 1877; 13th edit. 1900. A most useful book, based on long experience at the table of the House of Commons. 4. 'Oliver Cromwell, the Protector,' 1890 (new edition 1903), a strange book, which represents Cromwell as the 'cat's paw' of the major-generals, a discredited trickster, and the fomenter of plots which enabled him to crush his enemies by unjust executions. He wrote letters in the 'Athenæum,' 22 Jan. and 5 and 26 Feb. 1881, on the date of the warrant for the execution of Charles I, which S. R. Gardiner criticised adversely (*History of the Great Civil War*, iii. 584-5 n).

[Private information; information received from and through Sir Courtenay P. Ilbert, K.C.B.] W. H.

PALMER, SIR ARTHUR POWER (1840-1904), general, born on 25 June 1840 at Kurubul, India, was son of Captain Nicholas Power Palmer of the 54th Bengal native infantry, by his wife, Rebecca Carter, daughter of Charles Barrett, of Dungarvan, co. Waterford. His father was killed on the retreat from Kabul in 1841, and his mother married secondly, in 1849, Morgan, son of Morgan Crofton, captain R.N., of co. Roscommon.

Educated at Cheltenham College (1852-6), he entered the Indian army on 20 Feb. 1857 as ensign in the 5th Bengal native infantry. He served throughout the Indian Mutiny campaign of 1857-9, raising a regiment of Sikhs 600 strong for service in Oude in March 1858. After receiving his commission as lieutenant on 30 April 1858, he joined Hodson's horse at Lucknow in the following June. At the action of Nawab-

gunge Barabunki his horse was killed under him, and he was present at minor affairs (during one of which he was wounded) in the Oude campaign until its conclusion on the Nepal frontier. He was mentioned in despatches and received the medal.

In 1861 Palmer was transferred to the Bengal staff corps, and shared in the campaign on the north-west frontier in 1863-4, being present in the affair with the Momunds near Shubkudder and receiving the medal with clasp. He served as adjutant to the 10th Bengal lancers in the Abyssinian expedition of 1868, and his services were favourably noticed by Lord Napier of Magdala. Again he was awarded the medal.

Palmer acted as aide-de-camp to General Stafford in the Duffla expedition of 1874-5, and was mentioned in despatches. In 1876-7 he was on special duty with the Dutch troops in Achin, and fought in several actions in the Dutch conflict with the native forces. He was mentioned in despatches and received the Dutch cross with two clasps from the Netherland government. Meanwhile he was promoted captain in 1869, and his next service was in the Afghan war of 1878-80, when he acted as assistant adjutant and quartermaster-general to the Kuram field force. In the attack on the Peiwar Kotal (2 Dec. 1878) Palmer rendered good service by making a feint on the right of the Afghan position, and in January 1879 he accompanied the expedition into the Khost Valley. He was mentioned in despatches (*Lond. Gaz.* 4 Feb. 1879), and received the medal with clasp, and was given the brevet of lieutenant-colonel on 12 Nov. 1879. From 1880 to 1885 he was assistant adjutant general in Bengal, becoming colonel in 1883. Two years later he took part as commander of the 9th Bengal cavalry in the expedition to Suakin. He showed great dash and energy through the campaign. For his share in the raid on Thakul on 6 May 1885 he was mentioned in despatches (*Lond. Gaz.* 25 Aug. 1885). He received the medal with clasp, the bronze star, and the C.B. on 25 Aug. 1885.

During the campaign in Burma in 1892-3 Palmer was once more in action, commanding the force operating in the Northern Chin Hills. He received the thanks of the government of India; he was mentioned in despatches and government orders, and was nominated K.C.B. on 8 May 1894. Meanwhile he attained the rank of major-general in 1893 and of lieutenant-general in 1897. In 1897-8 he served in the Tirah campaign as general officer on the line of communications, and subsequently

commanded the second division at the action of Chagru Kotal. He was awarded the medal with two clasps, and his services were acknowledged in government orders and in despatches (*Lond. Gaz.* 1 March, 25 April 1898). He commanded the Punjab frontier force from 1898 to 1900, being promoted general in 1899. On the death of Sir William Lockhart [q. v. Suppl I] he was appointed provisional commander-in-chief in India, and member of the viceroy's council (19 March 1900).

In selecting regiments and commanders for service in South Africa and China in 1900 Palmer showed high administrative capacity, and though owing to the uncertainty of his tenure of office he carried out no sweeping changes, he introduced many practical reforms in musketry. He held the post of commander-in-chief till 1902, when he was succeeded by Lord Kitchener.

He was nominated G.C.I.E. in 1901, and G.C.B. in 1903. He died on 28 Feb. 1904 in London, after an operation for appendicitis, and was buried at Brompton. He married (1) in 1867 Helen Aylmer (d. 1896), daughter of Aylmer Harris; and (2) in 1898 Constance Gabrielle (d. 1912), daughter of Godfrey Shaw and widow of Walter Milton Roberts, who survived him with two daughters.

An oil painting of Palmer by Herbert Brooks belongs to Palmer's step-sister, Mrs. Schneider.

[*The Times*, 29 Feb. 1904; Cheltenham Coll. Reg. 1911; *The Cheltonian*, March 1904; Lord Roberts's Forty-one Years in India, 30th edit. 1898, p. 362; S. P. Oliver, *Second Afghan War*, 1908; R. H. Vetch, *Life of Sir Gerald Graham*, 1901; H. D. Hutchinson, *The Campaign in Tirah*, 1898, p. 62; Hart's and official Army Lists.] H. M. V.

PALMER, SIR CHARLES MARK, first baronet (1822-1907), ship-owner and ironmaster, born at King's Street, South Shields, on 3 Nov. 1822, was fourth son in a family of seven sons and one daughter of George Palmer (1789-1866), a ship-owner and merchant engaged in the Greenland and Indian trades. His mother was Maria, daughter of Thomas Taylor of Hill House, Monkwearmouth. He was educated privately, first in South Shields and afterwards at Bruce's Academy, Percy Street, Newcastle, one of the leading private schools in the north of England. On leaving school he studied for a short time in France. At sixteen he entered his father's firm, Messrs. Palmer, Bechwith & Company, timber merchants; but a year later, at the early age of seventeen, he formed a

partnership with Sir William Hutt, Nicholas Wood, and John Bowes in the manufacture of coke. The firm subsequently acquired collieries in the north. At that time the northern coalfield was practically shut out from the London markets, owing to the difficulties of conveying the coal by rail. Palmer solved the problem by building boats wherein to bring coal by sea to London, and thus laid the foundation of the extensive colliery services which now ply between northern ports and the metropolis. In 1851 he and his brother George established a shipyard near the pit village of Jarrow. The first iron vessel launched from this yard was a paddle tug, the *Northumberland*, and this was followed (in 1852) by the *John Bowes*, which was the first iron screw collier to be built, and had a coal capacity of 690 tons. The experiment was a complete success.

With the growth of the shipyard, the village of Jarrow, which at the outset contained only some thousand inhabitants, grew into a town with a population of nearly 40,000. To their original objects the firm added the construction of battleships. During the Crimean war the admiralty accepted Palmer's tender for the construction of a floating battery for the destruction of the forts at Kronstadt, and the *Terror*, an armoured battery, was constructed and launched within three months. He further revolutionised the industry by substituting rolled armour plate for forged armour plate, and at Jarrow the first armour plate mill was laid down for the manufacture of what were known as 'Palmer's rolled plates.' He was also one of the first to recognise the value of the Cleveland ironstone, which was smelted at the blast furnaces at Jarrow from 1860. Deeply interested in science, he was an original member of the Iron and Steel Institute, and at the first annual meeting in London, 1870, he read a paper on 'Iron as a Material for Shipbuilding.'

He introduced the co-operative principle for the benefit of his workmen, and zealously promoted the welfare of Jarrow. In 1875, when the town received its charter, he became its first mayor.

In 1868 Palmer unsuccessfully contested the representation in Parliament of South Shields in the liberal interest. In 1874 he and Sir Isaac Lowthian Bell [q.v. Suppl. II] were returned for North Durham after a severe contest, although they were subsequently unseated on a petition. Palmer was placed at the head of the poll at a new election in June 1874, Sir George Elliot, the conservative candidate, being re-

turned with him, and Bell, the second liberal candidate, being defeated. A threatened petition against Palmer's return was withdrawn. When Jarrow was created a constituency, in 1885, he became its member till death. No conservative candidate ventured to oppose him, and although labour candidates contested the seat in 1885, 1892, and 1906, they were severely defeated. He was a deputy lieutenant for Durham and for the North Riding of Yorkshire. In 1886 he was created a baronet, while from the King of Italy he received the commandership of the order of St. Maurice and St. Lazarus. He founded in Jarrow the Mechanics' Institute and the Palmer Memorial Hospital. He was honorary colonel of the Newcastle-on-Tyne and Durham engineer volunteers.

Palmer acquired Easington and Hinderwell Manors and Grinkle Park and Seaton Hall estates, to which he devoted much attention. He died on 4 June 1907 at his residence, 37 Curzon Street, Mayfair, London, and was buried at Easington church, Yorkshire, the parish church on the estate. He was married three times: (1) on 29 July 1846 to Jane (*d.* 1865), daughter of Ebenezer Robson of Newcastle, by whom he had four sons, of whom the second, George Robson (1849-1910), became second baronet, and Alfred Molyneux (*b.* 1853), third baronet; (2) on 4 July 1867 to Augusta Mary (*d.* 1875), daughter of Alfred Lambert of Paris, by whom he had two sons; and (3) on 17 Feb. 1877 to Gertrude, daughter of James Montgomery of Cranford, Middlesex, by whom he had one son, Godfrey Mark (*b.* 1878), liberal M.P. for Jarrow since 1910, and a daughter.

A bronze statue by Albert Toft, subscribed for by friends and employees, is in the grounds of the memorial hospital at Jarrow. A marble bust, also by Toft, is in the Newcastle-on-Tyne Commercial Exchange. A cartoon portrait by 'Ape' appeared in 'Vanity Fair' in 1884.

[*Pioneers of the Iron Trade*, by J. S. Jeans, 1875; *Journal Iron and Steel Institute*, vol. lxxiii.; *Men and Women of the Time*, 1899; *The Times*, 5 June 1907.] L. P. S.

PALMER, SIR ELWIN MITFORD (1852-1906), finance officer in India and Egypt, born in London on 3 March 1852, was second son of Edward Palmer by his wife Caroline, daughter of Colonel Gunthorpe. Educated at Lancing College, he entered the financial department of the government of India in 1870, and being attached to the comptroller-general's office on 10 Nov. 1871, became assistant comptroller-general. Leaving India, Palmer on

16 Aug. 1885 succeeded Sir Gerald Fitzgerald as director-general of accounts in Egypt where he had already served from 31 December 1878 to 30 April 1879. To Fitzgerald and Palmer 'Egypt owes a system of accounts which can bear comparison with those of any other country in Europe' (MILNER, p. 253). He was created C.M.G. in 1888. Next year he succeeded Sir Edgar Vincent as financial adviser to the Khedive, and 'ably and prudently continued his predecessor's policy with 'brilliant results' (*ibid.* p. 251). He was largely instrumental in the conversion of the privileged, Daira, and Domains loans, and had much to do with the contract for the construction of the Assouan reservoir (COLVIN, pp. 285-6). In 1898 the National Bank of Egypt was created by khedivial decree, and Palmer resigned his appointment as financial adviser in order to become its first governor at Cairo. In the same year he became chairman of the Cairo committee of the Daira Sanieh Company, which had taken over from the government the Daira or private estates of Ismail Pasha. In 1902 he was made president of the Agricultural Bank of Egypt, which was an offshoot of the National Bank. Palmer was a shrewd, hard-working man, with long financial training and great knowledge of accounts; he was a specialist rather than a man of general administrative capacity, and his particular faculties were brought into play in developing industrial and commercial enterprises at the time when Egypt began to reap the benefit of administrative reform and engineering works. He was made K.C.M.G. in 1892, K.C.B. in 1897, and held the grand cordons of the orders of Osmanie and Medjidie. He died at Cairo on 28 January 1906. In 1881 he married Mary Augusta Lynch, daughter of Major Herbert M. Clogstoun, V.C., and left one son and two daughters.

[The Times, 29 Jan. 1906; England in Egypt by Alfred (Viscount) Milner, 3rd edit. 1893; Sir Auckland Colvin, The Making of Modern Egypt, 1906; the Earl of Cromer, Modern Egypt, 1908.] C. P. L.

PARISH, WILLIAM DOUGLAS (1833-1904), writer on dialect, was fifth son of Sir Woodbine Parish [q. v.] by his first wife Amelia Jane, daughter of Leonard Becher Morse. Of his seven brothers and five sisters, the eldest, Major-General Henry Woodbine Parish, C.B. (1821-1890), served with distinction in South Africa under Sir Harry Smith, and later in Abyssinia; the second, John Edward

(1822-1894), became an admiral, and the third, Francis (1824-1906), was some time consul at Buenos Ayres, and later consul-general and state commissioner at Havana. His half-sister, Blanche Marion Parish, married in 1871 Sir Ughtred James Kay-Shuttleworth, first Baron Shuttleworth.

Born at 5 Gloucester Place, Portman Square, St. Marylebone, on 16 Dec. 1833, Parish was at Charterhouse School from 1848 to 1853. He matriculated at Trinity College, Oxford, in the latter year, graduating B.C.L. in 1858. Next year he was ordained to the curacy of Firlie in Sussex, becoming vicar in 1863 of the adjoining parishes of Selmeaton and Alceston. That benefice he held until his death. He endeared himself not only to his parishioners but also to gypsies and vagrants. From 1877 to 1900 he was chancellor of Chichester Cathedral. Parish died unmarried in Selmeaton vicarage on 23 Sept. 1904, and was buried in Selmeaton churchyard. There are a window and two brasses to his memory in the church.

Parish's principal work, 'A Dictionary of the Sussex Dialect and Collection of Provincialisms in use in the County of Sussex' (Lewes, 1875, 2 editions), is more than a contribution to etymology: it is the classic example of what a country parson with antiquarian tastes, a sense of humour, and a sympathetic affection for his peasant neighbours, can do to record for posterity not only the dialect but the domestic habits of the people of his time and place.

Parish's other publications were: 1. 'The Telegraphist's Easy Guide,' 1874, an explanation of the Morse system written primarily for the boys of his parish, to whom he taught signalling as a pastime. 2. 'School Attendance secured without Compulsion,' 1875 (5 editions), a pamphlet describing his successful system of giving back to parents their children's school payments as a reward for good attendances. 3. 'Domesday Book in Relation to the County of Sussex,' 1886 fol., for the Sussex Archaeological Society, on the council of which he served for many years. 4. 'A Dictionary of the Kentish Dialect' (with the Rev. W. F. Shaw), 1887, on the lines of the Sussex book, but lacking evidence of intimate acquaintance with the Kentish people. Parish also edited a useful alphabetical 'List of Carthusians [Charterhouse schoolboys], 1800-79' (Lewes, 1879).

[A Life of Sir Woodbine Parish, 1910, pp. 419-425; The Times, 26 and 28 Sept. 1904; East Sussex News, 30 Sept. 1904; works mentioned; private information.] P. L.

PARKER, ALBERT EDMUND, third EARL OF MORLEY (1843-1905), Chairman of Committees of the House of Lords, born in London on 11 June 1843, was only son of Edward Parker, second earl (1810-1864), by his wife Harriet Sophia (*d.* 1897), only daughter of Montagu Edmund Parker of Whiteway, Devonshire, and widow of William Coryton, of Pentillie Castle, Cornwall. Educated at Eton, where he subsequently became a fellow and governor, and at Balliol College, Oxford, he took a first class in literæ humaniores and graduated B.A. in 1865, having succeeded his father in the peerage in 1864. In the House of Lords he figured as a polished speaker of liberal principles. From 1868 to 1874 he was a lord-in-waiting to Queen Victoria during Gladstone's first administration. When Gladstone returned to office in 1880 Morley became under-secretary for war, serving first under Hugh Childers [q. v. Suppl. I] and then under Lord Hartington [q. v. Suppl. II]. He proved an efficient minister, notably in speeches upon recruiting (*Hansard*, cclxxx. cols. 1846-1859) and upon army organisation (*ibid.* cclxxxi. cols. 750-756); and he displayed a grasp of affairs during the debates on the suppression of the rebellion of Arabi Pasha in Egypt and the expedition to Khartoum. He quitted office with the ministry in 1885.

When the home rule question arose to divide the liberal party, Morley at first followed Gladstone; and from February to April 1886 was first commissioner of public works in that minister's third government. On 12 April he resigned, together with Mr. Edward (afterwards Lord) Heneage, chancellor of the duchy of Lancaster, after Gladstone had divulged the scope of his measure. He took little part in the ensuing political controversy, but his judicial temper was put to profitable use when, on 4 April 1889, he was chosen chairman of committees and deputy-speaker of the House of Lords on the proposal of Lord Granville by ninety-five votes to seventy-nine given to Lord Balfour of Burleigh, who was proposed by Lord Salisbury. He exercised his powers over private bill legislation with much discretion. For the guidance of promoters, 'a model bill' was annually devised by his standing counsel and himself, and by the beginning of every session the proposed measures, however numerous, had been passed under thorough review. Attacked by a lingering illness, he, to the general regret, sent in his resignation, which he intended to be temporary, in February 1904, Lord Balfour of Burleigh taking

his place (*Hansard*, vol. cxxix. cols. 1139-1142). On 12 Feb. 1905 he finally resigned. Lord Lansdowne then said that, 'besides great diligence and ability, Lord Morley had shown great qualities of firmness, great powers of conciliation, and a sound and steady judgment, unswayed by considerations of personal popularity' (*ibid.* vol. cxli. col. 287). He died fourteen days later, on 26 Feb. 1905, at Saltram, Plympton St. Mary, and was buried in the parish churchyard. On the announcement of his death in the House of Lords further tributes to his memory were paid by Lord Spencer, Lord Halsbury, and Dr. Talbot, then bishop of Rochester.

The earl took an active interest in Devonshire affairs. He was a chairman of quarter sessions and vice-chairman of the Devon county council from 1889 to 1901, when he succeeded Lord Clinton as chairman. His speeches displayed a wide knowledge of local finance and requirements, and he held the appointment until 1904. In 1900, as one of the three deputy lords-lieutenant, he took an active part in the county in the equipment of imperial yeomanry and volunteers for the South African war. In succession to his father and grandfather he interested himself in the Plymouth chamber of commerce, became its president in 1864, and made its annual dinner the occasion for a speech on public affairs. He took pride in the fine collection of pictures at Saltram, and was an enthusiastic gardener.

He married in 1876 Margaret, daughter of Robert Stayner Holford of Dorchester House, London, and Weston Birt House, Tetbury, and had a daughter and three sons, of whom Edmund Robert, Viscount Boringdon, born on 19 April 1877, succeeded him as fourth earl. His portrait by Ellis Roberts is at 31 Prince's Gardens, London, S.W., and a copy of the head and shoulders, made after his death by the artist at the request of the Devon county council, is in the council's chamber at Exeter.

[The Times, and Western Morning News, 27 Feb. 1905; private information.]

L. C. S.

PARKER, CHARLES STUART (1829-1910), politician and author, born at Aigburth, Liverpool, on 1 June 1829, was the eldest son of Charles Stewart Parker of Fairlie, Ayrshire, a partner in the prosperous Liverpool firm of Sandbach, Tinne & Co., West India merchants. His mother was Anne, eldest daughter of Samuel Sandbach of Hafodunos, Denbighshire. Dr. Chalmers, a friend of his paternal grandparents, was one of

Parker's godfathers. He was through life influenced by the religious temper of his home training. On 13 Aug. 1838 his father's sister Anne married Edward (afterwards Viscount) Cardwell [q. v.], whose political views he came to share. Parker was at Eton from 1842 to 1847, and won in 1846 the Prince Consort's prize for German. On 10 June 1847 he matriculated from Brasenose College, Oxford, but gaining a scholarship at University College next year migrated thither. At University College, with which he was long closely associated, he formed intimacies with Arthur Penrhyn Stanley, Goldwin Smith, John Conington, Arthur Gray Butler, William Bright, and T. W. Jex-Blake, afterwards dean of Wells. Friends at other colleges included Arthur Peel, afterwards Speaker of the House of Commons, G. C. Brodrick, Thomas Hill Green [q. v.], George Joachim Goschen, W. H. Fremantle (Dean of Ripon), Mr. Frederic Harrison, and Grant Duff. In 1852 he joined Goschen, Brodrick, and others in starting the Oxford Essay Club, and he frequently attended the club dinners in later life at Goschen's house and elsewhere.

In Easter term 1852 Parker was placed in the first class in the final classical school, and in the second class of the mathematical school. He graduated B.A. and proceeded M.A. in 1855. He was elected fellow of his college in 1854, and retained the office till 1868. He resided at Oxford till 1864, throwing himself with vigour into the work of both college and university. He was college tutor from 1858 to 1865, and lectured in modern history. He was examiner in the final classical school in 1859, 1860, 1863, and 1868. He won the confidence of undergraduates, and introduced them to men of note from the outer world, whom from an early date he entertained at Oxford. He organised the university volunteer corps and did much while major of the battalion (1865-8) to improve its efficiency, especially in shooting. The main recreation of his university days was mountaineering. He preferred climbing without guides, and it was without guides that he with his brothers Sandbach and Alfred made the second and fourth attempts on the Matterhorn in 1860 and 1861 respectively (cf. WHYMPER'S *Scrambles amongst the Alps*). Subsequently Parker's companions in the Alps included William Henry Gladstone and Stephen Gladstone, sons of the statesman, who was an early friend of Parker and his family.

Like Brodrick, Goldwin Smith, and other brilliant Oxford men, Parker was

a contributor to the early issues of the 'Saturday Review' in 1855, but he soon withdrew owing to his dislike of the cynical tone of the paper, and a characteristic impatience of its partisan spirit. He gradually concentrated his interest on a liberal reform of the university. He especially urged a prudent recognition of the claims of science, modern history, and modern languages in the academic curriculum, and the throwing open of scholarships to competition. He early declared for a national system of elementary education which should be efficient and compulsory, rather than voluntary. In 1867 he published two essays, one on 'Popular Education' in 'Questions for a Reformed Parliament,' and the other on 'Classical Education' in F. W. Farrar's 'Essays on a Liberal Education.'

In 1864 Parker, who inherited ample means, diversified his academic duties by becoming private secretary to Edward Cardwell, whose wife was his aunt. Cardwell was then colonial secretary, and Parker remained with him till he went out of office in 1866. At the wish of Gladstone, with whom his relations steadily became closer, he stood for Perthshire in 1868 in the liberal interest, gaining a startling victory over the former conservative member, Sir William Stirling Maxwell [q. v.]. He remained in the House of Commons throughout Gladstone's first administration, but was defeated by Stirling Maxwell in his old constituency at the general election of 1874. He was however re-elected for the city of Perth in 1878, and retained the seat till 1892, when he was defeated in a three-cornered contest. He failed to win a seat in West Perthshire in 1900. His refinement of manner and accent militated against his gaining the ear of the house, but his leaders respected him for his conscientious study of political issues and his judicial habit of mind. During his first parliament he was in constant touch with his old chief Cardwell, then secretary for war, and supported the abolition of purchase and Cardwell's other reforms of the army. He was often consulted by Gladstone, to whose measures and policy throughout his parliamentary career he gave a discriminating assent. At Gladstone's invitation he revised his speeches for the Midlothian campaign of 1878-80.

But it was on educational policy that Parker exerted his chief influence. Joining the public schools commission (1868-74), he proved one of its most active members, urging that the public school curriculum

should be modernised in sympathy with a progressive policy at the universities. He also sat on the commission for military education in 1869, and advocated the linking up of the public schools with Sandhurst and Woolwich, so as to ensure a broad general culture before technical and professional training. Again, as a member of the Scotch educational endowments commission in 1872, he argued persistently that the benefits of endowments should go 'not to the most necessitous of those fairly fitted intellectually, but to the most fit among those who were fairly necessitous.' His views greatly stimulated the development of secondary education in Scotland. He wished the Scotch elementary schools to form a 'ladder' to the university, and he sought to protect them from the evil system of 'payment by results.' He was in 1887 chairman of a departmental committee on higher education in the elementary schools of Scotland, and the report which he drew up with Sir Henry Craik in 1888 gave practical effect to his wise proposals.

Parker, whose wide interests embraced a precise study of scientific hypotheses, engaged in his later years in biographical work of historical importance. In 1891 he brought out the first volume of a life of Sir Robert Peel 'from his private correspondence,' which was completed in 3 vols. in 1899. In 1907 there followed 'The Life and Letters of Sir James Graham' (2 vols.). He allowed the subjects of his biographies to tell their story in their own words as far as possible. Parker, who was elected honorary fellow of University College in 1899, was made hon. LL.D. of Glasgow and hon. D.C.L. of Oxford in 1908. In 1907 he was admitted to the privy council. His last public act was to attend the council in May 1910 on the death of King Edward VII and sign the proclamation of King George V.

Parker died unmarried at his London residence, 32 Old Queen Street, Westminster, on 18 June 1910, and was buried at Fairlie. His portrait was painted by Sir Hubert von Herkomer. He bequeathed 5000*l.* to University College, where two Parker scholarships for modern history have been established.

[*The Times*, 19 June, 29 Aug. (will) 1910; Eton School Lists; Foster's Alumni Oxon.; private information; personal knowledge.]

PARKER, JOSEPH (1830-1902), congregationalist divine, born at Hexham on 9 April 1830, was the only son of Teasdale Parker, a stonemason, and deacon of the congregational church, by his wife Elizabeth

Dodd. His education at three local schools was interrupted at fourteen with a view to his following the building trade under his father; he soon went back to school, and became teacher of various subjects, including Latin and Greek. Though he taught in the congregational Sunday school, he joined the Wesleyan body, to which his parents had for a time seceded. This led to his becoming a local preacher; his first sermon was in June 1848. The family returned to congregationalism in 1852, and Parker, having obtained a preaching engagement from John Campbell (1794-1867) [q. v.], of the Moorfields Tabernacle, left for London on 8 April 1852. While in London, Campbell gave him nine months' sermon drill, and he attended the lectures of John Hoppus [q. v.] at University College. Soon becoming known as a preacher of original gifts, he was called to Banbury (salary 120*l.*), and ordained there on 8 Nov. 1853. His Banbury ministry of four years and eight months was marked by the building of a larger chapel, a public discussion on secularism with George Jacob Holyoake [q. v. Suppl. II], and the winning of the second prize (75*l.*) in a Glasgow prize essay competition on the 'Support of the Ordinances of the Gospel.' In 1858 he was called to Cavendish Chapel, Manchester, in succession to Robert Halley [q. v.]. He declined to leave Banbury till the debt (700*l.*) on his new chapel there was discharged. The Manchester congregation cleared off this, along with a debt (200*l.*) on their own chapel. Parker accepted their call in a letter (10 June 1858) stipulating for 'the most perfect freedom of action,' and maintaining that 'the office of deacon is purely secular.' He began his Manchester ministry on 25 July 1858, and for eleven years made himself as a preacher a power in that city, while exercising a wider influence through his literary labours.

In 1862 he received the degree of D.D. from Chicago University, but he first visited America in 1873. In 1867 he was made chairman of the Lancashire congregational union. Rejecting in 1868, he accepted in 1869, a call to the Poultry Chapel, London, in succession to James Spence, D.D. (1811-76). He rapidly filled an empty chapel, instituted the Thursday noon-day service, and conducted for three years an 'institute of homiletics' for the gratuitous instruction of young students in the art of preaching. He had come to London on condition of a removal of the congregation from the Poultry to a

new site. After some delay a site on Holborn Viaduct was secured for 25,000*l.*, and the Poultry Chapel sold for 50,200*l.* Parker meanwhile carried on his ministry in Cannon Street hall (Sunday mornings), Exeter Hall (Sunday evenings), and Albion Chapel (Thursdays). His newly built chapel, called the City Temple, was opened on 19 May 1874, when the lord mayor attended in state; Dean Stanley spoke at the collation which followed.

To the end of his days Parker's popularity never waned, nor did his resources fail. At his Thursday services clergymen irrespective of denomination were constantly seen. William Henry Fremantle (dean of Ripon) and Hugh Reginald Haweis [q. v. Suppl. II] would have preached at these services but were inhibited; a notable address on preaching was given by Gladstone (22 March 1877) after Parker's discourse. In 1880 Parker came forward as parliamentary candidate for the City of London, with a programme which included disestablishment and the suppression of the liquor traffic; on the advice of nonconformist friends the candidature was withdrawn. In 1894, and again in 1901, he was chairman of the Congregational Union of England and Wales. Visiting Edinburgh in February 1887, he delivered an address on preaching, and preached in various churches, including St. Giles'. His fifth voyage to America was made in the following August, and on 4 Oct. he delivered at Brooklyn the panegyric of Henry Ward Beecher (d. 8 March 1887), whom he was thought to resemble in gifts, and whose place in America some expected him to fill. In July and August 1888 he conducted a 'rural mission' in Scotland; in May 1894 he addressed the general assembly of the Free Church in Edinburgh, against some phases of the 'higher criticism.' In the following November he protested against the reporting of sermons as a form of literary piracy. 'The Times' of 18 May 1896 contains his letter in favour of 'education, free, compulsory and secular.' In March 1902 he was made president of the National Free Church council. After a long illness in that year he resumed preaching in September. His letter to 'The Times,' 'A Generation in a City Pulpit,' appeared on 22 Sept.; his last sermon was preached on 28 Sept.; he died at Hampstead on 28 Nov. 1902, and was buried in the Hampstead cemetery.

At the City Temple his portrait, painted in 1894 by Robert Gibb, R.S.A., is in the

vestry, as well as a bust by C. B. Birch, A.R.A. (1883), in the entrance. Another bust was executed by John Adams-Acton [q. v. Suppl. II]. A cartoon portrait by 'Ape' appeared in 'Vanity Fair' in 1884.

Parker married (1) on 15 Nov. 1851 Ann Nesbitt (d. 1863) of Horsley Hills; (2) on 22 Dec. 1864 Emma Jane (d. 26 Jan. 1899), daughter of Andrew Common, banker, of Sunderland. He had no issue.

Both by its strength and its freshness Parker's pulpit work impressed some of the best judges in his time. Holyoake, who commends his fairness in controversy, says he 'had a will of adamant and a soul of fire.' Further, he was a master in the arts of advertisement, and in the power of investing old themes with a novelty which startled and arrested. His writings, embodying much of his own experience, are racy in style and imbued with strong sense. He was a constant contributor to periodicals, beginning with the 'Homilist,' edited by David Thomas (1813-94) [q. v.]; he himself brought out various periodicals, the 'Congregational Economist' (1858), the 'Cavendish Church Pulpit,' 'Our Own,' the 'Pulpit Analyst' (1866-1870), the 'City Temple' (1869-73), the 'Fountain,' and the 'Christian Chronicle.'

His chief publication was 'The People's Bible,' 25 vols., 1885-1895. Other of his works were: 1. 'Six Chapters on Secularism,' 1854. 2. 'Helps to Truthseekers,' 1857; 3rd edit. 1858. 3. 'Questions of the Day,' 1860 (sermons). 4. 'John Stuart Mill on Liberty: a Critique,' 1865. 5. 'Wednesday Evenings at Cavendish Chapel,' 1865; 2 edits. 6. 'Ecce Deus . . . with Notes on "Ecce Homo,"' Edinburgh, 1867; 5th edit. 1875. 7. 'Springdale Abbey: Extracts from the Diaries and Letters of an English Preacher,' 1868 (fiction). 8. 'Ad Clerum: Advices to a Young Preacher,' 1870. 9. 'Tyne Chylde: My Life and Teaching,' 1880; 1886 (an autobiographical fiction). 10. 'The Inner Life of Christ,' 3 vols. 1881-2; 1884 (commentary). 11. 'Weaver Stephen,' 1886, (a novel). 12. 'Well Begun: Notes for those who have to Make their Way,' 1894. 13. 'Tyne Folk,' 1896. 14. 'Gambling in Various Aspects'; 5th edit. 1902. 15. 'Christian Profiles in a Pagan Mirror,' 1898. 16. 'Paterson's Parish: A Lifetime amongst the Dissenters,' 1898. 17. 'The City Temple Pulpit,' 1899. 18. 'A Preacher's Life,' 1899 (autobiography). 19. 'The Pulpit Bible,' 1901, 4to. 20. 'The Gospel of Jesus Christ,' 1903; new edit. 1908 (posthumous sermons).

Adamson, Life, 1902 (nine portraits); The Times, 29 Nov., 1 and 5 Dec. 1902; G. J. Holyoake, Two Great Preachers, 1903; J. Morgan Richards, Life of John Oliver Hobbes, 1911; G. Pike, Dr. Parker and his Friends, 1904.] A. G.

PARR, MRS. LOUISA (*d.* 1903), novelist, born in London, was the only child of Matthew Taylor, R.N. Her early years were spent at Plymouth. In 1868 she published in 'Good Words,' under the pseudonym of 'Mrs. Olinthus Lobb,' a short story entitled 'How it all happened.' It attracted attention, and appeared in a French version as a *feuilleton* in the 'Journal des Débats,' the editor apologising for departing from his rule of never printing translations. At the request of the Queen of Württemberg it was translated into German, and it was issued in America in pamphlet form. The next year Miss Taylor married George Parr, a doctor living in Kensington and a collector of early editions of works on London. He predeceased her.

In 1871 Mrs. Parr published 'Dorothy Fox,' a novel of Quaker life, which was so much appreciated in America that a publisher there paid Mrs. Parr 300*l.* for the advance sheets of her next novel. Nothing of importance followed until 1880, when her best novel, 'Adam and Eve,' was published. It is an interesting story, told with artistic restraint, of Cornish smuggling life founded on incidents related in Jonathan Couch's 'History of Polperro' (1871). Six novels followed, none coming near to 'Adam and Eve' in merit, the last, 'Can This be Love?' appearing in 1893. The life of Miss Mulock (Mrs. Craik) in 'Women Novelists of Queen Victoria's Reign' (1897) is from her pen. She also contributed short stories to magazines. A sense of humour and a pleasing style are the main characteristics of her work. She was always at her best in dealing with the sea.

Mrs. Parr died on 2 Nov. 1903 at 18 Upper Phillimore Place, Kensington, London.

[Who's Who, 1902; Men and Women of the Time, 1899; Athenæum, 14 Nov. 1903; Helen C. Black, Pen, Pencil, Baton and Mask, 1896; The Times, 7 Nov. 1903 (a mere reference).] E. L.

PARRY, JOSEPH (1841-1903), musical composer, born on 21 May 1841 at Merthyr Tydfil, was son of Daniel Parry (*d.* 1867), an ironworker of that town, by his wife

Mary. A brother (Henry) and two sisters (Jane and Elizabeth) gained some prominence as vocalists in the United States (*Y Cerddor Cymreig*, 1869, p. 15). Joseph started work at the puddling furnaces before he was ten. In 1853 his father emigrated to the United States, and the family followed in 1854, settling at Danville, Pennsylvania. Parry first studied music at about seventeen years of age, attending a class conducted by two of his Welsh fellow-workers at the iron-works. At an eisteddfod held at Danville at Christmas 1860 he won his first prize for composition, namely for a temperance march. Next year a subscription raised by the Welsh colony at Danville enabled Parry to study at a normal college at Genesee, New York. He returned after a short course to become organist at Danville. After winning many prizes at American eisteddfods, he sent several pieces for competition to the national eisteddfod held at Swansea in September 1863 and at Llandudno in August 1864, and at each gained prizes. In the summer of 1865 he attended the Aberystwyth eisteddfod, where the title 'Pencerdd America' was conferred on him. A glee, 'Ar dôn o flaen gwyntoedd,' published shortly afterwards at Wrexham, was widely popular in Wales, and appeared in New York in 'Y Gronfa Gerddorol' of Hugh J. Hughes (*Y Drych*, 19 March 1903). On his return to America, a fund was started to enable him to pursue his musical education. In aid of the fund Parry gave a series of concerts in Pennsylvania, Ohio, and New York, generally singing songs of his own composition (*Y Cerddor Cymreig*, 1870, p. 30). Meanwhile he was awarded prizes for his cantata 'The Prodigal Son' at Chester eisteddfod, September 1866 (still in MS., though the overture to it was played at the Royal Academy of Music in 1871), and for his glee 'Rhosyn yr Haf' (published in 1867) at Utica (January 1867).

In 1868 Parry and his family (he was already married) removed to London, and in September he entered the Royal Academy of Music, where he studied for three years, and won the bronze and silver medals. In 1871 he took the degree of Mus. Bac. at Cambridge. His exercise, a choral fugue in B minor, was performed at the Academy concert on 21 July. After going back to America to keep a music school at Danville (1871-3) he became professor of music at the newly founded University College of Wales at Aberystwyth. The appointment gave a great

impetus to musical studies in Wales. He proceeded Mus.Doc. at Cambridge in 1878, his exercise, a cantata, 'Jerusalem,' being performed by a Welsh choir from Aberdare. When the Aberystwyth professorship was discontinued in 1879 (DAVIES and JONES, *University of Wales*, pp. 121, 133), Parry kept a private school of music, first at Aberystwyth and then (1881-8) at Swansea. In 1888 he was appointed lecturer, and subsequently professor of music, at the University College, Cardiff, which he held (together with the directorship of a private musical institute in the town) till his death at his residence, Cartref, Penarth, on 17 Feb. 1903. He was buried at St. Augustine's, Penarth.

Joseph Parry was a most prolific composer. One of his first published pieces was a song, 'My Childhood's Dreams,' issued from Scranton, Pennsylvania, in 1865 (*Cerddor Cymreig*, Sept. 1865, p. 69). His opera 'Blodwen,' with Welsh words by Richard Davies (Mynyddog), performed from MS. at Aberystwyth and Aberdare in 1878, and later at the Alexandra Palace, London, but not published till 1888 (Swansea), has been performed hundreds of times in Wales, most often, however, as a cantata. It was the first opera performed in the Welsh language. His other operas include 'Virginia,' written in 1882 but still in MS., based on incidents in the American civil war; 'Sylvia' (1889), the words by his son, David Mendelssohn; 'Ceridwen,' a one-act dramatic cantata, first performed at the Liverpool eisteddfod, 1900; and 'The Maid of Cefn Ydfa' (words by Joseph Bennett), first produced by the Moody Manners Co. at the Grand Theatre, Cardiff, on 14 Dec. 1902.

Parry was also the author of two oratorios, 'Emmanuel,' performed at St. James's Hall, London, in 1880, but not published till 1882 (Swansea), and 'Saul of Tarsus,' first performed at the Rhyl eisteddfod on 8 Sept. 1892 (published London, 1893); also the following cantatas, 'The Birds' (Wrexham, 1873); 'Nebuchadnezzar' (London, 1884); 'Cambria' (first performed at the Llandudno eisteddfod, 1896); 'Joseph' (Swansea, 1881). His contributions to sacred music include some 400 hymn tunes, the best known being 'Aberystwyth,' composed on 3 July 1877 for the second volume (1879) of the Welsh Congregationalists' Hymnal of Edward Stephen (Tany-marian) [q. v.] This and sixty-six other tunes and a number of short anthems were published by Parry in 1892 as a Welsh national tune-book. The copy-

right in these and in a Sunday-school tune-book ('Telyn yr Ysgol Sul,' first published in 1877) was acquired after Dr. Parry's death by the Welsh Congregational Union, to which connexion Parry belonged. The appearance of his anthems resulted in a great advance in Welsh sacred music, and his setting of 'The Lord is my Shepherd' is said to rival Schubert's.

He edited and harmonised the music of a 'National Collection of Welsh Songs,' entitled 'Cambrian Minstrelsie' (Edinburgh, 6 vols. 1893). He also brought out a collection of his own songs, 'Dr. Parry's Book of Songs' (in five parts with portrait of the author), and issued a Welsh handbook on theory, being part i. of an intended series on music ('Elfenau Cerddoriaeth,' Cardiff, 1888).

Parry married (at Danville) Jane daughter of Gomer Thomas, who survived him with one son, David Mendelssohn, and two daughters. Of two sons who predeceased him, William Sterndale (1872-1892) and JOSEPH HAYDN PARRY (1864-1894), the latter, who showed much musical promise, was appointed professor at the Guildhall school of music in 1890, and composed, among other works, 'Cigarette,' a comic opera (the libretto by his brother, David Mendelssohn Parry), produced on 15 Aug. 1892 at the Theatre Royal, Cardiff, and in September at the Lyric Theatre, London, and 'Miami,' a more ambitious work, set to an adaptation of 'The Green Bushes,' and produced 16 Oct. 1893 at the Princess's Theatre, London (GROVE'S *Dict. of Music and Musicians*, 1907, v. 499; *Western Mail*, 30 March 1894; *Annual Register*, 1894, p. 157; MARDY REES, *Notable Welshmen*, 432).

D. LL. T.

PARSONS, SIR LAURENCE, fourth EARL OF ROSSE (1840–1908), astronomer, born at Birr Castle, Parsonstown, King's Co., Ireland, on 17 Nov. 1840, was eldest of four surviving sons of William Parsons, third earl of Rosse [q. v.], the astronomer. The youngest brother, Sir Charles Algernon Parsons, C.B., F.R.S. (b. 1854), is well known for his invention of the compound steam turbine, since applied to marine propulsion.

Known in youth by the courtesy title of Baron Oxmantown, co. Wexford, Laurence was educated at home, first under the tutorship of the Rev. T. T. Gray, M.A., of Trinity College, Dublin, and then of John Purser, LL.D., afterwards professor of mathematics in Queen's College, Belfast.

Subsequently he entered Trinity College, Dublin, graduating in 1864, but he was non-resident. He was early imbued with his father's spirit of inquiry. At his father's observatory at Birr he assisted in the workshops and met leading men of science. Succeeding in 1867 to the peerage on his father's death, Lord Rosse thenceforward divided his interests between the management of his estates and the pursuit of astro-physics. He was made sheriff of King's Co., Ireland, in 1867, and became a representative peer of Ireland in 1868. On 29 Aug. 1890 he was created a knight of the Order of St. Patrick. He was subsequently lord-lieutenant of King's Co. (1892–1908).

According to Dr. Otto Boeddicker (technical coadjutor at Birr Observatory), Rosse had 'an inherited genius for mechanical relations and contrivances, and endless were his ideas and designs, all of a most ingenious character.' His first scientific paper, 'Description of an Equatoreal Clock,' appeared in the 'Monthly Notices' of the Royal Astronomical Society (1866). This was followed by a classical memoir in practical astronomy, 'An Account of Observations of the Great Nebula in Orion, made at Birr Castle, with the three-feet and six-feet Telescopes, between 1848 and 1867,' published in the 'Philosophical Transactions' of the Royal Society. An elaborate drawing of the nebula (engraved by J. Basire) accompanied the paper, and was characterised by Dr. J. E. L. Dreyer (*Monthly Notices Roy. Astron. Soc.* Feb. 1909) as being 'always of value as a faithful representation of the appearance of the Orion nebula in the largest telescope of the nineteenth century.' This study completed, Rosse took up (1868–9) an investigation on the radiation of heat from the moon (see *Proc. Roy. Soc.* vols. xvii., xix.), which formed the subject of the Royal Society's Bakerian lecture

for 1873 (*Phil. Trans.* vol. clxiii.), and occupied his attention for the greater part of his life, despite somewhat scant notice from the scientific world. At the Royal Institution (1895) he gave a lecture, 'The Radiant Heat from the Moon during the Progress of an Eclipse' (*Proc. Roy. Inst.* vol. xiv.). Two days after Rosse's death, Sir Howard Grubb, F.R.S., exhibited at the Dublin meeting of the British Association Rosse's new development of apparatus for lunar heat observation. Other contributions comprised 'The Electric Resistance of Selenium' (*Phil. Mag.* 1874); 'On some Recent Improvements made in the Mountings of the Telescopes at Birr Castle' (*Phil. Trans.* 1881); 'On a Leaf-arrester, or Apparatus for removing Leaves, &c., from a Water Supply' (*Rept. Brit. Assoc.* 1901).

Lord Rosse was elected chancellor of Dublin University in 1885, succeeding Earl Cairns, and held office till his death. In 1903, in association with the provost and members of the university, he issued an appeal for funds (subscribing liberally himself) to secure the erection and equipment of science laboratories in Trinity College; the project had a successful issue.

The University of Oxford conferred the honorary degree of D.C.L. in 1870, and Dublin and Cambridge Universities that of LL.D. in 1879 and 1900 respectively. Elected a fellow of the Royal Society on 19 Dec. 1867, he served on the council (1871–2, 1887–8), and was vice-president for those years. On 13 Dec. 1867 he was elected a fellow of the Royal Astronomical Society, and served on the council (1876–8). Rosse was president of the Royal Dublin Society (1887–92) and of the Royal Irish Academy (1896–1901). He was made an honorary member of the Institution of Mechanical Engineers in 1888.

He died at Birr Castle on 30 Aug. 1908, and was buried in the old churchyard of Birr. He married on 1 Sept. 1870 Frances Cassandra Harvey, only child of Edward William Hawke, fourth baron Hawke of Towton, by his second wife, Frances, daughter of Walker Fetherstonhaugh. He had issue two sons and one daughter. The elder son, William Edward Parsons, succeeded to the title.

Lord Rosse was interested in the prosecution of magnetic observations at Valencia Observatory, Ireland, and collected a sum of money in furtherance of that object. After his death the capital was transferred to the trusteeship of the Royal Society, and is known as the 'Rosse Fund.' By

his will he left 1000*l.* to the Science Schools Fund of Trinity College, Dublin, and the Rosse telescope and all his scientific instruments, apparatus, and papers to his sons in order of seniority, successively, whom failing, to the Royal Society. He left 2000*l.* upon trust for the upkeep of the telescope.

[Proc. Roy. Soc., vol. lxxxiii, A. and Catal. Sci. Papers; Monthly Notices Roy. Astron. Soc., vol. lxix.; Roy. Irish Acad. Minutes, session 1908-9, pp. 1, 8; Proc. Inst. Mechan. Eng. 1908; Roy. Soc. Arts Journ., vol. lvi.; The Observatory, Oct. 1908; Engineering, 4 Sept. 1908; Nature, vol. lxxxviii.; The Times, 31 Aug., 3 Sept., 17 Dec. 1908.]

T. E. J.

PATON, JOHN BROWN (1830-1911), nonconformist divine and philanthropist, son of Alexander Paton by his wife Mary, daughter of Andrew Brown of Newmilns, Ayrshire, was born on 17 Dec. 1830 at Galston, Ayrshire. On his father's side he was descended from John (*not* James) Paton (*d.* 1684) [q. v.], the covenanter. Both his parents, who were brought up in distinct seceding bodies (burgher and anti-burgher), now belonged to the united secession church, Newmilns. The father ultimately joined the congregationalists. From London parish school Paton passed in 1838 to the tuition of his maternal uncle, Andrew Morton Brown, D.D., congregational minister, then at Poole, Dorset. In 1844 Paton was at Kilmarnock, where he met Alexander Russel [q. v.], and came under the spell of James Morison (1816-1893) [q. v.]. Returning in 1844 to his uncle's care, now at Cheltenham, Paton's future career was determined by the influence of Henry Rogers (1806-1877) [q. v.]. Deciding to become a congregational minister, he entered in Jan. 1847 Spring Hill College, Birmingham (now Mansfield College, Oxford), in which Rogers held the chair of literature and philosophy. With his fellow-student, Robert William Dale [q. v. Suppl. I], he formed a close and lifelong friendship. He heard Emerson lecture on the 'Conduct of Life' in the Birmingham town hall, and attended (from 1850) the ministry of Robert Alfred Vaughan [q. v.], to whose 'intense spirituality' he owed much. During his college course he graduated B.A. at London University in 1849; gained the Hebrew and New Testament prize there (1850), and a divinity scholarship (1852) on the foundation of Daniel Williams (1643 ?-1716) [q. v.], and proceeded M.A. London in 1854, both in

classics and in philosophy (with gold medal).

Leaving college in June 1854 he took charge of a mission in Wicker, a parish in the northern part of Sheffield. His ministry was eminently successful; the Wicker congregational church was built in 1855; in addition, the congregation in Garden Street chapel, Sheffield, was revived. In 1861 Cavendish College, Manchester, was started for the training of candidates for the congregational ministry; Paton went weekly from Sheffield to take part in its professorial work. In 1863 the institution was transferred to Nottingham as the Congregational Institute, with Paton as its first principal. Temporary premises were exchanged for a permanent building (1868), and the institute gained increasing reputation during the thirty-five years of Paton's headship. In his management of young men he was an ideal head; no feature of his teaching was more marked than the skill and judgment with which he conducted the work of sermon-making and delivery. In 1882 he was made D.D. of Glasgow University. On his retirement in 1898 his portrait by Arnesby Brown, promoted by a committee headed by the archbishop of Canterbury (Temple), was presented on 26 Oct. 1898 by the bishop of Hereford (Percival) to the city of Nottingham, and is now in the Castle Museum (a replica was given to Paton).

Paton's beneficent activity took other than denominational directions. A visit to Kaiserswerth had impressed him with the idea of the co-operation of all creeds to bring the influence of religion to the regeneration of society. In conjunction with Canon Morse, vicar of St. Mary's, Nottingham, he promoted a series of university lectures which led the way to the establishment of the Nottingham University College in 1880. It was due to Paton's suggestion that the bishop of Lincoln (Wordsworth) sent a letter of sympathy in 1872 to the Old Catholics (MARCHANT, p. 289). Greatly interested in the Inner Mission, founded in 1848 by Dr. Wichern of Hamburg, he took an active share in plans for the raising of social conditions, e.g. home colonisation with small land-holders, the co-operative banks movement, the social purity crusade. Among societies of which he was the founder were the 'National Home Reading Union' (1889), suggested by the account given by Sir Joshua Girling Fitch [q. v. Suppl. II] of 'The Chautauqua Reading Circle' in the 'Nineteenth Century,' Oct. 1888. He also instituted the 'Recreative Evening School

Associations' (1885) out of which sprang the 'continuation classes' of the State schools (1893); the 'Bible Reading and Prayer Union' (1892); the 'English Land Colonisation Society,' 1892 (now the 'Co-operative Small Holders Association'); a colony for unemployables and epileptic children at Lingfield (now at Wallingford), 1894; the 'Christian Social Service Union,' which undertook the care of the Lingfield and similar colonies (1894); the 'Social Institutes Union' (1896); the 'Scottish Christian Social Union' (1901); the Boys' (1900) and Girls' (1903) Life Brigades; the Young Men's and Young Women's Brigade of Service (1905); and the Boys' and Girls' League of Honour (1906). He was president of the Licensing Laws Information Bureau (1898-1902), and vice-president of the British Institute for Social Service (1904), and of the British and Foreign Bible Society (1907).

Paton, in conjunction with Dale, edited (1858-61) 'The Eclectic Review.' With F. S. Williams, his colleague, he edited a 'Home Mission and Tract Series' (1865). He was a consulting editor (1882-8) of the 'Contemporary Review,' to which, at his urgent request, Lightfoot previously contributed (1874-7) his articles on 'Supernatural Religion.' With Sir Percy William Bunting [q. v. Suppl. II], editor of the 'Contemporary Review,' and the Rev. Alfred Ernest Garvie, he edited a series of papers entitled 'Christ and Civilisation' (1910), his last work.

He died at Nottingham on 26 Jan. 1911, and was buried in the general cemetery, where the service at the graveside (after a nonconformist service in Castlegate chapel) was conducted by the bishop of Hereford (Percival) and the dean of Norwich (Wakefield), now bishop of Birmingham. He married Jessie, daughter of William P. Paton of Glasgow, and was survived by three sons and two daughters; his son, John Lewis, is high master of the Manchester grammar school.

Paton's publications include: 1. 'The Origin of the Priesthood in the Christian Church,' 1877. 2. 'Christianity and the Wellbeing of the People. The Inner Mission of Germany,' 1885; 2nd edit. 1900. 3. 'The Two-fold Alternative . . . Materialism or Religion . . . a Priestly Caste or a Christian Brotherhood,' 1889; 4th edit. 1909. 4. 'Criticisms and Essays,' 2 vols. 1895-7. 5. 'Christ's Miracle of To-day,' 1905. 6. 'Social Questions of the Day,' 6 vols. 1906. 7. 'The Life, Faith and Prayer of the Church,' 1909, 16mo (four sermons). 8. 'Present Remedies for Unemployment,' 1909.

Addison, Roll of Graduates, Glasgow, 1898; Who's Who, 1911; The Times, 27 and 30 Jan. and 1 Feb. 1911; R. Cochrane's Beneficent and Useful Lives, 1890, pp. 146-159 (for account of the National Home Reading Union); Life and Letters, by John Lewis Paton, his son in preparation.)] A. G.

PATON, JOHN GIBSON (1824-1907), missionary to the New Hebrides, born on 24 May 1824 at Braehead, Kirkmahoe, Dumfriesshire, was eldest of the eleven children (five sons and six daughters) of James Paton, a peasant stocking-maker, by his wife Janet Jardine Rogerson. Both parents were of covenanting stock and rigid adherents of the 'Reformed Presbyterian Church of Scotland,' which still represented the faith of the covenanters. When Paton was five years old, the family removed to Torthorwold, a few miles from Dumfries, where his parents passed the remaining forty years of their lives. Here he attended the parish school, till, in his twelfth year, he was put to his father's trade of stocking-making. Paton soon freed himself from the family workshop, and began to support and educate himself. He put himself for six weeks—all he could afford—to Dumfries Academy; he served under the surveyors for the ordnance map of Dumfries; he hired himself at the fair as a farm labourer; he taught, when he could get opportunity, in schools, and even for a time set up a school for himself; but every spare moment was devoted to serious study. At last he settled down for ten years as a city missionary in a then very neglected part of Glasgow, where he created an excellent school and put the whole district in order.

The 'Reformed Church,' by which John Paton was ordained, had already a single missionary, the Rev. John Inglis, at Aneityum, the southernmost of the New Hebrides Islands in the South Seas; and the elders of the church were seeking somewhat vainly for volunteers to join in that hazardous enterprise. Paton offered himself, and was accepted. On 1 Dec. 1857 he was licensed as a preacher, in his thirty-third year, and on 23 March following he was ordained. With his newly married young wife, Mary Ann Robson, he reached the mission station at Aneityum on 30 Aug., and the pair were soon sent on to establish a new station in the island of Tanna, the natives of which were then entirely untouched by Western civilisation, except

in so far as they had from time to time been irritated by aggression on the part of sandalwood traders. The young Scotchman and his wife, without any experience of the world outside the small body to which they belonged, were thus the first white residents in an island full of naked and painted wildmen, cannibals, utterly regardless of the value of even their own lives, and without any sense of mutual kindness and obligation. A few months later, in March 1859, a child was born to this strangely placed couple, and in a few days more wife and child were both dead.

Paton, alone but for another missionary on the other and almost inaccessible side of the island, was left for four years to persuade the Tannese to his own way of thinking. In May 1861 a Canadian missionary and his wife, on the neighbouring island of Erromango, were massacred; and the Tannese, encouraged by the example, redoubled their attacks on Paton, who, after many hairbreadth escapes, got safely away from Tanna, with the loss of all his property except his Bible and some translations which he had made into the island language during his four years' struggle.

From Tanna Paton reached New South Wales, where he knew no one, walked into a church, pleaded successfully for a few minutes' hearing, and spoke with such effect that from that moment he entered on the career of special work which was to occupy the remaining forty-five years of his long life. His main objects—in which he succeeded to a marvellous degree—were to provide missionaries for each of the New Hebridean islands, and to provide a ship for the missionary service. As the direct result of his extraordinary personality and power of persuasion, the 'John G. Paton Mission Fund' was established in 1890 to carry on the work permanently. Returning for the first time to Scotland (1863-4), he there married again, and with his new wife and certain missionaries whom he had persuaded to join in his work was back in the Pacific early in 1865. After placing the new missionaries in various islands, Paton himself settled on the small island of Aniwa, the headquarters whence from 1866 to 1881 he contrived to make his influence felt. After 1881 his 'frequent deputation pilgrimages among the churches in Great Britain and the colonies rendered his visits to Aniwa few and far between,' and his headquarters were at Melbourne.

In addition to his special work as missionary he took considerable part in moving the civil authorities—not merely British,

but also those of the United States—to check the dangerous local traffic in strong drink and firearms. He also resisted the recruiting of native labour from the islands; and he lost no opportunity of protesting against the growth of non-British influence in the same places.

During a visit home in 1884, at the suggestion of his youngest brother, Dr. James Paton, the missionary somewhat reluctantly undertook to write his autobiography. James Paton (1843-1906), who had also passed from the ministry of the 'reformed' to that of the Free Church of Scotland, and had graduated D.D. of Glasgow University, shaped his brother's rough notes into a book which, first published in 1889, has played a great part in spreading Paton's influence.

His last years were mainly spent in Melbourne. He died there on 28 Jan. 1907, and was buried in Boroondara cemetery.

Paton's second wife, Margaret, whom he married at Edinburgh in 1864, was daughter of John Whitecross, author of books of scriptural anecdote, and was a woman of great piety and strong character. She showed literary ability in her 'Letters and Sketches from the New Hebrides' (1894), and remarkable power of organisation in her work for the Australian 'Presbyterian Women's Missionary Union.' She was of great assistance to her husband up to her death on 16 May 1905; in her memory a church was erected at Vila, now the centre of administration in the New Hebrides. By her Paton had two daughters and three sons. Two sons became missionaries in the New Hebrides; and one daughter married a missionary there.

[John G. Paton, *Missionary to the New Hebrides: an Autobiography*, edited by his brother, the Rev. James Paton, D.D., with portrait and map (2 pts. 1889); vol. i. 1891; 're-arranged and edited for young folks,' 1892 and 1893 (a penny edition); *Letters and Sketches from the New Hebrides*, by Mrs. John G. Paton, 1894; John G. Paton, *Later Years and Farewell: a Sequel*, by A. K. Langridge and (Paton's son) Frank H. L. Paton, 1910; *The Triumph of the Gospel in the New Hebrides*, by Frank H. L. Paton, 1903.] E. M. T.

PATON, SIR JOSEPH NOËL (1821-1901), artist, born on 13 December 1821, at Dunfermline, was elder son of Joseph Neil Paton, designer of patterns for damask (the staple industry of the town), who was a collector of works of art and after many phases of religious development became a Swedenborgian. His mother, Catherine MacDiarmid, who claimed descent from

Malcolm Canmore, through the Robertsons of Struan, was an enthusiast for fairy-tales and the traditions and legends of the Highlands. His younger brother, Waller Hugh [q. v.], was the landscape-painter, and one of his two sisters, Amelia (1820-1904), who married David Octavius Hill [q. v.], modelled with skill and executed several public statues of merit. At an early age the boy Joseph, who read widely, was impressed by the designs, as well as the poetry, of William Blake. By the time he was fourteen he had made a series of illustrations to the Bible. After completing his general education at a local school, he in 1839 assisted his father in designing, and for the next three years (1840-42) held a situation as a designer for sewed muslins in Paisley. His leisure was devoted to art, and he commenced to paint in oils. In 1843 he entered the schools of the Royal Academy in London, where he began a lifelong friendship with (Sir) John Everett Millais [q. v. Suppl. I], but the Academy training proved uncongenial, and Paton soon went north again. Senior to the Pre-Raphaelites by a few years, Paton sympathised with their ideals, and anticipated some of their practice, but he did not share their ardour for reality, and his pictures, being more conventional both in subject and in style than theirs, more readily won popular approval. In the Westminster Hall competitions, held in connection with the decoration of the Houses of Parliament, Paton was awarded in 1845, when he was only twenty-four, one of the three 200*l.* premiums for his cartoon 'The Spirit of Religion or The Battle of the Soul,' and in 1847 the sum of 300*l.* for his oil-paintings of 'The Reconciliation of Oberon and Titania' and 'Christ bearing the Cross,' a colossal canvas. To 'The Reconciliation' (1847) Paton soon added a companion painting, 'The Quarrel of Oberon and Titania' (1849), the former being purchased by the Royal Scottish Academy, the latter by the Royal Association; both are now in the National Gallery of Scotland. They received enthusiastic welcome, and thenceforth Paton enjoyed an outstanding position, at any rate in Scotland. Elected an associate of the Royal Scottish Academy in 1847, he became an academician in 1850.

From 1856 to 1869 Paton exhibited fourteen pictures at the Royal Academy, and during that period fully maintained his popularity as painter of scenes from fairy tale or history. 'Home from the Crimea' (1856) was one of the few pictures in which the artist touched contemporary

life. He showed technical accomplishment and intensity of feeling in 'Luther at Erfurt' (1861). 'The Fairy Raid' (1867) evinced abundant fancy. Other notable works of this time were 'Dante meditating the Episode of Francesca da Rimini' (1852); 'The Dead Lady' (1854); 'In Memoriam' (1857); 'Hesperus' (1858), now in the Glasgow Gallery; 'The Bluidie Tryste' (1858); 'The Dowie Dens of Yarrow' series (1860). 'The Pursuit of Pleasure' (1855) is the first work in which Paton's strong leaning to allegory was revealed. In 1865 Paton was made by Queen Victoria Her Majesty's Limner for Scotland, and he was knighted in 1867. Meantime, while not wholly abandoning fanciful or romantic subjects, he devoted his chief strength to religious themes. 'Mors Janua Vitæ,' shown in 1866 at the Royal Academy, marks the beginning of the series to which belong 'Faith and Reason' (1871); 'Satan watching the Sleep of Christ' (1874); 'Lux in Tenebris' (1879); 'In Die Malo' (1881); 'Vigilate et Orate' (1885), painted for Queen Victoria; 'The Choice' (1886); and 'Beati Mundo Corde' (1890). These large pictures were not shown in the usual exhibitions, but were sent on tour all over the country, with footlights and a lecturer; they proved highly popular, and long lists of subscribers for reproductions were secured. But their artistic value and interest were small, and Paton's reputation among connoisseurs declined.

Paton's gift was that of an illustrator. He valued intention more highly than execution, and set moral purpose above æsthetic charm. His work lacks the true effects of colour. Technically his strongest qualities were drawing, which was correct and was marked by a sense of suave beauty; the design, if wanting in simplicity and concentration, was usually learned and accomplished. His draughtsmanship is seen at its best perhaps in his drawings and studies in black and white, and in the outline compositions he made in illustration of Coleridge's 'Ancient Mariner' (issued by the Art Union of London in 1864) and other poems. This feeling for form and design also found an outlet in some graceful works in sculpture and in a few ambitious projects of a monumental kind.

Paton's interests were varied. Widely read, he published two volumes of verse, 'Poems by a Painter' (1861) and 'Spindrift' (1867), marked by considerable charm and originality, mainly dealing with

themes similar to those of his pictures. The delightful song, 'With the Sunshine and the Swallows and the Flowers,' set to music by the Rev. Dr. John Park, is widely known. His fine collection of art-objects and of arms and armour, which was admirably arranged in his Edinburgh house, 33 George Square, was purchased after his death, largely by public subscription, and placed in the Royal Scottish Museum, Chambers Street, Edinburgh. Paton was made hon. LL.D. by Edinburgh University in 1876, and on two occasions, in 1876 and again in 1891, he was offered the presidency of the Royal Scottish Academy. He died at Edinburgh on 26 Dec. 1901, and was buried in the Dean cemetery.

In 1858 Paton married Margaret (*d.* April 1900), daughter of Alexander Ferrier, Bloomhill, Dumbartonshire; by her he had issue seven sons and four daughters. The eldest son, Dr. Diarmid Noël Paton, is professor of physiology in Glasgow University.

In the Scottish National Portrait Gallery there is a marble bust of Paton by his sister, Mrs. Hill. Other portraits are a picture by his son Ranald, painter, and a bust by another son, who became a lawyer.

Story, 1895; Scots Pictorial, 28 Aug. 1897; exhibition catalogues; Ruskin's Notes on the Royal Academy, 1856 and 1858; R.S.A. Report, 1902; catalogue, National Gallery of Scotland; J. L. Caw's Scottish painting, 1908; The English Pre-Raphaelites, by Percy Bate; private information.] J. L. C.

PAUL, CHARLES KEGAN (1828-1902), author and publisher, son of the Rev. Charles Paul (1802-1861), by his wife Frances Kegan Horne (1802-1848), was born on 8 March 1828 at White Lackington near Ilminster, Somersetshire, where his father was curate. He was educated first at Ilminster grammar school under the Rev. John Allen and afterwards at Eton, where he entered Dr. Hawtrey's house in 1841. He matriculated at Exeter College, Oxford, in January 1846, and in 1849 made the acquaintance of Charles Kingsley, whose contagious energy greatly impressed him. Tractarian theories did not appeal to him, and he showed a leaning towards broad church views in theology. Graduating B.A. in October 1849, he was ordained deacon in the Lent of 1851, and accepted the curacy of Tew, in the diocese of Oxford. Friendship with Kingsley brought him into association with F. D. Maurice, Tom Hughes, J. M. Ludlow, and other co-operative and Christian socialist leaders. He was now

broadly high church in doctrine, given to ritualism, and a radical in politics. About this time he took up the practice of mesmerism. In 1852, when he was ordained priest, he became curate of Bloxham, near Banbury, travelled in Germany with pupils, and in November 1853 was given a 'conductship' or chaplaincy at Eton College. In 1853 appeared his first literary production, a sermon on 'The Communion of Saints.' He became a vegetarian and turned his attention to Positivism, and was appointed a 'Master in College' (*Memories*, p. 205) in 1854. Two years later he married Margaret Agnes Colville (youngest sister of Sir James W. Colville [q. v.]). He contributed to the 'Tracts for Priests and People,' brought out by Maurice and Tom Hughes, one on 'The Boundaries of the Church' (1861), in which he stated that the very minimum of dogma was required from lay members of the Church of England. These views brought down upon him the wrath of Bishop Wilberforce. He left Eton in 1862 to become vicar of an Eton living at Sturminster Marshall, Dorsetshire. As the endowment was small, he took pupils. In 1870 he joined a unitarian society called the Free Christian Union. In 1872 he associated himself with Joseph Arch's movement on behalf of the agricultural labourers in Dorset, and in 1873 he edited the new series of the 'New Quarterly Magazine.' He gradually found himself out of sympathy with the teaching of the Church of England, and in 1874 threw up his living and came to London. In 1876 appeared his most noteworthy production, 'William Godwin, his Friends and Contemporaries,' with portraits and illustrations, 2 vols. The work was undertaken at the request of Sir Percy Shelley, Godwin's grandson, who placed at Paul's disposal a mass of unpublished documents, which he used with judgment.

For some years Paul had acted as reader for Henry Samuel King, publisher, of Cornhill, who brought out several of his books; King in 1877 relinquished the publishing part of his business and Paul took it over, inaugurating the house of C. Kegan Paul and Co. at No. 1 Paternoster Square. Paul thus succeeded King as Tennyson's publisher. Among Paul's earliest publications were the 'Nineteenth Century,' the new monthly periodical (1877), the works of George William Cox [q. v. Suppl. II], the 'Parchment Library of English Classics,' Tennyson's works in one volume, the 'International Scientific' series (begun

by H. S. King), some works of Thomas Hardy, George Meredith, and R. L. Stevenson, and Badger's English-Arabic Lexicon. One of his ventures was to give 5000 guineas for the 'Last Journals of General Gordon,' which cost the firm 7000*l.* before a single copy was ready. In 1881 Mr. Alfred Trench, son of the archbishop, joined the firm, now styled Kegan Paul, Trench & Co. After various vicissitudes, including a calamitous fire in 1883, Messrs. Trübner & Co. and George Redway joined the firm in 1889, and the amalgamation was converted into a limited company under the style of Kegan Paul, Trench, Trübner & Co., Ltd. They moved into large new premises, called Paternoster House, in Charing Cross Road, in 1891, and for some years the business was prosperous. In 1895 the profits of the publishing firm fell with alarming abruptness, the directors resigned, and the capital was reduced. Paul at the same time lost money as director of the Hansard Printing and Publishing Company, and other enterprises. Paul's publishing concern is now incorporated in that of Messrs. Routledge.

Meanwhile from 1888 Paul began to attend mass, and in 1890 during a visit to France he decided to enter the catholic church, and made his submission at the church of the Servites at Fulham on 12 Aug. 1890. His new views were displayed in tracts on 'Miracle' (1891), 'Abstinence and Moderation' (1891), and 'Celibacy' (1899), issued by the Catholic Truth Society, and an edition of 'The Temperance Speeches' of Cardinal Manning (1894). A volume of 'Memories' (1899), which is interesting for its stories of early school and Eton life, ends with his conversion.

In 1895 Paul was run over in Kensington Road, and never recovered from the accident. He died in London on 19 July 1902, in his seventy-fifth year, and was buried at Kensal Green.

A portrait painted by Mrs. Anna Lea Merritt is in the possession of Miss R. M. Paul, his daughter.

Paul also wrote: 1. 'Reading Book for Evening Schools,' 1864. 2. 'Shelley Memorials, from Authentic Sources,' 3rd edition, 1874. 3. 'Mary Wollstonecraft [afterwards Mrs. Godwin], Letters to Imlay, with Prefatory Memoir,' 1879 (expanded from 'Godwin, his Friends, &c.'). 4. 'Biographical Sketches,' 1883 (Edward Irving, John Keble, Maria Hare, Rowland Williams, Charles Kingsley, George Eliot, John Henry Newman). 5. 'Faith and Unfaith and other

Essays,' 1891 ('The Production and Life of Books' deals with the ethics and practice of publishing). 6. 'Maria Drummond, a Sketch,' 1891 (Mrs. Drummond of Fredley, near Dorking, widow of Thomas Drummond (1797-1840) [q. v.]). 7. 'Confessio Viatoris,' 1891 (religious development elaborated in 'Memories'). 8. 'On the Way Side, Verses and Translations,' 1899.

Paul also published several translations including 'Goethe's Faust, in Rime' (1873) (a careful piece of work in the metres of the original); 'Pascal's Thoughts' (1885, several reissues); 'De Imitatione' (1907); and he edited with a preface 'The Genius of Christianity unveiled, being Essays never before published; by William Godwin' (1873).

[Family information; Paul's Memories, 1899; Allibone, Dict. Eng. Lit. Suppl., 1891; Athenæum, 26 July 1902; The Publishers' Circular, 26 July 1902 (with a portrait after a photograph); Bookseller, 7 Aug. 1902; The Times, 21 July 1902; Who's Who, 1902.]

H. R. T.

PAUL, WILLIAM (1822-1905), horticulturist, born at Churchgate, Cheshunt, Hertfordshire, on 16 June 1822, was second son of Adam Paul, a nurseryman of Huguenot descent, who came to London from Aberdeenshire towards the close of the eighteenth century and purchased the Cheshunt nursery in 1806. After education at a private school at Waltham Cross, William joined his father's business. On Adam Paul's death in 1847 the business was carried on as A. Paul & Son by William and his elder brother George. In 1860 this partnership was dissolved. William Paul & Son carried on the Waltham Cross nursery, which he had founded a year before, while George established the firm of Paul & Son at Cheshunt.

John Claudius Loudon [q. v.] before his death in 1843 discovered Paul's literary abilities, and for him Paul did early literary work. He afterwards helped John Lindley [q. v.], for whom, in 1843, he wrote the articles in the 'Gardeners' Chronicle' on 'Roses in Pots,' which were issued separately in the same year, and reached a ninth edition in 1908. Paul's book, 'The Rose Garden,' which was first published in 1848, and reached its tenth edition in 1903, has enjoyed the unique fortune of maintaining a pre-eminent authority for sixty years. It is a practical treatise, to which Paul's wide reading gave a literary character. Coloured illustrations long rendered the book expensive;

later editions were issued in two forms, with and without these plates.

Paul served on the committee of the National Floricultural Society from 1851 until it was dissolved in 1858, when the floral committee of the Royal Horticultural Society was established. In July 1858 he joined the National Rose Society, which Samuel Reynolds Hole [q. v. Suppl. II] had just founded, and in 1866 he was one of the executive committee of twenty-one members for the great International Horticultural Exhibition. He also acted as a commissioner for the Paris Exhibition of 1867. Paul was elected a fellow of the Linnean Society in 1875, and received the Victoria medal of horticulture when it was first instituted in 1897.

Although best known as a rosarian, Paul from the outset of his career devoted attention to the improvement of other races of plants, such as hollyhocks, asters, hyacinths, phloxes, camellias, zonal pelargoniums, hollies, ivies, shrubs, fruit-trees, and Brussels sprouts. He dealt with these subjects in 'American Plants, their History and Culture' (1858), the 'Lecture on the Hyacinth' (1864), and papers on 'An Hour with the Hollyhock' (1851) and on 'Tree Scenery' (1870-2). He contributed papers on the varieties of yew and holly to the 'Proceedings' of the Royal Horticultural Society (1861, 1863). In addition to 'The Rose Annual,' which he issued from 1858 to 1881, Paul was associated with his friends Dr. Robert Hogg and Thomas Moore in the editorship of 'The Florist and Pomologist' from 1868 to 1874. The practical knowledge with which he wrote of varied types of plant life impressed Charles Darwin (cf. *Animals and Plants under Domestication*, vol. ii.). Clear and fluent as a speaker, he proved an acceptable lecturer. One of his best lectures, 'Improvements in Plants,' at Manchester in 1869, was included in his 'Contributions to Horticultural Literature, 1843-1892' (1892).

Paul died of a paralytic seizure on 31 March 1905, and was buried in the family vault at Cheshunt cemetery. His wife, Amelia Jane Harding, predeceased him. His business was carried on by his son, Arthur William Paul. The rich library of old gardening books and general literature, which he collected at his residence, Waltham House, was sold at Sotheby's after his death, but many volumes were bought by his son.

Besides the works mentioned, Paul was author of: 1. 'Villa Gardening,' 1855; 3rd revised edit. 1876. 2. A shilling

brochure, 'Roses and Rose-Culture,' 1874; 11th edit. 1910. 3. 'The Future of Epping Forest,' 1880.

[Garden, lvii. (1900), 166; lxiii. (1903), preface with portrait; and lxvii. (1905), 213; Journal of Horticulture, l. (1905), 305 (with portrait); Gardeners' Chron. 1905, i. 216, 231; Proc. Linnean Soc. 1904-5, 46-7.]

G. S. B.

PAUNCEFOTE, SIR JULIAN, first BARON PAUNCEFOTE OF PRESTON (1828-1902), lawyer and diplomatist, born at Munich on 13 Sept. 1828, was second son of Robert Pauncefote (formerly Smith) of Preston Court, Gloucestershire (1788-1843), by his wife Emma (*d.* 1853), daughter of R. Smith. His paternal grandfather, Thomas Smith, of Gedling, Nottinghamshire, and Foel Allt, Wales, was first cousin of Robert Smith, first baron Carrington. Educated partly at Marlborough College, partly at Paris and Geneva, Julian was called to the bar as a member of the Inner Temple on 4 May 1852. He was private secretary to Sir William Molesworth, eighth baronet [q. v.], during the latter's short term of office as secretary of state for the colonies in 1855. On Molesworth's death he returned to the bar and practised as a conveyancer. In 1862 he went to Hong Kong, where there was an opening for a barrister, and three years afterwards he received the appointment of attorney-general in that colony. This office he held for seven years, acting for the chief justice of the supreme court when the latter was absent on leave, and preparing 'The Hong Kong Code of Civil Procedure.'

In 1872 he was appointed chief justice of the Leeward Islands, which had recently been amalgamated in one colony. On quitting Hong Kong he was formally thanked for his services by the executive and legislative councils, and received the honour of knighthood. He took up his new appointment in 1874, opened the new federal court, and put the administration of justice into working order. Towards the end of the year he returned to England and succeeded Sir Henry Holland, now Viscount Knutsford, as legal assistant under-secretary in the colonial office. In 1876, on the recommendation of a committee of the House of Commons, a similar post was created at the foreign office, and was bestowed by Lord Derby, then foreign secretary, on Pauncefote, who was specially qualified for it by his knowledge of French. His services were recognised by the bestowal on him of the K.C.M.G. in Jan. 1880, and of the C.B. three months

later. After doing much political work in addition to his normal duties, owing to the long illness of Charles Stuart Aubrey Abbott, third baron Tenterden [q. v.], the permanent under-secretary of state, and the infirm health of other members of the staff, Pauncefote, on Lord Tenterden's death in 1882, was appointed by Earl Granville, then foreign secretary, to the vacant place, while he continued to superintend the legal work. In 1885 he and Sir Charles Rivers Wilson took part in the international commission at Paris concerning the free navigation of the Suez Canal, and were largely concerned in the draft settlement on which was based the convention of Constantinople (29 Oct. 1888). He was created G.C.M.G. at the close of 1885, and K.C.B. in 1888.

On 2 April 1889 Pauncefote was appointed envoy extraordinary and minister plenipotentiary to the United States; Lord Salisbury had left the office vacant for some months after the abrupt dismissal of Lord Sackville [q. v. Suppl. II]. At Washington, Pauncefote by his personal influence contributed materially to the solution of the various differences, some of them sufficiently acute, which arose between the two countries, and rendered invaluable service in producing a more friendly feeling towards Great Britain in the United States. His patience, urbanity, and habits of complete and impartial study of complicated details combined with his legal training greatly to assist him in dealing with American politicians and officials, most of whom were lawyers. Among the most critical questions with which he had to deal were the claim of the United States to prevent pelagic sealing by Canadian vessels in the Behring Sea, a question which, after passing through some menacing phases, was eventually referred to the decision of an arbitral tribunal at Paris in February 1892; an arrangement was concluded for a *modus vivendi* pending the award. A second question, which concerned the boundary between Venezuela and British Guiana, was taken up by the United States government in 1895, and the unusual tenour and wording of President Cleveland's message to Congress on the subject, in December, threatened at one moment serious complications. The matter was referred in February 1897 to an arbitral tribunal at Paris, which in October 1899 decided substantially in favour of the British claim. In the discussions and negotiations which preceded the outbreak of war between the United States and Spain, in April 1898, Pauncefote tactfully

sought with the representatives of the great European powers to secure a pacific arrangement without suggesting any indifference to freedom and good government in Cuba. Pauncefote's prudence throughout the period of the war did much to establish a lasting friendship between England and the United States.

In 1893, after it had been ascertained that such a step would be agreeable to the United States government, the British representative at Washington was raised from the rank of envoy to that of ambassador. Other great powers followed suit, and Pauncefote, as the senior ambassador, was of much service in settling various questions of precedence and etiquette consequent on the change.

In 1897, after prolonged negotiations, he concluded a convention with the United States for the settlement by arbitration of differences between the two countries. The convention, however, was not approved by the senate, and remained unratified.

In 1899 Pauncefote was appointed senior British delegate at the first Hague conference which met to devise means for the limitation of armaments and the pacific settlement of international differences. Pauncefote here rendered his most important service to the cause of peace. Insuperable obstacles were soon apparent to the general acceptance of any binding obligation to reduce armaments or to submit disputes to arbitration. Pauncefote, therefore, ably assisted the president, M. de Staal, in setting the conference to work, as the best alternative, on establishing a suitable permanent tribunal of arbitration, to which voluntary recourse could at any time be readily had, and which other powers might bind themselves to recommend to disputants. In framing the needful machinery Pauncefote gave unostentatious but most efficient assistance, and shared with the president the credit of the success attained. On his return to England, after the termination of the conference, he was raised to the peerage on 18 Aug. 1899. The remaining years of his life were spent as British ambassador in the United States. In February 1900 he signed with Mr. John Hay, the United States secretary of state, a convention designed to replace the provisions of the Clayton-Bulwer treaty of 19 April 1850 with regard to the construction of a canal across the Isthmus of Panama. The convention, however, failed to secure confirmation by the senate, and was not ratified. A second convention ('the

Hay-Pauncefote treaty') signed by him on 18 Nov. 1901 was more fortunate. By its provisions the ships of all nations passing through the canal were placed on an equal footing, and the United States government precluded itself from imposing preferential dues. Nevertheless, and in spite of the protests of the British government, the United States government passed in Aug. 1912 a law allowing free passage through the canal to American coasting vessels.

Growing years, the climate of Washington, the constant strain of work, and sedentary habits had by 1901 seriously impaired Pauncefote's naturally vigorous constitution, and he died at Washington, of a prolonged attack of gout, on 24 May 1902. He had been made Hon. LL.D. of Harvard and Columbia Universities in 1900. His death called forth unprecedented expressions of public regret in the United States; the funeral ceremony in Washington was attended by the president and by the leading authorities, and the United States government, with the assent of the British government, conveyed the body to England in a United States vessel of war. The burial took place at St. Oswald's Church, Stoke Newington. A fine monument, executed in bronze by George Wade, has been placed at the head of the grave in the churchyard by his widow and daughters.

Pauncefote married on 14 Sept. 1859 Selina Fitzgerald, daughter of Major William Cubitt, of Catfield, Norfolk. By her he had one son, who died in infancy, and four daughters.

An excellent portrait by Benjamin Constant is in the possession of Lady Pauncefote, and a copy is at Marlborough College. A cartoon portrait appeared in 'Vanity Fair' in 1883.

[The Times, 26, 27, 30 May 1902; Foreign Office List, 1902, p. 194; Papers laid before Parliament.] S.

PAVY, FREDERICK WILLIAM (1829-1911), physician, born at Wroughton, Wiltshire, on 29 May 1829, was son of William Pavy, a maltster there, by Mary his wife. Educated at Merchant Taylors' School in Suffolk Lane, London, where he entered in Jan. 1840, he experienced a Spartan discipline under James Bellamy, the headmaster, father of Dr. James Bellamy [q. v. Suppl. II]. He proceeded to Guy's Hospital in 1848, and matriculated at the University of London. Here he gained honours at the intermediate examination in medicine in 1850, and the scholarship and medal in materia medica

and pharmaceutical chemistry. In 1852 he graduated M.B. with honours in physiology and comparative anatomy, obstetric medicine and surgery, and the medal in medicine (the medal in surgery being gained by Joseph, afterwards Lord, Lister). Pavy then served as house surgeon and house physician at Guy's Hospital, and in 1853 he went to Paris and joined the English Medical Society of Paris, of which he became a vice-president. The society met in a room near the Luxembourg and owned a small library. It was the rendezvous of the English medical students, where they met weekly to read papers and to report interesting cases. In Paris Pavy came more especially under the influence of Claude Bernard, who was at this time giving a course of experimental lectures on the rôle and nature of glycogen and the phenomena of diabetes. Pavy made the study of diabetes the work of his life and imitated his master in the manner of his lectures.

On his return to England Pavy was appointed lecturer on comparative anatomy at Guy's Hospital in 1854, and from 1856 to 1878 he lectured there upon physiology and microscopical anatomy, and afterwards upon systematic medicine. He was elected assistant physician to the hospital in 1858, on the promotion of (Sir) William Gull [q. v.], and became full physician in 1871, when the number of physicians was increased from three to four. He was appointed consulting physician to the hospital in 1890, his tenure of office upon the full staff having been prolonged for an additional year.

At the Royal College of Physicians of London he was elected a fellow in 1860; he served as an examiner in 1872-3 and in 1878-9; he was a councillor from 1875 to 1877 and again from 1888 to 1890; a censor in 1882, 1883, and 1891. He delivered the Goulstonian lectures in 1862-3; the Croonian lectures in 1878 and 1894, and the Harveian oration in 1886. He was awarded the Baly medal in 1901.

He also did good work at the medical societies of London. In 1860 he delivered the Lettsomian lectures at the Medical Society 'On Certain Points connected with Diabetes.' He served as president of the Pathological Society from 1893 to 1895 and as president of the Royal Medical and Chirurgical Society from 1900 to 1902. He acted for some years as president of the Association for the Advancement of Medicine by Research, and from 1901 he served, after the death of Sir William MacCormac [q. v. Suppl. II], as president of the national

committee for Great Britain and Ireland of the International Congress of Medicine. The permanent committee of this congress, meeting at the Hague in 1909, appointed him the first chairman.

Pavy was elected F.R.S. in 1863; the University of Glasgow conferred upon him the hon. degree of LL.D. in 1888, and in 1909 he was crowned Lauréat de l'Académie de Médecine de Paris and received the Prix Godard for his physiological researches. On 26 June 1909, at a meeting of the Physiological Society of Great Britain and Ireland held at Oxford, he was presented with a silver bowl bearing an expression 'of affection and admiration.'

Pavy died at his house, 35 Grosvenor Street, London, W., on 19 Sept. 1911, and was buried at Highgate cemetery.

He married in 1854 Julia, daughter of W. Oliver, by whom he had two daughters who predeceased him. The elder, Florence Julia (*d.* 1902), was married in 1881 to the Rev. Sir Borradaile Savory, second baronet, son of Sir William Scovell Savory, first baronet, F.R.S. [q. v.].

A sketch—a good likeness—made by W. Strang, A.R.A., hangs in the rooms of the Royal Society of Medicine.

Pavy was the last survivor of a line of distinguished physician-chemists who did much to lay the foundations and advance the study of metabolic disorders; at the same time he ranks as a pioneer amongst the chemical pathologists of the modern school. As a pupil of Claude Bernard he recognised that all advances in the study of disease must rest upon investigations into the normal processes of the body; but as his investigations proceeded, he found himself obliged to dissent from the views of his master and to adopt new working hypotheses which he put to the test of experiment and frequently varied. Some of his theories did not meet with the approval of those who were working along similar lines, and others never obtained general acceptance. He made the study of carbohydrate metabolism the work of his life, and he was the founder of the modern theory of diabetes. In this connection his name was associated with many practical improvements in clinical and practical medicine, and 'Pavy's Test' for sugar and his use of sugar tests and albumen tests in the solid form have made his name familiar to physicians and medical students throughout the world. As a practical physician, too, he was greatly interested in dietetics, and he wrote a well-known book upon the subject, 'A Treatise on Food and Dietetics physio-

logically and therapeutically considered' (1873; 2nd edit. 1875; Philadelphia, 1874; New York, 1881). Throughout life he remained a student, and even to the last week he was at work in the laboratory which he had built at the back of his consulting room in Grosvenor Street. Quiet in bearing, gentle and courteous in speech, and with a somewhat old-fashioned formality of manner, he was generous in his benefactions. At Guy's medical school he built a well-equipped gymnasium and presented it to the students' union in 1890.

Besides the works cited Pavy published:

1. 'Researches on the Nature and Treatment of Diabetes,' 1862; 2nd edit. 1869; translated into German by Dr. W. Langenbeck, Göttingen, 1864.
2. 'A Treatise on the Functions of Digestion, its Disorders and their Treatment,' 1867; 2nd edit. 1869.
3. 'The Croonian Lectures on Certain Points connected with Diabetes, delivered at the Royal College of Physicians,' 1878.
4. 'The Harveian Oration, delivered at the Royal College of Physicians,' 1886.
5. 'The Physiology of the Carbohydrates, their Application as Food and Relation to Diabetes,' 1894; translated into German by Karl Grube, Leipzig and Vienna, 1895.
6. 'On Carbohydrate Metabolism (a course of advanced lectures on Physiology delivered at the University of London, May 1905), with an appendix on the assimilation of carbohydrate into proteid and fat, followed by the fundamental principles and the treatment of Diabetes dialectically discussed,' 1906.

Gaz.* 1911, xxv. 393 (with bibliography); additional information kindly given by Sir William Borradaile Savory, Bart., his grandson, by H. L. Eason, Esq., M.S., dean of the medical school at Guy's Hospital, and by Dr. J. S. Edkins; personal knowledge.]

D'A. P.

PAYNE, EDWARD JOHN (1844–1904), historian, born at High Wycombe, Buckinghamshire, on 22 July 1844, was the son of Edward William Payne, who was in humble circumstances, by his wife Mary Welch. Payne owed his education largely to his own exertions. After receiving early training at the grammar school of High Wycombe, he was employed by a local architect and surveyor named Pontifex, and he studied architecture under William Burges [q. v.]. Interested in music from youth, he also acted as organist of

the parish church. In 1867, at the age of twenty-three, he matriculated at Magdalen Hall, Oxford, whence he passed to Charsley's Hall. While an undergraduate he supported himself at first by pursuing his work as land surveyor and architect at Wycombe, where he designed the Easton Street almshouses, and afterwards by coaching in classics at Oxford. In 1871 Payne graduated B.A. with a first class in the final classical school, and in 1872 he was elected to an open fellowship in University College. He remained a fellow till his marriage in 1899, and was thereupon re-elected to a research fellowship. Although his life was mainly spent in London, he was keenly interested in the management of the affairs of his college, and during the years of serious agricultural depression his good counsel and business aptitude proved of great service.

On 17 Nov. 1874 he was called to the bar by Lincoln's Inn, and in 1883 was appointed honorary recorder of Wycombe, holding the office till his death. But Payne's mature years were mainly devoted to literary work. English colonial history and exploration were the main subjects of his study. In 1875 he contributed a well-informed 'History of European Colonies' to E. A. Freeman's 'Historical Course for Schools.' In 1883 he collaborated with Mr. J. S. Cotton in 'Colonies and Dependencies' for the 'English Citizen' series, and the section on 'Colonies' which fell to Payne he later developed into his 'Colonies and Colonial Federation' (1904). He also fully edited Burke's 'Select Works' (Oxford, 1876; new edit. 1912) and 'The Voyages of Elizabethan Seamen to America' (from Hakluyt, 1880; new edit. 1907). But these labours were preliminaries to a great design of a 'History of the New World called America.' The first and second volumes (published respectively in 1892 and 1899) supplied a preliminary sketch of the geographical knowledge and exploration of the Middle Ages, an account of the discovery of America, and the beginning of an exhaustive summing up of all available knowledge as to the ethnology, language, religion, social and economic condition of the native peoples. Nothing more was published, and an original plan to extend the survey to Australasia was untouched. Payne contributed the first two chapters on 'The Age of Discovery' and 'The New World' to the 'Cambridge Modern History' (vol. i. 1902).

At the same time Payne wrote much on music. He contributed largely to Grove's 'Dictionary of Music and Musicians.'

His article on 'Stradivari' was recognised as an advance on all previous studies. The history of stringed instruments had a strong attraction for him, and he was himself an accomplished amateur performer on the violin and on various ancient instruments. He helped to found the Bar Musical Society, and was its first honorary secretary.

In his later years Payne lived at Wendover, and suffered from heart-weakness and fits of giddiness. On 26 Dec. 1904 he was found drowned in the Wendover canal, into which he had apparently fallen in a fit. On 5 April 1899 he married Emma Leonora Helena, daughter of Major Pertz and granddaughter of Georg Heinrich Pertz, editor of the 'Monumenta Germaniæ Historica.' She survived him with one son and two daughters, and was awarded a civil list pension of 120*l.* in 1905. A portrait by A. S. Zibleri is in her possession.

[Records of Buckinghamshire, vol. ix.; The Times, 28 Dec. 1904; Oxford Mag. 25 Jan. 1905; Musical Times, Feb. 1905; private information.] D. H.

PAYNE, JOSEPH FRANK (1840-1910), physician, son of Joseph Payne [q. v.], a schoolmaster, professor of education at the College of Preceptors, by his wife Eliza Dyer, also a teacher of great ability, was born in the parish of St. Giles, Camberwell, on 10 Jan. 1840. After school education under his father at Leatherhead, Surrey, he went to University College, London, and thence gained in 1858 a demyship at Magdalen College, Oxford. He graduated B.A. in 1862, taking a first class in natural science, and afterwards obtained the Burdett-Countts scholarship in geology (1863), the Radcliffe travelling fellowship (1865), and a fellowship at Magdalen, which he vacated on his marriage in 1883, becoming an honorary fellow on 30 May 1906. He also took a B.Sc. degree in the University of London in 1865. He studied medicine at St. George's Hospital, London, and graduated M.B. at Oxford in 1867, and M.D. in 1880. He became a member of the College of Physicians in 1868, and was elected a fellow in 1873, being the junior chosen to deliver the Goulstonian lectures. His subject was 'The Origin and Relation of New Growths.' In accordance with the terms of Dr. Radcliffe's foundation he visited Paris, Berlin, and Vienna, and made good use of their pathological opportunities. He described his foreign experiences in three articles published in the

'British Medical Journal' in 1871. His first post at a medical school in London was that of demonstrator of morbid anatomy at St. Mary's Hospital in 1869, and he became assistant physician there as well as at the Hospital for Sick Children in Great Ormond Street. In 1871 he left St. Mary's on becoming assistant physician to St. Thomas's Hospital, an office which he held till appointed physician in 1887. In 1900 he had reached the age limit, and became consulting physician. He was also on the staff of the Hospital for Skin Diseases at Blackfriars, and was thus engaged in the active practice and teaching of his profession for over thirty years.

Pathology, epidemiology, dermatology, and the history of medicine were the subjects in which he took most interest, and he made considerable additions to knowledge in each. In September 1877 he was the chief medical witness for the defence at the sensational trial in London of Louis Staunton and others for the murder of his wife Harriet by starvation, and effectively argued that cerebral meningitis was the cause of death, a view which in spite of the prisoner's conviction was subsequently adopted (ATLAY'S *Trial of the Stauntons*, 1911, pp. 176 *et passim*). He edited in 1875 Jones and Sieveking's 'Manual of Pathological Anatomy,' and in 1888 published a full and original 'Manual of General Pathology,' besides reading many papers before the Pathological Society, of which he became president in 1897. He delivered at the College of Physicians in 1891 the Lumleian lectures 'On Cancer, especially of the Internal Organs.' In 1879 he was sent to Russia by the British government with Surgeon-major Colvill to observe and report upon the epidemic of plague then existing at Vetlanka (*Trans. Epidemiological Soc.* vol. iv.). The Russian government did little to facilitate the inquiry, and a severe illness prevented Payne from accomplishing much, but he always retained a warm interest in epidemiology, and wrote articles on plague in the 'Encyclopædia Britannica' (9th edit.), 'St. Thomas's Hospital Reports,' 'Quarterly Review' (October 1901), and 'Allbutt's System of Medicine,' vol. 2, 1907. He took an active part on a committee of the College of Physicians in 1905 on the Indian epidemic of plague and was chosen as the spokesman of the committee to the secretary of state. He printed in 1894, with an introduction on the history of the plague, the 'Loimographia' of the apothecary William Boghurst, who witnessed the London plague of

1665, from the MS. in the Sloane collection. Payne also made numerous contributions to the 'Transactions' of the Epidemiological Society, of which he was president in 1892-3. In 1889 he published 'Observations on some Rare Diseases of the Skin,' and was president of the Dermatological Society (1892-3). Many papers by him are to be found in its 'Transactions.'

Payne's first important contribution to the history of medicine was a life of Linacre [q. v.] prefixed to a facsimile of the 1521 Cambridge edition of his Latin version of Galen, 'De Temperamentis' (Cambridge, 1881). In 1896 he delivered the Harveian oration at the College of Physicians on the relation of Harvey to Galen, and in 1900 wrote an excellent life of Thomas Sydenham [q. v.]. He had a great knowledge of bibliography and of the history of woodcuts, and read (21 Jan. 1901) a paper before the Bibliographical Society 'On the "Herbarius" and "Hortus Sanitatis."' In 1903 and 1904 he delivered the first Fitz-Patrick lectures on the history of medicine at the College of Physicians. The first course was on 'English Medicine in the Anglo-Saxon Times' (Oxford, 1904), the second on 'English Medicine in the Anglo-Norman Period.' The history of Gilbertus Anglicus and the contents of his 'Compendium Medicinæ' had never before been thoroughly set forth. Payne showed that Gilbert was a genuine observer of considerable ability. The lectures of 1904 which Payne was preparing for the press at the time of his death did much to elucidate the writings of Ricardus Anglicus and the anatomical teaching of the Middle Ages. Payne demonstrated that the 'Anatomy of the Body of Man,' printed in Tudor times and of which the editions extend into the middle of the seventeenth century, was not written by Thomas Vicary [q. v.], whose name appears on the title-page, but was a mere translation of a mediæval manuscript of unknown authorship. He wrote long and valuable articles on the history of medicine in the 'Encyclopædia Britannica,' and in Allbutt's 'System of Medicine' (vol. i. 1905), besides several lives in this Dictionary. During the spring of 1909 he delivered a course of lectures on Galen and Greek medicine at the request of the delegates of the Common University Fund at Oxford. His last historical work was entitled 'History of the College Club,' and was privately printed in 1909.

In 1899 he was elected Harveian librarian of the College of Physicians, a post for which his qualifications were exceptional.

He gave many valuable books to the library, and opened the stores of his mind to everyone who sought his knowledge. He was for eight years an examiner for the licence of the College of Physicians, was a censor in 1896-7, and senior censor in 1905. He discharged in 1896 the laborious duty of editor of the 'Nomenclature of Diseases,' and in addition to these public services sat on the royal commission on tuberculosis (1890), on the general medical council as representative of the University of Oxford (1899-1904), on the senate of the University of London (1899-1906), and on the committee of the London Library. He collected a fine library, the medical part of which, except five manuscripts and two books which he bequeathed to the College of Physicians, was sold to one purchaser for 2300*l*. He had a large collection of editions of Milton's works and a series of herbals. His conversation was both learned and pleasant, and though full of antique lore he was an earnest advocate of modern changes. He was below the middle height and had a curious jerky manner of expressing emphasis both in public speaking and in private conversation. Among the physicians of London there was no man of greater general popularity in his time. He lived at 78 Wimpole Street while engaged in practice, and after his retirement at New Barnet. Failing health interrupted the literary labours of his last year, and he died at Lyonsdown House, New Barnet, on 16 Nov. 1910, and was buried at Bell's Hill cemetery, Barnet. He married, on 1 Sept. 1882, Helen, daughter of the Hon. John Macpherson of Melbourne, Victoria, by whom he had one son and three daughters. A fine charcoal drawing of his head, made by Mr. J. S. Sargent shortly before his death, hangs in the dining-room of the College of Physicians.

[The Times, 18 Nov. 1910; Lancet, and Brit. Med. Journal, 26 Nov. 1910; Sir T. Barlow, Annual Address to Royal Coll. of Physicians; Macray, Reg. Fellows Magd. Coll. vi. 170-1 and vii.; Sotheby, Cat. of Library, 12 July 1911; personal knowledge.] N. M.

PEARCE, STEPHEN (1819-1904), portrait and equestrian painter, born on 16 Nov. 1819 at the King's Mews, Charing Cross, was only child of Stephen Pearce, clerk in the department of the master of horse, by his wife, Ann Whittington. He was trained at Sass's Academy in Charlotte Street, and at the Royal Academy schools, 1840, and in 1841 became a pupil of Sir Martin Archer Shee [q. v.]. From 1842 to

1846 he acted as amanuensis to Charles Lever [q. v.], and he afterwards visited Italy. Paintings by him of favourite horses in the royal mews (transferred in 1825 to Buckingham Palace) were exhibited at the Academy in 1839 and 1841, and from 1849, on his return from Italy, till 1885 he contributed numerous portraits and equestrian paintings to Burlington House.

Early friendship with Colonel John Barrow, keeper of the admiralty records, brought Pearce a commission to paint 'The Arctic Council discussing a plan of search for Sir John Franklin.' This work he completed in 1851; it contained portraits of Back, Beechey, Bird, Parry, Richardson, Ross, Sabine, and others; was exhibited at the Royal Academy in 1853, and was engraved by James Scott. Pearce's picture increased the public interest in Franklin's fate. Pearce also painted for Colonel Barrow half-lengths of Sir Robert McClure, Sir Leopold McClintock, Sir George Nares, and Captain Penny in their Arctic dress, and a series of small portraits of other arctic explorers. Lady Franklin also commissioned a similar series, which passed at her death to Miss Cracroft, her husband's niece. All these pictures are in the National Portrait Gallery, to which Colonel Barrow and Miss Cracroft respectively bequeathed them. Pearce's other sitters included Sir Francis Beaufort and Sir James Clark Ross (for Greenwich Hospital), Sir Edward Sabine and Sir John Barrow (for the Royal Society), and Sir George Gabriel Stokes, Charles Lever, Sims Reeves, Sir Erasmus Wilson (Hospital for Diseases of the Skin, Westgate-on-Sea, copied for the Royal College of Surgeons), and the seventh Duke of Bedford.

Pearce was also widely known as a painter of equestrian presentation portraits and groups, the most important of which is the large landscape 'Coursing at Ashdown Park,' completed in 1869, and presented by the coursers of the United Kingdom to the Earl of Craven. For this picture, which measures ten feet long and contains about sixty equestrian portraits, including the Earl and Countess of Craven and members of the family, the Earls of Beckett and Sefton, Lord and Lady Grey de Wilton, the artist received 1000 guineas and 200 guineas for the copyright. Pearce painted equestrian portraits of many masters of foxhounds and harriers, as well as of the Earl of Coventry, Sir Richard and Lady Glyn, and of Mr. Burton on 'Kingsbridge' and Captain H. Coventry on 'Alcibiade,' winners of the Grand National.

Pearce retired from general practice in

1885 and from active work in 1888. He contributed ninety-nine subjects to the Academy exhibitions, and about thirty of his pictures were engraved by J. Scott, C. Mottram, and others. His portraits, almost entirely of men, are accurate likenesses, and his horses and dogs are well drawn. The earlier paintings are somewhat tight in execution, with a tendency to over-emphasis of shadow, but the later pictures are freer in style.

Pearce's somewhat naïve 'Memories of the Past,' published by him in 1903, contains nineteen reproductions from his paintings, a list of subjects painted, biographical and some technical notes. He died on 31 Jan. 1904 at Sussex Gardens, W., and was buried at the Old Town cemetery, Eastbourne. A portrait of himself he bequeathed to the National Portrait Gallery.

He married in 1858 Matilda Jane Cheswright, who survived him with five sons.

[Memories of the Past, 1903, by Stephen Pearce; Sporting Gaz., 2 Oct. 1869; Lists of the Printsellers' Association; Royal Acad. Catalogues; misc. pamphlets, letters, and official records, Nat. Port. Gall.; personal knowledge and private information.]

J. D. M.

PEARCE, SIR WILLIAM GEORGE, second baronet, of Carde (1861-1907), benefactor to Trinity College, Cambridge, born at Chatham on 23 July 1861, was only child of Sir William Pearce [q. v.] by his wife Dinah Elizabeth, daughter of Robert Sowter of Gravesend. Educated at Rugby (1876-1878), he matriculated in 1881 at Trinity College, Cambridge, and graduated B.A. and LL.B. in 1884, proceeding M.A. in 1888. He was called to the bar at the Inner Temple in 1885. On the death of his father in December 1888 he succeeded him in the chairmanship of the Fairfield Shipbuilding and Engineering Company of Glasgow, an undertaking the development of which had been the principal work of his father's life. Under Pearce's chairmanship, which lasted from 1888 until his death, the company maintained its high reputation [see ELGAR, FRANCIS, Suppl. II]. Pearce was returned to parliament in 1892 as conservative member for Plymouth along with Sir Edward Clarke, but did not seek re-election in 1895. He was honorary colonel of the 2nd Devon volunteers Royal Garrison Artillery. He was a keen sportsman, and his estate of Chilton Lodge, Hungerford, was noted for the excellence of its shooting. He died after a short illness on 2 Nov. 1907 at 2 Deanery Street, Park Lane, and was buried at Chilton Foliat near Hungerford.

He married on 18 March 1905 Caroline Eva, daughter of Robert Coote. There was no issue of the marriage. By his will he left the residue of his property, estimated at over 150,000*l.*, subject to his wife's life interest, to Trinity College, Cambridge, of which he had remained a member, although he had maintained no close association with the college after his life there as an undergraduate. Lady Pearce only survived her husband a few weeks. The college thus acquired probably the most valuable of the many accessions which have been made to its endowments since its foundation by Henry VIII.

[The Times, 4 and 8 Nov. 1907; History of the Fairfield Works.] H. M. L. I.

PEARSON, SIR CHARLES JOHN, LORD PEARSON (1843-1910), Scottish judge, born at Edinburgh on 6 Nov. 1843, was second son of Charles Pearson, chartered accountant, of Edinburgh, by his wife Margaret, daughter of John Dalziel, solicitor, of Earlston, Berwickshire. After attending Edinburgh Academy, he proceeded to the University of St. Andrews, and thence to Corpus Christi College, Oxford, where he distinguished himself in classics, winning the Gaisford Greek prizes for prose (1862) and verse (1863). He graduated B.A. with a first class in the final classical school in 1865. He afterwards attended law lectures in Edinburgh, and became a member of the Juridical Society, of which he was librarian in 1872-3, and of the Speculative Society (president 1869-71). He was called to the English bar (from the Inner Temple) on 10 June 1870, and on 19 July 1870 passed to the Scottish bar, where he rapidly obtained a large practice. Though not one of the crown counsel for Scotland, he was specially retained for the prosecution at the trial of the City of Glasgow Bank directors (Jan. 1879), became sheriff of chancery in 1885, and procurator and cashier for the Church of Scotland in 1886. In 1887 he was knighted, and was appointed sheriff of Renfrew and Bute in 1888, and of Perthshire in 1889. Pearson was a conservative, though not a keen politician, and in 1890 was appointed solicitor-general for Scotland in Lord Salisbury's second administration, and was elected (unopposed) as M.P. for Edinburgh and St. Andrews Universities. In the same year he became Q.C. In 1891 he succeeded James Patrick Bannerman Robertson, Lord Robertson [q. v. Suppl. II], as lord advocate, and was sworn of the privy council. At the general election of 1892 he was again returned unopposed for

Edinburgh and St. Andrews Universities. After the fall of Lord Salisbury's ministry in 1892 he ceased to be lord advocate, and was chosen dean of the Faculty of Advocates. He received the honorary degree of LL.D. from Edinburgh University in 1894, and on the return of the conservatives to power in the following year became again lord advocate, and resigned the deanship. In 1896, on the resignation of Andrew Rutherford Clark, Lord Rutherford Clark, he was raised to the bench, from which he retired, owing to bad health, in 1909. He died at Edinburgh on 15 Aug. 1910, and was buried in the Dean cemetery there.

Pearson married on 23 July 1873 Elizabeth, daughter of M. Grayhurst Hewat of St. Cuthbert's, Norwood, by whom he had three sons. A painting, by J. Irvine, belongs to his widow.

[Scotsman, and The Times, 16 Aug. 1910; Roll of the Faculty of Advocates; Hist. of the Speculative Soc., p. 156; Records of the Juridical Soc.; Acts of the General Assembly of the Church of Scotland, 1886; Foster, Men at the Bar.] G. W. T. O.

PEASE, SIR JOSEPH WHITWELL, first baronet (1828-1903), director of mercantile enterprise, born at Darlington on 23 June 1828, was elder son of Joseph Pease (1799-1872), by his wife Emma, daughter of Joseph Gurney of Norwich. Edward Pease [q. v.] was his grandfather. In January 1839 he went to the Friends' school, York, under John Ford (in January 1900 he laid the foundation stone of extensive new buildings at Bootham). Entering the Pease banking firm at Darlington in 1845, he became largely engaged in the woollen manufactures, collieries, and iron trade with which the firm was associated. He was soon either director or chairman of the Owners of the Middlesbrough Estate, Ltd., Robert Stephenson & Co., Ltd., Pease & Partners, Ltd., and J. & J. W. Pease, bankers. In 1894 he was elected chairman of the North Eastern railway, having been deputy chairman for many years. He also farmed extensively, and read a paper on the 'Meat Supply of Great Britain' at the South Durham and North Yorks Chamber of Agriculture, 26 Jan. 1878.

In 1865 Pease was returned liberal M.P. for South Durham, which he represented for twenty years. After the Redistribution Act of 1885 he sat for the Barnard Castle division of Durham county until his death. He strongly supported Gladstone on all questions, including Irish home rule, and rendered useful service to the

House of Commons in matters of trade, particularly in regard to the coal and iron industries of the North of England. He was president of the Peace Society and of the Society for the Suppression of the Opium Traffic, and a champion of both interests in parliament. On 22 June 1881 he moved the second reading of a bill to abolish capital punishment, and his speech was separately printed. In 1882 Gladstone created him a baronet (18 May). No quaker had previously accepted such a distinction, although Sir John Rodes (1693-1743) inherited one.

At the end of 1902 the concerns with which Pease and his family were identified became involved in financial difficulties. Liabilities to the North Eastern railway amounted to 230,000*l.* Voluntary arrangements were made by various banking firms of quaker origin with whom the Peases had intimate connection, and the actual loss to the railway was reduced at least one-half. Heavy losses fell on the companies with which Pease was associated and on several London banks.

He died at Kerris Veau, his Falmouth residence, of heart failure, on 23 June 1903 and was buried at Darlington.

He married in 1854 Mary, daughter of Alfred Fox of Falmouth (she died on 3 Aug. 1892), and by her left two sons and six daughters. The elder son, Alfred Edward Pease, second baronet, M.P. for York (1885-92), and for the Cleveland division of Yorkshire (1897-1902), was resident magistrate in the Transvaal in 1903. The second son, Joseph Albert Pease, who sat as a liberal in the House of Commons from 1892, became president of the board of education in 1911.

A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1887.

[The Times, 24 June 1903; Who's Who, 1902; Hansard; private information.] C. F. S.

PEEK, SIR CUTHBERT EDGAR, second baronet (1855-1901), amateur astronomer and meteorologist, born at Wimbledon on 30 Jan. 1855, was only child of Sir Henry William Peek, first baronet (created 1874), of Wimbledon House, Wimbledon, Surrey, a partner in the firm of Messrs. Peek Brothers & Co.^d (now Peek, Winch & Co.), colonial merchants, of East Cheap, and M.P. for East Surrey from 1868 to 1884. His mother was Margaret Maria, second daughter of William Edgar of Eagle House, Clapham Common. Cuthbert, after education at Eton, entered Pembroke College, Cambridge, in 1876 and graduated B.A. in 1880, proceeding M.A. in

1884. After leaving Cambridge he went through a course of astronomy and surveying, and put his knowledge to practical use in two journeys, made in 1881, into unfrequented parts of Iceland, where he took regular observations of latitude and longitude and dip of the magnetic needle (cf. his account, *Geograph. Soc. Journal*, 1882, pp. 129-40). On his return he set up a small observatory in the grounds of his father's house at Wimbledon, where he observed with a 3-inch equatorial. In 1882 Peek spent six weeks at his own expense at Jimbour, Queensland, for the purpose of observing the transit of Venus across the sun's disc in Dec. 1882. There, with his principal instrument, an equatorially mounted telescope of 6·4 inches, he observed, in days preceding the transit, double stars and star-clusters, paying special attention to the nebula round η Argus, one of the wonders of the Southern sky, which he described in a memoir. Observations of the transit were prevented by cloud. Peek made extensive travels in Australia and New Zealand, bringing back with him many curious objects to add to his father's collection at Rousdon near Lyme Regis.

In 1884 he established, on his father's estate at Rousdon, a meteorological station of the second order, and in the same year he set up there an astronomical observatory to contain the 6·4 inch Merz telescope and a transit instrument with other accessories. With the aid of his assistant, Mr. Charles Grover, he began a systematic observation of the variation of brightness of long period variable stars, by Argelander's method, and on a plan consistent with that of the Harvard College Observatory. Annual reports were sent to the Royal Astronomical Society, which Peek joined on 11 Jan. 1884, and short sets of observations were occasionally published in pamphlet form. The complete series of the observations of 22 stars extending over sixteen years were collected at Peek's request by Professor Herbert Hall Turner of Oxford and published by him after Peek's death in the 'Memoirs of the Royal Astronomical Society' (vol. lv.). The introduction to the volume contains a section written by Peek in 1896 explaining his astronomical methods. With similar system regular observations were made with his meteorological instruments, and these were collected and published in annual volumes.

Peek succeeded to the baronetcy and to the estates that his father had bought in Surrey and Devonshire on his father's death on 26 Aug. 1898. He was elected

F.S.A. on 6 March 1890, was hon. secretary of the Anthropological Society, and often served on the council or as a vice-president of the Royal Meteorological Society between 1884 and his death. He endowed the Royal Geographical Society, of whose council he was a member, with a medal for the advancement of geographical knowledge. Interested in shooting, he presented a challenge cup and an annual prize to be shot for by members of the Cambridge University volunteer corps. He died at Brighton on 6 July 1901 of congestion of the brain, and was buried at Rousdon, Devonshire.

On 3 Jan. 1884 he married Augusta Louisa Brodrick, eldest daughter of William Brodrick, eighth Viscount Midleton, and sister of Mr. St. John Brodrick, ninth Viscount Midleton, sometime secretary of state for war. She survived him with two sons and four daughters. His elder son, Wilfrid (b. 9 Oct. 1884) succeeded to the baronetcy.

[Obituary notice by Charles Grover in the *Observatory Magazine*, August 1901; *Monthly Notices of the Royal Astronomical Society*, February 1902.] H. P. H.

PEEL, SIR FREDERICK (1823-1906), railway commissioner, born in Stanhope St., London, W., on 26 Oct. 1823, was second son of Sir Robert Peel, second baronet [q. v.], statesman, by his wife Julia, daughter of General Sir John Floyd, first baronet [q. v.]. His eldest brother was Sir Robert Peel, third baronet [q. v.]; his younger brothers were Sir William Peel [q. v.], naval captain, and Arthur Wellesley (afterwards first Viscount) Peel, who was speaker of the House of Commons (1884-95).

Frederick was educated at Harrow (1836-41), and thence he matriculated at Cambridge from Trinity College. He graduated B.A. in 1845 as a junior optime and as sixth classic in the classical tripos, and proceeded M.A. in 1849. On leaving Cambridge he became a student at the Inner Temple on 5 May 1845, and was called to the bar on 2 Feb. 1849. In the same month he entered the House of Commons, being returned unopposed as liberal member for Leominster. His promising maiden speech (11 May 1849) in favour of the removal of Jewish disabilities called forth general commendation (*Greville Memoirs*, vi. 295). Peel was a staunch supporter of free trade and of the extension of the franchise, but being distrustful of secret voting he was not in favour of the ballot. His outspoken criticism of the liberal government's ecclesiastical titles

bill (14 Feb. 1851) showed independent judgment, and Lord John Russell recognised his ability by appointing him under-secretary for the colonies. After the general election of 1852, when Peel successfully contested Bury, he resumed the post of under-secretary for the colonies in Lord Aberdeen's coalition ministry. On 15 Feb. 1853 he introduced the clergy reserves bill (HANSARD, *Parliamentary Debates*, 3 S., cxxiv. col. 133), which was designed to give the government of Canada effective control over the churches there. The object of the measure was to repeal the clauses in the Canadian Constitutional Act of 1791, by which one-seventh of the lands of the colony was appropriated for the maintenance of the protestant clergy. Under Peel's auspices the bill passed the House of Commons, despite violent opposition from the conservatives, and received the royal assent on 9 May 1853. On the fall of the Aberdeen ministry in January 1855 Peel was nominated by Lord Palmerston under-secretary for war. In view of the popular outcry against the mismanagement of the Crimean war the post involved heavy responsibilities. Peel's chief, Lord Panmure [q. v.], sat in the House of Lords, and Peel was responsible minister in the House of Commons. He incurred severe censure for the misfortunes and failures incident to the war. In 1857 he lost his seat for Bury and resigned office. In recognition of his services he was made a privy councillor. He was once more returned for Bury in 1859 and was advanced by Lord Palmerston to the financial secretaryship of the treasury, a post which he held till 1865, when he was again defeated at Bury at the general election. After the death of Palmerston, Peel found himself ill-suited to the more democratic temper of parliamentary life. He unsuccessfully contested south-east Lancashire in 1868, and never re-entered the House of Commons. He was created K.C.M.G. in 1869, and thenceforth devoted himself to legal pursuits.

In 1873, on the passing of the Regulation of Railways Act, Peel was appointed a member of the railway and canal commission, on which he served till his death. The tribunal was constituted as a court of arbitration to settle disagreements between railways and their customers which lay beyond the scope of ordinary litigation. The commission rapidly developed in importance, and was reorganised by the Railway and Canal Act of 1888, a judge of the high court being added to its members. Peel

and his colleagues rendered useful service to the farming and commercial interests by reducing preferential rates on many railways. In *Ford & Co. v. London and South Western Railway* they decided that the existence of a favoured list of passengers constituted an undue preference (*The Times*, 3 Nov. 1890). The decisions of the commissioners were seldom reversed on appeal. In the case of *Sowerby & Co. v. Great Northern Railway*, Peel dissented from the judgment of his colleagues, Mr. Justice Wills and Mr. Price, to the effect that the railway company was entitled to make charges in addition to the maximum in respect of station accommodation and expenses, but the view of the majority was upheld by the court of appeal (21 March 1891). As senior commissioner Peel became the most influential member of the tribunal. He had his father's judicial mind and cautious, equable temper, but his reticence and aloofness militated against his success in public life. He died in London on 6 June 1906, and was buried at Hampton-in-Arden, Warwickshire. He married (1) on 12 Aug. 1857, Elizabeth Emily (*d.* 1865), daughter of John Shelley of Avington House, Hampshire, and niece of Percy Bysshe Shelley [q. v.], the poet; and (2) on 3 Sept. 1879, Janet, daughter of Philip Pleydell-Bouverie of Brymore, Somersetshire, who survived him. He left no issue. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1903.

[*The Times*, and *Morning Post*, 7 June 1906; C. S. Parker, *Sir Robert Peel*, 3 vols., 1899; Harrow School Register, 1911; Burke's Peerage and Baronetage; Herbert Paul, *History of Modern England*, vol. i. 1904; Railway Commission Reports.] G. S. W.

PEEL, JAMES (1811–1906), landscape painter, born on 1 July 1811 in Westgate Road, Newcastle-on-Tyne, was son of Thomas Peel, woollen draper (*d.* 24 April 1822), partner in the firm of Fenwick, Reid & Co. Educated at Bruce's school, he had as schoolfellows there Sir Charles Mark Palmer [q. v. Suppl. II] and John Collingwood Bruce, the antiquary. Edward Dalziel, father of the wood engravers the Dalziel Brothers [see DALZIEL, EDWARD, Suppl. II], first taught him drawing, and in 1840 he came to London to paint portraits. Among his early work were full-sized copies of Wilkie's 'Blind Fiddler' and 'The Village Festival,' in the National Gallery, as well as portraits and miniatures. Eventually he confined himself wholly to landscape painting, in which he exhibited at the

Royal Academy from 1843 to 1888 and at the Royal Society of British Artists from 1845 onwards. His pictures made their mark by their sincere feeling for nature and their excellent drawing, especially of trees. Three of his pictures, 'A Lane in Berwickshire,' 'Cotherstone, Yorkshire,' and 'Pont-y-pant, Wales,' are in the Laing Art Gallery, Newcastle, where a loan exhibition of his works was held in 1907. Several were bought for other provincial galleries at Glasgow, Leeds, and Sunderland, and for clients in Newcastle. He resided at Darlington from 1848 to 1857, when he again settled in London.

In 1861 he was admitted a member of the Royal Society of British Artists, of which he became a leading supporter. In association with Madox Brown, William Bell Scott [q. v.], and other artists he was an active organiser of 'free' exhibitions like those of the Dudley Gallery and of the Portland Gallery, of which the latter ended disastrously. Working to the end with all the vigour of earlier years, he died at his residence, Elms Lodge, Oxford Road, Reading, on 28 Jan. 1906. Peel married at Darlington, on 30 May 1849, Sarah Martha, eldest daughter of Thomas Blyth, and left issue.

[The Times, 5 Feb. 1906; Newcastle Weekly Chron., 20 March 1897 (with photographic reproduction); Illustr. Cat. of Exhib. of Works by James Peel, Laing Art Gall., Newcastle, March 1907 (with portrait); private information.] F. W. G.-N.

PEILE, SIR JAMES BRAITHWAITE (1833-1906), Indian administrator, born at Liverpool on 27 April 1833, was second son in a family of ten children of Thomas Williamson Peile [q. v.], by his wife Mary, daughter of James Braithwaite. Colonel John Peile, R.A., was a brother. In 1852 James proceeded from Repton School, of which his father was headmaster, with a scholarship to Oriel College, Oxford.

At Michaelmas term 1853 he won a first class in classical moderations and two years later a first class in the final classical school. Meanwhile in 1855 the civil service of India was thrown open to public competition, and Peile obtained one of the first twenty appointments, being placed tenth.

He travelled out to India to join the Bombay service in September 1856 by the paddle steamer *Pekin*, having as a fellow traveller William Brydon [q. v.], sole survivor of the Kabul retreat in 1842. Peile was at once nominated to district work. From the Thana district he was sent to Surat, and thence to Ahmedabad on 15

April 1857, where the belated news of the Meerut outbreak reached that station on 21 May 1857. Peile thus experienced some of the stern realities of the Mutiny, and he described them graphically in private letters to a friend who published them in 'The Times' on 3 Dec. 1857. In 1858 Peile was actively engaged in extending primary education and learning an inspector's duties under Sir Theodore Hope. On 4 May 1859 he was entrusted with the special inquiry into the claims made against the British government by the ruler of Bhavnagar, a native state in Kathiawar. His successful settlement of this difficulty brought him to the front and he was made under-secretary of the Bombay government.

Peile's observations in Bhavnagar had deeply impressed him with the impoverished condition of Girassias and Talukdars, depressed landowners descended from ruling chiefs, who were rapidly losing their proprietary rights. For the next five years (1861-6) he was chiefly absorbed in endeavours to remedy this state of affairs. He devised and carried out in Gujarat a scheme of summary settlement for the holders of 'alienated' estates (*i.e.* lands granted on favourable terms by government). There followed the enactment of Bombay Act, vi., 1862, for the relief of the Talukdars of Western Ahmedabad. Peile resigned the post of under-secretary to government in order that he might ensure the success of legislation inspired by himself. Many estates were measured and valued by him, complicated boundary disputes settled, and the rents due to government were fixed for a term of years. His reputation for overcoming difficulties was so established that, on the occurrence of a dispute in the Rajput state of Dharanpur which threatened civil disturbance, he was sent to compose it. His arrangements were satisfactory, and his thoroughness and efficiency greatly impressed Sir Bartle Frere. In April 1866 he was selected as commissioner for revising subordinate civil establishments throughout Bombay, and then, when a wave of speculation passed over the province, he became registrar-general of assurances, and took an active part in compelling companies to furnish accounts. Having thus established his claims to promotion, he took furlough to England from September 1867 to April 1869.

On his return to duty he became director of public instruction in succession to Sir Alexander Grant [q. v.], and held the post till 1873. He laid truly the foundations of primary education, in which Bombay has

always taken the lead. He also compiled an outline of history to assist school teachers in giving their lessons. In 1872 the finances of the city of Bombay became embarrassed, and Peile was sent to settle them, acting as municipal commissioner. Subsequently he undertook for a short period the political charge of Kathiawar, to which he returned again in 1874, holding it until 1878. As political agent of Kathiawar Peile greatly added to his reputation. This important agency covered 23,000 square miles, the territorial sovereignty being divided among the Gaekwar of Baroda and 193 other chiefs, all equally jealous of their attributes of internal sovereignty. Peile found the province in disorder and its chiefs discontented, and he left it tranquil and grateful. In 1873 Waghirs and other outlaws terrorised the chiefs and oppressed their subjects. Capt. Herbert and La Touche had been murdered, and one morning as Peile reached his tent the famous leader Harising Ragji, who was under trial for seven murders and had just escaped from prison, appeared before him. Peile, who was alone, refused to guarantee to him more than justice, and the fugitive was rearrested, tried, and convicted. Gradually the chiefs were persuaded to co-operate in maintaining order, and a police force was organised. While the British officer asserted the rights of the paramount power, he did not ignore the rights of the chiefs, whose claims to revenue from salt and opium he vigorously asserted against the government of Bombay in later years, and he encouraged the chiefs to send their karbharis or ministers in order to discuss with him and each other their common interests. He lent Chester Macnaghten his powerful support and encouragement in establishing an efficient college at Rajkote for the sons and relatives of the ruling chiefs. Able to take up the records of a tangled suit or case and read them in the vernacular, he defeated intrigue and corruption, for which the public offices had gained a bad name, by mastering details and facts without the aid of a native clerk. By such means he won the confidence of the chiefs, and secured their active assistance. The Peile bridge, opened on 17 June 1877, over the Bhadar in Jetpur, and the consent won from the ruler of Bhavnagar in 1878 to the construction of a railway, are standing records of a policy of united effort which to-day covers the province with roads and railways. In 1877 the shadow of famine lay over the province,

and Peile sought help from Sir Richard Temple [q. v. Suppl. II], who told him plainly that he 'could not spare a single rupee.' Peile's answer, 'I know then where I stand,' impressed Temple. He at once proceeded to organise self-help by local co-operation, and averted a grave catastrophe. Peile was a member of the famine commission (1878-80), and Temple in giving evidence before it declared that 'the condition of Kathiawar was a credit to British rule.'

Peile spent a few months in Sind in 1878, but declined an offer of the commissionership there. From 1879 to 1882 he was secretary and acting chief secretary to the Bombay government. During 1879 he accompanied the famine commission on its tour of inquiry, receiving in the course of it the honour of C.S.I. In October he proceeded to London to assist in writing the famous famine report remarkable 'for its detailed knowledge of varying conditions and grasp of general principles' (LORD HARTINGTON'S *Despatch*, No. 4, dated 14 March 1881). On his return to Bombay he was sent to Baroda to clear off appeals against the government of Baroda in respect of Girassia claims. He had hardly rejoined the secretariat when the governor-general recalled him to Simla to take part in a conference regarding the rights of certain Kathiawar states to manufacture salt. On 23 Dec. 1882 he became member of council at Bombay, and to him Lord Ripon [q. v. Suppl. II] looked with confidence to give effect to his self-government policy. Peile matured and carried through such important measures as the legislative councils Bombay Acts I and II, 1884, Local Boards, and District Municipalities Acts. These Acts did not go as far as Lord Ripon hoped in the elimination of official guidance from municipal and local board committees; but Peile knew that it was unsafe to go further, and the viceroy cordially acknowledged his services. In 1886 he carried an amendment of the Bombay Land Revenue Code, securing to the peasantry the benefit of agricultural improvements. His experience in educational matters was of great service. He had become vice-chancellor of the university in 1884, and in 1886 he dealt with technical education in his convocation address. In 1886 Peile left the Bombay council on his appointment by Lord Dufferin, Lord Ripon's successor on the supreme council. From 4 Oct. 1886 to 8 Oct. 1887, with a few days' interval, Peile served as a member of the supreme government. His presence greatly assisted the

enactment of the Punjab Tenancy Act and the Land Revenue Bill, while Lady Dufferin found an active supporter and exponent at a public meeting of her benevolent scheme for female medical aid.

To the regret of Lord Dufferin, Peile left India on his nomination to the India council in London (12 Nov. 1887). In 1897 his ten years' term of office was extended for another five years. During these fifteen years he took a leading part at the India office in the government of India. He was one of the first to urge upon his colleagues the need for enlarging provincial councils and for increasing their powers. He was a jealous guardian of the finances of India, strenuously opposing the application of her revenues to the cost of sending troops in 1896 to Suakin as 'not being a direct interest of India.' He also objected to imposing on cotton exported to India a differential and preferential rate (3 per cent.) of import duties, when the general tariff fixed for revenue purposes was 5 per cent. While he advocated a progressive increase in the number of Indians admitted to the higher branches of the service, he firmly opposed the 'ill-considered resolution' of the House of Commons (2 June 1893), in favour of simultaneous examinations. He declined the offer of chairmanship of the second famine commission, but he served on the royal commission on the administration of the expenditure of India in 1895, and recorded the reservations with which he assented to their report dated 6 April 1900. He was made K.C.S.I. in 1888.

Throughout his career he had found recreation in sketching, and some of his productions in black and white won prizes at exhibitions in India. Retiring from public office on 11 Nov. 1902, he devoted himself to family affairs, and found leisure to record an account of his life for his children. He died suddenly on 25 April 1906 at 28 Campden House Court, London, W., and was buried at the Kensington cemetery, Hanwell.

Peile married in Bombay, on 7 Dec. 1859, Louisa Elisabeth Bruce, daughter of General Sackville Hamilton Berkeley. His wife survived him with two sons, James Hamilton Francis, archdeacon of Warwick, and Dr. W. H. Peile, M.D., and a daughter.

[The Times, 27 April 1906; *Annals of the Peiles of Strathclyde*, by the Rev. J. W. Peile (brother of Sir James); *Famine Commissioners Reports*; *Legislative Proc. of Governments of India and Bombay*; *Kathiawar administration Reports*; private papers lent by the archdeacon of Warwick.] W. L-W.

PEILE, JOHN (1837-1910), Master of Christ's College, Cambridge, and philologist, born at Whitehaven, Cumberland, on 24 April 1837, was only son of Williamson Peile, F.G.S., by his wife Elizabeth Hodgson. Sir James Braithwaite Peile [q. v. Suppl. II] was his first cousin. His father died when he was five years old, and in 1848 he was sent to Repton School, of which his uncle, Thomas Williamson Peile [q. v.], was then headmaster. At Repton he remained till his uncle's retirement in 1854. During the next two years he attended the school at St. Bees, and in 1856 was entered at Christ's College, Cambridge. In 1859 he won the Craven scholarship, and in 1860 was bracketed with two others as senior classic, and with one of these, Mr. Francis Cotterell Hodgson, as chancellor's medallist. He graduated B.A. in 1860 and proceeded M.A. in 1863. Having been elected a fellow of Christ's in 1860, and appointed assistant tutor and composition lecturer, he settled down to college and university work, which occupied him till near his death. He took up the study of Sanskrit and comparative philology, and in 1865, and again in 1866, spent some time working with Professor Benfey at Göttingen. Till the appointment of Professor Edward Byles Cowell [q. v. Suppl. II] in 1867, he was teacher of Sanskrit in the university, and when Sanskrit became a subject for a section of part 2 of the classical tripos, he published a volume of 'Notes on the Tale of Nala' (1881) to accompany Professor Jarrett's edition of the text. He also corrected Jarrett's edition, which in consequence of a difficult method of transliteration was very inaccurately printed. In 1869 appeared his book 'An Introduction to Greek and Latin Etymology.' The lecture form of the first edition was altered in the second, which was issued in 1871; a third appeared in 1875. Soon after the point of view of comparative philologists changed in some degree, and Peile, who by this time was becoming more immersed in college and university business, allowed the book to go out of print. A little primer of 'Philology' (1877) had for long a very wide circulation. To the ninth edition of the 'Encyclopædia Britannica' he contributed the article on the alphabet and also articles upon the individual letters. He was for many years a contributor to the 'Athenæum,' reviewing classical and philological publications. In 1904 he was elected a member of the British Academy.

Peile was tutor of his college from 1871 to 1884, when, on his appointment to the

newly constituted post of university reader in comparative philology, which was not tenable with a college tutorship, he resigned, but remained a college lecturer. On the death of Dr. Swainson in 1887 he was elected Master of Christ's, but continued to lecture for the university till his election as vice-chancellor in 1891. His two years' tenure of the vice-chancellorship (1891-3) was eventful beyond the common. The most important incident was the passing of an act of parliament, whereby the perennial conflict of jurisdictions between 'town and gown' was brought to an end satisfactory to both parties, the university surrendering its jurisdiction over persons not belonging to its own body and receiving representation on the town council. The controversy had reached an acute stage over a case of proctorial discipline, and the new arrangement was mainly due to Peile's broadmindedness and statesmanship. His vigorous vice-chancellorship made him henceforward more than ever prominent in the affairs of the university. While he was vice-chancellor a new chancellor—Spencer Compton Cavendish, eighth duke of Devonshire [q. v. Suppl. II]—was installed, and Peile visited Dublin on the occasion of the tercentenary of Trinity College, which conferred upon him the honorary degree of Litt.D. (1892). He had been one of the early recipients of the degree of Litt.D. on the establishment of that degree at Cambridge in 1884.

In 1874 Peile had been elected a member of the council of the senate, a position which he held uninterruptedly for thirty-two years. Along with Prof. Henry Sidgwick [q. v. Suppl. I] and Coutts Trotter [q. v.] he represented in the university the liberalising movement then perhaps at the zenith of its influence. He was long an active supporter of women's education and a member of the council of Newnham College, and in the university controversy of 1897 on the question of 'Women's Degrees' he advocated the opening to women of university degrees. After the death of Prof. Arthur Cayley [q. v. Suppl. I] in 1895 he became president of the council, and a new block of college buildings at Newnham has been named after him. He was in favour of making Greek no longer compulsory on all candidates for admission to the university when the question was debated in 1891, and again in 1905 and 1906. He also took an active part in the university extension movement.

Though he never ceased to take an interest in comparative philology, and remained for many years an active and influential member of the special board for

classics, most of his leisure, after he ceased to be vice-chancellor in 1893, was devoted to compiling a biographical register of the members of his college and of its forerunner, God's House, a work which entailed a great amount of research. In connection with this undertaking he wrote in 1900 a history of the college for Robinson's series of college histories. The first volume of his register (1448-1665) was completed before Peile's death, which took place at the college after a long illness on 9 Oct. 1910. He is buried in the churchyard of Trumpington, the parish in which he lived before becoming Master of Christ's College.

In 1866 he married Annette, daughter of William Cripps Kitchener, and had by her, besides two children who died in infancy, two sons, and a daughter, Hester Mary, who married, in 1890, John Augustine Kempthorne, since 1910 bishop-suffragan of Hull.

Peile was a man of moderate views who had the faculty of remaining on good terms with his most active opponents. He was an effective speaker and a good chairman. As a college officer he was very popular, and the college prospered under him. As a lecturer on classical subjects (most frequently on Theocritus, Homer, Plautus, and Lucretius), and on comparative philology, he was able to put his views clearly and interestingly, and, like Charles Lamb, he sometimes found the slight hesitation in his speech a help in emphasising a point. To him much more than to anyone else was due the successful study of comparative philology in Cambridge.

A portrait by Sir George Reid, P.R.S.A., is in the possession of the college; a replica presented to Mrs. Peile was given by her to Newnham College, and now hangs in Peile Hall.

[Information from Mrs. Peile, Dr. Shipley, Master of Christ's College, Prof. Henry Jackson, and the headmaster of Repton; Prof. W. W. Skeat in *Proc. Brit. Acad.* 1910; Dr. W. H. D. Rouse in *Christ's Coll. Mag.* 1910; personal knowledge since 1882.] P. G.

PELHAM, HENRY FRANCIS (1846-1907), Camden professor of ancient history, Oxford, was grandson of Thomas Pelham, second earl of Chichester [q. v.], and eldest of the five children of John Thomas Pelham, bishop of Norwich [q. v.], by his wife Henrietta, second daughter of Thomas William Tatton of Wythenshawe Hall, Cheshire. Of his three brothers, John Barrington became vicar of Thundridge in 1908, and Sidney archdeacon of Norfolk in 1901. Pelham was born on 19 Sept. 1846

at Bergh Apton, then his father's parish. Entering Harrow (Westcott's house) in May 1860, he moved rapidly up the school, and left in December 1864. Next year he won an open classical scholarship at Trinity College, Oxford (matriculating on 22 April 1865); he came into residence in October. At Oxford he took 'first classes' in honour classical moderations and in literæ humaniores, was elected a fellow of Exeter College in 1869, and graduated B.A. in the same year. In 1870 he won the chancellor's English essay prize with a dissertation on the reciprocal influence of national character and national language. He worked continuously as classical tutor and lecturer at Exeter College from 1870 till 1889. He was elected by his college proctor of the university in 1879. Losing his fellowship on his marriage in 1873, he was re-elected in 1882, under the statutes of the second university commission.

From school onwards his principal subject was ancient and more particularly Roman history. He soon began to publish articles on this theme (first in 'Journal of Philology,' 1876), while his lectures, which (under the system then growing up) were open to members of other colleges besides Exeter, attracted increasingly large audiences; he also planned, with the Clarendon Press, a detailed 'History of the Roman Empire,' which he was not destined to carry out. In 1887 he succeeded W. W. Capes as 'common fund reader' in ancient history, and in 1889 he became Camden professor of ancient history in succession to George Rawlinson [q. v. Suppl. II], a post to which a fellowship at Brazenose is attached. As professor he developed the lectures and teaching which he had been giving as college tutor and reader, and attracted even larger audiences. But his research work was stopped by an attack of cataract in both eyes (1890), and though a few specimen paragraphs of his projected 'History' were set up in type in 1888, he completed in manuscript only three and a half chapters, covering the years B.C. 35-15, and he never resumed the work after 1890; his other research, too, was hereafter limited to detached points in Roman imperial history. On the other hand, he joined actively in administrative work, for which his strong personality and his clear sense fitted him at least as well as for research; he served on many Oxford boards, was a member of the hebdomadal council from 1879 to 1905, aided semi-academic educational movements (for women, &c.), and in 1897 accepted the presidency of his old

college, Trinity. He was elected honorary fellow of Exeter in 1895, was an original fellow of the British Academy in 1902 and received the hon. degree of LL.D. at Aberdeen in 1906. He became F.S.A. in 1890. He died in the president's lodgings at Trinity on 12 Feb. 1907, and was buried in St. Sepulchre's cemetery, Oxford. On 30 July 1873 he married Laura Priscilla, third daughter of Sir Edward North Buxton, second baronet, and granddaughter of Sir Thomas Fowell Buxton, first baronet [q. v.]; she survived him with two sons and a daughter.

Pelham was a somewhat unusual combination of the scholar and the practical man. An excellent teacher, lecturing at a time when Oxford was widening its outlook and Mommsen and his school were recreating Roman history, he helped to revolutionise the study of ancient history in Oxford, and by consequence in England. Still more, as one who combined practical organising genius with an understanding of the real needs of learning and the true character of scientific research, he did more than any other one man to develop his university as a place of learning, while conserving its value as a place of education. Thus, he was prominent in providing endowments for higher study and research, in introducing archæology and geography to the circle of Oxford historical work, and in founding the British Schools at Rome and Athens. In pursuit of his principles he helped actively to put natural science, English and foreign languages on a more adequate basis in Oxford, and to give women full opportunities of academic education at the university. After his death his friends founded in his memory a Pelham studentship at the British School at Rome, to be held by Oxford men (or by women students) pursuing higher studies at Rome.

Pelham wrote little. His chief publications were: 1. 'Outlines of Roman History,' London, 1893, enlarged from a monograph in the 'Encyclopædia Britannica,' 1887. 2. Scattered essays and articles on Roman history, of which the chief, with a fragment of the unfinished 'History,' have been collected in a posthumous volume of 'Essays,' Oxford, 1911. Both volumes exhibit very high historical powers, but Pelham's eyesight and perhaps his temperament turned him to other activities with more result.

A portrait by Sir Hubert von Herkomer hangs in the hall of Trinity College.

[Mémorial by Prof. Haverfield, prefixed to Pelham's Essays, 1911; The Times, 13 Feb. 1907; Proc. Brit. Acad. 1907-8; private information.] F. J. H.

PELL, ALBERT (1820-1907), agriculturist, born in Montagu Place, Bloomsbury, London, on 12 March 1820, was eldest of three sons of Sir Albert Pell (1768-1832), serjeant-at-law in 1808, who retired from practice in 1825 in indignation at being passed over by Lord Eldon for judicial promotion, but in 1831 was persuaded by his friend Brougham, when he became lord chancellor, to accept a judgeship of the court of review in bankruptcy; he was at the same time knighted on 7 Dec. (cf. WOOLRYCH's *Serjeants-at-Law* (1869), ii. 752-71). Pell's mother was Margaret Letitia Matilda (1786-1868), third daughter and co-heiress of Henry Beauchamp St. John, twelfth Lord St. John of Bletsoe.

Brought up at his father's houses at Pinner Hill and in Harley Street, Pell from 1832 to 1838 was at Rugby school under Arnold. Thence he passed in 1840 to Trinity College, Cambridge, where he describes himself as 'idle and unstudious.' He was, however, instrumental in introducing Rugby football to Cambridge. His parentage entitled him to take the honorary degree of M.A. in 1842, after two years' residence. Plans for reading for the bar were abandoned, owing to his liking for a country life. He at first took a farm in the Harrow Vale, twelve miles from London, and after his marriage in 1846 lived near Ely, finally settling for good in the spring of 1848 at Hazelbeach, mid-way between Northampton and Market Harborough, in a house which he rented from his wife's relative Sir Charles Isham. He found his farm at Hazelbeach to be 'dreadfully out of order, foul, wet and exhausted'; but he set to work on its improvement with characteristic energy. He became a regular attendant at the local markets, besides being 'churchwarden, overseer, surveyor of the highways, guardian of the poor, and justice of the peace' (*Reminiscences*, p. 165). The outbreak of cattle plague in 1865 bestirred him to a vehement campaign in his district in defence of the system of slaughter for stamping out the contagion; and he organised a great meeting of agriculturists in London on the subject. An indirect outcome of this gathering was the establishment of the central chamber of agriculture, of which Pell became in 1866 the first chairman. At a bye-election for South Leicestershire in 1867, Pell, owing to his exertions in exterminating the cattle plague, was chosen as conservative candidate, but was beaten by a small majority. In 1868 he was returned, and he represented the con-

stituency until his retirement in 1885. Though nominally a conservative, he was, in the words of his friend, Mr. James Bryce, 'no more of a party man than his sense of party loyalty required. His political opinions might be described as half tory, half radical. The tory views and the radical views were not mixed to make what used to be called a liberal conservative, but remained distinct, leaving him a tory in some points, a radical in others' (*Reminiscences*, introd. p. xlv).

Pell was an authority on questions of poor law, of which he had a wide experience. He was guardian for his own parish of Hazelbeach as early as 1853. In 1873 he moved at his own board of guardians (Brixworth) for a committee to inquire into the mode of administration of outdoor relief in that and other unions, and as the outcome of the committee's report outdoor relief was practically abolished in the Brixworth union, with remarkable results. In 1876 he carried an amendment on Lord Sandon's education bill, providing for the abolition of school boards in districts where there were only voluntary schools (H. PAUL, *Hist. of Modern England*, 1905, iii. 413-4). From 1876 to 1889 Pell had a seat as a nominated guardian for St. George's-in-the-East, London, in which parish he had property, and tried to enforce there his views on outdoor relief. He failed in his endeavours to induce the House of Commons to consider his proposals (*Hansard*, cccxx. 1515). But in 1884 he carried against the government by 208 votes to 197 a motion deprecating 'the postponement of further measures of relief acknowledged to be due to ratepayers in counties and boroughs in respect of local charges imposed on them for national services.' On this occasion he made his longest speech in the house, speaking for an hour and a half (*Hansard*, cclxxxvi. 1023). Pell was a prominent figure at poor law conferences, and was chairman of the central conference from 1877 to 1898. He was also an active member of the Northamptonshire county council from its establishment in 1889. Indeed, on all subjects connected with county government, social reform, local taxation, and agricultural improvement he was regarded as an authority both in and out of parliament. In June 1879 he and his friend Clare Sewell Read [q. v. Suppl. II] went, as assistant commissioners to the Duke of Richmond's royal commission on agriculture, to America and Canada to study agricultural questions there. Another inquiry which much inter-

ested him was that of the royal commission on the City guilds, of which he was appointed a member at the instance of his friend Sir William Harcourt, who said to Pell that 'he would give him something to keep him quiet for a year or two' (*Reminiscences*, p. 314). He sat also on the royal commissions as to the City parochial charities and the aged poor.

Shortly after his retirement from parliament in 1885 Pell became (30 June 1886) a member of the council of the Royal Agricultural Society, and did excellent work on its 'Journal,' and on its chemical and education committees. He contributed to its 'Journal' two articles on 'The Making of the Land in England' (1887 and 1889) and a biography of Arthur Young (1893), as well as other minor articles and notes. He was a member of the Farmers' Club, which he joined in February 1867, becoming a member of the committee in 1881, and chairman in 1888. He was one of the pioneers of the teaching of agriculture at his old university, and was made hon. LL.D. there when the Royal Agricultural Society met at Cambridge in 1894. In his later years he suffered much from deafness and from his lungs, and wintered at Torquay. There he died on 7 April 1907, and was buried at Hazelbeach.

In 1846 Pell married his cousin, Elizabeth Barbara, daughter of Sir Henry Halford, second baronet (1825-1894), being attired for the occasion 'in puce-coloured kerseymere trousers, straps, and Wellington boots, an embroidered satin waistcoat and a blue dress coat with brass buttons' (*Reminiscences*, p. 139).

He had no children; and on his death a nephew, Albert James Pell, succeeded to the family property at Wiburton Manor, Ely, where there hangs a portrait of Pell, painted in 1886 by Miss S. Stevens.

[Pell's *Reminiscences* (up to 1885), edited after his death by Thomas Mackay, 1908; article in *Poor Law Conferences of 1899-1900*, by W. Chance; personal knowledge.] E. C.

PEMBER, EDWARD HENRY (1833-1911), lawyer, eldest son of John Edward Rose Pember of Clapham Park, Surrey, by his wife Mary, daughter of Arthur Robson, was born at his father's house on 28 May 1833. He was educated at Harrow, and after reading for a short time with the Rev. T. Elwin, headmaster of Charterhouse School, a noted teacher, he matriculated on 23 May 1850 at Christ Church, Oxford, where he was elected a student in 1854. He took

a first class in classical moderations in 1852, and in 1854 he was placed in the first class in literæ humaniores, and in the third class of the newly founded school of law and modern history. He entered as a student of Lincoln's Inn on 2 May 1855, reading in the chambers first of the conveyancer Joseph Burrell and then of George Markham Giffard, afterwards lord justice [q. v.]. Called to the bar on 26 Jan. 1858, he chose the Midland circuit, and laid himself out for common law practice; briefs were slow in coming when a fortunate accident introduced him to the parliamentary bar. For that class of work and tribunal Pember was admirably equipped. His fine presence, his command of flowing classical English, together with his quickness of comprehension and his readiness in repartee, soon made him a prime favourite with the committees of both houses. Edmund Beckett (afterwards Lord Grimthorpe) [q. v. Suppl. II] and George Stovin Venables [q. v.] were then the chiefs of the parliamentary bar, but Pember more than held his own with them, and after they were gone he disputed the lead at Westminster for over thirty years with such formidable rivals as Samuel Pope [q. v. Suppl. II] and (Sir) Ralph Littler [q. v. Suppl. II]. Perhaps the greatest achievement in his forensic career was his conduct of the bill for creating the Manchester Ship Canal, which was passed in July 1885 in the teeth of the most strenuous opposition; Pember's reply for the promoters, which was largely extemporaneous, was one of the most effective speeches ever delivered in a parliamentary committee room. His speeches as a rule were most carefully prepared, and were fine examples of literary style. His treatment of witnesses was not always adroit, and he was over-prone to argument with experts and men of science; but his straightforwardness gave him the full confidence of those before whom he practised. In April 1897 he appeared as counsel for Cecil Rhodes [q. v. Suppl. II] before the parliamentary committee appointed to investigate the origin and attendant circumstances of the Jameson raid. Pember took silk in 1874, was made a bencher of his Inn in 1876, and served the office of treasurer in 1906-7. He retired from practice in 1903 in full vigour of mind and body. He died after a short illness on 5 April 1911, at his Hampshire home, Vicar's Hill, Lympington, and was buried at Boldre Church, Brockenhurst.

Pember was throughout his life a prominent figure in the social and literary life of London. A brilliant talker, he was one

of the most regular and welcome attendants at the dinners of 'The Club.' From 1896 to 1911 he acted as joint secretary of the Dilettanti Society, and in 1909 his portrait was painted for that body by Sir Edward Poynter, R.A. He was an accomplished musician, having studied singing under Perugini and possessing considerable technical theoretical knowledge. In 1910 Pember was elected perpetual secretary of the newly formed academic committee of the Royal Society of Literature. During the days of waiting at the bar he was a constant contributor to the weekly press, and he is generally credited with the famous epigram on Lord Westbury's judgment in the 'Essays and Reviews' case—'Hell dismissed with costs.' Some extracts from a mock Newdigate poem of his, 'On the Feast of Belshazzar' (the subject for 1852, when the prize was awarded to Edwin Arnold), were long current in Oxford. Widely read in general literature and highly critical in taste, he found relaxation and amusement in the making of *vers de société* and of translations and adaptations from the Greek and Latin, especially from Horace and the Greek dramatists. During the latter years of his life his leisure was largely occupied in the composition of classical plays in English, cast in the Attic mould, drawn from scriptural and mythological themes. He had a good dramatic sense and a correct and fastidious ear. He refrained from publication, and confined the circulation of his plays and poems to a fit and cultured audience.

Pember married on 28 August 1861 Fanny, only daughter of William Richardson of Sydney, New South Wales, who survived him. His eldest and only surviving son, Francis William, became fellow of All Souls in 1884 and bursar in 1911.

Besides the picture by Sir Edward Poynter, now in the rooms of the Dilettanti Society, there is a portrait of Pember by Frank Holl, R.A., in the possession of his widow.

Pember 'printed for private distribution': 1. 'Debita Flacco, Echoes of Ode and Epode,' 1891. 2. 'The Voyage of the Phœceans and other Poems, with Prometheus Bound done into English Verse,' 1895. 3. 'Adrastus of Phrygia and other Poems, with the Hippolytus of Euripides done into English Verse,' 1897. 4. 'The Death-Song of Thamyris and other Poems, with the Oedipus of Colonus done into English Verse,' 1899. 5. 'The Finding of Phœdipides and other Poems,' 1901. 6. 'Jephthah's Daughter and other Poems,' 1904. 7. 'Er of Pamphylia and other Poems,' 1908. He contributed also 'Lives of early

Italian Musicians' to Sir George Grove's 'Dictionary of Music,' and a searching anonymous criticism of Lord Lovelace's 'Astarte' to Mr. John Murray's 'Detractors of Byron' (Roxburghe Club, 1906).

[Memoir by W. J. Courthope in Proc. Acad. Committee Royal Soc. of Lit., 1911; The Times, 6 April 1911; Foster's Men at the Bar; Oxf. Univ. Cal.; private information.] J. B. A.

PEMBERTON, THOMAS EDGAR (1849-1905), biographer of the stage, born at Birmingham Heath on 1 July 1849, was eldest son of Thomas Pemberton, J.P., the head of an old-established firm of brass founders in Livery Street, Birmingham. Charles Reece Pemberton [q. v.] belonged to the same old Warwickshire family. Educated at the Edgbaston proprietary schools, Pemberton at nineteen entered his father's counting-house, and in due course gained control of the business of the firm, with which he was connected until 1900. Of literary taste from youth, Pemberton long divided his time between commerce and varied literary endeavours. His industry was unceasing. After the publication of two indifferent novels, 'Charles Lysaght: a Novel devoid of Novelty' (1873) and 'Under Pressure' (1874), he showed some aptitude for fiction in 'A Very Old Question' (3 vols. 1877). There followed 'Born to Blush Unseen' (1879) and an allegorical fairy tale, 'Fair-brass,' written for his children.

At his father's house he met in youth E. A. Sothorn, Madge Robertson (Mrs. Kendal), and other players on visits to Birmingham, and he soon tried his hand at the drama. His comedietta 'Weeds,' the first of a long list of ephemeral pieces, mainly farcical, was written for the Kendals, and produced at the Prince of Wales's Theatre, Birmingham, on 16 Nov. 1874. His many plays were rarely seen outside provincial theatres. He came to know Bret Harte, and his best play, 'Sue,' was adapted with Bret Harte's collaboration from the latter's story 'The Judgment of Bolinas Plain.' Originally brought out in America, it was subsequently produced at the Garrick on 10 June 1898. The partnership was continued. 'Held Up,' a four-act play by Harte and Pemberton, was produced at the Worcester theatre on 24 Aug. 1903. One or two unproduced plays written by the two remain in manuscript. On Bret Harte's death in 1902 Pemberton wrote 'Bret Harte: a Treatise and a Tribute.'

In succession to his friend Sam Timmins, Pemberton was the dramatic critic of the

'Birmingham Daily Post' from 1882 until he retired to the country at Broadway in 1900. As a theatrical biographer, Pemberton made his widest reputation, writing memoirs of Edward Askew Sotherton (1889); the Kendals (1891); T. W. Robertson (1892); John Hare (1895); Ellen Terry and her sisters (1902); and Sir Charles Wyndham (1905). He was personally familiar with most of his themes, but his biographic method had no literary distinction. An excellent amateur actor, Pemberton frequently lectured on theatrical subjects. In 1889 he was elected a governor of the Shakespeare Memorial theatre, Stratford-on-Avon, and showed much interest in its work. He died after a long illness at his residence, Pye Corner, Broadway, Worcestershire, on 28 Sept. 1905, and was buried in the churchyard there.

Pemberton married on 11 March 1873, in the 'Old Meeting House,' Birmingham, Mary Elizabeth, second daughter of Edward Richard Patie Townley of Edgbaston, who survived him, with two sons and three daughters.

Besides the works cited, Pemberton published 'Dickens's London' (1875), 'Charles Dickens and the Stage' (1888), and 'The Birmingham Theatres: a Local Retrospect' (1889).

[Edgbastonia, vol. xxv. No. 293; Birmingham and Moseley Society Journal, vol. vii. No. 75 (with portrait); Birmingham Daily Mail, 28 Sept. 1905; Birmingham Daily Post, 29 Sept. 1905; private information; personal knowledge and research.] W. J. L.

PENNANT, GEORGE SHOLTO GORDON DOUGLAS, second BARON PENRHYN (1836-1907), colliery owner. [See DOUGLAS-PENNANT.]

PENRHYN, second BARON. [See DOUGLAS-PENNANT.]

PENROSE, FRANCIS CRANMER (1817-1903), architect, archaeologist, and astronomer, born on 29 Oct. 1817 at Bracebridge near Lincoln, was youngest son of John Penrose, vicar of that place. Both his father and his mother, Elizabeth Penrose, writer for the young under the pseudonym of 'Mrs. Markham,' are noticed separately in this Dictionary. Penrose owed his second name to direct descent through his mother from the sister of Archbishop Cranmer. His aunt Mary Penrose became the wife of Dr. Thomas Arnold [q. v.] of Rugby.

Francis was the original of the 'Mary' in the 'History of England,' by his mother ('Mrs. Markham'). After a few years at Bedford grammar school

(1825-9) he passed to the foundation at Winchester College. From early years he had shown a taste for drawing, and on leaving Winchester he went in 1835 to the office of the architect Edward Blore [q. v.], where he worked until 1839. Thereupon, instead of starting architectural practice, he entered Magdalene College, Cambridge, as an undergraduate, and came out tenth senior optime in 1842. With his artistic and mathematical bents he combined repute as an athlete. He thrice rowed in the race against Oxford, in 1840, 1841, and 1842. He was captain of his college boat, which he brought from a low place to nearly head of the river, and was the inventor of the system of charts still in use in both universities for registering the relative positions of crews in the bumping races. More than once he walked in the day from Cambridge to London, and skated from Ely to the Wash. Among his friends while an undergraduate were Charles Kingsley [q. v.], almost a contemporary at Magdalene, Charles Blachford Mansfield [q. v.], John Malcolm Ludlow [q. v. Suppl. II], and John Couch Adams [q. v. Suppl. I], who with George Peacock [q. v.] awakened an interest in astronomy. Through Kingsley he came to know Frederick Denison Maurice [q. v.], and as a young man he saw much of his first cousin Matthew Arnold [q. v. Suppl. I].

In 1842 Penrose was appointed travelling bachelor of the University of Cambridge, and at once set out on an important architectural tour (1842-5). To his skill as a draughtsman he had added command of the art of water-colour, in which he had taken lessons from Peter De Wint [q. v.]. He made his first prolonged halt at Paris, where he visited the observatory, as well as architectural scenes. At Paris, and subsequently at Chartres, Fontainebleau, Sens, Auxerre, Bourges, Avignon, Nismes, and Arles, he sketched and studied industriously. At Rome in 1843 his keen eye criticised the pitch of the pediment of the Pantheon as being 'steeper than I quite like,' a comment which subsequently received justification. Fifty-two years later M. Chedanne of Paris read a paper in London (at a meeting over which Penrose presided), and proved that the pitch of the pediment had been altered from the original design. Penrose stayed six months at Rome, and thence wrote the stipulated Latin letter as travelling bachelor to the University of Cambridge. He chose as his theme the Cathedral of Bourges.

Between June 1843 and the following spring Penrose visited the chief cities of Italy, and after a brief return to England started somewhat reluctantly for Greece. He describes Athens as 'by far the most miserable town of its size I have ever seen' (9 Jan. 1845). But he soon fell under the spell of the 'Pericleian Monuments,' to which his first enthusiasm for Gothic architecture quickly gave way. In August he made his way home through Switzerland, Augsburg, Munich, and Cologne.

Already Penrose realised the importance of exact mensuration to a critical study of Greek architecture. The pamphlet on the subject by John Pennethorne [q. v.] attracted his attention on its publication in 1844. On his arrival in England the Society of Dilettanti had determined to test thoroughly Pennethorne's theories as to the measurements of Greek classical buildings, and they commissioned Penrose to undertake the task in their behalf. In 1846 Penrose was again at Athens. His principal collaborator in the work of measurement there was Thomas Willson of Lincoln. They completed their labours in May 1847. Despite corrections in detail Penrose confirmed in essentials Pennethorne's theories. When in 1878 Pennethorne brought out his 'Geometry and Optics of Ancient Architecture' he adopted with due acknowledgment Penrose's mass of indisputable material.

'Anomalies in the Construction of the Parthenon,' which the Society of Dilettanti published in 1847, was the first result of Penrose's labours, but it was in 1851 that there appeared his monumental work, 'Principles of Athenian Architecture,' of which a more complete edition was issued in 1888. Penrose's exhaustive and minutely accurate measurements finally established that what is apparently parallel or straight in Greek architecture of the best period is generally neither straight nor parallel but curved or inclined. He solved the puzzle which all Vitruvius's commentators had found insoluble by identifying the 'scamilli impares' with those top and bottom blocks of the columns which, by virtue of the inclination of the column or the curvature of stylobate and architrave, are 'unequal' (i.e. they have their upper and lower faces out of parallel). Some important conclusions relating to the Roman temple of Jupiter Olympius at Athens Penrose laid before the Institute of British Architects in 1888.

In 1852 Dean Milman and the chapter appointed Penrose surveyor of St. Paul's

Cathedral. The appointment was made with a view to the completion of the interior decoration in accordance with the intentions of Wren. Penrose deemed it necessary to allot, apart from the decorative scheme, 2000*l.* per annum to the maintenance of the fabric, and a public appeal in 1870 provided substantial financial support. Penrose took up the decorative scheme with enthusiasm, and he insisted on respecting his conception of Wren's generous intentions. In the result he soon found himself at variance with the chapter, who favoured a more restricted plan. Nor was he at one with them on the methods of completing the Wellington monument (see STEVENS, ALFRED). Counsels prevailed in which the surveyor was neither consulted nor concerned.

Like Wren himself Penrose found relief from the disappointment in astronomical study, which had already attracted him at Cambridge and in Paris. He was an adept at mechanical inventions, and an instrument for drawing spirals won him a prize at the Great Exhibition of 1851. A theodolite which he had bought in 1852 primarily for use in measurement of buildings, he applied at the suggestion of Dr. G. Boole to such astronomical purposes as accurate determination of orientation and time in connection, for example, with the fixing of sundials. In 1862 came the purchase of a small astronomical telescope which was soon superseded by a larger one with a 5½-inch object-glass (Steinhil), equatorially mounted by Troughton & Simms. In 1866 Penrose, finding the prediction of the time of an occultation of Saturn in the 'Nautical Almanac' inadequate for his purpose, endeavoured with success 'to obtain by graphical construction a more exact correspondence suited to the site' of the observer. He published his results in 1869 in 'The Prediction and Reduction of Occultations and Eclipses' (4to), and the work reached a second edition in 1902.

In 1870 he visited Jerez in the south of Spain to view the total eclipse of the sun with his smaller (2¼-inch) instrument. The observation was spoilt by a cloud, but Penrose made the acquaintance of Professor Charles A. Young of America, whom he met again at Denver in 1878. Penrose's observations on the eclipse of 29 July 1878 were published in the Washington observations (Appendix III). He afterwards extended to comets the graphical method of prediction which he had applied to the moon (cf. his paper before the Royal

Astronomical Society, December 1881, and chapter vi. in G. F. CHAMBERS'S *Handbook of Astronomy*, 4th edit. 3 vols. 1889).

His last astronomical work was a study of the orientation of temples, to which Sir Norman Lockyer directed his attention. Presuming that 'the object sought by the ancients in orienting their temples was to obtain from the stars at their rising or setting, as the case might be, a sufficient warning of the approach of dawn for preparation for the critical moment of sacrifice,' he perceived the importance of calculating the places of certain stars at distant epochs, and the possibility of estimating the age of certain temples by assuming an orientation and calculating the period of variation or apparent movement in the stars due to the precession of the equinoxes. Penrose applied his theory to certain Greek temples (see *Proceedings and Philosophic Transactions of Royal Society*), and with Lockyer he worked out a calculation on this basis in relation to Stonehenge (see also *Journal R.I.B.A.* 25 Jan. 1902). He joined the Royal Astronomical Society in 1867, and in 1894 his astronomical researches were recognised by his election as F.R.S.

Penrose's creative work as an architect was incommensurate in quantity with his obvious ability. He built at Cambridge the entrance gate at Magdalene, and a wing at St. John's; at Rugby School he erected the infirmary; at Wren's church, St. Stephen's, Walbrook, he designed the carved choir stalls. The vicarages at Harefield near Uxbridge and at Maids Moreton were his, as also were church restorations at Chilvers Coton and Long Stanton.

When in 1882 the foundation of the British School at Athens was projected, Penrose generously designed the building without fee. It was completed in 1886, when Penrose accepted the directorate for one season, 1886-7. He held the office again in 1890-1. At St. Paul's, where his chief architectural work was done, he designed the choir school, the choir seats and desks, the marble pulpit and stairs, carved oak lobbies at the western entrances of the north transept, the mosaic pavements in the crypt, the Wellington tomb in the crypt, the font and pavement in the south chapel, and the marble memorial to Lord Napier of Magdala. He was also responsible for the removal of the Wellington monument to a new position, the rearrangement of the steps at the west entrance, and the exposure of the remains of the ancient cathedral in the churchyard.

Penrose, whose fellowship of the Royal

Institute of British Architects dated from 1848, received the royal gold medal of the institute in 1883 and was president in 1894-6. He became F.S.A. in 1898, when he was elected antiquary to the Royal Academy. He was made in 1884 one of the first honorary fellows of Magdalene College, Cambridge, and in 1898 he became a Litt.D. of his university as well as an hon. D.C.L. of Oxford. He was a knight of the order of the Saviour of Greece.

His own house, Colebyfield, Wimbledon (which had a small observatory), was designed by himself. There, where he resided for forty years, he died on 15 Feb. 1903. He was buried at Wimbledon. He married in 1856 Harriette, daughter of Francis Gibbs, surgeon, of Harewood, Yorkshire. His wife predeceased him by twelve days. He left a son, Dr. Francis G. Penrose, and four daughters, the eldest of whom, Emily, became successively principal of Bedford College, Holloway College, and Somerville College, Oxford.

Penrose's portrait at the Royal Institute of British Architects is one of the most characteristic works of J. S. Sargent, R.A. (a copy is at Magdalene College). A memorial tablet was placed in the crypt of St. Paul's Cathedral, chiefly by architectural friends.

[*R.I.B.A. Journal*, vol. x. 3rd series, 1903, p. 337, article by Mr. J. D. Crace, also pp. 213-4; *Royal Society Obituary Notices*, vol. i. pt. 3, 1904, p. 305; information from Dr. Francis G. Penrose.] P. W.

PERCY, HENRY ALGERNON GEORGE, EARL PERCY (1871-1909), politician and traveller, born at 25 (now 28) Grosvenor Square, London, on 21 Jan. 1871, was eldest son of Henry George Percy, Earl Percy, who became seventh duke of Northumberland in succession to his father in 1899. As Lord Warkworth he won at Eton the prize for English verse, and at Christ Church, Oxford, first class honours in classical moderations in 1891 and literæ humaniores in 1893, his class in the latter school being reputed one of the best of the year. He also obtained at Oxford in 1892 the Newdigate prize for English verse on the subject of St. Francis of Assisi, and his recitation of his poem in the Sheldonian Theatre was long remembered as one of the most impressive of these performances. In 1895 he contested Berwick-on-Tweed as a conservative without success against Sir Edward Grey, but later in the year was chosen at a bye-election for South Kensington, which he

represented continuously till his death. Marked out from the first as a debater of ability, industry, and independence, he soon became conspicuous in a group of conservatives who sometimes adopted a critical attitude towards their leaders, and, in view of his future prospects, few felt surprise when, on Mr. Balfour becoming prime minister in July 1902, Earl Percy (as he had been styled since his father's succession to the dukedom in 1899) was appointed parliamentary under-secretary for India. Approving himself in this office by the immense pains which he took to master matters proper to his department, he passed to foreign affairs as under-secretary of state on the reconstruction of Mr. Balfour's cabinet in October 1903. Since his chief, Lord Lansdowne, was in the upper house, Lord Percy had occasion to appear prominently in the commons and to prove both his capacity and his independence, especially in dealing with Near Eastern matters, which had long engaged his interest, and had induced him once and again to visit Turkish soil.

Travel in the Near East divided his interests with politics. In 1895 he first visited the Ottoman dominions, when he returned with Lord Encombe from Persia though Baghdad and Damascus. He went back to Turkey in 1897 to make with Sir John Stirling Maxwell and Mr. Lionel Holland a journey through Asia Minor to Erzerum, Van, the Nestorian valleys, and the wilder parts of central Kurdistan. He returned by Mosul, Diarbekr, and Aleppo, and published his experiences in 'Notes of a Diary in Asiatic Turkey' (1898), a volume which showed strong but discriminating Turcophilism, sensitiveness to the scenic grandeur of the regions traversed, and growing interest in their history and archæology. True to the traditions of his family, he began to collect antiques, particularly cylinder seals; and subsequently extending his interest to Egypt, he applied himself to the study of hieroglyphics.

His most important tour in Turkey was undertaken in 1899. He then made his way with his cousin, Mr. Algernon Heber Percy, through Asia Minor and up the course of the southern source of the Euphrates to Bitlis and his Nestorian friends of Hakkiari. Thence he went on into the Alps of Jelu Dag, traversing a little-known part of Kurdistan near the Turco-Persian border, and passed by Neri to Altin Keupri, whence he descended the Lesser Zab and Tigris on a raft to Baghdad. On his way out he had been received by

Sultan Abdul Hamid. His second book, 'The Highlands of Asiatic Turkey' (1901), was inspired by his old sympathy for Turks, but also by a deepened sense of the evils of Hamidism, whose downfall he foresaw. Intolerant equally of Armenian and of Russian aspirations, he advocated agreement with Germany on Ottoman affairs.

He was in Macedonia in 1902, when appointed to office, and returned home through a wild part of North Albania, although not followed by the large Turkish escort which the solicitude of the Porte had prescribed for him. Thereafter parliamentary duties prevented him from making other than short recess tours, during one of which he took a motor-boat up the Nile, to practise for a projected cruise on the Euphrates, which he did not live to achieve. On Macedonian and indeed all Ottoman affairs his authority was acknowledged, although his views were not always welcome to the advocates of the *rayah* nationalists. An effective and thoughtful though not ambitious or frequent speaker, and a forceful but reserved personality, he had come to be regarded as a future leader in his party, when, to general sorrow, he died of pneumonia on 30 Dec. 1909, while passing through Paris on his way to Normandy. He was unmarried. He became a trustee of the National Portrait Gallery in 1901, and received in 1907 the degree of D.C.L. from the University of Durham.

[The Times, 31 Dec. 1909; private information.] D. G. H.

PERKIN, SIR WILLIAM HENRY (1838-1907), chemist, born on 12 March 1838 at King David's Lane, Shadwell, was youngest of three sons of George Fowler Perkin (1802-1865), a builder and contractor, by his wife Sarah Cuthbert. With his two brothers and three sisters he inherited a pronounced musical talent from his father. William Henry, after early education at a private school, was sent in 1851 to the City of London school, where his native aptitude for chemical study was effectively encouraged by his master, Thomas Hall. In 1853 he entered the Royal College of Chemistry as a student under Hofmann. By the end of his second year he had, under Hofmann's guidance, carried out his first piece of research, a study of the action of cyanogen chloride on naphthylamine, the results of which he announced in a paper read before the Chemical Society. In 1857 he was appointed an honorary assistant to his professor.

In 1854 he fitted up a laboratory in

his own home, where he prosecuted independent research. Here, in conjunction with Mr. (now Sir) A. H. Church, he soon discovered the first representative of the group of azo-dyes, namely, 'azodinaphthyl-diamine' or, in modern nomenclature, 'aminoazonaphthalene.' This substance was patented at a later date (Eng. Pat. 893 of 1863) and had a limited use as a dyestuff. During the Easter vacation of 1856, with the idea of synthesising quinine, Perkin tried, with a negative result, the experiment of oxidising a salt of allyltoluidine with potassium dichromate. On repeating the experiment with aniline, however, he obtained a dark-coloured precipitate which proved to be a colouring matter possessed of dyeing properties, and was the first aniline dye to be discovered. Encouraged by the favourable report made on his new product by practical dyers and especially by Messrs. Pullar of Perth, Perkin resigned his position at the Royal College of Chemistry and entered on the career of an industrial chemist. Assisted by his father and his elder brother, Thomas D. Perkin, he opened a chemical factory at Greenford Green. The new dye was patented (Eng. Pat. 1984 of 1856), and at the end of 1858 it was first manufactured at Perkin's works under the name of 'Aniline Purple' or 'Tyrian Purple.' The name 'Mauve,' by which it was afterwards generally known, was at once given to it in France. Perkin straightway devoted himself to developing processes of manufacturing his raw material (aniline) and to improvements in the methods of silk dyeing, as well as of suitable mordants for enabling the dyestuff to be applied to the cotton fibre. To Perkin's discovery of the first of the aniline dyes was ultimately due the supersession of vegetable by chemical dye-stuffs. In recognition of his invention the 'Société Industrielle de Mulhouse' awarded him, in 1859, a silver medal, and afterwards a gold one.

In 1868 the German chemists Graebe and Liebermann showed that 'alizarin,' the 'Turkey red' dyestuff or colouring matter of the madder-root, was a derivative of the coal-tar product anthracene and not of naphthalene, as had hitherto been believed. They then patented in Germany and in Great Britain a process for the manufacture of 'alizarin' which was too costly to hold out much hope of successful competition with the madder plant, requiring, as it did, the use of bromine. With the object of cheapening this process, Perkin in 1869 introduced two new methods for the manufacture of artificial alizarin, one starting from dichloro-

anthracene and the other, which is still in use, from the sulphonic acid of anthraquinone. This branch of the coal-tar industry developed rapidly, and, in spite of some competing effort of German manufacturers, the English market was almost entirely held by Perkin until the end of 1873. Perkin delivered before the Society of Arts in 1879 two lectures, which were published under the title 'The history of alizarin and allied colouring matters, and their production from coal-tar.' Meanwhile, in 1873, when the increasing demand for artificial alizarin rendered imperative an enlarged plant at Perkin's Greenford Green works, he transferred the concern to the firm of Brooke, Simpson & Spiller, and, retiring after eighteen years from the industry, thenceforth devoted himself to pure chemical research.

Concurrently with his industrial work Perkin had maintained a strong interest in pure chemistry, and had already published many important papers in the 'Transactions of the Chemical Society,' where his contributions finally numbered ninety. In 1858, in conjunction with Duppa, he discovered that aminoacetic acid could be obtained by heating bromoacetic acid with ammonia, and in 1867 he published a description of his method of synthesising unsaturated organic acids, known as the 'Perkin synthesis.' Next year the synthesis of coumarin, the odorous substance contained in Tonka bean, etc., was announced, and the continuation of this work, after his retirement from the industry, led to his celebrated discovery of the synthesis of cinnamic acid from benzaldehyde. Scientific papers on the chemistry of 'Aniline Purple' or 'mauve' were also published in the 'Proceedings of the Royal Society' in 1863 and 1864 and in the 'Transactions of the Chemical Society' in 1879. In 1881 he first drew attention to the magnetic rotatory power of some of the compounds which he had prepared in his researches, and mainly to the study of this property as applied to the investigation of the constitution or structure of chemical molecules he devoted the rest of his life.

Perkin's services were widely recognised. Having joined the Chemical Society in 1856, he held the office of president from 1883 to 1885, and received the society's Longstaff medal in 1888. He was elected F.R.S. in 1866 and received from the Royal Society a royal medal in 1879, and the Davy medal in 1889. He was president of the Society of Chemical Industry in 1884-5, receiving the gold medal of

the society in 1898, and at his death was president of the Society of Dyers and Colourists. The Society of Arts conferred on him the Albert medal in 1890, and the Institution of Gas Engineers the Birmingham medal in 1892. He also received honorary doctorates from the universities of Würzburg (1882), St. Andrews (1891), and Manchester (1904).

In July 1906 the jubilee was celebrated universally of Perkin's discovery of 'mauve,' the first aniline dye, which had created the important coal-tar dyeing industry and had revolutionised industrial processes in varied directions. Perkin was knighted and received honorary degrees of doctor from the universities of Oxford, Leeds, Heidelberg, Columbia (New York), Johns Hopkins (Baltimore), and Munich Technical High School. He was presented with the Hofmann medal by the German Chemical Society and the Lavoisier medal by the French Chemical Society. A sum of 2700*l.*, subscribed by chemists from all countries, was handed to the Chemical Society as the 'Perkin Memorial Fund,' to be applied to the encouragement of research in subjects relating to the coal-tar and allied industries. The 'Perkin medal' for distinguished services to chemical industry was instituted by the Society of Dyers and Colourists, and the American memorial committee founded a Perkin medal for American chemists.

Perkin died at Sudbury on 14 July 1907, and was buried at Christ Church graveyard, Harrow. He was twice married: (1) on 13 Sept. 1859 to Jemima Harriett, daughter of John Lisset; she died on 27 Nov. 1862; (2) on 8 Feb. 1866 to Alexandrine Caroline, daughter of Ivan Herman Mollwo; she survived him. He had three sons and four daughters. His eldest son, William Henry Perkin, Ph.D. (Würzburg), Hon. Sc.D. (Cantab.), Hon. LL.D. (Edin.), F.R.S., professor of organic chemistry at Manchester University; the second son, Arthur George Perkin, F.R.S.; and the youngest son, Frederick Mollwo Perkin, Ph.D., have all distinguished themselves in the same department of science as their father.

Perkin's portrait in his robe as LL.D. of the university of St. Andrews, painted by Henry Grant in 1898, is on the wall at the Leathersellers' Hall in St. Helen's Place, of which company he was master in 1896; another portrait by Arthur Stockdale Cope, R.A., presented to him on the jubilee celebration of 1906, is destined for the National Portrait Gallery. There is also an engraved portrait by Arthur J. Williams

in the British Museum of Portraits, South Kensington collection, and a marble bust by F. W. Pomeroy, A.R.A., is in the rooms of the Chemical Society at Burlington House.

[Trans. Chemical Society, 1908, 93, 2214-2257, and Roy. Soc. Proc. 80*A*, 1908 (memoirs by R. Meldola); Jubilee of the Discovery of Mauve and of the Foundation of the Coal-tar Colour Industry by Sir W. H. Perkin, ed. by R. Meldola, A. G. Green and J. C. Cain, 1906.] J. C. C.

PERKINS, SIR ÆNEAS (1834-1901), general, colonel commandant royal engineers (late Bengal), born at Lewisham, Kent, on 19 May 1834, was sixth son in a family of thirteen children of Charles Perkins, merchant, of London, by his wife Jane Homby, daughter of Charles William Barkley (b. 1759), after whom Barkley Sound and Island in the Pacific are named. His grandfather was John Perkins of Camberwell, a partner in Barclay & Perkins's Brewery. A brother George, in the Bengal artillery, was killed at the battle of the Hindun before Delhi in 1857.

Educated at Dr. Prendergast's school at Lewisham and at Stoton and Mayor's school at Wimbledon, where Frederick (afterwards Earl) Roberts, his lifelong friend, was his schoolfellow, Æneas entered the military seminary of the East India Company at Addiscombe on 1 Feb. 1850, in the same batch as Roberts. At Addiscombe he showed ability in mathematics, and was a leader in all sports. Obtaining a commission as second lieutenant in the Bengal engineers on 12 Dec. 1851, he, after professional instruction at Chatham, arrived at Fort William, Calcutta, on 16 Jan. 1854.

As assistant engineer in the public works department Perkins was soon employed on irrigation work on the Bari Doab Canal in the Punjab. Promoted first lieutenant on 17 Aug. 1856, he was transferred in November to the Ambala division, and in the following May, when the Mutiny began, joined the force under General George Anson [q. v.], commander-in-chief in India, which marched to the relief of Delhi. Perkins was present at the battle of Badli-ki-serai on 8 June, and at the subsequent seizure of the Delhi Ridge. He did much good work during the early part of the siege. On 11-12 June he was employed in the construction of a mortar battery, known as 'Perkins's Battery'; on the 17th he took part in the destruction of a rebel battery and the capture of its guns; and on 14 July in the repulse of the sortie; but, wounded a

few days later near the walls of Delhi, he was sent to Ambala. Although he soon recovered from the actual wound, he was forced by broken health to remain there until March 1858, when he was invalided home. For his services in the Mutiny campaign he received the medal and clasp.

On returning to India in 1859, Perkins held various offices in Bengal, including those of assistant principal of the Civil Engineering College at Calcutta, assistant consulting engineer for the railways, and executive engineer of the Berhampur Division. On 12 March 1862 he was promoted second captain and in the autumn of 1864 took part as field engineer in the Bhutan Expedition, during which he was three times mentioned in despatches for gallant conduct, and was recommended for a brevet majority. Towards the end of the expedition he was appointed chief engineer of the force. A strong recommendation for the Victoria Cross for conspicuous gallantry in storming a stockade at the summit of the Baru Pass was rejected on account of the delay in sending it in. For his services in Bhutan, Perkins received the medal and a brevet majority on 30 June 1865.

Perkins was next stationed at Morshedabad as executive engineer, and in 1866 was transferred to the Darjeeling division in the same grade. Promoted first captain in his corps on 31 Oct. 1868, two years later he was sent to the North West provinces as superintending engineer, and in April 1872 he was transferred in the same grade to the military works branch. He became regimental major on 5 July 1872, brevet lieutenant-colonel 29 Dec. 1874, and regimental lieutenant-colonel on 1 Oct. 1877.

A year later Perkins was selected for active service in Afghanistan at the request of Major-general (afterwards Field-marshal Earl) Roberts, commanding the Kuram field force. He was appointed commanding royal engineer of that force. During the operations in front of the Peiwar Kotal he skillfully reconnoitred the enemy's position, and selected a site from which the mountain battery could shell the Afghan camp. The works carried on under his control in the Kuram Valley greatly facilitated the subsequent advance on Kabul. He was mentioned in despatches, and was created a C.B. in 1879. On the conclusion of peace with Sirdar Yakub Khan, Perkins remained in the Kuram Valley, laying out a cantonment proposed to be formed at Shalofzan, but on the news of the massacre of Sir Louis Cavagnari [q. v.] and his escort at

Kabul an immediate advance was made by the Kuram column, and Perkins was present at the victory of Charasiab and the entry into Kabul on 8 Oct. 1879. He was again mentioned in despatches.

The work which then devolved upon the engineers was extremely heavy. The Sherpur cantonment and Bala Hissar had to be repaired, and a new line of communication with India via Jalalabad had to be opened out. The Sherpur cantonment was rendered defensible by the beginning of December and none too soon. A few days later the Afghans assembled in such overwhelming numbers that Sir Frederick Roberts had to assemble the whole of his force within the walls of Sherpur. Under Perkins's direction emplacements and abattis were rapidly constructed, blockhouses were built on the Bimaru heights, walls and villages dangerously near the cantonment were blown down and levelled, and a second line of defence within the enclosure was improvised. On 23 Dec. the enemy delivered their assault in great numbers. It was repulsed, and a counter attack dispersed the Afghans to their homes. Perkins was mentioned in despatches and promoted brevet colonel on 29 Dec. 1879.

Steps were now taken by Perkins to render the position at Kabul absolutely secure. A fort and blockhouse were erected on Siah Sang, the Bala Hissar and the Asmai Heights were fortified, Sherpur was converted into a strongly entrenched camp, bridges were thrown across the Kabul river, the main roads were made passable for artillery, and many new roads were laid out. The works completed during the next seven months, chiefly by means of unskilled Afghan labour, comprised ten forts, fifteen detached posts, three large and several small bridges, 4000 yards of loopholed parapet, 45 miles of road, and quarters for 8000 men. At the end of July 1880 the news of the Maiwand disaster reached Kabul, and Perkins accompanied Sir Frederick Roberts as commanding royal engineer with the picked force of 10,000 men in the famous march to Kandahar. He was present at the battle of Kandahar on 1 Sept. 1880 and soon afterwards returned to India. He received the medal with four clasps and bronze decoration, and was made an aide-de-camp to the Queen.

Rejoining the military works department, Perkins was appointed superintending engineer at Rawal Pindi, and from April to July 1881 he officiated as inspector-general of military works. After a furlough

lasting two years, Perkins was appointed chief engineer of the Central Provinces, was transferred in the same capacity in April 1886 to the Punjab, and on 10 March 1887 was promoted major-general. In May 1889 he vacated his appointment in the military works department on attaining the age of fifty-five years, and in 1890 was selected by Lord Roberts, then commander-in-chief in India, to command the Oudh division; but this command was cut short by his promotion to lieutenant-general on 1 April 1891, and he returned to England. Promoted to be general on 1 April 1895, and made a colonel commandant of his corps on the same date, he was two years later created K.C.B. He died in London on 22 Dec. 1901, and was buried at Brookwood cemetery. Lord Roberts wrote of him with admiring affection, crediting him with 'quick perception, unflagging energy, sound judgment, tenacity of purpose and indomitable pluck.' Perkins figures in de Lange's picture of the march to Kandahar.

He married in 1863 Janette Wilhelmina (who survived him), daughter of Werner Cathray, formerly 13th light dragoons, by whom he left two sons—Major Arthur Ernest John Perkins, R.A., and Major Æneas Charles Perkins, 40th Pathans, and three daughters, two of whom are married.

[Royal Engineers' Records; obituary notice, *The Times*, 23 Dec. 1901; memoir in *Royal Engineers' Journal*, June 1903, by Field-marshal Earl Roberts; private information.]

R. H. V.

PEROWNE, EDWARD HENRY (1826–1906), Master of Corpus Christi College, Cambridge, younger brother of John James Stewart Perowne [q. v. Suppl. II], was born at Burdwan, Bengal, on 8 Jan. 1826. After private education he was admitted pensioner of Corpus Christi College, Cambridge, in 1846 and scholar in 1847; he was Porson prizeman in 1848, members' prizeman in 1849 and 1852, and senior classic in 1850. He graduated B.A. in 1850, proceeding M.A. in 1853, B.D. in 1860, D.D. in 1863. He was admitted *ad eundem* (M.A.) at Oxford in 1857. Ordained deacon in 1850 and priest in 1851, he was curate of Maddermarket, Norfolk (1850–1). Elected fellow and tutor of Corpus in 1858, he became Master in 1879. He was Whitehall preacher (1864–6); Hulsean lecturer in 1866, examining chaplain to the bishop of St. Asaph (1874–88); prebendary of St. Asaph (1877–90); vice-chancellor of Cambridge University (1879–81); hon. chaplain to Queen Victoria (1898–1900), and chaplain-in-ordinary (1900–1), examining chaplain to the bishop of Worcester (1891–

1901). Devoted to his college and university, a sound disciplinarian, a man of many friendships and wide interests, Perowne refused high preferment and was long one of the most conspicuous figures in the academic and social life of Cambridge. He was a strong evangelical, and in politics a somewhat rigid conservative. He died unmarried at Cambridge, after a long illness, on 5 Feb. 1906, and was buried at Grantchester. A portrait of Perowne, painted in 1885 by Rudolf Lehmann, is at Corpus Christi College, Cambridge.

His principal works were: 1. 'The Christian's Daily Life, a Life of Faith,' 1860. 2. 'Corporate Responsibility,' 1862. 3. 'Counsel to Undergraduates on entering the University,' 1863. 4. 'The God-head of Jesus,' 1867. 5. 'Commentary on Galatians' ('Cambridge Bible for Schools'), 1890. 6. 'Savonarola,' 1900.

[*The Times*, 6 Feb. 1906; *Guardian*, 7 Feb. 1906; *Record*, 9 Feb. 1906; *Cambridge Review*, 15 Feb. 1906 (by C. W. Moule); *Crockford's Clerical Directory*; *Cambridge Univ. Calendar*; cf. Charles Whibley's *In Cap and Gown* (1889), p. 326.] A. R. B.

PEROWNE, JOHN JAMES STEWART (1823–1904), bishop of Worcester, born at Burdwan, Bengal, on 13 March 1823, was eldest of three sons of the Rev. John Perowne, a missionary of the Church Missionary Society, by his wife, Eliza Scott of Heacham, Norfolk. His brothers were Edward Henry Perowne [q. v. Suppl. II] and Thomas Thomason Perowne, archdeacon of Norwich from 1898 to 1910. The family is of Huguenot origin. From Norwich grammar school Perowne won a scholarship at Corpus Christi College, Cambridge. He was Bell University scholar in 1842; members' prizeman in 1844, 1846, and 1847; Crosse scholar in 1845; Tyrwhitt scholar in 1848. He graduated B.A. in 1845, proceeding M.A. in 1848, B.D. in 1856, and D.D. in 1873. In 1845 he became assistant master at Cheam school; was ordained deacon in 1847 and priest in 1848; and served the curacy of Tunstead, Norfolk, 1847–9. In 1849 he became a master at King Edward's school, Birmingham; but in 1851 was elected to a fellowship at Corpus Christi College, Cambridge. For a time he served his college as assistant tutor, whilst also lecturing at King's College, London, and acting as assistant preacher at Lincoln's Inn. He examined for the classical tripos in 1851 and 1852, and was select preacher in 1853, an office he also filled in 1861, 1873, 1876, 1879, 1882, and 1897.

From 1862 till 1872 Perowne worked in Wales. He was vice-principal of St. David's College, Lampeter (1862-72); curial prebendary of St. David's (1867-72); canon of Llandaff (1869-1878); and rector of Llandisilio, Montgomeryshire (1870-71). Meanwhile his commentary on the Psalms (1864) made his name as an Old Testament scholar, and in 1870 he was chosen one of the Old Testament revision company. In 1868 he had become Hulsean lecturer, and in 1872 he returned to Cambridge. From 1873 to 1875 he held a fellowship at Trinity; he was Lady Margaret preacher in 1874, and Whitehall preacher from 1874 to 1876; in 1875 he succeeded Joseph Barber Lightfoot [q. v.] as Hulsean professor, and held office until 1878. For the same period (1875-1878) he was one of the honorary chaplains to Queen Victoria.

In 1878 Perowne was appointed dean of Peterborough. He developed the cathedral services, carried on the restoration of the fabric, and cultivated friendly relations with nonconformists. In 1881 he was appointed to the Ecclesiastical Courts Commission, and was one of seven commissioners who signed a protest against the exercise by the bishop of an absolute veto on proceedings. In 1889 he aided in founding a body known as 'Churchmen in Council,' which aimed at uniting 'moderate' churchmen in a policy regarding ritual; he explained the aim of the society by issuing in the same year a proposal for authorising both the maximum and the minimum interpretation of the Ornaments Rubric, which was widely discussed but led to no results.

Perowne was consecrated bishop of Worcester in Westminster Abbey on 2 Feb. 1891. He obtained the appointment of a suffragan bishop, created a new archdeaconry, and summoned a diocesan conference. In 1892 he presided at some sessions of an informal conference on reunion of all English protestants held at Grindelwald, and at an English church service there administered the Holy Communion to nonconformists, an act which provoked much criticism. The church congress, hitherto excluded from the diocese, met at Birmingham in 1893, when the bishop announced his assent to the division of his diocese, and his willingness to contribute to the stipend of the new see 500*l.* a year from the income of Worcester. This was afterwards made contingent on his being allowed to give up Hartlebury Castle, to which the ecclesiastical commissioners refused consent. Attacked in the Birming-

ham press for his action in the matter in 1896, Perowne was presented with an address of approval by 60 beneficed clergy of three rural deaneries. He resigned the see in 1901, and retired to Southwick, near Tewkesbury, where he died on 6 Nov. 1904. The Worcester diocese was divided under Perowne's successor and the see of Birmingham founded in 1905.

Perowne married in 1862 Anna Maria, daughter of Humphrey William Woolrych, serjeant-at-law, by whom he had four sons and one daughter, all of whom survived him.

Though a life-long evangelical, Perowne took a line independent of his party in regard to Biblical criticism, home reunion, and proposals for meeting ritual difficulties. As a bishop he accepted a difficult see late in life, but showed himself an industrious, capable administrator. There is a portrait of the bishop by the Hon. John Collier in the hall of Corpus Christi College, Cambridge, and another by Weigall at Hartlebury Castle.

Perowne's main work was the translation of and commentary on the Psalms (1864), of which a sixth edition appeared in 1886. His Hulsean lectures on Immortality were published in 1868. In acting as general editor of the 'Cambridge Bible for Schools' (1877, &c.), he directed a work of much greater importance than its title suggests. He also edited Thomas Rogers on the 'Catholic Doctrine of the Church of England' (for the Parker Society, 1854); 'Remains of Connop Thirlwall, Bishop of St. David's' (1877); 'The Letters, Literary and Theological, of Connop Thirlwall' (1881); 'The Cambridge Greek Testament for Schools' (1881).

[The Times, 8 Nov. 1904; Record, 11 Nov. 1904; Lowndes, *Bishops of the Day*; Report of the Ecclesiastical Courts Commission, 1883; Report of the Birmingham Church Congress, 1893; private information.] A. R. B.

PERRY, WALTER COPLAND (1814-1911), schoolmaster and archæologist, born in Norwich on 24 July 1814, was second son of Isaac Perry (1777-1837), who was at first a congregational minister at Cherry Lane, Norwich. (1802-14), then a unitarian minister, Ipswich (1814-25) and at Edinburgh (1828-30), and afterwards a schoolmaster at Liverpool. Walter's mother was Elizabeth, daughter of John Dawson Copland. He had his early education from his father, a fine scholar. In 1831 he was entered, as Walter Coupland Perry, at Manchester College, then at York (now at Oxford), remaining till 1836. He distin-

guished himself as a classical scholar, and on the advice of John Kenrick [q. v.], who had studied at Göttingen, he went thither in 1836, gaining (25 August 1837) the degree of Ph.D. with the highest honours. In his ninetieth year he received from this university, unsolicited, a document recording his services to letters (16 Nov. 1903). Returning to York, he supplied (1837-8) Kenrick's place as classical tutor. His first publication consisted of two letters on 'German Universities,' contributed to the 'Christian Reformer' (1837). From 1838 to 1844 he was minister at George's Meeting, Exeter, as colleague with Henry Acton [q. v.]. His pulpit services had more of a scholarly than a popular character. In 1844 he conformed to the Anglican church as a layman; his 'Prayer Bell' (1843) suggests that his views were more evangelical than was common in his previous denomination.

On 12 January 1844 he entered as a student at the Middle Temple, but was not called to the bar till 31 Jan. 1851. Settling as a schoolmaster at Bonn (end of 1844) he obtained great reputation as a teacher, in which capacity he was ably seconded by an admirable wife. On 17 Sept. 1860, Perry, along with nine other English residents at Bonn, was put on trial in the Bonn police court in consequence of their published protest against language used by the public prosecutor in presenting a charge against Captain Macdonald, arising out of a dispute at the railway station on 12 Sept. On 24 Sept. Perry, who stated during the trial that he 'had been in the habit of acting as the organ and representative of the English visitors at Bonn,' was sentenced to a fine of 100 thalers, or five weeks' imprisonment in default; the sentence was not carried out, owing to the general amnesty on the death of Frederick William IV (1 Jan. 1861). Among Perry's pupils were Edward Robert Bulwer, first earl of Lytton [q. v.], Sir Francis Bertie, British ambassador in Paris, and Sir Eric Barrington. The Crown Prince Frederick, who was, through the late Prince Consort, brought into connection with Perry in 1852, twice gave him his portrait, and at Buckingham Palace in 1887 produced the English Prayer Book which Perry had given him in 1867.

Returning to this country in 1875, Perry settled in London, where he was a member of the Athenæum Club, and employed his leisure in the production of works on classical and mediæval subjects. On 29 April 1876 his former pupils made a large presen-

tation of plate to Dr. and Mrs. Perry. By his efforts, initiated at a meeting in Grosvenor House on 16 May 1877, followed by his paper 'On the Formation of a Gallery of Casts from the Antique in London' (1878), he succeeded in furnishing the country with a large collection of casts, installed at first in a special gallery at the South Kensington Museum. He strongly resented a re-arrangement by which they were relegated to a badly lighted gallery, and welcomed their transference to the British Museum.

Perry, who had great charm of manner, was a mountaineer, an excellent horseman, a sportsman with rod and gun, and a good amateur actor. He retained his eyesight and hearing to the last. On 21 June 1904, anticipating his ninetieth birthday, he entertained at dinner a number of his pupils. He lived over seven years longer, dying at his residence, 25 Manchester Square, London, W., on 28 Dec. 1911; he was buried in Hendon parish churchyard. He married (1) on 23 June 1841 Hephzibah Elizabeth (*d.* 1880), second daughter of Samuel Shaen of Crix Hall, Hatfield Peverel, Essex, by whom he had five sons, who all survived him, and one daughter (*d.* 1898); (2) in 1889 Evelyn Emma, daughter of Robert Stopford, who survived him. His portrait was painted in water-colour and in oils; both are in the possession of his widow.

Perry's period of authorship covered no less than seventy-one years, his literary energy being maintained to the age of ninety-four. He published: 1. 'A Prayer Bell for the Universal Church . . . Reflections preparatory to . . . Prayer . . . Addresses . . . for . . . Holy Communion,' 1843, 16mo. 2. 'German University Education,' 1845, 12mo; 2nd edit. 1846, 12mo (expanded from letters (1837) in the 'Christian Reformer'). 3. 'The Franks . . . to the Death of King Pepin,' 1857. 4. 'Greek and Roman Sculpture: a Popular Introduction,' 1882 (illustrated). 5. 'A Descriptive Catalogue of . . . Casts from the Antique in the South Kensington Museum,' 1884, 1887. 6. 'Walter Stanhope,' 1888 (a novel published under the pseudonym 'John Copland'). 7. 'The Women of Homer,' 1898 (illustrated). 8. 'The Revolt of the Horses,' 1898 (a story, suggested by Swift's 'Houyhnhnms'). 9. 'The Boy's Odyssey,' 1901, 1906. 10. 'The Boy's Iliad,' 1902. 11. 'Sancta Paula: a Romance of the Fourth Century,' 1902. 12. 'Sicily in Fable, History, Art and Song,' 1908 (maps). He translated from the German H. C. L. von Sybel's 'History of the French Revolution,' 1867-9, 4 vols. Some works

of fiction additional to the above were published without his name.

[The Times, 1 and 3 Jan. 1912; Christian Life, 6 Jan. 1912; Browne, Hist. Cong. Norf. and Suff., 1877, pp. 271, 392; Hist. Account, St. Mark's Chapel, Edinburgh, 1908; Roll of Students, Manchester College, 1868; Foster, Men at the Bar, 1885, p. 361 (needs correction); Trial of the English Residents at Bonn, 1861; information from Rev. T. L. Marshall, Exeter, Rev. J. Collins Odgers, Liverpool, and Col. Ottley Lane Perry.] A. G.

PETIT, SIR DINSHAW MANOCKJEE, first baronet (1823–1901), Parsi merchant and philanthropist, born at Bombay on 30 June 1823, was elder of two sons of Manockjee Nasarwanji Petit (1803–59), merchant, by his wife Bai Humabai (1809–51), daughter of J. D. Mooghna. In 1805 his grandfather, Nasarwanji Cowasjee Bomanjee, migrated from Surat to Bombay, where he acted as agent to French vessels and those of the East India Company. On account of his small stature his French clients gave him the cognomen of Petit, and, in accordance with Parsi custom, this became the family surname, though with Anglicised pronunciation. Dinshaw went at the age of nine to a school kept by a pensioned sergeant named Sykes, and later to a more ambitious seminary kept by Messrs. Mainwaring and Corbet. At the age of seventeen he obtained a clerkship on a monthly salary of Rs. 15 (then the equivalent of 1*l.* 10*s.*) in the mercantile office of Dirom, Richmond and Co., of which his father was native manager. Subsequently his father built up a large broker's business, in which Dinshaw and his younger brother, Nasarwanjee, became partners in 1852, carrying it on after their father's death in May 1859 till 1864, when they divided a fortune of about 25 lakhs of rupees and separated by mutual consent.

Meanwhile Dinshaw inaugurated the cotton manufacturing industry which has made Bombay the Manchester of India. A cotton mill was started for the first time in Bombay in 1854 by another Parsi, Cowasjee Nanabhai Davur, but it spun yarns only. In 1855 Dinshaw induced his father to erect a similar mill with additional machinery for weaving cloth. This mill commenced work as the Oriental Spinning and Weaving Mill, in 1857. In 1860 he and his brother started the Manockjee Petit mill, which they converted into a joint-stock company concern.

During the 'share mania' of 1861 and 1865, when the ruin of the cotton industry of Lancashire by the American civil war

excited wild speculation in Bombay, Dinshaw Petit maintained his self-control and reaped colossal gains. Other mills were soon built by him, or came under his management, and he led the way in the manufacture of hosiery, damask, other fancy cloths, sewing thread, and also in machine dyeing on a large scale. Before his death he had the chief interest in six joint-stock mills aggregating nearly a quarter of a million spindles and 2340 looms, and employing some 10,000 persons. He is thus mainly responsible for the conversion of the town and island of Bombay into a great industrial centre.

Dinshaw Petit served on the board of the bank of Bombay; was a justice of the peace for the city, and for a short time a member of the municipal corporation; and was sheriff of the city (1886–7). He served on the legislative council of the governor-general (1886–8), and was the first Parsi to receive that honour. Having been knighted in February 1887, he was created a baronet of the United Kingdom on 1 Sept. 1890, with special limitation to his second son. Petit was the second Indian native to receive this hereditary title, the first being Sir Jamsetjee Jeejeebhoy [q. v.]. Like Sir Jamsetjee, Petit obtained special legislation requiring all successors to the title to assume his name in the event of not possessing it at their succession.

Throughout western India Dinshaw Petit showed public spirit in the disposal of his great wealth. He arranged for housing the technical institute at Bombay—a memorial of Queen Victoria's jubilee of 1887—in the manufacturing district of the city. He founded the Petit hospital for women and children; gave a lakh of rupees (nearly 7000*l.*) towards building a home for lepers; erected a hospital for animals as a memorial to his wife; and presented property both in Bombay and Poona for research laboratories. A devout Parsi, he was always attentive to the claims of his own community, and in various places where small colonies of them are to be found erected for their use fire temples and towers of silence (i.e. places for the disposal of the dead).

Petit died at his Bombay residence, Petit Hall, on 5 May 1901, and his remains were committed to the towers of silence, Malabar Hill, the same day. At the *oothumna*, or third day obsequies, charities were announced amounting to Rs. 638,551 (42,570*l.*).

Petit married on 27 Feb. 1837 Sakerbai, daughter of Framjee Bhikhajee Panday, of

Bombay; she died on 5 March 1890, having issue three sons and eight daughters. Petit's second son, Framjee Dinshaw, on whom the baronetcy had been entailed, predeceased his father on 8 Aug. 1895, and his eldest son, Jeejeebhoy Framjee (b. 7 June 1873), became second baronet under the name of Sir Dinshaw Manockjee Petit. A posthumous painting of the first baronet by Sir James Linton belongs to the present Sir Dinshaw of Pettit Hall, Bombay, and a statue, to form the public memorial in Bombay, is being executed by Sir Thomas Brock, R.A.

[History of the Parsis, 1884, 2 vols.; Representative Men of India, Bombay, 1891; Sir W. Hunter's Bombay, 1885 to 1890, 1892; Imperial Gazetteer of India; Burke's Peerage; Times of India, 6 May 1901.] F. H. B.

PETRE, SIR GEORGE GLYNN (1822–1905), diplomatist, born on 4 Sept. 1822 at Twickenham, was great-grandson of Robert Edward Petre, ninth Baron Petre, and was second son of Henry William Petre of Dunkenhalth, Clayton-le-Moors, by his first wife Elizabeth Anne, daughter of Edmund John Glynn, of Glynn, Cornwall. Educated at Stonyhurst College and Prior Park, Bath, he entered the diplomatic service in 1846 as attaché to the British legation at Frankfort, then the seat of the diet of the German confederation, and was there during the revolutionary movements which convulsed Germany in 1848. He was transferred to Hanover in 1852 and to Paris in 1853, and was appointed paid attaché at the Hague in 1855 and at Naples in March 1856. Owing to the neglect by the tyrannical government of the Two Sicilies of the joint remonstrance of the British and French governments in May, diplomatic relations were broken off in the summer. Sir William Temple, the British minister, was compelled by ill-health to leave Naples in July, and Petre assumed charge of the legation until it was withdrawn at the end of October. Petre performed his duties with judgment and ability; his reports laid before parliament give an interesting narrative of the course of events. In 1857 he was temporarily attached to the embassy at Paris, and in June 1859 he accompanied Sir Henry Elliot [q. v. Suppl. II] on his special mission to Naples, diplomatic relations having been resumed on the accession of Francis II to the throne. He then proceeded as secretary of legation to Hanover, and acted as chargé d'affaires there from December 1859 until February 1860; he

was transferred in 1864 to Copenhagen (where, in the following year, he assisted at the investiture of King Christian IX with the order of the Garter), to Brussels in 1866, and was promoted to be secretary of embassy at Berlin in 1868. After four years of service at Berlin, covering the period of the Franco-German war, he became chargé d'affaires at Stuttgart in 1872, and in April 1881 he was appointed British envoy at Buenos Ayres. In 1882 he was also accredited to the republic of Paraguay as minister plenipotentiary. In January 1884 he was appointed British envoy at Lisbon, where he remained until his retirement on a pension (1 Jan. 1893).

During the latter years of his service in Portugal the obstacles offered by the Portuguese authorities to free communication with the British missions and settlements established on the Shiré river and the shores of Lake Nyassa, and the seizure of British vessels while passing through Portuguese waters on their way to the lake, led to a state of acute tension between the two governments. A convention for the settlement of these and cognate questions was signed by Lord Salisbury and the Portuguese minister in London on 20 Aug. 1890, but in consequence of popular and parliamentary opposition the Portuguese government resigned office without obtaining the authority of the Cortes to ratify it, and their successors found themselves equally unable to carry it through. The negotiations had therefore to be resumed *de novo*. A *modus vivendi* was agreed upon and signed by Lord Salisbury and the new Portuguese minister, Senhor Luiz de Soveral, on 14 Nov. 1890, by which Portugal granted free transit over the waterways of the Zambesi, Shiré and Pungwe rivers and a satisfactory settlement was finally placed on record in the convention signed by Petre and the Portuguese minister for foreign affairs on 11 June 1891. Petre's naturally calm and conciliatory disposition and the excellent personal relations which he succeeded in maintaining with the Portuguese ministers did much to keep the discussions on a friendly basis and to procure acceptance of the British demands. He was made C.B. in 1886 and K.C.M.G. in 1890. He died at Brighton on 17 May 1905, and was buried at Odiham, Hampshire.

A portrait in water-colours is in the possession of his widow at Hatchwoods, Winchfield, Hampshire. Another, in oils, painted when he was at Berlin, is at Dunkenhalth.

Petrie married on 10 April 1858 Emma Katharine Julia, fifth daughter of Major Ralph Henry Sneyd, and left six sons. One son and an only daughter predeceased him.

[The Times, 23 May 1905; Lord Augustus Loftus, *Diplomatic Reminiscences*, 2nd ser. i. 374; Foreign Office List, 1906, p. 399; Papers laid before Parliament; Burke's Peerage, s.v. Petrie.] S.

PETRIE, WILLIAM (1821-1908), electrician, born at King's Langley, Hertfordshire, on 21 Jan. 1821, was eldest of four sons of William Petrie (b. 1784), a war office official. His mother, Margaret, was daughter and co-heiress of Henry Mitton, banker, of the Chase, Enfield. In 1829 Petrie's father was sent to the Cape of Good Hope, where he acted until 1837 as deputy commissary-general, having as a near neighbour Sir John Herschel [q. v.], the astronomer. After home education in Cape Town, Petrie, with his brother Martin [q. v.], was entered at the South African College. He had early shown a liking for mechanics and chemistry, and his youthful studies were much influenced by Herschel's friendly encouragement.

In 1836 Petrie commenced studying for the medical profession, attending the Cape Town Hospital, but in the year following the family returned to London, and the curriculum was not pursued. He then attended King's College. Later (1840) he studied at Frankfort-on-Main, devoting himself to magnetism and electricity. His inquiries bore fruit in 'Results of some Experiments in Electricity and Magnetism,' published in the 'Philosophical Magazine' in 1841; and 'On the Results of an Extensive Series of Magnetic Investigations, including most of the known Varieties of Steel,' communicated at the British Association's Southampton meeting of 1846 (see also papers presented to the Association in 1850).

Petrie returned to England in 1841, when he took out a patent for a magneto-electric machine. From 1846 to 1853 he worked assiduously at electric lighting problems in collaboration with William Edwards Staite. To Petrie's acumen is due the invention (1847-8) of the first truly self-regulating arc lamp. The essential feature was 'to impart more surely such motions to one of the electrodes that the light may be preserved from going out, be kept more uniform, and be renewed by the action of the apparatus itself whenever it has been put out.' Petrie's working drawings (still preserved) were made in conformity with this automatic principle, and he super-

intended the manufacture of the new lamp at Holtzapffel's works in Long Acre. It was submitted to rigorous tests, and was found to yield a light of between 600 and 700 standard candle-power, with a consumption of $\frac{1}{3}$ lb. of zinc per 100 candle-power per hour. On 28 Nov. and 2 Dec. 1848 Petrie made displays with a lamp of 700 candle-power from the portico of the National Gallery, and on various nights in 1849 from the old Hungerford suspension bridge in London. The demonstrations were witnessed by Wheatstone and other prominent men of science. On 6 Feb. 1850, Petrie (with Staite) read a paper before the Society of Arts on 'Improvements in the Electric Light.'

Petrie and Staite's long and courageous efforts to promote electric illumination were financially disastrous, and their pioneering services escaped the recognition of those who perfected the applications of the illuminant. Subsequently Petrie turned his attention to electro-chemistry, and superintended large chemical works; he introduced into the processes many improvements which he patented. He also designed and equipped chemical works in France, Australia, and the United States. For many years he was adviser and designer with Johnson, Matthey & Co.

Petrie died on 16 March 1908 at Bromley, Kent, and was buried there. He married on 2 Aug. 1851 Anne, only child of Matthew Flinders [q. v.]. She was a competent linguist, and studied Egyptology. Under the pseudonym 'Philomathes' she published a work on the relation between mythology and scripture, and as 'X.Q.' contributed essays to periodical literature. Their son, the sole issue of the marriage, is William Matthew Flinders Petrie, F.R.S., professor of Egyptology in University College, London.

[Electrical Engineer, 29 Aug. 1902 and 6 Feb. 1903, articles by J. J. Fahie (portraits and diagrams); Roy. Soc. Catal. Sci. Papers; Patent Office Specifications; Illustrated London News, 9 Dec. 1848; private information.]

T. E. J.

PETTIGREW, JAMES BELL (1834-1908), anatomist, born on 26 May 1834 at Roxhill, Lanarkshire, was son of Robert Pettigrew and Mary Bell. He was related on his father's side to Thomas Joseph Pettigrew [q. v.], and on his mother's side to Henry Bell [q. v.], the builder of the Comet steamship. Educated at the Free West Academy of Airdrie, he studied arts at the University of Glasgow from 1850 to 1855. He then

migrated to Edinburgh, where he pursued medical studies. In 1858-9 he was awarded Professor John Goodsir's senior anatomy gold medal for the best treatise 'On the arrangement of the muscular fibres in the ventricles of the vertebrate heart' (*Phil. Trans.* 1864). This treatise procured him the appointment of Croonian lecturer at the Royal Society of London in 1860. He gained at Edinburgh in 1860 the annual gold medal in the class of medical jurisprudence with an essay 'On the presumption of survivorship' (*Brit. and For. Med. Chirurg. Rev.* Jan. 1865). He graduated M.D. at Edinburgh in 1861, obtaining the gold medal for his inaugural dissertation on 'the ganglia and nerves of the heart and their connection with the cerebrospinal and sympathetic systems in mammalia' (*Proc. Royal Soc. Edin.* 1865). In 1861 he acted as house surgeon to Prof. James Syme [q. v.] at the Royal Infirmary, Edinburgh, and in 1862 he was appointed assistant in the Hunterian museum at the Royal College of Surgeons of England. Here he remained until 1867, adding dissections to the collection and writing papers on various anatomical subjects. In 1867 he contributed a paper to the 'Transactions of the Linnean Society' 'On the mechanical appliances by which flight is maintained in the animal kingdom,' and in the same year he left the Hunterian museum in order to spend two years in the south of Ireland so as to extend his knowledge of the flight of insects, birds and bats. He also experimented largely on the subject of artificial flight.

Elected F.R.S. in 1869, in the autumn of that year he became curator of the museum of the Royal College of Surgeons of Edinburgh and pathologist at the Royal Infirmary. He continued his anatomical, physical, and physiological researches, especially those on flight, and in 1870 he published a memoir 'On the physiology of wings, being an analysis of the movements by which flight is produced in the insect, bird and bat' (*Trans. Royal Soc. Edin.* vol. xxvi.).

At Edinburgh he was elected F.R.S. in 1872 and F.R.C.P. in 1873. He was appointed in the same year lecturer on physiology at the Royal College of Surgeons of Edinburgh. In 1874 he was awarded the Godard prize of the French Académie des Sciences for his anatomico-physiological researches and was made a laureate of the Institut de France. In 1875 he was appointed Chandos professor of medicine and anatomy and dean of the medical

faculty in the university of St. Andrews. In 1875-6-7 he delivered special courses of lectures on physiology in Dundee, and University College, Dundee, owes its origin largely to his efforts. In 1877 he was elected by the Universities of Glasgow and St. Andrews to represent those bodies on the General Medical Council. He continued the dual representation until 1886, when a new medical act enabled each of the Scottish universities to return its own member. Pettigrew thenceforth represented St. Andrews on the council. In 1883 he received the hon. degree of LL.D. at Glasgow.

He died at his residence, the Swallowgate, St. Andrews, on 30 Jan. 1908. He married in 1890 Elsie, second daughter of Sir William Gray, of Greatham, Durham, but left no family. His portrait by W. W. Ouless was exhibited at the Royal Academy in 1902. A museum for the botanic gardens was erected in his memory by his widow as an adjunct to the Bute medical buildings of St. Andrews University.

Pettigrew was author of: 1. 'Animal Locomotion, or Walking, Swimming, and Flying, with a Dissertation on Aéronautics,' in International Scientific Series, 1873, translated into French (1874) and into German (1879). 2. 'The Physiology of Circulation in Plants, in the Lower Animals and in Man,' illustrated, 1874. 3. 'Design in Nature,' illustrated by spiral and other arrangements in the inorganic and organic kingdoms, 3 vols. 4to, 1908, published posthumously; this work occupied the last ten years of Pettigrew's life.

[Men and Women of the Time, 1899; *Lancet*, 1908, vol. i. p. 471; *Brit. Med. Journal*, 1908, vol. i. p. 357; information kindly given by Mrs. Bell Pettigrew.] D'A. P.

PHEAR, SIR JOHN BUDD (1825-1905), judge in India and author, born at Earl Stonham, Suffolk, on 9 Feb. 1825, was eldest of three sons of John Phear, thirteenth wrangler at Cambridge in 1815, fellow and tutor of Pembroke College, Cambridge, and rector of Earl Stonham from 1824 to 1881, by his wife Catherine Wreford, only daughter of Samuel Budd, medical practitioner, of North Tawton, Devon. Of his two brothers, Henry Carlyon Phear (1826-1880) was second wrangler and first Smith's prizeman in 1849, fellow of Caius College, Cambridge, and a chancery barrister of some eminence, and Samuel George Phear (b. 1829) was fourth wrangler in 1852, and fellow and from 1871 to 1895 Master of Emmanuel College, Cambridge. Educated privately by his

father, John entered Pembroke College, Cambridge, on 29 March 1843, graduated B.A. as sixth wrangler in 1847 and proceeded M.A. in 1850. He was elected Fellow of Clare College on 23 April 1847, mathematical lecturer in September following, and assistant tutor in 1854. He showed mathematical ability in two text-books, 'Elementary Mechanics' (Cambridge, 1850) and 'Elementary Hydrostatics with Numerous Examples' (Cambridge, 1852; 2nd edit. 1857). He left Cambridge in 1854, but retained his fellowship until his marriage in 1865. He was moderator of the mathematical tripos in 1856.

Entering as a student at the Inner Temple on 12 Nov. 1847, Phear was called to the bar on 26 Jan. 1854 and joined the western circuit, subsequently transferring himself to the Norfolk circuit. In 1864 he was appointed a judge of the High Court of Bengal and went out to Calcutta. He was in complete sympathy with the natives of India and they acknowledged his wise and impartial administration of justice. He displayed activity in other than judicial work, was president of the Asiatic Society of Bengal (1870-1), of the Bengal Social Science Association, and of the Bethune Society (for social purposes), and closely studied native social life. Leaving Calcutta in 1876, he was knighted on 4 Oct. 1877, and became in the same year chief justice of Ceylon. He revised the civil and criminal code for Ceylon, and the Ceylon bar presented a portrait of him (in oils) to his court in appreciation of his services.

On his return to England in 1879 Phear settled at Marpool Hall, Exmouth, Devonshire, and at once took active part in local public life. He was chairman of quarter sessions from 18 Oct. 1881 till 15 Oct. 1895, and an alderman of the Devon county council from 24 Jan. 1889 till death. An ardent liberal politician, he thrice contested unsuccessfully Devon county divisions in the liberal interest—Honiton in 1885, Tavistock in 1886, and Tiverton in 1892. He joined the Devonshire Association for the Advancement of Science, Literature, and Art in June 1881, contributed among other interesting papers one on manorial tenures, and was president in 1886. A keen sportsman, a good cricketer, and a life member of the London Skating Club, he was a fellow of the Geological Society from 1852.

Sir John died at Marpool Hall, Exmouth, on 7 April 1905, and was buried at Littleham. He married at Madras on 16 Oct. 1865 Emily, daughter of John Bolton of Burnley House, Stockwell. She was a member of

the Exmouth school board, and died on 31 Dec. 1898, leaving two daughters and a son.

Phear's most important publication was 'The Aryan Village in India and Ceylon' (1880), which embodies the fruit of much intelligent observation. He had previously issued 'The Hindoo Joint Family' (Calcutta, 1867), a lecture at the Bethune Society, 18 March 1867. Phear's other works include 'A Treatise on Rights of Water, including Public and Private Rights to the Sea, and Sea-shore' (1859), and 'Observations on the Present State of the Law affecting Title to Land and its Transfer' (1862).

[Private information; The Times, 8 April 1905; records of Pembroke and Clare Colleges and Inner Temple.] T. C. H.

PHILLIPS, WILLIAM (1822-1905), botanist and antiquary, born at Presteign, Radnorshire, on 4 May 1822, was fourth son in a family of ten children of Thomas Phillips and Elizabeth, daughter of James Cross, whose ancestors had been farmers of Hanwood and burgesses of Shrewsbury since 1634. After receiving a very rudimentary education at a school at Presteign, Phillips was apprenticed to his elder brother James, a tailor, in High Street, Shrewsbury, with whom and another brother, Edward, he went in due course into partnership. In 1859 he joined the Shrewsbury volunteers, and became a colour-sergeant and an excellent rifle-shot, winning the bronze medal of the National Rifle Association in 1860. After some early private study of astronomy and photography, he took up botany about 1861 at the suggestion of his friend William Allport Leighton [q. v.], the lichenologist. Beginning with flowering plants, Phillips turned to the fungi about 1869, first to the Hymenomycetes and afterwards mainly to the Discomycetes, though other groups of cryptogams were not neglected. Between 1873 and 1891, in conjunction with Dr. Plowright, he contributed a series of notes on 'New and rare British Fungi' to 'Grevillea,' and between 1874 and 1881 he issued a set of specimens entitled 'Elvellacei Britannici.' In 1878 he helped to found, and formed the council of, the Shropshire Archæological and Natural History Society, and in its 'Transactions' (vol. i.) appeared his paper on the ferns and fern-allies of Shropshire, which he had printed privately in 1877; many other papers followed in the subsequent 'Transactions.' In 1878 Phillips published a

'Guide to the Botany of Shrewsbury,' and before his death completed for the 'Victoria County History' an account of the botany of the county. After nearly twenty years' preparation Phillips in 1887 published his chief work, 'A Manual of the British Discomycetes,' in the International Scientific series (with twelve excellent plates drawn by himself).

Compelled with advancing years to discontinue microscopic work, Phillips engaged in archaeological research of various kinds. He made special studies of the earthworks, castles, and moated houses of Shropshire. Many of his results were published in the 'Transactions of the Shropshire Archaeological Society,' in 'Salopian Shreds and Patches,' in 'Bye-Gones,' and in 'Shropshire Notes and Queries,' which he edited, and to a great extent wrote, towards the close of his life. 'The Ottley Papers,' relating to the civil war, which he edited for the Shropshire Society between 1893 and 1898, form a complete county history for the period; and he carefully edited the first part of Blakeway's 'Topographical History of Shrewsbury.' He took a prominent part in the preservation of the remains of Uriconium; actively helped to arrange the borough records of Shrewsbury, and to prepare the calendar (1896); edited the 'Quarter Sessions Rolls' of Shropshire from 1652 to 1659, and transcribed the parish registers of Battlefield (2 vols. 1899-1900) and Stirchley (1905) for the Shropshire Parish Register Society. In 1896 Phillips, a methodist and at one time a local preacher, published 'Early Methodism in Shropshire.' The conversion of the Shrewsbury Free School buildings into a museum and free library (from 1882) owed much to Phillips, who became the curator of botany. Many manuscript volumes by him on antiquarian subjects are preserved there. His botanical manuscripts and drawings, including his large correspondence with botanists at home and abroad, were purchased at his death for the botanical department of the British Museum. Phillips was elected a fellow of the Linnean Society in 1875, and was F.S.A. He became a borough magistrate in 1886, and was presented with the freedom of the borough on 17 Aug. 1903. He died of heart-disease at his residence in Canonbury, Shrewsbury, on 23 Oct. 1905, and was buried in the general cemetery, Shrewsbury.

Phillips married in 1846 Sarah Ann, daughter of Thomas Hitchins of Shrewsbury, who died in 1895. Two sons and two daughters survived him.

Miles Joseph Berkeley [q.v.] dedicated to Phillips a genus of fungi under the name *Phillipsia*.

G. S. B.

PIATTI, ALFREDO CARLO (1822-1901), violoncellist and composer, was born on 8 Jan. 1822 at Bergamo, where his father, Antonio Piatti, was leader of the town orchestra. At five years old he began to learn the violoncello under his great-uncle Zanetti, and at seven played in the orchestra, next year succeeding to Zanetti's place. In 1832 he obtained a five years' scholarship at the Conservatorio of Milan. At the end of his course he played in public a concerto of his own composition, and was presented with the violoncello he had used, on 21 Sept. 1837. He then played in the Bergamo orchestra, taking trips with his father when there was a chance of playing solos. After a time he went into Austria and Hungary, but fell ill at Pesth, and was obliged to sell his prize violoncello. Rescued by a Bergamo friend he returned home by way of Munich, where he met Liszt, and played at his concert. Liszt publicly embraced him, and he was thrice recalled. After appearing at Paris and Ems, he reached London, where he played in the opera orchestra and at private parties, and made his debut as soloist at Mrs. Anderson's concert on 31 May 1844. The boy Joachim first appeared at the same concert. Piatti made several other appearances, and a provincial tour in the autumn; his success everywhere was immediate and complete, but he earned little, and was able to return home only by the assistance of the vocalist Mme. Castellan. In 1845 he toured in Russia. In 1846 he returned to England, where he at once became a principal figure in London musical life. His small figure and serious spectacled face were thenceforth familiar for half a century to all London concert-goers. Mendelssohn talked of writing a concerto for him, which however has not been found. Alike in execution, in tone, and in expression he was unsurpassed. Difficulties had no existence for him, and his delivery of a melody was a lesson to vocalists. He took composition lessons from Molique. After Lindley's retirement in 1851 Piatti had no rival, leading the violoncellos at the

principal concerts, and taking part in chamber music, for which he was peculiarly fitted. Sterndale Bennett's sonata-duo (1852), Molique's concerto (1853), and Sullivan's concerto (1866) and Duo (1868) were all written for him and first performed by him. At the Monday Popular Concerts Piatti played from their establishment in 1859 till 1896. He lived at 15 Northwick Terrace, St. John's Wood, latterly spending the summer at an estate he had bought at Cadenabbia, Lake Como. He rarely played outside London; he appeared at Bergamo in 1875 and again in 1893, on the latter occasion receiving the order of the Crown of Italy from King Humbert. On 22 March 1894, to celebrate the jubilee of his and Joachim's first appearances in London, a testimonial to both was publicly presented to them at the Grafton Galleries.

In 1898 Piatti retired. His last few months were spent with his only surviving daughter, Countess Lochis, at Crocetta near Bergamo, where he died on 22 July 1901. He was buried in the castle chapel; four professors played his favourite movement, the variations on 'Der Tod und das Mädchen' in Schubert's D minor quartett, and agreed to play it annually at the graveside. Piatti married in 1856 Mary Ann Lucey Welsh, daughter of a singing master; but they separated. She died in Sept. 1901.

Piatti's compositions included six sonatas, three concertos, twelve caprices, and some slighter pieces for the violoncello, as well as some songs with violoncello obbligato, one of which, 'Awake, awake,' had a lasting success. He re-edited works by Boccherini, Locatelli, Veracini, Marcello, and Porpora, and Kummer's method. He arranged for the violoncello Ariosti's sonatas, melodies by Schubert and Mendelssohn, and variations from Christopher Symphon's 'Division-Violist' (1659).

A portrait by Frank Holl was exhibited at the Royal Academy in 1879.

[Morton Latham, Alfredo Piatti (with portraits); Grove's Dict. of Music; Musical Times (with portrait), Aug. 1901.] H. D.

PICKARD, BENJAMIN (1842-1904), trade union leader, born on 26 Feb. 1842 at Kippax, near Pontefract, in Yorkshire, was son of Thomas Pickard, a working miner, by his wife Elizabeth Firth. He was educated at the colliery school. At twelve he commenced to work in the mine with his father, and in due course went through the various grades of labour there. He early joined the miners' union, becoming lodge secretary in 1858, and in 1873, when

the membership and work of the West Yorkshire Miners' Association greatly increased, he was elected its assistant secretary, succeeding to the secretaryship in 1876. He had also joined the Wesleyan body and became one of its local preachers. He foresaw that the next step in trade unionism was the amalgamation of local societies, and in 1881 he brought about the union of the south and west Yorkshire associations, under the title of the Yorkshire Miners' Association, and became its secretary; and when the Miners' Federation of Great Britain was formed in 1888 he was elected president. His policy was to protect members by restricting output and so check excessive driving. In 1885 the employers resolved to reduce wages. Pickard advised acceptance, but the men declined to follow his lead and a strike ensued which was unsuccessful, but events then gave Pickard his grip upon the miners which he never lost. Prosperous times followed, but he again found himself involved in the dispute of 1893, when the miners again resisted a reduction of 25 per cent. and refused arbitration on the ground that they were entitled to a living wage. It was another form of the opposition to a sliding scale for wages which the Miners' Federation had been formed to carry on. In this great dispute, which lasted sixteen weeks, Pickard played the leading part, and in the end received a testimonial of 750*l.* from the men. The result of this strike was the establishment of conciliation boards to settle all wages disputes. Things went smoothly until 1902 when reductions were again threatened, unrest was widespread, and the Denaby Main strike ensued. During the board of trade inquiry which followed this strike and at which he gave evidence, Pickard died in London on 3 Feb. 1904; he was buried in the Barnsley cemetery.

A liberal in politics, Pickard sat in parliament for the Normanton division of Yorkshire from 1885 till his death. In parliament he was the leader of the eight hours for miners agitation, and his interest in arbitration sent him in 1887 on a peace deputation to the president of the United States (Grover Cleveland). In 1897 he received a cheque for 500*l.* from liberal members of the House of Commons as a mark of respect. Before entering parliament he was a member of the Wakefield school board, and in 1889 was elected an alderman of the West Riding county council.

He married in 1864 the daughter of John Freeman of Kippax; she died in 1901.

[The Times, 4 Feb. 1904; Reports of Miners' Federation; Sidney Webb's History of Trades Unionism 1894, and his Industrial Democracy 1897; family information.] J. R. M.

PICTON, JAMES ALLANSON (1832-1910), politician and author, born at Liverpool on 8 Aug. 1832, was eldest son of Sir James Allanson Picton [q. v.] by his wife Sarah Pooley. After early education at the High School, then held at the Mechanics' Institute, he entered the office of his father, who was an architect, in his sixteenth year. In his nineteenth year he resolved to study for the ministry, and joined both the Lancashire Independent College and Owens College, Manchester. At Owens College he was first in classics in his final examination, and in 1855 he proceeded M.A. at London University. A first attempt in 1856 to enter the ministry failed owing to a suspicion of heterodoxy. Study of German philosophy dissatisfied him with conventional doctrine. Later in the year, however, he was appointed to Cheetham Hill congregational church, Manchester. There with the Rev. Arthur Mursell he undertook a course of popular lectures to the working classes. A sermon on the 'Christian law of progress' in 1862 led to a revival of the allegation of heresy. Removing to Leicester, he accepted the pastorate of Gallowtree Gate chapel, and there made a high reputation. In 1869 he became pastor of St Thomas's Square chapel, Hackney, remaining there till 1879. At Hackney, to the dismay of strict orthodoxy, he delivered to the working classes, on Sunday afternoons, popular lectures on secular themes such as English history and the principles of radical and conservative politics. He thus prepared the way for the Pleasant Sunday Afternoon movement. His growing tendency to rationalism inclined him to pantheism in later years.

Picton soon took an active part in public life as an uncompromising radical of an advanced type. A champion of secularism in education, he represented Hackney on the London school board from 1870 to 1879. For three years he was chairman of the school management committee. In 1883 he was accepted as a radical candidate for parliament for the Tower Hamlets, but withdrew in 1884, when in June he entered parliament as member for Leicester, succeeding Peter Alfred Taylor [q. v.], most of whose opinions he shared. He was re-elected for Leicester in 1885, 1886, and 1892, retiring from the House of Commons

and from public life in 1894. Picton, who was very small in stature, possessed much oratorical power, but, never losing the manner of the pulpit, failed to win the ear of the House of Commons, where he was only known as a sincere advocate of extreme views.

Picton wrote much in the press and published many sermons, pamphlets, and volumes on religion and politics. From 1879 to 1884 he was a frequent leader writer in the 'Weekly Dispatch,' then an advanced radical organ, and contributed to the 'Christian World,' the 'Theological Review,' the 'Fortnightly Review,' the 'Contemporary Review,' 'Macmillan's Magazine,' the 'Examiner,' and other periodicals.

His books included: 1. 'A Catechism of the Gospels,' 1866. 2. 'New Theories and the Old Faith,' 1870. 3. 'The Mystery of Matter,' 1873. 4. 'The Religion of Jesus,' 1876. 5. 'Pulpit Discourses,' 1879. 6. 'Oliver Cromwell: the Man and his Mission,' 1882 (a popular eulogy). 7. 'Lessons from the English Commonwealth,' 1884. 8. 'The Conflict of Oligarchy and Democracy,' 1885. 9. 'Sir James A. Picton: a Biography,' 1891. 10. 'The Bible in School,' 1901. 11. 'The Religion of the Universe,' 1904. 12. 'Pantheism,' 1905. 13. 'Spinoza: a Handbook to the Ethics,' 1907. 14. 'Man and the Bible,' 1909. He died at Caerlyr, Penmaenmawr, North Wales, where he had lived since his withdrawal from parliament, on 4 Feb. 1910, and his remains were cremated at Liverpool.

He married (1) Margaret, daughter of John Beaumont of Manchester; and (2) Jessie Carr, daughter of Sydney Williams, publisher, of Hamburg and London. Of four sons one survives.

[Morrison Davidson, Eminent Radicals, 1880; Frederick Rogers, Biographical sketch, 1883; H. W. Lucy's Diary of the Salisbury Parliament, 1886-92; House of Commons Guides, 1884-94; Who's Who, 1910; Christian World, Literary Guide, and Leicester Daily Post and Liverpool Daily Post, Feb., March 1910.] F. R.

PIRBRIGHT, first BARON. [See DE WORMS, HENRY (1840-1903), politician.]

PITMAN, SIR HENRY ALFRED (1808-1908), physician, born in London on 1 July 1808, was youngest of the seven children of Thomas Dix Pitman, a solicitor in Furnival's Inn, by his wife Ann Simmons, of a Worcester family. Educated privately, he entered Trinity College, Cambridge, in 1827, where he graduated B.A. in 1832.

After travelling abroad for a year he spent six months in the office of his brother-in-law, who was a solicitor, and thus obtained a training in business methods. He then turned to medicine, working first for a year at Cambridge and then at King's College and at St. George's Hospital; in 1835 he graduated M.B. at Cambridge, and after passing in 1838 the then necessary additional examination for the licence at that university, he proceeded M.D. in 1841. In 1840 he became a licentiate (equivalent to member), and in 1845 a fellow, of the Royal College of Physicians of London. In 1846 he was elected assistant physician, and in 1857 physician and lecturer on medicine at St. George's Hospital. He resigned in 1866 and was the first to be elected consulting physician there. After being censor in 1856-7, he was in 1858, in succession to Dr. Francis Hawkins [q. v.], elected registrar to the Royal College of Physicians.

Pitman, whose mental equipment was rather of the legal than of the medical order, had a gift for administration. He was long identified with the management of the Royal College of Physicians and the regulation and arrangement of the medical curriculum. The Medical Act of 1858 entailed numerous changes in the organisation of the college, which then surrendered the power to confer the exclusive right to practise in London. He was largely responsible for the translation of the old Latin statutes of the college into English bye-laws and regulations in harmony with the Medical Acts of 1858 and 1860. He took a prominent part in the construction of the first edition of the 'Nomenclature of Diseases,' which was prepared by the college for the government, being begun in 1859 and published in 1869. A fresh edition is issued decennially. He was largely responsible for the initiation and organisation of the conjoint examining board in England of the Royal College of Physicians and the Royal College of Surgeons, and it was in recognition of his work on the new diplomas (L.R.C.P., M.R.C.S.) that he was knighted in 1883. He also took an active part in the institution of a special examination and diploma in public health. From 1876 to 1886 he was the representative of the college on the general council of medical education and registration, and in 1881 chairman of the executive committee of the council. He resigned the registrarship of the College of Physicians in 1889, being then elected emeritus registrar.

Pitman died at the patriarchal age of 100 at Enfield on 6 Nov. 1908, and was buried in the Enfield cemetery. He married

in 1852 Frances (d. 11 Nov. 1910), only daughter of Thomas Wildman of Eastbourne, and had issue three sons and four daughters.

A portrait by Oulless hangs in the reading-room of the Royal College of Physicians, to which it was presented on behalf of some of the fellows by Sir Risdon Bennett in 1886.

[Autobiography in *Lancet*, 1908, ii. 1418; *Brit. Med. Journal*, 1908, ii. 1528; presidential address at the Royal College of Physicians by Sir R. Douglas Powell, Bt., K.C.V.O., on 5 April 1909.] H. D. R.

PLATTS, JOHN THOMPSON (1830-1904), Persian scholar, born at Calcutta on 1 August 1830, was second son of Robert Platts of Calcutta, India, who left at his death a large family and a widow in straitened circumstances. John, after being educated at Bedford (apparently privately), returned to India in early manhood, and during 1858-9 was mathematical master at Benares College. He was in charge of Saugor School in the Central Provinces from 1859 to 1861, when he became mathematical professor and headmaster of Benares College. In 1864 Platts was transferred to the post of assistant inspector of schools, second circle, North-west Provinces, and in 1868 he became officiating inspector of schools, northern circle, Central Provinces. He retired on 17 March 1872, owing to ill-health. Platts then returned to England, and settling at Ealing occupied himself with teaching Hindustānī and Persian. He had closely studied both languages and had thoroughly mastered their grammars and vocabulary. On 2 June 1880 he was elected teacher of Persian in the University of Oxford. He matriculated from Balliol College on 1 Feb. 1881, and on 21 June of that year was made M.A. *honoris causā*. On 19 March 1901 the degree of M.A. was conferred upon him by decree. He died suddenly in London on 21 Sept. 1904, and was buried at Wolvercote cemetery near Oxford.

Platts was twice married: (1) in 1856, at Lahore, India, to Alice Jane Kenyon (d. 1874), by whom he had three sons and four daughters; and (2) on 4 Oct. 1876 to Mary Elizabeth, only daughter of Thomas Dunn, architect and surveyor, of Melbourne, Australia, and widow of John Hayes, architect and surveyor, of Croydon; by her Platts had one son. His widow was awarded a civil list pension of 75*l.* in 1905.

Platts compiled: 1. 'A Grammar of the Hindustānī Language,' 1874. 2. 'A Hin-

dustānī-English Dictionary,' 1881. 3. 'A Dictionary of Urdu, Classical Hindī, and English,' 1884. 4. 'A Grammar of the Persian Language, Part I, Accidence,' 1894. He also edited the text of 'Gulistan of Sa'di' (1872), and published 'Sa'di (Shāikh Muslihuddin Shirāzi)' photographed from MS. under his superintendence (1891). He translated the 'Ikhwānū-s-Safā' from the Hindustānī of Maulavi Ikram Ali (1875), and the 'Gulistan of Sa'di' (1876).

Platts' grammars of Persian and Hindustānī were a marked advance upon the work of any English predecessor, and still hold the field. His 'Hindustānī-English Dictionary' is a monument of erudition and research.

[Record Department, India Office; Oxford Times, 1 Oct. 1904.] G. S. A. R.

PLAYFAIR, WILLIAM SMOULT (1835-1903), obstetric physician, born at St. Andrews, where his family had long been prominent citizens, on 27 July 1835, was fourth of the five sons of George Playfair, inspector-general of hospitals in Bengal, by his wife Jessie Ross of Edinburgh. Lyon, first Lord Playfair [q. v. Suppl. I], and Sir Robert Lambert Playfair [q. v. Suppl. I] were two of his brothers.

After being educated at St. Andrews, he became a medical student at Edinburgh in 1852, graduating M.D. in 1856 and then working for some time in Paris. In 1857 he entered the Indian medical service, and was an assistant surgeon at Oude during the Mutiny. During 1859-60 he was professor of surgery at the Calcutta Medical College; but for reasons of health he retired, and after practising for six months in St. Petersburg, he returned in 1863 to London without definite plans, but was soon elected assistant physician for diseases of women and children at King's College Hospital. In 1872, on the retirement of Sir William Overend Priestley [q. v. Suppl. I], he was appointed professor of obstetric medicine in King's College and obstetric physician to King's College Hospital, posts which he vacated after twenty-five years' service in 1898, and was elected emeritus professor and consulting physician. In 1863 he became M.R.C.P., and in 1870 was elected F.R.C.P.

Playfair became one of the foremost obstetricians in this country, and was among the first to decline to hand over obstetric operations to general surgeons, and thus set obstetricians the example of operating on their own patients. He was a prolific writer with a clear and graceful style.

He introduced into this country with much enthusiasm and success the Weir-Mitchell or 'rest-cure' treatment, which was soon widely adopted. In 1896 an action was brought against him by a patient for alleged breach of professional confidence which attracted much attention, and was notable for the enormous damages (12,000*l.*) given against him by the jury; this amount however was reduced by agreement to 9200*l.* on application for a new trial. Though opinion was much divided on the merits of the case, no stain was left on Playfair's professional character. He was physician accoucheur to the Duchess of Edinburgh and to the Duchess of Connaught, an hon. LL.D. of the Universities of Edinburgh (1898) and of St. Andrews (1885), an honorary fellow of the American and of the Boston Gynaecological Societies, and of the Obstetrical Society of Edinburgh. He was president of the Obstetrical Society of London (1879-80).

Playfair after an apoplectic stroke at Florence in 1903 died at St. Andrews, his native place, on 13 Aug. 1903, and was buried there in the new cemetery of St. Andrews, where his two distinguished brothers lie. A sum was collected to found a memorial to him in the new King's College Hospital at Denmark Hill, London. His portrait, painted by Fräulein von Nathusius, was presented by his widow to the Royal College of Physicians of London.

Playfair married on 26 April 1864 Emily, daughter of James Kitson of Leeds and sister of the first Lord Airedale; he had issue two sons and three daughters.

Playfair was author of: 1. 'Handbook of Obstetric Operations,' 1865. 2. 'Science and Practice of Midwifery,' 1876; 9th edit. 1898, translated into several languages. 3. 'Notes on the Systematic Treatment of Nerve Prostration and Hysteria connected with Uterine Disease,' 1881. He was joint editor with Sir Clifford Allbutt, K.C.B., of a 'System of Gynaecology' (1896; 2nd edit. revised by T. W. Eden, 1906). He contributed to Quain's 'Dictionary of Medicine' (1882) the article on 'Diseases of the Womb,' and to H. Tuke's 'Dictionary of Psychological Medicine' (1892) the article on 'Functional Neuroses,' and wrote much for medical periodicals, including forty-nine papers for the 'Transactions of the Obstetrical Society.'

[Obstetrical Trans., London, 1904, xlvii, 80-86; Brit. Med. Journal, 1903, ii. 439; the Families of Roger and Playfair, printed for private circulation, 1872; information from Hugh Playfair, M.D.] H. D. R.

PLUNKETT, SIR FRANCIS RICHARD (1835-1907), diplomatist, born at Corbalton Hall, co. Meath, on 3 Feb. 1835, was sixth son of Arthur James, ninth earl of Fingall, and Louise Emilia, only daughter of Elias Corbally of Corbalton Hall. Educated at the Roman catholic college, St. Mary's, Oscott, he was appointed attaché at Munich in January 1855, and transferred in July of that year to Naples, where he remained until diplomatic relations were broken off on 30 Oct. 1856. After a few months of service at the Hague he was transferred to Madrid, and in July 1859 was promoted to be paid attaché at St. Petersburg. In January 1863 he was transferred as second secretary to Copenhagen, where he served during the troubled times of the war of Austria and Prussia against Denmark. After service at Vienna, Berlin, Florence, and again at Berlin, he was promoted to be secretary of legation at Yedo in 1873, then at Washington in 1876, becoming secretary of embassy at St. Petersburg in 1877. He was transferred to Constantinople in 1881, but after a few months of service, during part of which he was in charge of the embassy in the absence of the ambassador, Lord Dufferin [q. v. Suppl. II], he was removed to Paris, with promotion to the titular rank of minister plenipotentiary. In July 1883 he was appointed British envoy at Tokio, and while there in 1886 he was made K.C.M.G. In 1886 and 1887 he took part as the senior British delegate in the conferences on the very difficult question of the revision of the treaties between Japan and the European powers, and the conditions on which the rights of extra-territorial jurisdiction enjoyed by those powers over their nationals resident in Japan should be abandoned. The conditions agreed upon at the conference were considered by the Japanese government to be too onerous, and it was not until 1894 that a definitive agreement was arrived at. In 1888 he was transferred to Stockholm, and in 1893 to Brussels, where in 1898 and 1899 he took part in the conferences for the abolition of bounties on the export of sugar and for the regulation of the liquor trade in Africa. In September 1900 he was appointed British ambassador at Vienna, and held that post till his retirement on pension in October 1905. He was made G.C.M.G. during his residence at Brussels in 1894, G.C.B. in 1901, and a G.C.V.O. in 1903, was sworn a privy councillor on his appointment as ambassador, and received from the

Emperor Francis Joseph the grand cross of the order of Leopold on leaving Vienna, where his natural kindliness of disposition and urbanity of manner had made him universally popular. He died at Paris on 28 Feb. 1907 and was buried at Boulogne-sur-Seine.

He married on 22 Aug. 1870 Mary Tevis, daughter of Charles Wain Morgan, of Philadelphia, by whom he had two daughters.

[The Times, 1 and 2 March 1907; Foreign Office List, 1908, p. 401; papers laid before Parliament.] S.

PODMORE, FRANK (1855-1910), writer on psychical research, born at Elstree, Hertfordshire, on 5 Feb. 1855, was the third son of the Rev. Thompson Podmore, at one time headmaster of Eastbourne College, by his wife Georgina Elizabeth, daughter of George Gray Barton and Sarah Barton. Educated first at Elstree Hill school (1863-8), Frank won a scholarship at Haileybury, leaving in 1874 with a classical scholarship at Pembroke College, Oxford. At Oxford he obtained a second class in classical moderations (1875) and a first class in natural science (1877). In 1879 he was appointed to a higher division clerkship in the secretary's department of the post office. This position he held till 1907, when he retired without a pension.

Through life Podmore was keenly interested in psychical research. At Oxford he had studied spiritualistic phenomena, had contributed papers to 'Human Nature' (the spiritualist organ) in 1875 and 1876, and had placed unqualified confidence in a slate-writing performance of the medium Slade. In 1880 however he changed his attitude and announced to the National Association of Spiritualists that he had become sceptical about spiritualistic doctrine. He was a member of the council of the Society for Psychical Research from 17 March 1882 until his resignation in May 1909. In that capacity he argued for theories of psychological, as opposed to spiritualist, causality, and for a far-reaching application of the hypothesis of telepathy. He became 'sceptic-in-chief' concerning spirit agency, and the official *advocatus diaboli* when the society undertook to adjudicate on the claim to authenticity of spiritualistic phenomena. His hostility was criticised by F. C. S. Schiller (*Mind*, N.S. no. 29) and by Andrew Lang. Podmore helped in compiling the census of hallucinations which the society began in 1889 (*Report in Proceedings*, vol. x. 1894), and with Edmund Gurney and F. W. H. Myers

[q. v. Suppl. I] he assisted in preparing 'Phantasms of the Living' (1836), an encyclopædic collection of tested evidence. In 'Modern Spiritualism' (1902) and 'The Newer Spiritualism' (posthumously issued, 1910) he critically studied the history of spiritualist manifestations from the seventeenth century onwards, and incidentally contested Myers' doctrine of the subliminal self in relation to human personality and its survival after death.

Podmore was one of the founders and members of the first executive committee of the Fabian Society, the title of which he apparently originated (4 Jan. 1884). He helped to prepare an early, and now rare, report on government organisation of unemployed labour, to which Sidney Webb also contributed. His rooms at 14 Dean's Yard, Westminster, were frequently the place of meeting. He wrote none of the 'Fabian Tracts,' and his interest in 'social reconstruction' bore its chief fruit in his full biography of Robert Owen the socialist and spiritualist in 1906.

In 1907 Podmore left London for Broughton near Kettering, a parish of which his brother, Claude Podmore, was rector. He died by drowning in the New Pool, Malvern, where he was making a short stay, on 14 Aug. 1910. The jury returned a verdict of 'found drowned.' He was buried at Malvern Wells cemetery.

Podmore married on 11 June 1891 Eleonore, daughter of Dr. Bramwell of Perth, and sister of Dr. Milne Bramwell, a well-known investigator of the therapeutic aspect of hypnotism. In his later years Podmore lived apart from his wife; there was no issue. A civil list pension of 60*l.* was granted his widow in 1912.

Podmore combined a good literary style with scientific method. Apart from the works cited he published: 1. 'Apparitions and Thought Transference,' 1894. 2. 'Studies in Psychical Research,' 1897. 3. 'Spiritualism (with Edw. Wake Cook, in 'Pro and Con' series, vol. 2), 1903. 4. 'The Naturalisation of the Supernatural,' 1908. 5. 'Mesmerism and Christian Science,' 1909. 6. 'Telepathic Hallucinations: the New View of Ghosts,' 1910.

His contributions to the 'Proceedings' of the Society for Psychical Research are very numerous, and he wrote articles on his special themes in the 'Encyclopædia Britannica' (11th edit.).

[The Times, 20 Aug. 1910; Malvern Gazette, 19 and 26 Aug. 1910; Proceedings of the Society for Psychical Research, lxi; Minutes of the Fabian Society, 1884;

E. S. H-R.

POLLEN, JOHN HUNGERFORD (1820-1902), artist and author, born at 6 New Burlington Street, London, W., on 19 Nov. 1820, was second son (in a family of three sons and three daughters) of Richard Pollen (1786-1838) of Rodbourne, Wiltshire, by his wife Anne, sister of Charles Robert Cockerell [q. v.], the architect. Sir John Walter Pollen (1784-1863), second baronet of Redenham, Hampshire, was his uncle. Educated at Durham House, Chelsea (1829-33), and at Eton (1833-8) under Edward Coleridge, Pollen matriculated at Christ Church, Oxford, in 1838; he graduated B.A. in 1842, and proceeded M.A. in 1844; he was fellow of Merton College (1842-52), and dean and bursar in 1844, and served as senior proctor of the university (1851-2).

Pollen fell early under the influence of the Oxford Movement, and read much patristic literature. Taking holy orders, he became curate of St. Peter-le-Bailey, Oxford; but the Tractarian upheaval of 1845 weakened Pollen's attachment to the Church of England, and he resigned his curacy in 1846. With Thomas William Allies [q. v. Suppl. II] he visited Paris in 1847, and studied the organisation of the French church. On his return he associated himself with Pusey, Charles Marriott [q. v.], and the leading ritualists, and became pro-vicar at St. Saviour's, Leeds, the church which Pusey had founded in 1842. During his stay there (1847-52) most of his colleagues seceded to Rome. In December 1852 he was inhibited by Charles Thomas Longley [q. v.], then bishop of Ripon, for his extreme sacramental views, and on 20 Oct. 1852 he was himself received into the Roman catholic church at Rouen. His elder brother Richard (afterwards third baronet) followed his example next year (see POLLEN's *Narrative of Five Years at St. Saviour's, Leeds*, Oxford, 1851, and his *Letter to the Parishioners of St. Saviour's, Leeds*, Oxford, 1851). Visits to Rome at the end of 1852 and 1853 led to friendship with (Cardinal) Herbert Vaughan [q. v. Suppl. II] and with W. M. Thackeray.

Pollen, who remained a layman, thenceforth devoted himself professionally to art and architecture. He had already studied the subjects at home and on his foreign travel, and practised them as an amateur,

with the encouragement of his uncle, Charles Cookerell.

In 1842 he restored the aisle of Wells Cathedral, where another uncle Dr. Goodenough, was dean. While curate he designed and executed in 1844 the ceilings of St. Peter-le-Bailey, Oxford, and he was responsible for the fine ceiling of Merton College chapel in 1850. Early in 1855 he accepted the invitation of John Henry Newman [q. v.], the rector, to become professor of fine arts in the catholic university of Ireland in Dublin, and to build and decorate the university church. His lectures, which began in June 1855 (printed in 'Atlantis,' the official magazine of the university), dealt with general æsthetic principles rather than with technique, in which he had no adequate training. He also joined the staff of the 'Tablet' newspaper, where he showed independence and sagacity as an art critic, detecting the merits of Turner and Whistler long before their general recognition.

In the summer of 1857 Pollen finally settled in London, living first at Hampstead and from 1858 to 1878 at Bayswater. He had previously met at Oxford Turner and Millais, and through Millais grew intimate with other Pre-Raphaelites. With Rossetti, Burne-Jones, and William Morris he assisted in the fresco decoration of the hall of the Union Society at Oxford in the summer of 1858 (see HOLMAN HUNT'S *Story of the Paintings at the Oxford Union Society*, Oxford, 1906, fol.; ESTHER WOOD'S *Gabriel Rossetti and the Pre-Raphaelite Movement*, 1894, pp. 142-6; *Memorials of Sir E. Burne-Jones*, 1904, i. 158 seq.). He was one of the first to reintroduce fresco decoration into England. Meanwhile his admiration for Turner's work brought him Ruskin's acquaintance (1855), and in 1860, at Ruskin's request, he designed for the new Oxford Museum a scheme of decoration, which was not carried out; his drawing is in the Museum (see *The Times*, 11 Feb. 1909).

From 1860 onwards Pollen was busily engaged on private and public commissions. Chief among his works were the decoration of Blickling Hall, Aylsham, for the Marquis of Lothian in 1860, and the fresco decoration at Alton Towers, the seat of the Earl of Shrewsbury (1874-7). At Alton Towers he produced the effect of tapestry by skilfully and with archaeological accuracy painting in oil on rough canvas incidents in the hundred years' war. A design in water-colours for one of the canvases, 'The Landing of Henry V at Harfleur,'

was purchased after Pollen's death for South Kensington Museum. He was responsible for stained glass windows, furniture, and panels in the Jacobean style at another of Lord Shrewsbury's seats, Ingestre Hall, Stafford, from 1876 to 1891; he built a house in 1876 for Lord Lovelace on the Thames Embankment, and an ornamental cottage in 1894 at Chenies for the Duchess of Bedford. Among many ecclesiastical commissions was the building and decoration in 1863 of the church of St. Mary, Rhyl, and of the convent of the Sacred Heart at Wandsworth in 1870.

Meanwhile, Thackeray, for whose 'Denis Duval' Pollen made in 1863 an unfinished series of sketches, introduced him to Sir Henry Cole [q. v.], who appointed him in December 1863 official editor of the art and industrial departments of the South Kensington (now Victoria and Albert) Museum. He also served on the advisory committee for purchases until November 1876. Pollen devoted his energies to the South Kensington collections, and besides issuing official catalogues gave lectures on historical ornament and kindred subjects. He served on the jury for art at the international exhibition at South Kensington in 1862, at the Dublin exhibition in 1865, and at Paris in 1867. At the Society of Arts he lectured frequently on decorative art, delivering the Cantor lectures in 1885 on 'Carving and Furniture,' and winning the society's silver medal for a paper on 'Renaissance Woodwork' in 1898.

Resigning his South Kensington post in November 1876, Pollen became in December private secretary to the Marquis of Ripon [q. v. Suppl. II], and continued to conduct the marquis's correspondence in England after 1880, when Lord Ripon went to India as viceroy. In the autumn of 1884 Pollen visited India, and after a brief archaeological tour returned home with the viceroy in December 1884. A privately printed pamphlet entitled 'An Indian Farewell to the Marquis of Ripon' (1885) described his Indian experience. He thenceforth avowed himself an advanced liberal in both Indian and Irish politics, supporting the efforts of Mr. Wilfrid Scawen Blunt in Ireland and forming an intimacy with Gladstone.

Artistic pursuits however remained to the end his chief interest, and his services as a decorator continued in demand. In 1886 and 1887 he exhibited drawings at the Royal Academy and at the Paris Salon, and he prepared in 1880 a series of designs for St. George's Hall, Liverpool, which were

not executed. He supported the newly founded United Arts and Crafts Guild, and was an exhibitor at the Guild's Exhibition at the New Gallery in October 1889. He died suddenly at 11 Pembridge Crescent, North Kensington, on 2 Dec. 1902, and was buried in the family vault at Kensal Green cemetery. He married on 18 Sept. 1855 Maria Margaret, second daughter of John Charles La Primaudaye, of Huguenot descent, of St. John's College, Oxford, and Graffham Rectory, by Ellen, sister of John Gellibrand Hubbard, first Lord Addington [q. v.], and had issue seven sons and three daughters. His widow published 'Seven Centuries of Lace' in 1908.

Pollen did much to reform taste in domestic furniture and decoration at home and abroad. He was an ardent sportsman and a member of the artists' corps of volunteers, formed in 1860. He was always active in catholic philanthropy. His most important publication was the 'Universal Catalogue of Books on Art' (2 vols. 1870; supplementary vol. 1877, 4to), which he prepared for South Kensington. Other official compilations were: 1. 'Ancient and Modern Furniture and Woodwork,' 1873; 2nd edit. 1875; revised edit. completed by T. A. Lehfeldt, 1908. 2. 'Catalogue of the Special Loan Exhibition of Enamels on Metals,' 1874. 3. 'A Description of the Trajan Column,' 1874. 4. 'Description of the Architecture and Monumental Sculptures,' 1874. 5. 'Ancient and Modern Gold and Silversmith's Work,' 1878. 6. 'A Catalogue of a Special Loan Collection of English Furniture and Figured Silk' (Bethnal Green Branch), 1896. He also contributed chapters on furniture and woodwork to Stanford's series of 'British Manufacturing Industries' (1874; 2nd edit. 1877).

There is a pencil sketch of Pollen by Sir William Ross (1823), a painting in oils by Mrs. Carpenter (1838), and an etching by Alphonse Legros (1865), as well as a rough pen-and-ink sketch drawn by himself in 1862. Reproductions of these appear in the 'Life' (1912). A drawing of Mrs. Pollen was made by D. G. Rossetti in 1858.

[The Times, 5 Dec. 1902; Tablet, 6 Dec. 1902; John Hungerford Pollen, by Anne Pollen, 1912; Liddon's Life of Pusey, iii. 112-136, 355-368; Bryan's Dict. of Painters; Graves's Royal Acad. Exhibitors, 1906; private information from Sir George Birdwood.]

W. B. O.

POORE, GEORGE VIVIAN (1843-1904), physician and authority on sanitation, born at Andover on 23 Sept. 1843, was

youngest of ten children of Commander John Poore, R.N., who had retired from the service on the reduction of the navy in 1815. His mother was Martha Midlane. In his early days he was destined for his father's profession, and after education at home was sent at the age of ten to the Royal Naval School at New Cross, where he stayed until he was nearly seventeen. Here he gained a medal for good conduct, but having determined to enter the medical profession declined a marine cadetship. He began his medical training by an apprenticeship at Broughton near Winchester under Dr. Luther Fox, father of Dr. William Tilbury Fox [q. v.]. On leaving Dr. Fox he matriculated at the University of London and entered as a student at University College Hospital, qualifying as M.R.C.S. England in 1866. During the same year he acted as surgeon to the Great Eastern while she was employed in the laying of the Atlantic cable.

In 1868 he graduated M.B. and B.S. at the University of London, proceeding to the doctorate in 1871. In 1870 he was admitted a member of the Royal College of Physicians of London, and in 1877 was elected a fellow. During 1870 and 1871 he travelled as medical attendant with Prince Leopold, Duke of Albany, and he remained in charge of his health until 1877. In 1872 he was selected by Queen Victoria to accompany Edward VII, when Prince of Wales, during his convalescence in the south of France after his severe attack of typhoid fever. In 1872, too, Poore became lecturer on medical jurisprudence at Charing Cross Hospital, and gave a course of lectures on the 'Medical Uses of Electricity,' a study which was then in its infancy. In 1876 he was elected assistant physician to University College Hospital and professor of medical jurisprudence and clinical medicine. Among his colleagues were Sir William Jenner, Sir John Russell Reynolds, Sir John Erichsen, Tilbury Fox, Grailly Hewett, and Sir Henry Thompson. In 1876 he also published his 'Text Book of Electricity in Medicine and Surgery,' at the time the most complete and useful English work on the subject.

Poore was a brilliant lecturer, his delivery being admirable, and his matter being always well arranged. His lectures on medical jurisprudence were published as 'A Treatise on Medical Jurisprudence' (1901; 2nd edit. 1902). In 1883 he was elected full physician to the hospital, and held this post with his professorship until May 1903, when failing health compelled his retire-

ment to his country house at Andover. He died there on 23 Nov. 1904 from cardiac failure due to aortic disease. He was unmarried.

Outside his purely medical work Poore was well known both to the medical profession and to the public as an ardent sanitarian. In 1891 he was general secretary of the sanitary congress. In his garden at Andover he proved that living humus had a powerful disinfecting property. In his 'Essays on Rural Hygiene' (1893), chapter iv., entitled 'The Living Earth,' he set forth this opinion with characteristic charm of style and wealth of illustration. He dealt with sanitation and with the wastefulness of the water carriage of sewage in his Milroy lectures for 1899, 'The Earth in Relation to the Destruction and Preservation of Contagia' (1902, with appendix of public addresses), and in 'The Dwelling House' (2nd edit. 1898). His views were regarded by many sanitary authorities as heretical, but he proved their practical value as far as the country dwelling was concerned.

Poore also published, together with contributions to medical journals and orations upon dietetic and sanitary matters: 1. 'Physical Diagnosis of Diseases of the Throat, Mouth, and Nose,' 1881. 2. 'London Ancient and Modern from the Sanitary and Medical Point of View,' 1889. 3. 'Nervous Affections of the Hand,' 1897.

[Lancet, 10 Dec. 1904; British Medical Journal, 3 Dec. 1904; information from friends; personal knowledge.] H. P. C.

POPE, GEORGE UGLOW (1820-1908), missionary and Tamil scholar, was born on 24 April 1820 in Prince Edward Island, Nova Scotia. His father, John Pope, born at Padstow, Cornwall, emigrated to Prince Edward Island in 1818, and in 1820 removed to Nova Scotia, where giving up trade he became a missionary; returning in 1826 to Plymouth, he there resumed his business as merchant and shipowner, and took a prominent part in municipal affairs. George's mother was Catherine Uglow of Stratton, North Cornwall. Both parents were devout Wesleyans. William Burt Pope [q. v. Suppl. II] was his younger brother. Educated at Wesleyan institutions at Bury and Hoxton, George resolved in his fourteenth year to become a missionary to the Tamil-speaking population of Southern India. He landed at Madras in 1839, having learned Tamil from books during the voyage. In 1843 he was

ordained in the Church of England, and henceforth was associated with the Society for the Propagation of the Gospel, which had recently taken over the native congregations founded by Christian Friedrich Schwartz [q. v.] and other German missionaries in the extreme south of India. During the first ten years his sphere of work was in Tinnevely. Then came a visit to England (1849-51), mostly spent at Oxford, where he came into intimate relation with Cardinal Manning, Archbishop Trench, Bishop Samuel Wilberforce, Bishop Lonsdale, Dr. Pusey, and John Keble. On his return to India there followed another ten years of missionary labour in Tanjore, during which he felt himself compelled to protest against the practices of the Lutheran missionaries of Tranquebar in the toleration of caste and native customs. At this time he founded in Tinnevely district the Sawyer-puram seminary for training native clergy, which has a Pope memorial hall and library; and also St. Peter's schools for boys (now a college) and for girls at Tanjore.

In 1859 he founded the grammar school at Ootacamund, on the Nilgiri Hills, of which he was the first headmaster; and in 1870 he was transferred to the principalship of Bishop Cotton's schools and college at Bangalore, in Mysore, where he left the reputation of severity with the cane. With both these appointments he combined clerical duty, and during this period published many educational manuals. In 1859 he became a fellow of the newly founded Madras University, for which he was a constant examiner. In 1864 the Lambeth degree of D.D. was conferred on him by Archbishop Longley. He left India finally in 1880, after forty years of active work. A short time was passed in Manchester, and then he settled at Oxford as diocesan secretary of the S.P.G. In 1884 he was appointed teacher of Tamil and Telugu in the university; in 1886 he was awarded the honorary degree of M.A.; and from 1888 he was chaplain at Balliol College, where he enjoyed the intimate friendship of two Masters, Jowett and Caird. In 1906 he received the gold medal of the Royal Asiatic Society, which is awarded every three years to an oriental scholar (cf. *Journ. Roy. Asiatic Soc.* 1906, pp. 767-790). He died at Oxford, after a brief illness, on 11 Feb. 1908, and was buried in St. Sepulchre's cemetery. His friends and pupils in India, the majority Hindus, placed by subscription a monument on his grave and founded a memorial prize for Tamil studies in the university of Madras;

a gymnasium called by his name has also been erected in Bishop Cotton's school at Bangalore.

Pope married (1) in 1841 Mary, daughter of the Rev. J. Carver; she died at Tuticorin in 1845; (2) in 1849, at Madras, Henrietta Page, daughter of G. Van Someren. She and her two daughters were awarded a joint civil list pension of 50*l.* in 1909. She died at Forest Hill, London, on 11 Sept. 1911, and is buried with her husband. Three sons won distinction in the service of the Indian government, viz. John Van Someren Pope, for seventeen years director of public instruction in Burma; Arthur William Uglow Pope, C.I.E. (1906), railway engineer and manager in India and China; and Lieut.-colonel Thomas Henry Pope, I.M.S., professor of ophthalmology at the Madras Medical College. A not very satisfactory portrait by Alfred Wolmark, painted by subscription among his Madras pupils, is in the Indian Institute at Oxford.

Pope ranks as the first of Tamil scholars, even when compared with Beschi, Francis Whyte Ellis [q. v.], and Bishop Caldwell, though he did not concern himself much with the cognate Dravidian languages. With him Tamil was the means to understand the history, religion, and sentiment of the people of Southern India. As early as 1842 he published (in Tamil) his 'First Catechism of Tamil Grammar,' which was re-issued in 1895, with an English translation, by the Clarendon Press. His educational books of this kind reached completion in the series entitled 'Handbook to the Ordinary Dialect of the Tamil Language,' which includes Tamil-English and English-Tamil dictionaries, as well as a prose reader and the seventh edition of his Tamil handbook (Oxford, 1904-6). But his reputation rests upon his critical editions of three classical works of old Tamil literature: the 'Kural' of the pariah poet Tiruvalluvar, which has supplied a metrical catechism of morality to the people of Southern India for at least a thousand years (1886); the 'Nāḷadiyār,' or four hundred quatrains of similar didactic sayings, probably of yet earlier date and of equal popularity (1893); and the 'Tiruvaṇṇam,' or sacred utterances of Manikka-Vaṇṇagar, to which is prefixed a summary of the life and legends of the author, with appendices illustrating the system of philosophy and religion in Southern India known as Saiva Siddhantam (1900). Of this last the preface is dated on the editor's eightieth birthday and the

dedication is to the memory of Jowett. All these books contain translations into English, together with copious notes and a lexicon. Apart from their erudition, they reveal Pope's warm sympathy with the people and their literature. In addition to his published books, Pope left in MS. complete editions and English translations of at least three Tamil works, as well as a vast amount of material for a standard Tamil dictionary, which it is hoped will be utilised by a committee of native scholars that has been formed at Madras. He further began about 1890 a catalogue of the Tamil printed books in the British Museum, which was carried out by Dr. L. D. Barnett. Among numerous pamphlets and sermons, published chiefly in his early days, was 'An Alphabet for all India' (Madras, 1859), a plan for adapting the Roman alphabet to all the languages of India.

Pope, whose culture was wide, was an enthusiastic student of all great literature. His favourite poet was Browning, to whose loftiness of speculation he paid tribute in his 'St. John in the Desert' (1897; 2nd edit. 1904, an introduction and notes to Browning's 'A Death in the Desert'). He knew Browning personally, and to him the poet gave the 'square old yellow book with crumpled vellum covers,' which formed the basis of 'The Ring and the Book,' and which Pope presented to the library of Balliol College. Keenly interested in all phases of philosophy and religion, he welcomed the development of modern Christian thought, but was always loyal to the Wesleyanism in which he had been brought up. His brilliant and picturesque talk bore witness to the variety of his intellectual interests and his catholicity of thought.

[Obituary by M. de Z. Wickremasinghe in *Journal of Royal Asiatic Soc.* 1908; personal reminiscences by Rev. A. L. Mayhew in *Guardian*, 26 Feb 1908.] J. S. C.

POPE, SAMUEL (1826-1901), barrister, born at Manchester on 11 Dec. 1826, was eldest son of Samuel Pope, a merchant of London and Manchester, by his wife Phebe, daughter of William Rushton, merchant, of Liverpool. After private education he was employed in business, and in his leisure cultivated in debating societies an aptitude for public speaking. Coming to London, he studied at London University, entered at the Middle Temple on 13 Nov. 1855, and was called to the bar on 7 June 1858. Deeply interested in politics, he unsuccessfully contested Stoke as a liberal

in the following year. For a few years he practised with success in his native town, but removed to London in 1865. In the same year, and again in 1868, he unsuccessfully contested Bolton. In 1869 he was however made recorder of the town and took silk. In London he soon devoted himself to parliamentary practice, for which his persuasive eloquence and commanding personality admirably fitted him. He presented complicated facts and figures simply and interestingly and in due perspective. At his death he was the leader of the parliamentary bar. He was chosen a bencher of his inn on 27 Jan. 1870, and was treasurer in 1888-9, when he made a valuable donation of books to the library.

A keen advocate of the temperance cause from youth, Pope was at his death an honorary secretary of the United Kingdom Alliance. He was a freemason, becoming senior grand deacon in grand lodge in 1886. He died at his residence, 74 Ashley Gardens, Westminster, on 22 July 1901, and was buried at Llanbedr in Merionethshire, of which county he was a J.P. and deputy lieutenant. Pope married Hannah, daughter of Thomas Bury of Timperley Lodge, Cheshire; she predeceased him without issue in 1880.

A portrait by Sir Hubert von Herkomer is in possession of the family. A loving cup with a bust of him in relief was presented to the Middle Temple in his memory by some friends (*Master Worsley's Book*, ed. A. R. Ingpen, K.C., p. 327). A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1885.

[The Times, 24 July 1901; Foster, *Men at the Bar*; *Men and Women of the Time*, 1899; Hutchinson, *Notable Middle Templars*, 1902; private information.] C. E. A. B.

POPE, WILLIAM BURT (1822-1903), Wesleyan divine, born at Horton, Nova Scotia, on 19 Feb. 1822, was younger son of John Pope, and younger brother of George Uglow Pope [q. v. Suppl. II for full parentage]. After education at a village school at Hooe and at a secondary school at Saltash, near Plymouth, William spent a year in boyhood (1837-8) at Bedeque, Prince Edward Island, assisting an uncle, a shipbuilder and general merchant. Devoting his leisure to the study of Latin, Greek, French and German, he was accepted, in 1840, by the Methodist synod of Cornwall as a candidate for the ministry, and entered the Methodist Theological Institution at Hoxton. There he added Hebrew and Arabic to his stock of languages. In 1842 he began his active

ministry at Kingsbridge, Devonshire, and served for short periods at Liskeard, Jersey, Sandhurst, Dover and Halifax, and for longer periods at City Road, London, Hull, Manchester, Leeds, and Southport.

In 1867 he succeeded Dr. John Hannah the elder [q. v.] as tutor of systematic theology at Didsbury. He received the degree of D.D. from the Wesleyan University, U.S.A., in 1865 and from the University of Edinburgh in 1877. In 1876 he visited America with Dr. Rigg as delegate to the general conference of the Methodist Episcopal church at Baltimore. In 1877 he was president of the Wesleyan conference at Bristol. He resigned his position at Didsbury in 1886. He died, after much suffering from mental depression, on 5 July 1903, and was buried in Abney Park cemetery, London.

Pope's industry was unflagging. He began his day at 4 A.M., and made notable contributions to theological literature which were deemed authoritative by his own church, while he was actively engaged in the ministry and in teaching. His chief work was the 'Compendium of Christian Theology,' in three volumes (1875; 2nd edit. 1880). In the same year appeared his Fernley lecture on 'The Person of Christ,' which was translated into German. His published collections of sermons included 'The Prayers of St. Paul' (2nd edit. 1896), and his characteristic 'Sermons, Addresses and Charges,' delivered during the year of his presidency (1878). In 1860 he became editor, having as his co-editor (1883-6) James Harrison Rigg [q. v. Suppl. II], of the 'London Quarterly Review,' to which he was already a contributor. Pope translated from the German, in whole or part, three important books for Messrs. T. and T. Clark's 'Theological Library,' Stier on 'The Words of the Lord Jesus' (1855); Ebrard on the 'Epistles of St. John' (1860); and Haupt on the 'First Epistle of St. John' (1879), and he contributed to 'Schaff's Popular Commentary' expositions of Ezra, Nehemiah (1882) and the Epistles of St. John (1883).

A portrait, painted by Mr. A. T. Nowell, was presented to Didsbury College by old students and friends in 1892.

Pope married, in 1845, Ann Eliza Lethbridge, daughter of a yeoman farmer of Modbury, near Plymouth. By her he had six sons, two of whom died in early life, and four daughters.

PORTAL, MELVILLE (1819-1904), politician, born on 31 July 1819 at his father's second seat of Freefolk Priors, Hampshire, was eldest surviving son of John Portal of Freefolk Priors and Laverstoke, Hampshire, the head of the Huguenot family of that name, by his second wife, Elizabeth, only daughter of Henry Drummond and Anne Dundas, daughter of Henry, first Viscount Melville [q. v.]. He was sent to Harrow school in 1832 to the house of Archdeacon Phelps, and left in 1837. He matriculated at Christ Church, Oxford, on 30 May 1838, graduated B.A. in 1842, and proceeded M.A. in 1844. He was treasurer in 1841 and president next year of the Union at Oxford, and was an admirer of John Henry Newman [q. v.], whom he venerated throughout life and who occasionally wrote to him (WARD, *Life of Newman*, i. 617), though Portal's convictions never advanced further towards Rome. With four other young Oxonians he provided the funds for the building of the church of Bussage, a neglected village in Gloucestershire. On 15 April 1842 he was entered a student of Lincoln's Inn, was called to the bar on 24 Nov. 1845, and went the western circuit. He succeeded to his father's estate in 1848, and on 6 April 1849 was elected M.P. for the northern division of Hampshire as a conservative with a majority of 331 over William Shaw. In July 1852 Portal was re-elected without opposition, and sat till the next general election in 1857, when he retired. His first speech in the House of Commons was on 25 March 1851, the seventh night of the debate on the ecclesiastical titles assumption bill. He described it as 'the hasty effusion of an off-handed premier' and voted against it. In 1855 he married a sister of the wife of the prime minister, Lord John Russell [q. v.], and became his friend. Portal resided constantly at Laverstoke, and from 1846, when he was appointed a county magistrate, took a prominent part in the judicial and administrative work of the county; in 1863 he was high sheriff. He was chairman of the judicial business (1865-89) and was chairman of quarter sessions (1879-1903), during which time he reformed the treatment of prisoners in the county goal and introduced arrangements since adopted throughout England. In 1871 Portal persuaded the quarter sessions to order the restoration of the great hall of the castle of Winchester, where the assizes were held, and the work was carried out under his supervision. He published in 1899 'The Great Hall of

Winchester Castle,' a quarto containing the history and architectural description of the castle, which he had written and illustrated in memory of fifty years' familiar intercourse with friends within its walls. He died at Laverstoke on 24 Jan. 1904, and was buried in the mortuary chapel in Laverstoke park. His life was spent in laborious and disinterested public service. His portrait by Archibald Stuart Wortley was presented to the county by members of the court of quarter sessions on 13 Oct. 1890, and is in the great hall at Winchester. He married on 9 Oct. 1855 Lady Charlotte Mary, fourth daughter of Gilbert Elliot, second earl of Minto [q. v.]. She died on 3 June 1899. They had three sons, of whom the second was Sir Gerald Herbert Portal [q. v.], and three daughters.

POTT, ALFRED (1822-1908), principal of Cuddesdon College, born on 30 Sept. 1822 at Norwood, was the second son of Charles Pott of Norwood, Surrey, and Anna, daughter of C. S. Cox, master in chancery. Educated at Eton under Edward Craven Hawtrej [q. v.], he matriculated at Balliol College, Oxford, on 16 Dec. 1840. Having been elected to a demyship at Magdalen College in 1843, he graduated B.A. in 1844 with a second class in literæ humaniores, and next year he won the Johnson theological scholarship. He proceeded M.A. in 1847, and B.D. in 1854. He was ordained deacon in 1845 and priest in the following year. He became curate of Cuddesdon, and in 1851 vicar on the nomination of Bishop Samuel Wilberforce [q. v.]. In 1853 he was elected a fellow of Magdalen College; and in 1854 he was appointed first principal of the new theological college at Cuddesdon. Here he laid down the lines upon which the college was subsequently carried on. But he was somewhat overshadowed by his vice-principal, Henry Parry Liddon [q. v.], and he resigned owing to ill-health shortly after Charles Pourtales Golightly [q. v.] had called attention to the extreme high church practices of the Cuddesdon system. In 1858 he accepted the living of East Hendred, Berkshire, becoming vicar of Abingdon in 1867. Bishop Wilberforce appointed Pott one of his examining chaplains, made him hon. canon of Christ Church in 1868, and in 1869 preferred him to the arch-

deaconry of Berkshire. Pott subsequently held the benefices of Clifton-Hampden (1874-82) and of Sonning (1882-99). He resigned the archdeaconry in 1903, but retained his hon. canonry. In convocation Pott was a recognised authority on ecclesiastical law; and as archdeacon he showed wisdom and judgment. Although a high churchman he enjoyed the friendship of men of widely divergent opinions. He died at Windlesham, Surrey, on 28 Feb. 1908, and was buried at Clifton-Hampden. In 1855 he married Emily Harriet (*d.* 1903), daughter of Joseph Gibbs, vicar of Clifton-Hampden.

Besides sermons and charges, Pott published: 1. 'Confirmation Lectures delivered to a Village Congregation,' 1852; 5th edit. 1886. 2. 'Village Lectures on the Sacraments and Occasional Services of the Church,' 1854.

G. S. W.

POWELL, FREDERICK YORK (1850-1904), regius professor of modern history at Oxford, born on 14 Jan. 1850 at 33 Woburn Place, Bloomsbury, was eldest child and only son of Frederick Powell, by his wife Mary (*d.* 1910), daughter of Dr. James York (*d.* 1882), 'a very clever and good physician and a pretty Spanish scholar and a handsome man.' His father, a commissariat merchant, who had an office in Mincing Lane, came of a south Wales family, and the son was proud to call himself a Welshman. Much of Powell's early life was spent at Sandgate, where he learned to love the sea and developed enduring friendships with the fisher folk. In the autumn of 1859 he was put to a preparatory school at Hastings (the Manor House, kept by Mr. Alexander Murray). In 1864 he entered Dr. Jex Blake's house at Rugby, but though he gained a name for 'uncanny stories and remote species of knowledge,' he never rose above the lower fifth and left, chiefly for reasons of health, in July 1866. The next two years were fruitfully spent in travel and self-education. There was a visit to Biarritz, and a tour in Sweden which gave Powell, who had read Dasent's story of 'Burnt Njal' at Rugby, occasion to learn and practise a Scandinavian tongue. At

eighteen he was placed under the care of Mr. Henry Tull Rhoades at Bonchurch, and began to work at Old French, German, and Icelandic. He was already a strong socialist and agnostic, and had formed most of the tastes and prejudices which accompanied him through life—an interest in old armour, a special attraction for the art of William Blake, a passion for northern and medieval literature, and an aversion from philosophy, excepting always the work of Kant and Schopenhauer.

Powell went to Oxford in 1868, and after a year spent with the non-collegiate students was received into Christ Church, on the recommendation of Dr. George William Kitchen, censor of the non-collegiate body and formerly student and tutor of Christ Church. He gained a first class in the school of law and modern history in Trinity term 1872. After graduating B.A., Powell spent two years (1872-4) at his father's house in Lancaster Gate. He had entered at the Middle Temple on 8 Nov. 1870, and was called to the bar on 6 June 1874.

Powell's first academic appointment was to teach one of the few subjects in which he had no enthusiastic interest. In 1874 he was appointed to a lectureship in law at Christ Church, and save for a year's interlude as history lecturer at Trinity—an engagement terminated owing to the representation of some of his pupils who wished to be crammed for examinations—Powell's official teaching in Oxford was, until 1894, confined to the uncongenial subjects of law and political economy. He had however attracted the attention of Mandell Creighton [q. v. Suppl. I], one of his examiners in the schools, and was invited to contribute a volume on Early England to Longman's 'Epochs of English History,' of which Creighton was editor. The book, 'Early England to the Norman Conquest,' which was published in 1876, delighted Creighton, who pronounced it to be written 'in a charmingly simple, almost Biblical style.' Meanwhile, in 1869, Powell had met Gudbrandr Vigfusson [q. v.], who had come to Oxford in 1866 to edit the 'Icelandic-English Dictionary' for the Oxford Press. In 1877 Powell was already engaged with Vigfusson upon the Prolegomena to an edition of the 'Sturlunga Saga,' 'taking down across the table,' said Vigfusson, 'my thoughts and theories, so that though the substance and drift of the arguments are mine, the English with the exception of bits and phrases here and there is Mr. Powell's throughout.' An 'Icelandic Prose Reader,' the notes to which were mainly the

work of Powell, followed in 1879, and two years later the 'Corpus Poeticum Boreale,' an edition of the whole of 'Ancient Northern Poetry,' with translations and a full commentary. The translations were provided by Powell and exhibited his easy command of a fresh, manly English style.

The first volume contains the old mythical and heroic poetry—the poems of the 'Elder Edda' and other pieces of like character. The second volume is a collection of the poems written, chiefly by Icelanders, in honour of successive kings of Norway and other important personages. It is here that Powell's work is most valuable in illustration of Scandinavian history. The poems are those which were used as authorities by the early historians of Norway (such as Snorre Sturluson); the introductions to the different sections, in the second volume of the 'Corpus,' containing biographical notices of the poets, form the only original work in English on this portion of Scandinavian history. It is hardly possible to describe the extraordinary variety of contents in the editorial part of the two volumes—essays on mythology and points of literary history, often venturesome and always full of life.

The 'Corpus Poeticum Boreale' at once made Powell's name as a northern scholar and was intended to be the prelude to an even more ambitious work. In August 1884 Powell spent a fortnight with Vigfusson in Copenhagen examining Icelandic manuscripts, with the view to an edition and translation of the best classics in the northern prose, a proposal for which had been submitted to the Clarendon Press. The work was steadily pushed on and most of the 'Origines Islandicæ' was already in proof when Vigfusson died in 1889. So long as Vigfusson was alive Powell was kept steadily working at his Scandinavian task, but with the removal of his friend and associate the passion for miscellaneous reading gained the ascendant, with the result that the work was never pushed to a conclusion and was only published in 1905 after Powell's death. Here, as before, the labour of the two fellow-workers is often indistinguishable. The text of the prose sagas is substantially the work of Vigfusson, 'the ordering, the English, and many of the literary criticisms, portraits, and parallels are Powell's' (ELTON, i. 101). But though Vigfusson was the leading partner in these northern expeditions, Powell's assistance was substantive and essential, adding as it did to

the fine technical scholarship of the Icelandic patriot a wide knowledge of medieval history and literature and a simple nervous English exactly adapted to its purpose.

Meanwhile, in 1884, through the good offices of Dean Liddell, Powell had been made a student of Christ Church. His official duties as law lecturer were to coach men for the law school, to look after Indian civil service candidates, and to lecture on pass political economy. His real and congenial avocations extended far beyond this narrow circuit. Besides his work on Scandinavian literature, he taught Old English, Old French, and even for a time Old German, for the Association for Education of Women in Oxford, took a leading share in founding the 'English Historical Review' (1885), and published a history of 'England from the Earliest Times to the Death of Henry VII' (1885), designed for 'the middle forms of schools,' which is remarkable for its fresh use of chronicles, ballads, and romances, and for its insight into the material fabric of medieval civilisation. Then a valuable series of little books, 'English History from Contemporary Writers,' began under his editorship in 1885.

Thus Powell built for himself a reputation as one of the most profound scholars in medieval history and literature in England, and, accordingly, no surprise was felt when upon the death of James Anthony Froude [q. v. Suppl. I] in 1894, and upon the refusal of Samuel Rawson Gardiner [q. v. Suppl. II] to come to Oxford, the regius professorship of modern history was conferred on Powell on the recommendation of Lord Rosebery (Dec. 1894). The post was accepted with misgivings. Powell had no gift either for public lecturing or for organisation. He was shy of an audience which he did not know, and although both in his inaugural lecture and upon subsequent occasions he pleaded for the scientific treatment of history, for the training of public archivists, for the divorce of history and ethics, his practice was consistently better or worse than his theory, and his numerous articles contributed to the press abound in the vigorous ethical judgments which were the necessity of his strong temperament.

As professor of history Powell disappointed some of his friends. He made no special contribution to the advance of historical science, and failed to make any general impression upon the undergraduates as a teacher. Indeed, from his fortieth year to the end of his life he

published only two works, a translation of the 'Færeyinga Saga' (1896), dedicated jointly to Henry Liddell, dean of Christ Church, and Henry Stone, an old fisherman at Sandgate, and a rendering of some quatrains from 'Omar Khayyám' (1901). His services to knowledge cannot however, be measured by the ordinary tests. Powell was the most generous as well as the most unambitious of men. His time was his friends' time, and the hours which might have been spent upon his own work were freely lavished upon the assistance of others. Thus the edition of the mythical books of 'Saxo Grammaticus,' translated by Professor Elton, was due to his suggestion, and the bulk of the introduction was his work; and again as delegate of the Clarendon Press, an office which he held from 1885 till his death, Powell was able to render services to the advancement of learning which were none the less substantial because they were unadvertised. As professor he regularly lectured in his rooms at Christ Church on the sources of English history, and on every Thursday evening was at home to undergraduates, and here, as on any other informal occasion, he was an unfailing source of inspiration. In his pleasant rooms in the Meadow Buildings of Christ Church, with their stacks of books and Japanese prints, his shyness would disappear and he would discourse freely on any subject which came up, from boxing and fencing (of which he was an excellent judge) to the last Portuguese novel. His knowledge of foreign, especially of Romance, literature was singularly wide. He brought Verlaine to lecture in Oxford in 1891, and as a curator of the Taylorian Institute (from 1887) procured an invitation to Stéphane Mallarmé to give a lecture at the Taylorian on 28 Feb. 1894. The Belgian poet Verhaeren and the French sculptor Rodin were likewise at different times Powell's guests at Christ Church. He had also worked at Old Irish, and as one of the presidents of the Irish Texts Society urged in 1899 the importance of publishing the MS. Irish literature of the sixteenth, seventeenth and eighteenth centuries. On 7 April 1902 he lectured in Dublin to the Irish Literary Society on Irish influence in English literature, and in December of the same year went to Liverpool to speak for the endowment of Celtic studies in the university. Meanwhile, he was becoming a student of Persian, had dived into Maori and Gypsy, and had made a valuable collection of Japanese prints. Rumour

asserted that he contributed to the 'Sporting Times,' and he was certainly as well acquainted with the boxing reports in the 'Licensed Victuallers' Gazette' as with the 'Kalevala' or 'Beowulf.' With all this he found time to write numerous reviews for the daily and weekly press, principally for the 'Academy,' and after 1890 for the 'Manchester Guardian' (see extracts in ELTON's *Biography*). Another side of Powell's versatile nature is illustrated by the preface which he wrote to a penny garland of songs of labour, written by his friend William Hines (1893), chimney sweeper, herbalist, and radical agitator, of Oxford, and by the active share which he took in the foundation of Ruskin College, an institution devised to bring working men to Oxford. Powell, who had the genius for making friends among the poor, presided over the inaugural meeting at the town hall on 22 Feb. 1899, and acted from the first as a member of the council of the college. In religion Powell described himself as a 'decent heathen Aryan,' in politics as 'a socialist and a jingo.' He was a strong home ruler, an advocate of the Boer war, and the first president of the Oxford Tariff Reform League. He was made hon. LL.D. of Glasgow in 1901.

In 1874 Powell married Mrs. Batten, a widow with two young daughters. Mrs. Powell did not live in Oxford. It was Powell's habit for many years to spend the middle of the week during term time in Oxford and the week-end with his family in town. In January 1881 he moved his household from 6 Stamford Green West, Upper Clapton, where he had resided since his marriage, to Bedford Park, then 'an oasis of green gardens and red houses' and the resort of painters, players, poets, and journalists, where he resided till 1902. Here his only child, a daughter, Mariella, was born in 1884. Four years later Powell lost his wife. In the summer of 1894 he visited Ambleuse on the coast of Normandy for the first time, and for the next ten years was 'a centre at the Hôtel Delpierre' during the summer season. Many of his graphic letters and poems refer to the delights of Ambleuse, where he developed a taste for sketching. In December 1902 Powell gave up his London house and settled in North Oxford with his daughter. The next year came warnings of heart trouble. He died on 8 May 1904 at Staverton Grange, Woodstock Road, Oxford. He was buried at Wolvercote cemetery, without religious rites by his own desire. His daughter was granted

a civil list pension of 70*l.* in 1905, and married Mr. F. H. Markoe in Christ Church cathedral, on 6 July 1912.

Oil-portraits by J. B. Yeats and J. Williamson are in the possession of his daughter. He also figures in a caricature by 'Spy' in 'Vanity Fair' (21 March 1895) and in William Rothenstein's 'Oxford Sketches.'

In appearance and dress Powell resembled a sea-captain. He was broad, burly and bearded, brusque in manner, with dark hair and eyes, and a deep rich laugh: in temperament an artist and a poet, in attainments a scholar, as a man simple, affectionate, observant, with rare powers of sensitive enjoyment, the delight of his friends, clerk and lay, rich and poor, and the centre of many clubs both in Oxford and London. In the sphere of learning he will chiefly be remembered for his published services to northern literature, and for the general stimulus which he gave to the study of medieval letters in Great Britain.

Besides the works mentioned, Powell published 'Old Stories from British History' (1882; 3rd edit. 1885; new impression 1903), and contributed with Vigfusson to the Grimm Centenary: 'Sigfred-Arminius and other Papers' (1886). He wrote several articles for this Dictionary, including a memoir of Vigfusson. Some chapters from his pen are included in W. G. Collingwood's 'Scandinavian Britain' (1908).

P. Ker; private knowledge.]

H. A. L. F.

PRATT, HODGSON (1824-1907), peace advocate, born at Bath on 10 Jan. 1824, was eldest of five sons of Samuel Peace Pratt by his wife Susanna Martha Hodgson (d. 1875). After education at Haileybury College (1844-6), where he won a prize for English essay in his first term, he matriculated at London University in 1844. In 1847 he joined the East India Company's service at Calcutta, subsequently becoming

under-secretary to the government of Bengal and inspector of public instruction there.

While in India Pratt showed much sympathy with the natives, stimulating the educational and social development of the province of Bengal, and urging on the Bengalis closer relations with English life and thought. In 1851 he helped to found the 'Vernacular Literature Society' which published Bengali translations of standard English literature, including Macaulay's 'Life of Clive,' 'Robinson Crusoe,' Lamb's 'Tales from Shakespeare,' and selections from the 'Percy Anecdotes' (see *Reports of Transactions*, 1854-7). Pratt acted as secretary till 1856. He also started a school of industrial art. In 1857 Pratt was at home on leave and at the close of that year he contributed to the 'Economist' articles and letters dealing with Indian questions, social, political, educational, and religious, which were published collectively in a pamphlet. The spread of the Indian Mutiny recalled Pratt hurriedly to India, which he left finally in 1861.

Settling in England Pratt immediately threw himself into the industrial co-operative movement, in association with Vansittart Neale, Tom Hughes, and George Jacob Holyoake. He met Henry Solly in 1864 and became a member of the council of the Working Men's Club and Institute Union (founded by Solly in June 1862). In its interest he travelled up and down the country, encouraging struggling branches and forming new ones (see PRATT's *Notes of a Tour among Clubs*, 1872). He was president from 1885 to 1902. With Solly he also started trade classes for workmen in St. Martin's Lane in 1874. In 1867 he was a vice-president with Auberon Herbert, W. E. Forster, George Joachim Goschen, and others of the Paris Excursion Committee, through whose efforts over 3000 British workmen visited the Paris Exhibition of that year (see PRATT's preface to *Modern Industries: Reports by 12 British Workmen of the Paris Exhibition*, 1868).

At the same time Pratt, who had a perfect command of French, was an ardent champion of international arbitration. On the outbreak of the Franco-Prussian war of 1870 he pleaded for the peaceful settlement of the dispute. Two years later he joined in an appeal to M. Thiers, the French premier, for the release of Elisée Reclus, the geographer, who had thrown in his lot with the Commune, and had been taken prisoner (EUGENE OSWALD, *Reminiscences of a Busy Life*, pp. 518-21). In 1880 he joined William

Phillips and others in founding the International Arbitration and Peace Association, becoming first chairman of the executive committee. Four years later (1 July 1884) he founded, and for some time edited, the association's 'Journal' (still continued under the title of 'Concord'). In behalf of the association he visited nearly all the countries of Europe and helped largely in the formation of many kindred Continental societies—in Belgium, Italy, Germany, Austria, and Hungary. He took part in many international peace congresses at Paris and elsewhere from 1889 onwards. For the association Pratt translated Elie Ducommun's 'The Programme of the Peace Movement' (1896) and he summarised in English Descamps's 'The Organisation of International Arbitration' (1897). Pratt's persuasive advocacy of international arbitration and industrial co-operation bore good fruit, and his work was appreciated by governments and peoples at home and abroad. But his disinterested and retiring disposition withheld from him any general fame. On his friends' recommendation his claims to the Nobel Peace Prize were considered in Dec. 1906, when the award was made to Theodore Roosevelt. A few years before his death Pratt grew convinced that the only complete solution of industrial and social problems lay in socialism.

Pratt, who suffered much from defective eyesight, spent the last years of his life at Le Pecq, Seine et Oise, France, where he died on 26 Feb. 1907. He was buried in Highgate cemetery. He married (1) in 1849 Sarah Caroline Wetherall, daughter of an Irish squire; and (2) in 1892 Monica, daughter of the Rev. James Mangan, D.D., LL.D. She survived him with one daughter. A portrait in oils by Mr. Felix Moscheles hangs at the Club and Institute Union, Clerkenwell Road, London. The Annual Hodgson Pratt Memorial Lecture and travelling scholarship for working men, as well as prizes, were established in 1911.

[Concord, March 1907; The Times, 5 March and 14 Nov. 1907; Henry Solly, *These Eighty Years*, 1893, ii. 243-4, 434 seq.; B. T. Hall, *Our Fifty Years* (Jubilee History of the Working Men's Club), 1912; Frédéric Passy, *Pour la paix*, 1909, p. 113; Memorials of Old Haileybury College, 1894; information from Mr. J. F. Green and Mr. J. J. Dent.] W. B. O.

PRATT, JOSEPH BISHOP (1854-1910), engraver, son of Anthony Pratt, a printer of mezzotints, by his wife Ann Bishop, was born at 4 College Terrace, Camden New Town, London, N., on 1 Jan. 1854. In 1868

he was apprenticed to David Lucas, with whom he remained five years. The first plate for which he received a commission, 'Maternal Felicity,' after Samuel Carter, was published in Dec. 1873. For the firms of Agnew, Graves, Lefèvre, Leggatt, and Tooth he engraved many plates of animal subjects after Landseer, Briton Rivière, Peter Graham, Rosa Bonheur, whom he visited at Fontainebleau, and others; these were varied occasionally by figure subjects and landscapes after Constable and Cox. Pratt's early engravings were chiefly in the 'mixed' manner, a combination of etching, line work and mezzotint, but a second period in his career began in 1896, from which date he confined himself to pure mezzotint, and almost exclusively to subjects after the English painters of the Georgian era, who had then come into fashion. Plates commissioned in that year and published in 1897 by Messrs. Agnew after Raeburn's 'Mrs. Gregory' and Lawrence's 'Mrs. Cuthbert' met with great success, and Pratt was thenceforth much employed by the same firm in engraving pictures by Gainsborough, Reynolds, Romney, Hoppner, and their contemporaries. In doing so, he limited himself to subjects that had not been engraved before. He continued to engrave for Messrs. Tooth a series of subjects after Peter Graham, R.A., and he was selected by Sir Luke Fildes, R.A., to engrave the state portraits of Edward VII (1902) and Queen Alexandra (1906). One of his last important plates, 'The Countess of Warwick and her Children,' after Romney, was published by Messrs. P. and D. Colnaghi in 1909. Pratt purchased from the widow of Thomas Oldham Barlow [q. v. Suppl. I], their late possessor, the set of mezzotinter's tools that had been used by Samuel Cousins. Exhibitions of Pratt's engravings held by Messrs. Agnew at Manchester and Liverpool in 1902, and by Messrs. Vicars in Bond Street in 1904, proved him to be the foremost reproductive engraver of his time. A considerable, though incomplete, collection of his work is in the British Museum. Pratt long resided at Harpenden, Hertfordshire, but removed in 1907 to Brenchley, Kent. Pratt died in London, after an operation, on 23 Dec. 1910. He had six children by his marriage, on 26 August 1878, to Caroline Almader James, who survived him; his eldest son, Stanley Claude Pratt, born on 9 June 1882, an engraver, was pupil of his father; his first plate was published in 1904.

1 Jan. 1911; Exhibition Catalogues; lists of the Printsellers' Association; private information.] C. D.

PRICE, FREDERICK GEORGE HILTON (1842-1909), antiquary, born in London on 20 Aug. 1842, was son of Frederick William Price (for many years partner and eventually chief acting partner in the banking firm of Child & Co.), who died on 31 Jan. 1888. Educated at Crawford College, Maidenhead, he entered Child's Bank in 1860, where he succeeded his father as chief acting partner. Much of his early leisure was devoted to the history of Child's Bank, and in 1875 he published 'Temple Bar, or some Account of Ye Marygold, No. 1 Fleet Street' (2nd edit. 1902), where Child's Bank had been established in the seventeenth century. In 1877 he brought out a useful 'Handbook of London Bankers' (enlarged edit. 1890-1). He was a member of the Council of the Bankers' Institute and of the Central Bankers' Association.

Price's life was mainly devoted to archaeology. Always keenly interested in the prehistoric as well as historic annals of London, he formed a fine collection of antiquities of the stone and bronze ages, of the Roman period, of Samian ware vessels imported during the first and second centuries from the south of France, English pottery ranging from the Norman times down to the last century, tiles, pewter vessels and plates, medieval ink-horns, coins, tokens (many from the burial pits on the site of Christ's Hospital), and so forth; the whole of his collection was secured to form in 1911 the nucleus of the London Museum at Kensington Palace (*The Times*, 25 March 1911).

Excavations at home and abroad had a great fascination for Price. He took a leading part in the excavation of the Roman villa at Brading in the Isle of Wight, the remains of which were by his exertions kept open to the public for some time, and on which, in conjunction with Mr. J. E. Price, he read a paper before the Royal Institute of British Architects on 13 Dec. 1880 (printed in the *Transactions* of that society, 1880-1, pp. 125 *seq.*). On the excavations at Silchester or Calleva Atrebatum (of the research fund of which he was treasurer) he read a paper at the Society of Antiquaries on 11 Feb. 1886 (printed in *Archæologia*, l. 263-280). At the same time he actively engaged in studying and collecting Egyptian antiquities. In 1886 he described a portion of

his collection in the 'Proceedings of the Society of Biblical Archaeology' (of which he was elected member in 1884, vice-president in 1901); a large selection from his collection was exhibited at the Burlington Fine Arts Club in 1895, and two years later he published an elaborate Catalogue of his Egyptian antiquities, which was followed in 1908 by a supplement. In 1905 he was elected president of the Egypt Exploration Fund (which he joined in 1885).

Price was deeply interested in the Society of Antiquaries, of which he became a member on 19 Jan. 1882. He was elected director on 23 April 1894, retaining the post till his death. A keen numismatist, he joined the Royal Numismatic Society in 1897. He was also elected fellow of the Geological Society in 1872. He was a voluminous contributor to the *Transactions* and *Proceedings* of most of the societies and institutions to which he belonged (cf. G. L. GOMME's *Index of Archaeological Papers*, 1663-1890, pp. 617-8 and *Annual Indexes of Archaeological Papers*, 1891 *et seq.*). A valuable series of illustrated papers on 'Signs of Old London' appeared in the succeeding issues of the 'London Topographical Record' (ii.-v.).

He died at Cannes on 14 March 1909, after an operation, and was buried at Finchley (in the next grave to his father). He bequeathed 100*l.* to the Society of Antiquaries for the Research Fund. His books, coins, old spoons, and miscellaneous objects of art and vertu fetched at auction (1909-1911) the sum of 2606*l.* 10*s.* 6*d.* His Egyptian collection realised 12,040*l.* 8*s.* 6*d.* at Sotheby's on 12-21 July 1911 (see *The Times*, 6 June 1911). The same firm sold his coins on 17-19 May 1909 and 7-8 April 1910, 575 lots realising 2309*l.* 9*s.* He married in 1867 Christina, daughter of William Bailey of Oaken, Staffordshire, who survived him, and by whom he had one son and one daughter.

In addition to works already mentioned Hilton Price edited 'Sketches of Life and Sport in S.E. Africa' (1870) and wrote 'The Signs of Old Lombard Street' (1887; revised edit. 1902) and 'Old Base Metal Spoons' (1908).

[Who's Who, 1909; *The Times*, 18 March 1909; *Athenæum*, 20 March 1909; *Proc. Soc. of Antiquaries*, second series, xxii. 444, 471-2; *London Topographical Record*, vi. 1909, pp. 107-8.] W. R.

PRICE, THOMAS (1852-1909), premier of South Australia, born at Brymbo near Wrexham; North Wales, on 19 Jan.

1852, was son of John Price by his wife Jane. Spending his childhood in Liverpool, he was educated at a penny school there, and then followed the trade of stonemason, taking an interest in public matters and adopting the temperance cause as an ardent Reebabite. Ordered to Australia for his health in 1883, he landed at Adelaide at a time when there was much difficulty in getting employment. He was temporarily employed as clerk of works at the government locomotive shops at Islington. Returning to his old calling of stonemason, he long worked on the new parliament buildings at Adelaide, then in course of erection, in which he afterwards sat as premier. In 1891 he became secretary of the Masons' and Bricklayers' Society in South Australia, and in 1893 he entered the House of Assembly of the colony as member for Starb in the labour interest. That constituency he represented until 1902, when he was elected for the re-formed district of Torrens. Of the labour party he became secretary in 1900 and parliamentary leader in 1901. In July 1905 he was chosen premier of South Australia, combining with it the duties of commissioner of public works and minister of education, and being the first labour premier of an Australian state, though the commonwealth had for four months in 1904 had a labour prime minister in Mr. Watson. Price held the office of premier until his death, nearly four years later. His cabinet was a coalition of liberal and labour members, and his capacity for leadership held it well together. Price was a man of the most kindly character: he had a strong sense of humour and an abundance of rugged eloquence. He was one of the few parliamentary speakers who are known to have changed votes and decided the fate of a measure by power of speech. During his premiership he was responsible for Acts relating to wages boards, municipalisation of the tramway system, which had previously been in the hands of seven companies, reduction of the franchise for the upper house, and the transfer of the northern territory to the commonwealth. The transfer of the territory, however, did not take place in his lifetime, as the commonwealth parliament only passed the necessary legislation for the purpose in the session of 1910. He died at the height of his popularity at his house at Hawthorn, near Adelaide, on 31 May 1909, and was buried in the West Terrace cemetery at Adelaide. He married on 14 April 1881 Anne Elizabeth, daughter of Edward Lloyd,

timber merchant, of Liverpool, and had issue four sons and three daughters. A portrait in oils, painted by Mr. Johnstone, was presented to the Walker Art Gallery at Liverpool in 1908; a replica is in the Adelaide Art Gallery.

[Johns's Notable Australians; The Times, 1 June 1909; private sources.] C. P. L.

PRINSEP, VALENTINE CAMERON, known as VAL PRINSEP (1838-1904), artist, born at Calcutta on St. Valentine's Day, 14 Feb. 1838, was second son of Henry Thoby Prinsep [q. v.], Indian civil servant and patron of artists, by his wife Sara Monckton, daughter of James Pattle. His mother, who was of French descent, was, like her six sisters, singularly handsome.

At an early age Valentine was sent to England to be educated, and with a view to the Indian civil service went to Haileybury. But close intimacy in youth with George Frederick Watts [q. v. Suppl. II] who for five and twenty years lived with his parents at Little Holland House and painted portraits of all the members of the family, and contact at weekly gatherings there with many celebrated artists, encouraged in Prinsep a taste for art, and giving up a nomination for the civil service, he resolved to adopt the profession of an artist. He went out with Watts in 1856-7 to watch Sir Charles Newton's excavation of Halicarnassus. After studying under Watts he proceeded to Gleyre's atelier in Paris. There Whistler, Poynter, and du Maurier were among his fellow students, and he sat unconsciously as a model for Taffy in du Maurier's novel 'Trilby.' From Paris Prinsep passed to Italy. With Burne-Jones he visited Siena and there he made the acquaintance of Robert Browning, of whom he saw much in Rome during the winter of 1859-60.

Friendship with Dante Gabriel Rossetti at first inclined him to Pre-Raphaelitism, but he soon came under the influence of another friend, Sir Frederic (afterwards Lord) Leighton, with whose work his own had much affinity. In 1858 he was one of the eight painters who under the direction of Rossetti and William Morris decorated the new hall of the Union Society at Oxford. In 1862 he exhibited at the Royal Academy his first picture, 'How Bianca Capello sought to poison the Cardinal de Medici'; it was well placed. From that time to his death Prinsep was an annual exhibitor. Prinsep's chief paintings were 'Miriam watching the Infant Moses' (exhibited at the Royal

Academy in 1867), 'A Venetian Lover' (1868), 'Bacchus and Ariadne' (1869), 'News from Abroad' (1871), 'The Linen Gatherers' (1876), 'The Gleaners,' and 'A Minuet.'

In 1876 he received a commission from the Indian government to paint a picture of the historical durbar held by Lord Lytton for the proclamation of Queen Victoria as Empress of India. The result was one large canvas and a number of smaller works on Eastern subjects. The chief picture, called 'At the Golden Gate' (1882), is a good example of Prinsep's work; it is in the possession of the family.

Prinsep was elected A.R.A. in 1878 and R.A. in 1894. His diploma picture, 'La Révolution,' was exhibited in 1896.

He died at Holland Park on 11 Nov. 1904, and was buried at Brompton cemetery. He married in 1884 Florence, daughter of Frederick Robert Leyland of Wootten Hall, Liverpool. She survived him with three sons.

Prinsep possessed versatile accomplishments, social gifts, great physical strength, and after his marriage ample means. He was a major of the artists' volunteer corps. He published an account of his visit to India under the title 'Imperial India: an Artist's Journals' (1879). Two plays by him, 'Cousin Dick' and 'M. le Duc,' were produced respectively at the Court Theatre in 1879 and at the St. James's in 1880. He was also author of two novels, 'Virginie' (1890) and 'Abibal the Tsourian' (1893). His painting never had much passion or power. His interests were too dispersed to enable him to become a great artist.

His portrait, painted in 1872 by G. F. Watts, R.A., belongs to his family. A statuette by E. Roscoe Mullins was exhibited at the Royal Academy in 1880. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1877.

[Mag. of Art, 1883 (woodcut portrait by A. Legros) and 1905; The Times, 14 Nov. 1904; Graves's Royal Acad. Exhibitors, 1906; Mrs. Orr, Life of Robert Browning, 1908, pp. 224 seq.; private information.]

F. W. G.-N.

PRIOR, MELTON (1845-1910), war artist, born in London on 12 Sept. 1845, was son of William Henry Prior (1812-1882), a draughtsman and landscape painter, by his wife Amelia. Educated at St. Clement Danes grammar school, London, where he attended art classes, and at Blériot College, Boulogne, he helped his father, and thus first developed his own artistic powers. He began working for the 'Illustrated London News' in 1868, and after spending five years in

sketching for the paper in England, he first acted as war correspondent in 1873, when the proprietor, Sir William Ingram, sent him to Ashanti with Sir Garnet (afterwards Lord) Wolseley's expedition. Thenceforth for thirty years he was similarly engaged for the 'Illustrated London News' with little intermission. In 1874 he proceeded to Spain to sketch incidents in the Carlist rising, and in 1876 to the Balkan peninsula, where he campaigned with the Austrians in Bosnia, followed the fortunes of the Servians in their short war with Bulgaria, and went through the Turco-Russian war. Prior watched the long series of campaigns in South Africa (1877-1881), including the Kaffir, Basuto and Zulu wars, and the Boer campaign which culminated at Majuba Hill (27 Feb. 1881). On 14 Sept. 1882 he was present with the English army on its entry into Cairo, was with Baker Pasha's army at El Teb (29 Feb. 1884), accompanied Lord Wolseley's relief expedition up the Nile (1884-5), and was with Sir Gerald Graham [q. v. Suppl. I] in his campaign in the Soudan early in 1885. From the Soudan he passed to Burma, where (Sir) Frederick (afterwards Earl) Roberts was engaged in active warfare (1886-7). The successive revolutions in Brazil, Argentine and Venezuela kept him much in South America between 1889 and 1892. Trouble in the Transvaal recalled him to South Africa in 1896; he went through the Greco-Turkish war, and the north-west frontier war in India next year, and saw the Cretan rising in 1898. When the South African war opened in October 1899 Prior went out with the first batch of correspondents, and was with the British besieged force in Ladysmith (2 Nov. 1899-28 Feb. 1900). In 1903 he was with the Somaliland expedition. His last campaign was the Russo-Japanese war, when he accompanied General Oku's army into the Liao-tung Peninsula (July 1904). Prior's many journeys to illustrate great social ceremonials included a visit to Athens in 1875 in the suite of King Edward VII when Prince of Wales, to Canada with King George V when Prince of Wales in 1901, and to the Delhi Durbar of 1903.

He twice went round the world, and every part of America was familiar to him. During his active career he only spent the whole of one year (1883) at home. Besides his drawings for the 'Illustrated London News' he occasionally made illustrations for the 'Sketch,' a paper under the same control. Prior's art, if not of the highest order, was eminently graphic, and he had a keen eye for a dramatic situation. He worked

almost entirely in black and white, with the pen or the pencil, and with extraordinary rapidity. He belonged to the adventurous school of war correspondents, of which Archibald Forbes [q. v. Suppl. I] was the leading spirit. In character he was genial, kind-hearted, and impulsive.

He died without issue on 2 Nov. 1910, at Carlyle Mansions, Chelsea, and was buried at Hither Green cemetery. He was twice married: (1) in 1873, to a daughter (d. 1907) of John Greeves, surgeon; (2) in 1908 to Georgina Catherine, daughter of George MacIntosh Douglas. A portrait of Prior, painted by Frederick Whiting, is at the Savage Club. A tablet to his memory in the crypt of St. Paul's Cathedral was unveiled by Sir Evelyn Wood on 22 Oct. 1912.

[Prior's Campaigns of a War Correspondent, ed. S. L. Bensusan, 1912; Mag. of Art, 1902; Art Journal, 1910; The Times, 3 Nov. 1910; private information.] F. W. G.-N.

PRITCHARD, SIR CHARLES BRADLEY (1837-1903), Anglo-Indian administrator, born at Clapham on 5 May 1837, was eldest son of Prof. Charles Pritchard (1808-1893) [q. v.] by his first wife Emily, daughter of J. Newton. After early education by his father he entered Rugby in 1849, and was transferred to Sherborne in 1852. Obtaining a nomination to the Indian army, he went to Addiscombe in 1854, but securing a writership in the Indian civil service, he completed his education at Haileybury.

On his arrival at Bombay in Jan. 1858 Pritchard first served as assistant magistrate and collector at Belgaum, and did useful work in freeing the district of bandits. In 1865 he was put in charge of the Thana district, and carried on a successful crusade against a system of frauds on the forest department. Nominated to the province of Khandesh in 1867, he was active in checking the enslavement of the native Bhils by the moneylenders, and in organising relief measures during the famine of 1868. The trenchant manner in which he dealt with frauds in the public departments led to his appointment as first collector of salt revenue in the Bombay presidency. In this capacity Pritchard reformed the administration, suppressed smuggling, and established a large salt factory at Kharghoda. Considerable opposition was excited by the system of private licences, which he introduced with a view to ensuring that the salt was properly weighed, but thanks to his persevering efforts the hostile movement gradually collapsed. The stability

of the Bombay salt revenue was henceforth assured, and when in 1876 a commission was appointed to reform the abuses of the Madras salt revenue, Pritchard was nominated its president.

In 1877 he undertook the difficult task of reforming the system for the manufacture and sale of opium and native spirits in the Bombay presidency. Pritchard's policy was to confine the manufacture of opium and spirits to a few selected places, to raise the excise duty to the highest possible rate, to reduce the number of retail shops, and to levy high licence fees. Measures were also taken to bring under control the supply of raw material from which the spirit was manufactured, and to restrict to contractors of known probity the right to sell spirits. These regulations despite their unpopularity were steadily enforced, and in recognition of his services Pritchard was made commissioner of customs in 1881, and of salt and *abkari* (excise on spirits) in 1882. Under his capable administration the Bombay presidency derived a largely increased revenue, amounting between 1874 and 1888 to an advance of 145 per cent. Pritchard, who had been made C.S.I. in 1886, held the post of commissioner of Sind from 1887 to 1889, and there he did much to develop harbour works and railway communications. He revived the idea of the Jamrao canal, which was completed in 1901, and he set on foot the scheme for the construction of a line linking up Karachi with the railway system of Rajputana, which was carried out by his successor, Sir Arthur Trevor.

In Nov. 1890 Pritchard was promoted to be revenue member of the government of Bombay, and in 1891 was created K.C.I.E. In the following year he took his seat on the viceroy's legislative council as member for the public works department. During his tenure of office he frequently found himself at variance with Lord Elgin, the viceroy, and with the majority of his colleagues on questions of high policy. He disapproved of the 'forward' policy, and he joined Sir Antony (afterwards Lord) MacDonnell and Sir James Westland [q. v. Suppl. II] in protesting against the expenditure of blood and treasure on expeditions to Waziristan, Swat, Chitral, and Tira. In 1896 his health showed signs of failure, and he resigned his seat on the council. Returning home, he settled in London, where he died on 23 Nov. 1903. He was buried at Norwood.

He married in 1862 Emily Dorothea, daughter of Hamerton John Williams, by

whom he had issue two surviving sons and two daughters, both deceased. His youngest daughter, Ethel, married in 1898 Sir Steyning Edgerley, K.C.V.O., and died in 1912.

A memorial tablet to Pritchard was placed in the crypt of St. Paul's Cathedral, London. A portrait by Sir George Reid is at Karachi, Sind, India.

[The Times, 25 Nov. 1903; Times of India, 29 Nov. 1896; National Review, Jan. 1904, art. by H. M. Birdwood; Ada Pritchard, Memoirs of Prof. Pritchard, 1897; C. E. Buckland, Dictionary of Indian Biography; private information from his daughter, Mrs. Ranken.] G. S. W.

PRITCHETT, ROBERT TAYLOR (1828-1907), gunmaker and draughtsman, born on 24 Feb. 1828, was son of Richard Ellis Pritchett, head of the firm of gunmakers at Enfield which supplied arms to the East India Company and to the board of ordnance. His mother was Ann Dumbleton. After leaving King's College school Robert was brought up to his father's trade, and made himself thoroughly familiar with the details of the business. By 1852 he had become intimate with William Ellis Metford [q. v.], 'the father of the modern rifle.' The 'Pritchett bullet,' with a hollow, unplugged base, which he and Metford invented in 1853, brought him fame and an award of 1000*l.* from the government on its adoption by the small-arms committee. As early as 1854 Pritchett was using his three-grooved rifle of his own invention.

The abolition of the East India Company in 1858 deprived Pritchett's firm of its principal customer, and he sought other interests; but for some years he kept in touch with military rifle matters (partly through the Victoria Rifles, which corps he joined at its foundation in 1853), and he lectured on gunlocks and rifles at the Working Men's College and elsewhere. He interested himself in 1854 in the foundation of that college, of which Frederick Denison Maurice [q. v.] and Charles Kingsley [q. v.] were among the pioneers. He remained a liveryman of the Gunmakers' Company till his death.

Art meanwhile became one of Pritchett's pursuits. He exhibited views of Belgium and Brittany at the Royal Academy as early as 1851 and 1852. He soon formed intimate friendships with John Leech [q. v.], Charles Keene [q. v.], and Birket Foster [q. v. Suppl. I.]. Through (Sir) John Tenniel he joined the staff of 'Punch,' for which he executed some 26 drawings be-

tween 1863 and 1869. In 1865 he sketched in Skye and the Hebrides, and next year he executed 100 illustrations for Cassell, Petter & Galpin. In 1868, after a visit to Holland, he received a commission for work from Messrs. Agnew, who showed a collection of his pictures in their galleries in 1869. One picture was purchased by Queen Victoria, and he was soon employed on many water-colour drawings of royal functions from 'Thanksgiving Day' in 1872 to Queen Victoria's funeral in 1901. Meanwhile he returned to Holland, where he dined at Loo with King Leopold II. and came to know Josef Israels. In 1869 and 1871 he exhibited scenes at Scheveningen at the Royal Academy, and in the latter year he published 'Brush Notes in Holland' and made numerous sketches in Paris after the Commune. After a visit to Norway in 1874-5 he issued 'Gamle Norge' (1878). In 1880 he cruised round the world with Mr. and Mrs. Joseph Lambert in their yacht the *Wanderer*, and illustrated their book on 'The Voyage of the *Wanderer*' (1883). In 1883 and 1885 he joined as artist the tours of Thomas (afterwards Earl) and Lady Brassey in the *Sunbeam* yacht, and many of his drawings appeared in Lady Brassey's 'In the Trades, the Tropics and the Roaring Forties' (1885) and 'The Last Voyage of the *Sunbeam*' (1889).

Pritchett also drew illustrations for 'Good Words' in 1881 and 1882, and made drawings for H. R. Mills's 'General Geography' (1888) and the 1890 edition of Charles Darwin's 'Voyage of the *Beagle*.' Exhibitions of his work were repeated in London between 1884 and 1890, and he lectured on his travels. He was an enthusiastic yachtsman, and an expert on yachts and craft of all kinds. He illustrated the Badminton volumes on 'Yachting' (1894) and 'Sea Fishing' (1895), and wrote much of the text of the former. His 'Pen and Pencil Sketches of Shipping and Craft all round the World' first appeared in 1899. A collector of curios, he was an authority on ancient armour, and issued in 1890 an illustrated account of his collection of pipes in 'Smokiana (Pipes of All Nations).' He was more successful in black-and-white than in water-colour; his drawings of shipping are noteworthy for technical accuracy.

Pritchett, who was an ardent sportsman, a good churchman, and a clever raconteur, resided for many years at The Sands, Swindon, and subsequently at Burghfield, Berkshire, where he died on 16 June 1907;

he was buried in the parish churchyard. His wife, Louisa Kezia McRae (*d.* 1899), whom he married on 22 Oct. 1857, his son Ellis (*d.* 1905), and his daughter Marian predeceased him. With the exception of some *netsuké*, which he bequeathed to the Victoria and Albert Museum, and some silver badges of the Ligue des Gueux, which he left to the British Museum, most of his curios, together with some of his drawings, were sold by auction by Messrs. Haslam & Son at Reading on 30 and 31 Oct. 1907; some of his pipes were subsequently dispersed by sale in London. The Victoria and Albert Museum has magazine illustrations, landscapes, and other drawings by him. His portrait by Daniel Albert Wehrschmidt was exhibited at the Royal Academy in 1899.

Cat.; The Times, 20 June 1907; Encycl. Brit. 11th edit. (s. v. Rifle); E. H. Knight, Dict. of Mechanics, i. 401-2; Engl. Cycl. iv. 91; private information.] B. S. L.

PROBERT, LEWIS (1841-1908), Welsh divine, third son of Evan and Mary Probert, was born at Llanelly, Breconshire, on 22 Sept. 1841. He became a congregational church member in 1860, at a time of revival, began to preach in 1862, and, after a short preparatory course under Henry Oliver at Pontypridd, entered Brecon College in 1863. In July 1867 he was ordained to the congregational ministry at Bodringallt, in the Rhondda valley, where he was active in establishing new churches among a rapidly growing colliery population. From 1872 to 1874 he was pastor of Pentre Ystrad, in this district; in Oct. 1874 he moved to Portmadoc, Carnarvonshire, where he spent twelve years. In 1886 he returned to Pentre; he soon gained considerable repute through his theological writings, and upon the death in 1896 of Evan Herber Evans [q. v. Suppl. I] was chosen to succeed him as principal of the congregational college at Bangor. That position he held until his death on 29 Dec. 1908. In 1891 he received the degree of D.D. from Ohio University and was chairman of the Welsh Congregational Union for 1901. He was twice married: (1) in 1870 to Annie, daughter of Edward Watkins, of Blaina, Monmouthshire, who died in 1874; and (2) in 1886 to Martha, only daughter of Benjamin Probert of Builth.

In theology Probert had conservative views, but was highly esteemed for the

breadth and solidity of his learning. He published the following: 1. A prize essay on the nonconformist ministry in Wales (Blaenau Festiniog, 1882). 2. A Welsh commentary upon Romans (Wrexham, 1890). 3. A companion volume upon Ephesians (Wrexham, 1892). 4. 'Crist a'r Saith Eglwys' (Rev. i.-iii.) (Merthyr, 1894). 5. 'Nerth y Goruchaf,' a treatise on the work of the Spirit (Wrexham, 1906).

[Album Aberhonddu (1898); Congregational Year Book for 1910, pp. 185-6; Rees and Thomas, Hanes yr Eglwys Annibynol, ii. 351, iv. 285, 467, 477.] J. E. L.

PROCTER, FRANCIS (1812-1905), divine, born at Hackney on 21 June 1812, was only son of Francis Procter, a warehouseman in Gracechurch St., Manchester, by Mary his wife. The son was of delicate health, and spent the early years of his life at Newland vicarage, Gloucestershire, under the care of an uncle, Payler Procter, who was vicar there. In 1825 he was sent to Shrewsbury school under Dr. Samuel Butler [q. v.], and thence passed in 1831 to St. Catharine's College, Cambridge, where another uncle, Dr. Joseph Procter, was Master. In 1835 he graduated B.A. as thirtieth wrangler and eleventh in the second class of the classical tripos. In the following year he was ordained deacon in the diocese of Lincoln, and in 1838 priest in the diocese of Ely. He served curacies at Streatley, Bedfordshire, from 1836 to 1840, and at Romsey from 1840 to 1842; when he gave up for the time parochial work in order to become fellow and assistant tutor of his college. In 1847 he left the university for the vicarage of Witton, Norfolk. There the rest of his long life was spent. After serving the cure for nearly sixty years, he died at Witton on 24 Aug. 1905, and was buried in the churchyard there. In 1848 he married Margaret, daughter of Thomas Meryon of Rye, Sussex, and had issue five sons and three daughters.

Procter was author of 'A History of the Book of Common Prayer, with a Rationale of its Offices,' which was originally published in 1855. In many fresh editions Procter kept the work abreast of the liturgical studies of the day. Further revised with Procter's concurrence in 1901, it still remains in use. Later he projected an edition of the 'Sarum Breviary,' for which he transcribed the text of the 'Great Breviary' printed at Paris in 1531. Procter published the first volume at Cambridge in 1879 with Christopher Wordsworth as joint-editor and with the co-operation of Henry Bradshaw, W. Chatter-

ley Bishop, and others; the second volume followed in 1882, and the concluding one in 1886.

Procter's liturgical work was careful and scholarly; his text-book followed the lines of sound exposition laid down by Wheatley and his followers, and his edition of the 'Sarum Breviary' was the most notable achievement of an era which was first developing the scientific study of medieval service-books. A portrait painted by an amateur is in the possession of his son.

[Information from Miss Procter (daughter); Shrewsbury School Register; Records of St. Catharine's College; Crockford's Clerical Directory.] W. H. F.

PROCTOR, ROBERT GEORGE COLLIER (1868-1903), bibliographer, born at Budleigh Salterton, Devonshire, on 13 May 1868, was only child of Robert Proctor (1821-1880) by his wife Anne Tate. The father, a good classical scholar, was crippled from boyhood by rheumatic fever. Proctor's grandfather, Robert Proctor (1798-1875), who published in 1825 'A Narrative of a Journey across the Cordillera of the Andes and of a Residence in Lima and other Parts of Peru in 1823 and 1824,' married Mary, sister of John Payne Collier [q. v.], who was thus the bibliographer's grand-uncle. A sister of Proctor's father (Mariquita) was first wife of George Edmund Street [q. v.], the architect.

Proctor, who in childhood developed a precocious love of study, went from a preparatory school at Reading to Marlborough College at the age of ten. Owing to his father's death on 5 March 1880, he stayed at Marlborough only a year. Thereupon he and his mother, who was thenceforth his inseparable companion, settled at Bath. In January 1881 he entered Bath College, where his scholarly instincts rapidly matured. In 1886 he won an open classical scholarship at Corpus Christi College, Oxford, and he matriculated at the university in October. His mother lived at Oxford during his academic course. He won a first class in classical moderations in Hilary term, 1888, and a second in the final classical school in Trinity term 1890, when he graduated B.A. While an undergraduate Proctor engaged in antiquarian research outside the curriculum of the schools. A visit to Greece stimulated his archaeological predilections. Already as a schoolboy he had collected books, and at Oxford he spent much time in his college library. A love of bibliographical study developed, and a catalogue which he pre-

pared of the Corpus incunabula and printed books up to 1600 gave promise of unusual bibliographical aptitude.

He remained at Oxford after taking his degree in order to continue his study of early printed books. Between 23 Feb. 1891 and Sept. 1893 he catalogued some 3000 incunabula in the Bodleian library, in continuation of work begun by Mr. Gordon Duff, and he did similar work at New College and at Brasenose.

On 16 Oct. 1893 he competed successfully (after a first failure) for entry into the library of the British Museum, and he remained an assistant in the printed books department until his death. There he made indefatigable use of his opportunities and quickly constituted himself a chief expert on early typography and bibliography. He rearranged the incunabula at the Museum and revised the entries of them in the catalogue, in which he was also responsible for the heading 'Liturgies.' He soon set himself to describe every fount of type used in Europe up to 1520, and by way of preparation read through the whole of the British Museum catalogue. His reputation was finally established by his 'Index of Early Printed Books from the Invention of Printing to the Year MD,' which was issued in four parts in 1898, after four years' toil. He then worked on a similar index for the period 1501-20, but of four projected sections only one—the German—was completed in his lifetime (1903).

Proctor's earliest contribution to bibliographical literature was an article on John van Doesborgh, the fifteenth-century printer of Antwerp, which appeared in 'The Library' in 1892 and was expanded into a monograph for the Bibliographical Society in 1894. Proctor soon read many learned papers before that society, for which he also prepared 'A Classified Index to the Serapeum' (1897) and 'The Printing of Greek in the Fifteenth Century' (1900). He likewise printed for private circulation three 'tracts on early printing,' viz. 'Lists of the Founts of Type and Woodcut Devices used by the Printers of the Southern Netherlands in the Fifteenth Century' (1895); 'A Note on Abraham Frammolt of Basel, Printer' (1895); and 'Additions to Campbell's "Annales de la typographie néerlandaise au XV siècle"' (1897).

Proctor subsequently experimented in Greek printing, adapting a beautiful type from the sixteenth-century Spanish fount used in the New Testament of the Complutensian Polyglot Bible. With his new

type Proctor caused to be printed at the Chiswick Press an edition of *Æschylus's 'Oresteia,'* which (Sir) Frederic Kenyon completed for publication in 1904. In the same type there subsequently appeared Homer's '*Odyssey*' (1909).

Interest in the work of William Morris's Kelmscott Press led to a personal acquaintance with Morris, with whose socialistic views Proctor was in sympathy. On F. S. Ellis's death in 1901 Proctor became one of the trustees under Morris's will. Morris's influence developed in Proctor an enthusiasm for Icelandic literature. His first rendering of an Icelandic saga, '*A Tale of the Weapon Firthers*,' was printed privately in 1902 as a wedding gift for his friend Mr. Francis Jenkinson, librarian at Cambridge University. He subsequently published a version of the *Laxdæla* saga (1903).

From boyhood Proctor was in the habit of making long walking tours, usually with his mother. The practice familiarised him not only with England and Scotland but with France, Switzerland, Belgium and Norway. On 29 Aug. 1903 he left London for a solitary walking tour in Tyrol. He reached the *Taschach* hut in the *Pitzthal* on 5 Sept. and left to cross a glacier pass without a guide. Nothing more was heard of him. He doubtless perished in a crevasse. At the end of the month, when his disappearance was realised in England, the weather had broken and no search was possible.

A memorial fund was formed for the purpose of issuing his scattered '*Bibliographical Essays*,' including his privately printed tracts. The collection appeared in 1905, with a memoir by Mr. A. W. Pollard. The memorial fund also provided for the compilation and publication of the three remaining parts of Proctor's '*Index of Early Printed Books from 1501 to 1520.*'

[Proctor's *Bibliographical Essays* (with memoir by A. W. Pollard and reproduction of a photograph taken at Oxford), 1905; *Athenæum*, 10 Oct. 1903; *Brit. Mus. Cat.*; private information.] S. L.

PROPERT, JOHN LUMSDEN (1834–1902), physician and art critic, born on 9 April 1834, was the son of John Propert (1792–1867), surgeon, by his wife Juliana Ross. His father founded in 1855 the Royal Medical Benevolent College, Epsom, of which he was long treasurer. Propert was educated at Marlborough College (Aug. 1843–Dec. 1847), and at King's College Hospital. He obtained the diploma of the Royal College

of Surgeons of England and the licence of the Society of Apothecaries in 1855, and in 1857 he graduated M.B. with honours in medicine at the University of London. He then joined his father in general practice in New Cavendish Street, London, and became highly successful.

Propert was widely known in artistic circles as a good etcher and a connoisseur of art. His house, 112 Gloucester Place, Portman Square, was filled with beautiful specimens of Wedgwood, bronzes, and jewelled work. He was credited with being one of the first to revive the taste for miniature painting in England. His very fine collection of miniatures was dispersed by sale in 1897. He published in 1887 '*A History of Miniature Art, Notes on Collectors and Collections*,' and compiled in 1889, with introduction, the illustrated catalogue of the exhibition of portrait miniatures at the Burlington Fine Arts Club.

Propert died at his house in Gloucester Place on 7 March 1902, and was buried at Brookwood cemetery. He married in 1864 Mary Jessica, daughter of William Hughes of Worcester, and had three sons and three daughters, of whom a son and three daughters survived him.

[*Lancet*, 1902, vol. i. p. 782; the *Brit. Med. Journal*, 1902, vol. i. p. 689; *Marlborough Coll. Reg.* i. p. 12; *Connoisseur*, 1902, iii. 48 (portrait); private information.] D'A. P.

PROUT, EBENEZER (1835–1909), musical composer, organist, and theorist, the son of a dissenting minister, was born at Oundle, Northamptonshire, on 1 March 1835. He studied at London University, graduating B.A. in 1854, and showing a gift for languages; but music was his passion from an early period. After acting as schoolmaster for some years he devoted himself to the musical profession, in spite of strong opposition from his father. Though he had some pianoforte lessons from Charles Kensington Salaman, he was almost entirely self-taught. He acted as organist in non-conformist chapels, and he contributed anthems to a volume (1872) for Dr. Allon's chapel at Islington, where he officiated (1861–73). In 1862 he won the first prize in a competition for a new string quartet, instituted by the Society of British Musicians, and in 1865 their prize for a pianoforte quartet; this work was occasionally played for several decades. A pianoforte quintet was still more successful. From 1861 to 1885 Prout was professor of the pianoforte at the Crystal Palace School of Art.

In 1871 the '*Monthly Musical Record*'

was started by Augener and Co., and Prout was appointed editor. He at once introduced a new element into musical criticism, which he made the prominent feature of his journal. He wrote detailed analyses of the less known works of Schubert, of Schumann's symphonies, and some of the later music-dramas of Wagner, all of which were practically unknown here. Prout and his coadjutors, notably Dannreuther, quickly widened the outlook of the musical public, and led the way for the introduction of Wagner's operas. In 1875 he was compelled to resign the editorship of the 'Record,' and after serving as musical critic of the 'Academy,' acted in a like capacity for the 'Athenæum' from 1879 to 1889.

Inspired, no doubt, by the performance of one of Handel's organ concertos with the orchestral accompaniment (then a quasi-novelty) at the Handel Festival, in 1871, Prout composed an organ concerto in E minor for modern resources of solo and orchestra. Stainer performed it at a Crystal Palace concert with great success, and many other performances were given elsewhere. Another undeveloped resource, the combination of pianoforte and harmonium, was next treated by Prout, who composed a duet-sonata in A major; this also was long successful. Afterwards he turned into the beaten tracks of English musical composition, and produced the cantatas 'Hereward' (1878), 'Alfred' (1882), 'Freedom' (1885), 'Queen Aimée' (for female voices, 1885), 'Psalm 100' (1886), 'The Red-Cross Knight' (1887), 'Damon and Phintias' (for male voices, 1889), as well as three symphonies for orchestra, and overtures, 'Twelfth Night' and 'Rokeby.' A string quartet, a piano quartet, an organ concerto, and sonatas for piano, with flute (1882) and clarinet (1890), failed to obtain much recognition. Prout published many arrangements of classical pieces for the organ. In 1877 he contributed a valuable primer on instrumentation to Novello's series of music primers. After being converted to a belief in Dr. Day's theory of harmony, he began a series of text-books in 1889 with 'Harmony, its Theory and Practice,' which reached a 24th edition. There followed 'Counterpoint, Strict and Free' (1890; 9th edit. 1910), 'Double Counterpoint and Canon' (1891), 'Fugue' (1891), 'Musical Form' (1893), 'Applied Forms' (1895), and 'The Orchestra' (2 vols. 1897), besides volumes of illustrative exercises. These, especially 'Fugue,' became standard

text-books. In later life Prout abandoned the 'Day Theory,' and in consequence largely re-wrote the book on harmony (*Musical Herald*, October 1903).

From 1876 to 1890 Prout was conductor of the Borough of Hackney Choral Association, performing many important works new and old. At the establishment of the National Training School for Music in 1876 he became professor of harmony, migrating in 1879 to the Royal Academy of Music, where he taught till his death; he was also professor at the Guildhall School of Music in 1884.

The repute of his text-books secured him the professorship of music at Dublin University in succession to Sir Robert Prescott Stewart [q. v.] in 1894. The university granted him the honorary degree of Mus. Doc. Although he was non-resident in Dublin, he fulfilled his duties as lecturer and examiner with zeal and ability. He was an active member of the Incorporated Society of Musicians, and frequently lectured at the annual conferences.

In his later years Prout's interest was mainly concentrated in Bach. Large selections of airs from Handel's operas and Bach's cantatas, translated and edited by Prout, appeared in 1905-9. A modernised edition of Handel's 'Messiah' (1902) had little success.

He lived at 246 Richmond Road, Hackney, always spending the summer vacation at Vik, Norway. He died suddenly at his house in Hackney on 5 Dec. 1909, and was buried at Abney Park cemetery. Prout married Julia West, daughter of a dissenting minister, and had a son, Louis B. Prout, who follows his father's profession, and three daughters. His large and valuable library was acquired by Trinity College, Dublin.

His portrait, painted in 1904 by E. Bent Walker, at the cost of his pupils, was presented to the Incorporated Society of Musicians.

[Interview in *Musical Times*, April 1899, with full details of early life; obituaries in *Musical Times*, *Musical Herald*, *Monthly Musical Record*, *Monthly Report of the Incorporated Society of Musicians*, January 1910; personal knowledge. D.

PRYNNE, GEORGE RUNDLE (1818-1903), hymn-writer, born at West Looe, Cornwall, on 23 Aug. 1818, was younger son

in a family of eight children of John Allen Prynne (a form of the surname abandoned later by his son) by his wife Susanna, daughter of John and Mary Rundle of Looe, Cornwall. The father, who claimed descent from William Prynne [q. v.] the puritan, was a native of Newlyn, Cornwall.

After education first at a school kept by his sister at Looe, then at the (private) Devonport Classical and Mathematical School, Prynne matriculated at St. John's College, Cambridge, in October 1836, but migrated to Catharine Hall (now St. Catharine's College), graduating B.A. on 18 Jan. 1840 (M.A. in 1861, and M.A. *ad eundem* at Oxford on 30 May 1861). Ordained deacon on 19 Sept. 1841, and priest on 25 Sept. 1842, he was licensed as curate first to the parish of Tywardreath in Cornwall, and on 18 Dec. 1843 to St. Andrew's, Clifton. At Clifton he first came in contact with Dr. Pusey [q. v.], whose views he adopted and publicly defended, but he declined Pusey's suggestion to join St. Saviour's, Leeds, on account of an implied obligation of celibacy. On the nomination of the prime minister, Sir Robert Peel, he became vicar of the parish of Par, Cornwall, newly formed out of that of Tywardreath, from October 1846 to August 1847, when he took by exchange the living of St. Levan and St. Sennen in the same county. From 16 Aug. 1848 until his death he was incumbent of the newly constituted parish of St. Peter's, formerly Eldad Chapel, Plymouth.

At Plymouth Prynne's strenuous advocacy of Anglican catholicism on Pusey's lines involved him in heated controversy. The conflict was largely fostered by John Hatchard, vicar of Plymouth. In 1850 Prynne brought a charge of criminal libel against Isaac Latimer, editor, publisher, and proprietor of the 'Plymouth and Devonport Weekly Journal,' for an article prompted by religious differences which seemed to reflect on his moral character (24 Jan. 1850). The trial took place at Exeter, before Mr. Justice Coleridge, on 6 and 7 Aug. 1850, and excited the bitterest feeling. The defendant alleged that the English Church Union was responsible for the prosecution and was supplying the necessary funds. The jury found the defendant not guilty (*Western Times*, Exeter, 10 Aug. 1850), and the heavy costs in which Prynne was mulcted gravely embarrassed him. In 1852 Prynne's support of Priscilla Lydia Sellon [q. v.] and her Devonport community of Sisters of Mercy, together with his advocacy of auricular confession and penance, provoked a pamphlet war with the Rev.

James Spurrell and the Rev. Michael Hobart Seymour. An inquiry by Phillpotts, bishop of Exeter, on 22 Sept. 1852, into allegations against Prynne's doctrine and practice resulted in Prynne's favour, but a riot took place when Dr. Phillpotts held a confirmation at Prynne's church next month. In 1860 Prynne 'conditionally' baptised Joseph Leycester Lyne, 'Father Ignatius' [q. v. Suppl. II], and employed him as unpaid curate. He joined the Society of the Holy Cross in 1860 and the English Church Union in 1862, becoming vice-president of the latter body in 1901. Meanwhile opposition diminished. His church was rebuilt and the new building consecrated in 1882 without disturbance. Although Prynne remained a tractarian to the end, he was chosen with Prebendary Sadler proctor in convocation for the clergy of the Exeter diocese from 1885 to 1892, and despite their divergence of opinion he was on friendly terms with his diocesans, Temple and Bickerseth. Contrary to the views of many of his party, he submitted to the Lambeth judgment (1889), which condemned the liturgical use of incense.

Prynne died at his vicarage after a short illness on 25 March 1903, and was buried at Plympton St. Mary, near Plymouth. He married on 17 April 1849 Emily (*d.* 1901), daughter of Admiral Sir Thomas Fellowes, and had issue four sons and six daughters. The sons Edward A. Fellowes Prynne and George H. Fellowes Prynne were connected as artist and architect respectively with the plan and adornment of their father's church at Plymouth, and the Prynne memorial there, a mural painting, allegorically representing the Church Triumphant, is by the son Edward.

Of Prynne's published works the most important was 'The Eucharistic Manual,' 1865 (tenth and last edit. 1895); it was censured by the primate, Archbishop Longley [q. v.]. He was also author of 'Truth and Reality of the Eucharistic Sacrifice' (1894) and 'Devotional Instructions on the Eucharistic Office' (1903). Other prose works consisted of sermons and doctrinal or controversial tracts. As a writer of hymns Prynne enjoyed considerable reputation. 'A Hymnal' compiled by him in 1875 contains his well-known 'Jesus, meek and gentle,' written in 1856, and some translations of Latin hymns. He also took part in the revision of 'Hymns Ancient and Modern,' and published 'The Soldier's Dying Visions, and other Poems and Hymns' (1881) and 'Via Dolorosa' in prose, on the Stations of the Cross (1901).

An oil painting by his son Edward Pryne in 1885 and a chalk drawing by Talford about 1853 belong to members of the family. A lithograph from a photograph was published by Beynon & Co., Cheltenham.

PUDDICOMBE, MRS. ANNE ADALISA, writing under the pseudonym of ALLEN RAINE (1836-1908), novelist, born on 6 Oct. 1836 in Bridge Street, Newcastle-Emlyn, was the eldest child in the family of two sons and two daughters of Benjamin Evans, solicitor of that town, by his wife Letitia Grace, daughter of Thomas Morgan, surgeon of the same place. The father was a grandson of the Rev. David Davis (1745-1827) [q. v.] of Castell Howel, and the mother a granddaughter of Daniel Rowlands (1713-1790) [q. v.] (J. T. JONES, *Geiriadur Bywgraffyddol*, ii. 290). After attending a school at Carmarthen for a short time she was educated first (1849-51) at Cheltenham with the family of Henry Solly, unitarian minister, and from 1851 till 1856 (with her sister) at Southfields, near Wimbledon. She learnt French and Italian and excelled in music, though she was past forty when she learned the violin. At Cheltenham and Southfields she saw many literary people, including Dickens and George Eliot. The next sixteen years she spent mainly at home in Wales, where her colloquial knowledge of Welsh was sufficient to gain her the intimacy of the inhabitants, and she acquired a minute knowledge of botany. On 10 April 1872 she was married at Penbryn church, Cardiganshire, to Beynon Puddicombe, foreign correspondent at Smith Payne's Bank, London. For eight years they lived at Elgin Villas, Addiscombe, near Croydon, where Mrs. Puddicombe suffered almost continuous ill-health. They next resided at Winchmore Hill, Middlesex. Her husband became mentally afflicted in February 1900, and she removed with him to Bronmor, Traethsaith, in the parish of Penbryn, which had previously been their summer residence. Here he died on 29 May 1906, and here also she succumbed to cancer on 21 June 1908, being buried by the side of her husband

in Penbryn churchyard. There was no issue of the marriage.

From youth Miss Evans showed a faculty for story-telling, and the influence of the Sollys and their circle helped to develop her literary instincts. At home a few sympathetic friends of like tastes joined her in bringing out a short-lived local periodical, 'Home Sunshine' (printed at Newcastle-Emlyn). It was not however till 1894 that she took seriously to writing fiction. At the National Eisteddfod held that year at Carnarvon she divided with another the prize for a serial story descriptive of Welsh life. Her story, 'Ynyscoer,' dealing with the life of the fishing population of an imaginary island off the Cardiganshire coast, was published serially in the 'North Wales Observer' but was not issued in book form. By June 1896 she completed a more ambitious work, which after being rejected (under the title of 'Mifanwy') by six publishing houses (see letter of Mr. A. M. BURGHESS in *Daily News*, 24 July 1908) was published by Messrs. Hutchinson & Co. in August 1897, under the title 'A Welsh Singer. By Allen Raine.' Her pseudonym was suggested to her in a dream. Like most of her subsequent works 'A Welsh Singer' is a simple love-story; the chief characters are peasants and seafaring folk of the primitive district around the fishing village of Traethsaith. Despite its crudities it caught the public ear. She dramatised the novel, but it was only acted for copyright purposes. Thenceforth Mrs. Puddicombe turned out book after book in rapid succession. Her haste left her no opportunity of improving her style or strengthening her power of characterisation, but she fully sustained her first popularity mainly owing to her idealisation of Welsh life, to the prim, simple and even child-like dialogue of characters in such faulty English as the uncritical might assume Cardiganshire fishermen to speak, and also to the imaginative or romantic element which she introduces into nearly all her stories. Her later works (all issued by the same publishers) were: 1. 'Torn Sails,' 1898. 2. 'By Berwen Banks,' 1899. 3. 'Garthowen,' 1900. 4. 'A Welsh Witch,' 1902. 5. 'On the Wings of the Wind,' 1903. 6. 'Hearts of Wales,' 1905, an historical romance dealing with the period of Glendower's rebellion (dramatised by Mr. and Mrs. Leon M. Leon). 7. 'Queen of the Rushes,' 1906, embodying incidents of the Welsh revival of 1904-5. After her death there appeared: 8. 'Neither Storehouse nor Barn,' 1908; published serially

in the 'Cardiff Times,' 1906. 9. 'All in a Month,' 1908, treating of her husband's malady. 10. 'Where Billows Roll,' 1909. 11. 'Under the Thatch,' 1910, treating of her own disease.

All her works have been re-issued at sixpence, and their total sales (outside America), it is stated, exceed two million copies. An 'Allen Raine Birthday Book' appeared in 1907.

Mrs. Puddicombe wrote some short stories for magazines (cf. 'Home, Sweet Home' in the 'Quiver' of June 1907), and translated into English verse Ceiriog's poem 'Alun Mabon' (*Wales* for 1897, vol. iv.).

[Information from her brother, Mr. J. H. Evans, and from Mrs. Philip H. Wicksteed, Childrey, near Wantage (daughter of the Rev. Henry Solly); *South Wales Daily News* and *Western Mail*, 23 June 1908; The Rev. H. Elvet Lewis in the *British Weekly* for 25 June 1908; *Review of Reviews*, Aug. 1905; probably the most reliable notice of her is a Welsh one by her friend Mrs. K. Jones, of Gellifahren, in *Yr Ymfynydd* for Sept. 1908. For a criticism of her work from a Welsh point of view, see Mr. Ernest Rhys in *Manchester Guardian*, 24 and 27 June 1908, and Mr. Beriah Evans in *Wales*, May 1911, p. 35.] D. LL. T.

PULLEN, HENRY WILLIAM (1836-1903), pamphleteer and miscellaneous writer, born at Little Gidding, Huntingdonshire on 29 Feb. 1836, was elder son of the four children of William Pullen, rector of Little Gidding, by his wife Amelia, daughter of Henry Wright. From Feb. 1845 to Christmas 1848 Henry was at the then newly opened Marlborough College under its first headmaster, Matthew Wilkinson. In 1848 his father, who owing to failing health had then removed with his family to Babbacombe, Devonshire, caused to be published a volume of verses and rhymes by the boy, called 'Affection's Offering.' After an interval Pullen proceeded to Clare College, Cambridge, where he graduated B.A. in 1859, proceeding M.A. in 1862. In 1859 he was ordained deacon on appointment to an assistant-mastership at Bradfield College, and became priest next year. Deeply interested in music, he was elected vicar-choral of York minster in 1862, and was transferred in 1863 to a similar post at Salisbury cathedral. At Salisbury he passed the next twelve years of his life, and did there his chief literary work. Several pamphlets (1869-72) on reform of cathedral organisation and clerical unbelief bore witness to

his pugnacious and somewhat unpractical temper.

Near the end of 1870, a month after the investment of Paris by the Germans, Pullen leapt into fame with a pamphlet 'The Fight at Dame Europa's School.' Here he effectively presented the European situation under a parable which all could understand, however they might differ from its moral. John, the head of the school, refuses to separate Louis and William, though he sees that Louis is beaten and that the prolongation of the fight is mere cruelty. John is reproached by Dame Europa for cowardice—is told that he has grown 'a sloven and a screw,' and is threatened with loss of his position.

The success of this squib is almost unexampled. The first edition of 500 copies was printed at Salisbury on 21 Oct. Twenty-nine thousand copies had been issued by 1 Feb. 1871. The Salisbury resources then becoming overstrained, Messrs. Spottiswoode of London printed 50,000 copies (1-9 Feb.). The 192nd thousand appeared on 18 April. The 193rd and final thousand was printed in April 1874. The pamphlet was translated into French, German, Italian, Danish, Dutch, Frisian, Swedish, Portuguese and Jersey-French. A dramatised version by George T. Ferneyhough was acted on 17 March 1871 by amateurs at Derby, in aid of a fund for French sufferers. 'The Fight,' which brought Pullen 3000*l.*, evoked a host of replies, of which 'John Justified' is perhaps the most effective. In 1872 Pullen renewed his onslaught on Gladstone's administration in 'The Radical Member,' but neither then nor in 'Dr. Bull's Academy' (1886) did he repeat his success.

In 1875 Pullen retired from Salisbury. During 1875-6 he served in Sir George Nares's arctic expedition as chaplain on the *Alert*, receiving on his return the Arctic medal. Thenceforth for twelve years he travelled widely on the Continent, making Perugia his headquarters. The publisher John Murray, to whom he had sent useful notes of travel, appointed him editor of the well-known 'Handbooks.' An admirable linguist in five or six languages, he successively revised nearly the whole of the series, beginning with North Germany.

Re-settling in England in 1898, Pullen held successively the curacy of Rockbeare, Devon (1898-9) and several locum-tenencies. In May 1903 he became rector of Thorpe Mandeville, Northamptonshire, but died unmarried in a nursing-home at Birmingham seven months later, on 15 Dec. 1903.

He is buried at Birdingbury, Warwickshire. There is a brass tablet to his memory on the chancel wall at Thorpe Mandeville.

Pullen's pen was busied with controversy till near the end. In some stories of school life, 'Tom Pippin's Wedding' (1871), 'The Ground Ash' (1874), and 'Pueris Reverentia' (1892), he attacked defects in the country's educational system. Pullen also published apart from pamphlets: 1. 'Our Choral Services,' 1865. 2. 'The Psalms and Canticles Pointed for Chanting,' 1867. 3. 'The House that Baby built,' 1874. 4. 'Clerical Errors,' 1874. 5. 'A Handbook of Ancient

Roman Marbles,' 1894. 6. 'Venus and Cupid,' 1896. Many of his books were published at his own expense and he lost heavily by them.

[The Rev. W. Pullen's preface to Affection's Offering, 1848; The Fight at Dame Europa's School and the literature connected with it, by F. Madan, 1882; Narrative of a Voyage to the Polar Sea, by Sir George Nares, 1878; The Times, 18 Dec. 1903; and private information.] H. C. M.

PYNE, MRS. LOUISA FANNY BODDA (1832-1904), vocalist. [See BODDA PYNE.]

Q

QUARRIER, WILLIAM (1829-1903), founder of the 'Orphan Homes of Scotland,' the only son, and the second of three children, of a ship carpenter, was born in Greenock on 29 Sept. 1829. When the boy was only a few years old his father died of cholera at Quebec, and shortly afterwards the mother removed with her children to Glasgow, where she maintained herself by fine sewing, the boy and the elder sister assisting her. At the age of seven Quarrier entered a pin factory, where, for ten hours a day in working a hand machine, he received a shilling a week. In a few months, however, he was apprenticed to a boot and shoe maker, becoming a journeyman at the age of twelve. About his sixteenth year he obtained work in a shop in Argyle St., Glasgow, owned by a Mrs. Hunter, who induced him, for the first time, to attend church, and not long afterwards he was appointed church officer. At the age of twenty he started a bootshop, and seven years afterwards, on 2 Dec. 1856, he married Isabella, daughter of Mrs. Hunter. Business prospered with him and he soon had three shops; but his early life of hardship made him resolve to devote his profits towards the assistance of the children of the streets. In 1864 the distress of a boy whose stock of matches had been stolen from him led Quarrier, with the help of several others, to found the shoeblack brigade. This was followed by a news brigade and a parcels brigade, with headquarters for the three brigades in the Trongate, called the Industrial Brigade Home; but, from various causes, the brigades were not so successful as he anticipated, and in 1871 he turned his attention to the formation of an orphan home, which was opened in November in Renfrew Lane.

In the same year a home for girls was opened in Renfield Street. From these homes a number of children were, through a lady's emigration scheme, sent each year to Canada, where there were receiving homes with facilities for getting the children placed in private families. In 1872 the home for boys was removed to Cessnock House, standing within its own grounds in the suburb of Govan, and shortly afterwards Elm Park, Govan Road, was rented for a girls' home. About the same time, a night refuge was established at Dovehill, with a mission hall attached to it. This was superseded in 1876 by a city orphan home, erected at a cost of 10,000*l.*, the building, which apart from the site cost 7000*l.*, being the gift of two ladies. There about 100 children are resident, the boys being at work at different trades in the city, and the girls being trained in home duties; the building also includes a hall for mission work. In 1876 a farm of forty acres near Bridge of Weir was purchased, where three separate cottages, or rather villas, and a central building, were opened in 1878, as the 'Orphan Homes of Scotland.' The homes, the gifts chiefly of individual friends, and erected at an average cost of about 1500*l.*, each provide accommodation for about thirty children, who are under the care of a 'father' and 'mother.' The homes now number over fifty; and the village also includes a church—protestant undenominational—a school, a training-ship on land, a poultry farm, extensive kitchen gardens, stores, bakehouses, etc. On additional ground the first of four consumptive sanatoriums was opened in September 1896; and there are now also homes for epileptics. The annual expenditure of the orphan homes, amounting to about 40,000*l.*,

is met by subscriptions which are not directly solicited.

Quarrier died on 16 Oct. 1903 and Mrs. Quarrier on 22 June 1904. They were buried in the cemetery of the 'Orphan Homes.' They left a son and three daughters. The institution is now managed by the family with the counsel and help of influential trustees.

QUILTER, HARRY (1851-1907), art critic, was the youngest of three sons of William Quilter (1808-1888), first president of the Institute of Accountants, and a well-known collector of water-colour drawings by British artists. Quilter's grandfather was a Suffolk farmer. His mother, his father's first wife, was Elizabeth Harriet, daughter of Thomas Cuthbert. His eldest brother, William Cuthbert, is noticed below. Born at Lower Norwood on 24 Jan. 1851, Harry was educated privately, and entered Trinity College, Cambridge, at Michaelmas 1870; he graduated B.A. in 1874 and proceeded M.A. in 1877. At Cambridge he played billiards and racquets, and read metaphysics, scraping through the moral sciences tripos of 1873 in the third class. He was intended for a business career, but on leaving the university travelled abroad, and devoted some time to desultory art study in Italy. He had entered himself as a student of the Inner Temple on 3 May 1872, and on returning to England he spent six months in studying for the bar, chiefly with Mr. (now Lord Justice) John Fletcher Moulton; he also attended the Slade school of art at University College and the Middlesex Hospital. He was called to the bar on 18 Nov. 1878. An attack of confluent small-pox injured his health, and the possession of a competence and a restless temperament disabled him from concentrating his energies. From 1876 to 1887 he was busily occupied as an art critic and journalist, writing chiefly for the 'Spectator.' In 1880-1 he was also for a time art critic for 'The Times' in succession to Tom Taylor, and in that capacity roused the anger of J. M. Whistler [q.v. Suppl. II.] by his frank criticism of the artist's Venetian etchings (cf. *The Gentle Art of Making Enemies*, p. 104). He also angered Whistler by his 'vandalism' in re-decorating Whistler's White House, Chelsea, which he purchased for 2700*l.* on 18 Sept. 1879

and occupied till 1888 (PENNELL, *Life of Whistler*, i. 258). Whistler's antipathy to critics was concentrated upon Quilter, to whom he always referred as 'Arry' and whom he lashed unsparingly until his death (cf. *ibid.* i. 267-8; and QUILTER's 'Memory and a Criticism' of Whistler in *Chambers's Journal*, 1903, reprinted in *Opinions*, pp. 134-151).

Besides writing on art Quilter was a collector and a practising artist. His work was regularly hung at the Institute of Painters in Oil Colours from 1884 to 1893. Between 1879 and 1887 he frequently lectured on art and literature in London and the provinces. In 1885 he studied landscape painting at Van Hove's studio at Bruges, and in 1886 was an unsuccessful candidate for the Slade professorship at Cambridge in succession to (Sir) Sidney Colvin (*Gentle Art*, pp. 118 *et seq.*). In January 1888, 'tired of being edited,' he started, without editorial experience, an ambitious periodical, the 'Universal Review,' of which the first number was published on 16 May 1888, and was heralded with a whole page advertisement in 'The Times'; it was elaborately illustrated, and contained articles by leading authorities in England and France (George Meredith contributed in 1889 his 'Jump to Glory Jane'). Its initial success was great, but the scheme failed pecuniarily and was abandoned with the issue for December 1890. He exhibited his paintings at the Dudley Gallery in January 1894, and a collection of his works in oils, sketches in wax, water-colours on vellum, chiefly of Cornish scenes, was shown at the New Dudley Gallery in February 1908. From 1894 to 1896 he conducted boarding schools at Mitcham and Liverpool on a 'rational' system which he had himself formulated, and on which he wrote an article, 'In the Days of her Youth,' in the 'Nineteenth Century' (June 1893). In 1902, after two years' continuous labour, he published 'What's What,' an entertaining miscellany of information (with photograph and reproductions of two of his pictures); of the 1182 pages he wrote about a third, containing 350,000 words.

Until the end he occupied himself with periodical writing, travelling, and collecting works of art. He died at 42 Queen's Gate Gardens on 10 July 1907, and was buried at Norwood. Most of his collections were sold at Christie's in April 1906, and fetched over 14,000*l.* He married in 1890 Mary Constance Hall, who survived him with two sons and four daughters.

Quilter's separate publications include: 1. A thin volume of light verse, 'Idle Hours,' by 'Shingawn' (a name taken from a sensational story in the *London Journal* of the time), 1872. 2. 'Giotto,' 1880; new edit. 1881. 3. 'The Academy: Notice of Pictures exhibited at the R.A. 1872-82,' 1883. 4. 'Sententiæ Artis: First Principles of Art,' 1886. 5. 'Preferences in Art, Life, and Literature,' 1892. 6. 'Opinions on Men, Women and Things,' 1909 (a collection of periodical essays made by his widow). He edited an edition of Meredith's 'Jump to Glory Jane' (1892), and illustrated one of Browning's 'Pied Piper of Hamelin' (1898).

[Quilter's *Opinions*, 1909; *Who's Who*, 1906; *The Times*, 13 July 1907; *Morning Post*, 12 July 1907; Mrs. C. W. Earle, *Memoirs and Memories*, 1911, pp. 291-8; information kindly supplied by Mrs. Harry Quilter (now Mrs. MacNalty) and his sister, Mrs. S. E. Muter.] W. R.

QUILTER, SIR WILLIAM CUTHBERT, first baronet (1841-1911), art collector and politician, born in London on 29 Jan. 1841, eldest brother of Harry Quilter [q. v. Suppl. II], was educated privately. After five years (1858-63) in his father's business he started on his own account with a partner as a stockbroker, and eventually founded the firm of Quilter, Balfour & Co. in 1885. He was one of the founders of the National Telephone Co. (registered on 10 March 1881), and was a director and large shareholder till his death. In 1883 he bought the Bawdsey estate near Felixstowe, extending to about 9000 acres, and spent large sums on sea defences, a spacious manor house, and an alpine garden (see *Gardeners' Chronicle*, 12 Dec. 1908). He showed enterprise as an agriculturist, particularly as a cattle-breeder (see *The Times*, 20 Nov. 1911). A keen yachtsman, he owned at various times several well-known boats, and was vice-commander of the Royal Harwich Yacht Club (1875-1909). Quilter was elected as a liberal for the Sudbury division of Suffolk in Dec. 1885. Declining to accept Glad-

stone's home rule policy, he was re-elected unopposed as a liberal unionist in July 1886 and continued to represent the same constituency in parliament until the dissolution of Dec. 1905. Being returned after a contest in 1892, and unopposed in 1895 and 1900, he was defeated by 136 votes in Jan. 1906. He rarely spoke in the house. He was created a baronet on 13 Sept. 1897; and was a J.P. and D.L. for Suffolk, and an alderman of the West Suffolk county council. Inheriting his father's taste for pictures, he formed a collection on different lines, confining himself to no one period or school. He was generous in loans to public exhibitions. Nearly the whole of his collection was displayed at Lawrie's Galleries, 159 Bond Street, in Nov. 1902, in aid of King Edward's Hospital Fund (cf. description by F. G. STEPHENS in *Magazine of Art*, vols. 20 and 21, privately reprinted with numerous illustrations). He presented Sir Hubert von Herkomer's portrait of Spencer Compton Cavendish, eighth duke of Devonshire [q. v. Suppl. II], to the National Portrait Gallery in 1909 (*The Times*, 21 July 1909). The collection of his pictures at his London house, 28 South Street, Park Lane (120 lots), realised £7,780l. at Christie's on 9 July 1909 (*The Times*, 10 July 1909; *Connoisseur*, July 1909; *Catalogue Raisonné* of the collection, by M. W. BROCKWELL and W. ROBERTS, privately printed, 100 copies, 1909).

He died suddenly at Bawdsey on 18 Nov. 1911, and was buried in the parish churchyard. His estate was valued at 1,220,639l., with net personalty 1,035,974l. (*The Times*, 15 Jan. 1912). He married on 7 May 1867 Mary Ann, daughter of John Wheeley Bevington of Brighton. She survived him with five sons and two daughters.

His portrait by Sir Hubert von Herkomer was exhibited at the Royal Academy in 1890; a caricature by 'Lib' (Prosperi) appeared in 'Vanity Fair' on 9 Feb. 1889.

[*The Times*, 20 Nov. 1911; Burke's Peerage, 1911; *Who's Who*, 1909; personal knowledge; information kindly supplied by Mr. A. J. Grout, Sir Cuthbert's private secretary.]

W. R.

R

RADCLIFFE-CROCKER, HENRY (1845-1909), dermatologist, born at Brighton on 6 March 1845, was son of Henry Radcliffe Crocker. After attending a private school at Brighton, he was thrown on his own resources at the age of sixteen, and went as apprentice and assistant to a doctor at Silverdale, Staffordshire. Studying by himself amid the duties of his apprenticeship, he passed the matriculation and preliminary scientific examination for the M.B. London degree, and in 1870 entered University College Hospital medical school, eking out his narrow means by acting as dispenser to a doctor in Sloane Street. In 1873 he passed M.R.C.S., and next year L.R.C.P. In his later London University examinations he gained the gold medal in *materia medica* (1872) and the university scholarship and gold medal in forensic medicine, besides taking honours in medicine and obstetric medicine (1874). At the hospital he won the Fellows gold medal in clinical medicine (1872). In 1874 he graduated B.S. (London) and next year M.D.

Meanwhile he was a resident obstetric physician and physician's assistant at University College Hospital; clinical assistant at the Hospital for Consumption and Diseases of the Chest, Brompton; and resident medical officer at Charing Cross Hospital (for six months). In 1875 he was appointed resident medical officer in University College Hospital, and next year assistant medical officer to the skin department, in succession to (Sir) John Tweedy.

In 1878 he was appointed assistant physician and pathologist to the East London Hospital for Children at Shadwell, and in 1884 honorary physician. He remained on the staff of the hospital until 1893. He became a member of the Royal College of Physicians in 1877, and a fellow in 1887, and he served on the council (1906-8). He was a member of the court of examiners of the Society of Apothecaries for many years (1880-8 and 1888-96).

Meanwhile Radcliffe-Crocker was specialising in diseases of the skin under the influence of William Tilbury Fox [q. v.], whom in 1879 he succeeded as physician and dermatologist at the University College Hospital. He was an original member of the Dermatological Society of London (1882; treasurer, 1900-5), and of the Dermatological

Society of Great Britain and Ireland (1894; president, 1899). When these societies amalgamated with other London societies to form the Royal Society of Medicine (1907), he was first president of the dermatological section (1907-8). He also was president of his section at the annual meeting of the British Medical Association in London (1905). He was an honorary member of the American Dermatological Society, of the Wiener Dermatologische Gesellschaft, and of the Società Italiana di Dermatologia e Sifilografia, and corresponding member of the Société Française de Dermatologie, and of the Berliner Dermatologische Gesellschaft; and he delivered the Lettsomian lectures on inflammations of the skin before the Medical Society of London (1903).

He was a prominent and active member of the British Medical Association, serving on the council from 1890 to 1904, and as treasurer from 1905 to 1907, and being a good business man he was chiefly instrumental in bringing about, whilst treasurer, the rebuilding and enlargement of the headquarters of the association in the Strand, and in making important changes in the business conduct of 'The British Medical Journal,' the journal of the association.

During his later years ill-health interrupted his public work. He died suddenly from heart failure whilst on a holiday at Engelberg, Switzerland, on 22 Aug. 1909, and was buried there. He married in 1880 Constance Mary, only daughter of Edward Fussell of Brighton, physician to the Sussex County Hospital, who survived him. There were no children.

From 1898 he had a country residence at Bourne End, Buckinghamshire. His extensive library, consisting of dermatological works in English, French, German, and Italian, was given by Mrs. Radcliffe-Crocker to the medical school of University College, together with 1500*l.* in 1912 to found a dermatological travelling scholarship.

Radcliffe-Crocker's high position as a dermatologist was due to his general knowledge of medicine, his particular skill as a clinician, and his power of expressing himself in his writings clearly and attractively. He always was emphatic in insisting on the importance of treating the general condition or diathesis which might be the predis-

posing cause of a skin affection, as well as treating directly the local condition itself. He was always among the first to test the value of new remedies and means of treatment. He was a distinguished leprologist, and his papers on rare skin diseases were most illuminating.

Radcliffe-Crocker's chief work, which held standard rank in the medical literature of the world, was 'Diseases of the Skin: their Description, Pathology, Diagnosis and Treatment' (1888), with a companion volume of 'The Atlas of Diseases of the Skin,' issued in bi-monthly parts (1893-6; 2 vols. fol. 1896). A second edition of the treatise in 1893, which greatly improved on the first, was recognised as the most comprehensive manual of dermatology then published in England. In the third edition (2 vols. 1903), in which he was helped by Dr. George Pernet, 15,000 cases of skin diseases were analysed and classified, and more plates of the microscopical anatomy of the diseases were included. The 'Atlas' forms a complete and systematic pictorial guide to dermatology, each disease being represented by coloured plates of actual cases, which were accompanied by a short and clear descriptive text.

Radcliffe-Crocker wrote on psoriasis and drug eruptions in Quain's 'Dictionary of Medicine' (new edit. 1894); on leprosy, purpura, guinea-worm, erythema, ichthyosis &c., in Heath's 'Dictionary of Surgery' (1886); on psoriasis and other squamous eruptions, and phlegmonous and ulcerative eruptions in 'Twentieth Century Medicine' (1896); on diseases of the hair in Clifford Allbutt's 'System of Medicine' (vol. viii. 1899). He was a regular contributor to the 'Lancet,' writing reviews and notices of contemporary dermatological work.

[Information from Mrs. Radcliffe-Crocker (widow); Lancet, 4 Sept. 1909; Brit. Med. Journal, 11 Sept. 1909; Index Cat. Surgeon-General's Office Washington.] E. M. B.

RAE, WILLIAM FRASER (1835-1905) author, born in Edinburgh on 3 March 1835, was elder son of George Rae and his wife, Catherine Fraser, both of Edinburgh. A younger brother, George Rae, settled early in Toronto, Canada, and became a successful lawyer there.

After education at Moffat Academy and at Heidelberg, where he became an excellent German scholar, Rae entered Lincoln's Inn as a student on 2 Nov. 1857, and on 30 April 1861 was called to the bar. But he soon abandoned pursuit of the law for the career of a journalist. He edited for a

time about 1860 the periodical called the 'Reader,' and early joined the staff of the 'Daily News' as a special correspondent in Canada and the United States. With the liberal views of the paper he was in complete sympathy. On his newspaper articles he based the volume 'Westward by Rail' (1870; 3rd edit. 1874), which had a sequel in 'Columbia and Canada: Notes on the Great Republic and the New Dominion' (1877). There subsequently appeared 'Newfoundland to Manitoba' (1881; with maps) and 'Facts about Manitoba' (1882), which reprinted articles from 'The Times.'

Afterwards throat trouble led Rae to spend much time at Austrian health resorts, concerning which he contributed a series of articles to 'The Times.' These reappeared as 'Austrian Health Resorts, and the Bitter Waters of Hungary' (1888; 2nd edit. 1889). In 'The Business of Travel' (1891) he described the methods of Thomas Cook & Son, the travel agents, and a visit to Egypt produced next year 'Egypt to-day; the First to the Third Khedive.'

Rae meanwhile made much success as the translator of Edmond About's 'Handbook of Social Economy' (1872; 2nd edit. 1885) and Taine's 'Notes on England' (1873; 8th edit. 1885). But his interests were soon largely absorbed by English political history of the eighteenth century. In 1874 he brought out a political study entitled 'Wilkes, Sheridan, and Fox: or the Opposition under George III,' which echoed the style of Macaulay and showed some historical insight. Further study of the period induced him to tackle the question of the identity of 'Junius,' and he wrote constantly on the subject in the 'Athenæum' between 11 Aug. 1888 and 6 May 1899 and occasionally later. He justified with new research the traditional refusal of that journal, for which Charles Wentworth Dilke [q. v. Suppl. II] was responsible, to identify Junius with Sir Philip Francis. He believed himself to be on the road to the true solution; but his published results were only negative. Rae also made a careful inquiry into the career of Sheridan. With the aid of Lord Dufferin and other living representatives he collected much unpublished material and sought to relieve Sheridan's memory of discredit. His labour resulted in 'Sheridan, a Biography' (2 vols. 1896, with introduction by the Marquess of Dufferin and Ava). Rae succeeded in proving the falsity of many rumours; but failed in his purpose of whitewashing his hero. In 1902 he pub-

lished from the original MSS. 'Sheridan's Plays, now printed as he wrote them,' as well as 'A Journey to Bath,' an unpublished comedy by Sheridan's mother.

Rae also made some halting incursions into fiction of the three-volume pattern. His 'Miss Bayle's Romance' (1887) was followed by 'A Modern Brigand' (1888), 'Maygrove' (1890), and 'An American Duchess' (1891).

In his last years he reviewed much for the 'Athenæum,' whose editor, Norman MacColl [q. v. Suppl. II], was a close friend. He spent his time chiefly at the Reform Club, which he joined in 1860, and where he was chairman of the library committee from 1873 till his death. He wrote the preface to C. W. Vincent's 'Catalogue of the Library of the Reform Club' (1883; 2nd and revised edit. 1894). To this Dictionary he was an occasional contributor. Chronic ill-health and the limited favour which the reading public extended to him tended somewhat to sour his last years. He died on 21 Jan. 1905 at 13 South Parade, Bath, and was buried at Bath.

Rae married, on 29 Aug. 1860, Sara Eliza, second daughter of James Fordati of the Isle of Man and London. She died at Franzensbad, where Rae and herself were frequent autumn visitors, on 29 Aug. 1902; she left two daughters.

Besides the works mentioned, Rae published anonymously in 1873 'Men of the Third Republic,' and translated 'English Portraits' from Sainte-Beuve in 1875.

[Who's Who, 1905; The Times, 25 Jan. 1905; Athenæum, 28 Jan. 1905; Foster's Men at the Bar; private information.] S. E. F.

RAGGI, MARIO (1821-1907), sculptor, born at Carrara, Italy, in 1821, studied art at the Royal Academy, Carrara, winning all available prizes at the age of seventeen. He then went to Rome, where he studied under Tenerani. In 1850 he came to London, working at first under Monti, afterwards for many years under Matthew Noble [q. v.], and finally setting up his own studio about 1875. His principal works were memorial busts and statues. He executed the national memorial to Beaconsfield in Parliament Square, a Jubilee memorial of Queen Victoria for Hong Kong, with replicas for Kimberley and Toronto, and statues of Lord Swansea for Swansea, Dr. Tait for Edinburgh, Dr. Crowther for Hobart Town, Sir Arthur Kennedy for Hong Kong, and Gladstone for Manchester.

His first exhibit in the Royal Academy

was a work entitled 'Innocence' in 1854. No further work was shown at the Academy till 1878, when he exhibited a marble bust of Admiral Rous, which he executed for the Jockey Club, Newmarket. He afterwards exhibited intermittently till 1895, among other works being busts of Cardinal Manning (1879), Cardinal Newman (1881), Lord John Manners, afterwards seventh Duke of Rutland (1884), and the duchess of Rutland (1895). Raggi died at the Mount, Roundstone, Farnham, Surrey, on 26 Nov. 1907.

[The Times, 29 Nov. 1907; Graves's Roy. Acad. Exhibitors, 1906.] S. E. F.

RAILTON, HERBERT (1858-1910), black-and-white draughtsman and illustrator, born on 21 Nov. 1858 at Pleasington, Lancashire, was eldest child (in a family of two sons and a daughter) of John Railton by his wife Eliza Ann Alexander. His parents were Roman catholics. After education at Malines, in Belgium, and at Ampleforth College, Yorkshire, he was trained as an architect in the office of W. S. Varley of Blackburn, and showed great skill as an architectural draughtsman, but he soon abandoned his profession for book-illustration, and came to London to practise that art in 1885. Some of his earliest work was contributed to the 'Portfolio' in that year. He first attracted attention by his illustrations in the Jubilee edition of the 'Pickwick Papers' (1887), and in the following year joined Mr. Hugh Thomson in illustrating 'Coaching Days and Coaching Ways,' by W. O. Tristram. Some of his best drawings appeared in the 'English Illustrated Magazine,' and among books which he illustrated may be mentioned 'The Peak of Derbyshire' by J. Leyland (1891), 'The Inns of Court and Chancery' by W. J. Loftie (1893), 'Hampton Court' by W. H. Hutton (1897), 'The Book of Glasgow Cathedral' by G. Eyre-Todd (1898), 'The Story of Bruges' by E. Gilliat-Smith (1901), and 'The Story of Chartres' by C. Headlam (1902). Railton was a delicate and careful draughtsman, and rendered the texture and detail of old buildings with particular charm. The crisp, broken line of his work lent his drawings an air of pleasant picturesqueness, though it was not without a mannerism which tended to become monotonous. His pen work was eminently suited for successful reproduction by process, and he exercised a wide influence on contemporary illustration.

Railton died in St. Mary's Hospital from pneumonia on 15 March 1910, and was

buried at St. Mary's catholic cemetery, Kensal Green. He married on 19 Sept. 1891 Frances Janetia Edney, who survived him with one daughter.

[The Times, 18 March 1910; Pennell's Pen Drawing and Pen Draughtsmen, 1889; information from Miss Railton.] M. H.

RAINE, ALLEN (pseudonym). [See PUDDICOMBE, MRS. ANNE ADALISA (1836-1908), novelist.]

RAINES, SIR JULIUS AUGUSTUS ROBERT (1827-1909), general, born at Rome on 9 March 1827, was only son of Colonel Joseph Robert Raines of Cork, of the 77th, 82nd, 95th, and 48th regiments, who had served in the Peninsular war, by his wife Julia, daughter of Edward Jardine of Sevenoaks, Kent, banker. In boyhood he lived with his mother's family at Sevenoaks, and attended the school there. He received his military education at the Ecole Militaire in Brunswick (where an uncle by marriage, Baron von Girsewald, was master of horse to the duke). Thence he passed to the Royal Military College, Sandhurst. He entered the army as ensign 3rd Buffs on 28 Jan. 1842, and in the same year exchanged into the 95th regiment. He was promoted lieutenant on 5 April 1844, and captain on 13 April 1852.

He served throughout the Crimean war, 1854-5. For his services with the Turkish army in Silistria, prior to the invasion of the Crimea, he long after received the first-class gold medal of the Liakât. After the affair at Bulganak he carried the Queen's colour at the battle of the Alma. He was at the battles of Inkerman and Tchernaya, and through the siege and fall of Sevastopol he served as an assistant engineer, being severely wounded in the trenches during the bombardment of 17 Oct. 1854, and being present in the trenches at the attack on the Redan on 18 June 1855. He received the medal with three clasps, and was mentioned in despatches 'as having served with zeal and distinction from the opening of the campaign.' The Sardinian and Turkish medals and fifth class Medjidie were also awarded him. A brevet of major was granted him on 24 April 1855, and he became major on 1 May 1857.

Raines commanded the 95th regiment throughout the Indian Mutiny campaign in 1857-9. He was present at the assault and capture of Rowa on 6 Jan. 1858, when he received the high commendation of the governor of Bombay and the commander-in-chief for 'gallantry displayed and ably conducting these operations.' He led the

left wing of the 95th regiment at the siege and capture of Awah on 24 Jan., and at the siege and capture of Kotah on 30 March was in command of the third assaulting column. At the battle of Kotah-ke-Serai he was mentioned in despatches by Sir Hugh Rose 'for good service.' He was especially active during the capture of Gwalior on 19 June, when he was wounded by a musket ball in the left arm, after taking by assault two 18-pounders and helping to turn the captured guns on the enemy. For gallantry in minor engagements he was four times mentioned in despatches. The 95th regiment, while under his command in Central India, marched 3000 miles (*Lond. Gaz.* 11 June and 10 Oct. 1853, 24 March, 18 April, and 2 Sept. 1859). He received the medal with clasp, was promoted to lieutenant-colonel on 17 Nov. 1857, received the brevet of colonel on 20 July 1858, and was made C.B. on 21 March 1859. Raines next saw active service at Aden, where he commanded an expedition into the interior of Arabia in 1865-6. The British troops captured and destroyed many towns and ports, including Ussalu, the Fudthlis capital, and seven cannon. Raines received the thanks of the commander-in-chief at Bombay. Subsequently Raines was promoted major-general on 6 March 1868, lieutenant-general on 1 Oct. 1877, and general (retired) on 1 July 1881, and was nominated colonel-in-chief of the Buffs, the East Kent regiment, in 1882.

He was advanced to K.C.B. on 3 June 1893 and G.C.B. in 1906, and in the same year he received the grand cross of the Danish Order of the Dannebrog. He died on 11 April 1909 at his residence, 46 Sussex Gardens, Hyde Park, W., and was buried in the parish church, Sevenoaks. He married on 15 Nov. 1859 his cousin, Catherine Elizabeth, eldest daughter and co-heiress of John Nicholas Wrixon of Killetra, Mallow, co. Cork. He had no issue.

Raines published in 1900 'The 95th (Derbyshire) Regiment in Central India.'

[The Times, 13 April 1909; Dod's Knightage; Walford's County Families; Hart's and Official Army Lists; Raines, The 95th (Derbyshire) Regiment in Central India, 1900.] H. M. V.

RAINY, ROBERT (1826-1906), Scottish divine, elder son of Harry Rainy, M.D. (d. 6 Aug. 1876), professor of forensic medicine in Glasgow University, by his wife Barbara Gordon (d. July 1854), was born at 49 Montrose Street (now the Technical College), Glasgow, on 1 Jan.

1826. On 10 Oct. 1835 he entered the Glasgow High School, where Alexander Maclaren [q. v. Suppl. II] was his schoolfellow. In October 1838 he proceeded to Glasgow University, where he graduated M.A. in April 1844. His father designed him for the medical profession; he had been taken by his father's friend, Robert Buchanan (1802-1875) [q. v.], to the debates in the general assembly of 1841 leading to 'disruption,' and when 'disruption' came in 1843 he felt a vocation to the ministry of the Free Church; on his father's advice he gave a year (1843-4) to medical study. In 1844 he entered the divinity hall of the Free Church New College, Edinburgh, studying under Chalmers, David Welsh [q. v.], William Cunningham [q. v.], 'rabbi' John Duncan [q. v.], and Alexander Campbell Fraser. He was at this time a member of the famous 'speculative society' at the Edinburgh University. He was licensed on 7 Nov. 1849 by the Free Church presbytery of Glasgow, and for six months had charge of a mission at Inchinnan, near Renfrew. By Elizabeth, dowager duchess of Gordon [q. v.], he was made chaplain at Huntly Lodge; declining other calls, he became minister of Huntly Free Church, ordained there by Strathbogie presbytery on 12 Jan. 1851. His reputation was such that in 1854 he was called to Free High Church, Edinburgh, in succession to Robert Gordon [q. v.]. As he wished to remain in Huntly, his presbytery declined (12 April 1854) to sustain the call; so did the synod; the general assembly (22 May 1854) transferred him to Edinburgh, henceforth his home. His pastorate lasted till 1862, when he was made professor of church history in the Free Church College, delivering his inaugural lecture on 7 Nov. 1862. In 1863 he received the degree of D.D. Glasgow. He became principal of the college in 1874, and retained this dignity till death, resigning his chair in 1901.

Rainy's position soon became that of the ecclesiastical statesman of his church, of whose assembly he was moderator in 1887, in 1900, and in 1905. No one since William Carstairs (1649-1715) [q. v.] (not even William Robertson (1721-1793) leader of the moderates) exercised so commanding an influence on the ecclesiastical life of Scotland. David Masson [q. v. Suppl. II] described him as a 'national functionary.' His three lectures (Jan. 1872) in reply to Dean Stanley's four lectures on the 'History of the Church of

Scotland,' given in that month at the Edinburgh Philosophical Institution (first delivered at Oxford, 1870), were not only a remarkable effort of readiness but a striking vindication of the attitude of Scottish religion. The flaw in his statesmanship was his dealing with the case (1876-81) of William Robertson Smith [q. v.]; in this matter there was some justification for Smith's description of Rainy as 'a jesuit' (SIMPSON, i. 396*n*). Yet of the Assembly speech (1881) by Marcus Dods [q. v. Suppl. II], in opposition to his action, Rainy said 'The finest thing I ever heard in my life' (MACKINTOSH, p. 77). Rainy's advocacy of the 'voluntary' policy (simply, however, as expedient in the circumstances) began in 1872, when, in criticism of the abolition of patronage (effected in 1874), he declared 'that the only solution was disestablishment.' This opened the way for a union with the United Presbyterian Church (mooted as early as 1863); but while Rainy rightly interpreted the feeling of the majority of his own generation, the older men and the 'highland host,' led by James Begg [q. v.] and John Kennedy [q. v.], were unprepared to surrender the principle of a state church. In 1876, after long negotiation, Rainy achieved the union of the reformed presbyterian synod with the Free Church; the original secession synod had been incorporated with the Free Church in 1852. In 1881 Rainy was made convener of the 'highland committee' of his church, a post which he held till death. He was hampered by unacquaintance with Gaelic, but succeeded in winning over a section of the minority opposed to the policy of union. The opposition was not so much to disestablishment as to union with a body which imperfect knowledge led them to distrust (SIMPSON, i. 446). As convener, Rainy raised, between 1882 and 1893, 10,795*l.* for the endowment scheme promoted by his predecessor, Thomas McLauchlan [q. v.], and over 10,000*l.* for the erection of church buildings, mainly in the Outer Hebrides, and subsequently 7500*l.* for special agencies (*Highland Witness*, p. 1074 seq.). In 1890 he supported the motion for refusing any process of heresy against professors Marcus Dods and Alexander Balmain Bruce [q. v. Suppl. I], who were let off with a caution. The question at issue was the inerrancy of Scripture, which Rainy held 'under difficulties,' but would not press, if inspiration were admitted. In 1892 he succeeded in passing into law the Declara-

tory Act, which distinguished in the Confession of Faith between 'substance' and points open to 'diversity of opinion,' and disclaimed 'any principles inconsistent with liberty of conscience and the right of private judgment.' Union with the United Presbyterian Church was effected on 31 Oct. 1900, and Rainy was elected the first moderator of the united body. Within six weeks from the date of the union a court of session summons was served upon all the general trustees of the former Free Church and all the members of the union assembly, the pursuers contending that they alone represented the Free Church, and were entitled to all its property. While litigation was going on, a charge of heresy was brought against George Adam Smith, D.D., on the ground of his Old Testament criticism; Rainy carried a motion declining to institute any process, maintaining that it was 'a question about the respect due to facts,' and could not be 'settled ecclesiastically' (SIMPSON, ii. 272-3). Judgments in the courts of session were given (9 Aug. 1901; 4 July, 1902) in favour of the United Free Church. An appeal to the House of Lords was heard from 24 Nov. to 4 Dec. 1903, and reheard from 9 to 23 June 1904. Judgment was given on 1 Aug., when five peers (Halsbury, Davey, James, Robertson, and Alverstone) found there had been a breach of the Free Church constitution; two (Macnaghten and Lindley) held there had not; one (Halsbury) found definite doctrinal change on predestination; two (Davey and Robertson) held that the position of the confession had been illegally modified; two (Macnaghten and Lindley) held the contrary. The entire church property was handed over to the so-called 'Wee Frees,' the United Free Church raising an emergency fund of 150,000*l.*; its assembly in 1905 passed a declaration of spiritual independence. After a royal commission which reported that 'the Free Church are unable to carry out all the trusts of the property,' the Churches (Scotland) Act (11 Aug. 1905) appointed an executive commission for the allocation of the property between the two bodies. The 'Wee Frees' got a sufficient equipment; the United Free Church raised a further sum of 150,000*l.* to supplement the property recovered. Rainy did not live to re-enter the recovered college building. He had been operated upon for an internal disorder, and left Edinburgh on 24 Oct. 1906 for a recuperative voyage to Australia. His last sermon was at sea on 11 Nov. He

reached Melbourne on 8 Dec., and died there of lymphadenoma on 22 Dec. 1906; on 7 March 1907 he was buried in the Dean cemetery, Edinburgh. He married on 2 Dec. 1857 Susan (b. 1835; d. 30 Sept. 1905), daughter of Adam Rolland of Gask, by whom he had four sons and three daughters. In 1894 his portrait by Sir George Reid was presented to the New College, and a replica to his wife.

His eldest son, ADAM ROLLAND RAINY (1862-1911), M.A., M.B., and C.M. Edin., studied at Berlin and Vienna, and practised (1887-1900) as a surgeon oculist in London. He travelled in Australia and New Zealand (1891), in the West Indies (1896), in Spain and Algiers (1899 and 1903). Entering on political work, he contested Kilmarnock Burghs in 1900 as a radical, gained the seat in 1906, and held it till his sudden death at North Berwick on 26 Aug. 1911. He married in 1887 Annabella, second daughter of Hugh Matheson, D.L. of Ross-shire, who survived him with a son and two daughters.

Robert Rainy was a man of fascinating personality and infinite tact, amounting to skilled diplomacy, being 'a rare manager of men,' regarded by his students with 'peculiar veneration and affection,' and, in spite of a certain aloofness, winning by his earnestness and goodwill the warm attachment of men in all parties. In general politics he took little part, but he followed Gladstone on the home rule question. His writings were not numerous but weighty. He published: 1. 'Three Lectures on the Church of Scotland,' Edinburgh 1872 (in reply to Dean Stanley). 2. 'The Delivery and Development of Christian Doctrine,' 1874 (Cunningham Lecture, delivered 1873). 3. 'The Bible and Criticism,' 1878 (four lectures to students of the Presbyterian Church of England). 4. 'The Epistle to the Philippians,' 1893 (in the 'Expositor's Bible'). 5. 'Presbyterianism as a Form of Church Life and Work,' Cambridge, 1894. 6. 'The Ancient Catholic Church from . . . Trajan to the Fourth . . . Council,' 1902. 7. 'Sojourning with God, and other Sermons,' 1902.

He edited 'The Presbyterian' (1868-71), and made contributions to many composite collections of theological literature, including W. Wilson's 'Memorials of R. S. Candlish' (1880), F. Hastings' 'The Atonement, a Clerical Symposium' (1883), and 'The Supernatural in Christianity' (1894).

The Times, 24 Dec. 1906; Highland Witness, February 1907 (memorial number; eight

portraits); R. Mackintosh, *Principal Rainy*, a biographical study, 1907 (two portraits); P. C. Simpson, *Life*, 1909, 2 vols. (eight portraits).] A. G.

RAMÉ, MARIA LOUISE ('OUIDA'). [See DE LA RAMÉE.]

RAMSAY, ALEXANDER (1822-1909), Scottish journalist, son of Alexander Ramsay, sheep farmer, was born in Glasgow on 22 May 1822. In 1824 his family removed to Edinburgh, where he was educated at Gillespie free school, and where, in 1836, he entered the printing office of Oliver and Boyd. The years 1843-44 he spent in London in the government printing office of T. and J. W. Harrison. Returning to Edinburgh in 1845, he engaged in literary work of different kinds until, in 1847, he was appointed editor of the 'Banffshire Journal,' a post which he filled for sixty-two years. He greatly raised the position of that newspaper, in which he gave prominence to the subject of the sea fisheries, and made a special feature of agriculture and the pure breeding of cattle. He was joint editor of vols. 2 (1872) and 3 (1875) of the 'Aberdeen-Angus Herd Book,' and sole editor of vols. 4 to 33 (1876-1905). Therein he performed a monumental work of a national kind, which was recognised in 1898 by a presentation from breeders of polled cattle throughout the United Kingdom and others; and later by the presentation of a cheque for 150*l.* by members of the Herd Book Society. He was elected provost of Banff in 1894, and next year received the hon. degree of LL.D. from Aberdeen University. He was twice married. He died at Earlhill, Banff, on 1 April 1909. A portrait, painted by Miss Evans, is in possession of the family. Many of his contributions to the 'Banffshire Journal' were reprinted as pamphlets. He also wrote a 'Life of Goldsmith,' privately circulated; and a 'History of the Highland and Agricultural Society of Scotland,' 1879.

[Obituary in *Banffshire Journal*, reprinted as a pamphlet (with portrait); information from the family; personal knowledge.] J. C. H.

RANDALL, RICHARD WILLIAM (1824-1906), dean of Chichester, born at Newbury, Berkshire, on 13 April 1824, was eldest son of James Randall, archdeacon of Berkshire, by his wife Rebe, only daughter of Richard Lowndes of Rose Hill, Dorking. A younger brother, James Leslie, was appointed suffragan bishop of Reading in 1889. Richard entered Winchester College in

1836, and matriculated at Christ Church, Oxford, on 12 May 1842. He graduated B.A. in 1846, with an hon. fourth class in classics, and proceeded M.A. in 1849 and D.D. in 1892. In 1847 he was ordained to the curacy of Binfield, Berkshire, and in 1851 was nominated to the rectory of Lavington-cum-Graffham, Sussex, in succession to Archdeacon (afterwards Cardinal) Manning [q. v.], who had just seceded to Rome. At Lavington Randall's innovations in high church doctrine and ritual excited some opposition. His name became widely known in high church circles, and he was frequently chosen by Bishop Samuel Wilberforce [q. v.] as preacher of Lenten sermons at Oxford.

In 1868 Randall was presented by the trustees to the new parish of All Saints, Clifton. Under his care All Saints became the centre of high church practice and teaching. Daily services as well as daily celebrations of the holy communion were instituted, and lectures, Bible classes, guilds, and confraternities were organised in the parish. Randall showed himself a capable administrator, and raised large sums in support of church work. Although a staunch ritualist and a supporter of the English Church Union, he avoided romanising excesses. In 1873, owing to complaints as to certain practices at All Saints, Charles John Ellicott [q. v. Suppl. II], bishop of Gloucester, refused to license curates to the church, but he declined to allow proceedings to be taken against Randall under the Public Worship Regulation Act. In 1889 the bishop resumed confirmations in the church, and in 1891 bestowed on Randall an honorary canonry in the cathedral, where he occupied the stall formerly held by his father.

In February 1892 Randall was appointed by Lord Salisbury dean of Chichester. For ten years he earnestly devoted himself to his duties, and he was select preacher at Oxford in 1893-4. Owing to ill-health he retired in 1902, and settled in London. He died at Bournemouth on 23 Dec. 1906, and was buried at Branksome. On 6 Nov. 1849 he married Wilhelmina, daughter of George Augustus Bruxner of the Manor House, Binfield, Berkshire, who survived him with three sons and three daughters.

Randall's published volumes, which were mainly devotional, included: 1. 'Public Catechising, the Church's Method of Training her Children,' two papers read at the Church Congress in 1873 and 1883 respectively; 2nd edit. 1888. 2. 'Life in the Catholic Church: its Blessings and

Responsibilities,' 1889. 3. 'Addresses and Meditations for a Retreat,' 1890.

[The Times, 24 Dec. 1906; Church Times, and Guardian, 27 Dec. 1906; Winchester College Register, 1907; A. R. Ashwell and R. G. Wilberforce, *Life of Samuel Wilberforce*, 1883, vols. ii. and iii.; Brit. Mus. Cat.] G. S. W.

RANDEGGER, ALBERTO (1832-1911), musician, born at Trieste on 13 April 1832, was son of a schoolmaster. The family name was derived from Randegg near Schaffhausen. His mother, a Tuscan lady, was an amateur musician, but the boy showed no musical taste till at the age of thirteen he played without preparation a tune with correct melody and harmonies. He was then placed under Tivoli, of Trieste Cathedral, and afterwards under Lafont, for pianoforte. He studied composition under Ricci. In 1852-4 he conducted at several theatres in Italy and Dalmatia, composed ballets, and collaborated in an opera buffa. His grand opera 'Bianca Capello' was produced at Brescia, with a success that brought him an offer to conduct it in America. On the way he was stopped by the news of the cholera outbreak at New York. On the invitation of his eldest brother he came to London for a visit in 1854, and decided to remain. He had never heard an oratorio, and the huge number of performers at an Exeter Hall performance daunted him, the strangeness of the style soon sending him to sleep. But on the advice of Sir Michael Costa he persevered, mastered the English language, and soon became known in London as a versatile musician equally capable as performer, conductor, and teacher. He took further lessons in composition in London from Bernhard Molique. In 1857 he conducted an opera season at St. James's Theatre. From 1859 to 1870 he was organist at St. Paul's, Regent's Park; on the Prince Consort's death he composed an anthem so impressive that the vicar preached no sermon, saying that any words would fail of their effect. Randegger was most successful as a teacher of singing, and in 1868 was appointed to the staff of the Royal Academy of Music. His compositions were distinguished by practical qualities, were always tasteful and externally effective, but had no deep originality, and soon fell into disuse. The principal were 'The Rival Beauties,' operetta (Leeds, 1864), and 'Fridolin,' cantata (Birmingham Festival, 1873); a trio, 'I Naviganti,' was much sung. For Novello's series of primers he wrote

'Singing,' which has had an exceptionally wide circulation. To the end of his life he remained an indefatigable worker, and attended the performance of new works, always taking a copy which he marked with all details of the rendering. He conducted the Carl Rosa company in English opera in 1880, and Italian opera for Sir Augustus Harris from 1887 to 1898, as well as many choral concerts. He introduced many important novelties, mainly English, at the Norwich Triennial Festivals, which he conducted from 1881 to 1905. He edited collections of classical airs, utilising his memoranda of Exeter Hall performances, thus continuing English musical traditions. Besides his extensive practice at the Royal Academy he also became in 1896 a teacher at the Royal College, sharing in the management of both institutions. He was much in request as an adjudicator in competitions, and would give his verdicts in well-chosen words, with practical advice that proved of value to the unsuccessful candidates. He was an honorary member of the Philharmonic Society of Madrid, and in 1892 the King of Italy raised him to the rank of Cavaliere.

He was still actively engaged, and a familiar figure at London musical functions, in 1911 when, after a short illness, he died at his residence, 5 Nottingham Place, W., on 18 Dec. A memorial service, attended by very many prominent musicians, was held at St. Pancras church by Canon Sheppard of the Chapel Royal on 21 Dec.; the remains were cremated at Golder's Green. He married in 1897 Louise Baldwin of Boston, U.S.A.

[Detailed account (with portrait) and many valuable reminiscences of older musicians in Musical Times, Oct. 1899; obituaries in Musical News, and Musical Standard, 23 Dec. 1911; Musical Times, and Musical Herald, Jan. 1912.] H. D.

RANDLES, MARSHALL (1826-1904), Wesleyan divine, born at Over-Darwen, Lancashire, on 7 April 1826, was son of John Randles of Derbyshire by his wife Mary Maguire. He was educated at a private school, and after engaging in business at Haslingden he was accepted as a candidate for the Methodist ministry in 1850 and studied at Didsbury College. He commenced his ministry in 1853, and was stationed successively at Montrose, Clitheroe, Boston, Nottingham, Lincoln, Halifax, Cheetham Hill, Altrincham, Bolton and Leeds. In 1882 he was elected a member of the legal conference, and in

1886 succeeded Dr. William Burt Pope [q. v. Suppl. II] as tutor of systematic theology at Didsbury. For many years he was chairman of the Manchester district, and in 1896 was elected president of the conference. In 1891 he received the degree of D.D. from the Wesleyan Theological College, Montreal. He retired in 1902 from the active ministry, and died at Manchester on 4 July 1904, being buried in Cheetham Hill Wesleyan churchyard.

In August 1856 he married Sarah Dewhurst, second daughter of John Scurrah of Padiham; by her he had a son and daughter; the son, Sir John Scurrah Randles, is conservative M.P. for North West Manchester.

A strong advocate of total abstinence, he first dealt with the question in 'Britain's Bane and Antidote' (1864). But his pen was mainly devoted to theology on conservative lines. In his best-known work, 'For Ever, an Essay on Everlasting Punishment' (1871; 4th edit. 1895), he argued in favour of the eternity of future punishment. Of kindred character was his book 'After Death: is there a Post-Mortem Probation?' (1904), in which he discusses 'Man's Immortality' (1903), by Dr. Robert Percival Downes, a work which favoured an intermediate period of moral probation after death. The view that God is incapable of suffering he strongly maintained, against Baldwin Brown, Dr. A. M. Fairbairn, George Matheson, George Adam Smith, and others, in 'The Blessed God: Impassibility' (1900). His ablest criticism of modern scepticism is found in his 'First Principles of Faith' (1884), in which he deals with the views of Mill, Herbert Spencer, and Mansel. He also published 'Substitution: a Treatise on the Atonement' (1877), and 'The Design and Use of Holy Scripture' (Fernley lecture, 1892), in which he incidentally acknowledges the service of the higher criticism.

A portrait, painted by Arthur Nowell, is at Didsbury College.

[Private information; works as above; Methodist Recorder, 23 July 1896.] C. H. I.

RANDOLPH, FRANCIS CHARLES HINGESTON-(1833-1910). [See HINGESTON-RANDOLPH.]

RANDOLPH, SIR GEORGE GRANVILLE (1818-1907), admiral, born in London on 26 Jan. 1818, was son of Thomas Randolph, prebendary of St. Paul's Cathedral from 1812 till his death

in 1875, chaplain-in-ordinary to Queen Victoria and rector of Hadham, Hertfordshire. Dr. John Randolph [q. v.], bishop of London, was his grandfather. George entered the navy as a first-class volunteer on 7 Dec. 1830. He passed his examination in 1837, and received his commission as lieutenant on 27 June 1838. In Sept. following he was appointed to the North Star, frigate, Captain Lord John Hay [q. v.], commodore on the north coast of Spain, and next, from 1840 to 1844, served on board the Vernon in the Mediterranean, being first lieutenant during the latter part of the commission. In Oct. 1844 he became first lieutenant of the *Daedalus*, of 20 guns, on the East India station, and on 19 Aug. 1845 commanded her barge at the destruction of Malloodo, a piratical stronghold in Borneo. The force landed on this occasion numbered 540 seamen and marines, under the command of Captain Charles Talbot of the *Vestal*; there was sharp fighting, and the British loss amounted to 21 killed and wounded. On 9 Nov. 1846 Randolph was promoted, and a year later was appointed to the *Bellerophon*, in which ship and in the *Rodney* he served for six years in the Mediterranean. He was present in the *Rodney* at the attack on Fort Constantine, Sevastopol, took part in other operations in the Black Sea, and received for his services the Crimean medal with clasp, the Turkish medal, and the fourth class of the *Medjidie*. He was also made a knight of the Legion of Honour, and promoted to captain on 18 Nov. 1854. In that rank he commanded the *Cornwallis*, coastguard ship in the Humber, and afterwards the *Diadem* and *Orlando*, screw frigates, on the North American station. The *Orlando* was transferred to the Mediterranean in 1863, and Randolph remained in her till May 1865, when he was appointed to the guardship at Sheerness. He was awarded a good service pension in March 1867, and from Sept. of that year till March 1869 was commodore at the Cape of Good Hope. He received the C.B. in June 1869, and was promoted to his flag on 24 April 1872. From Dec. 1873 to June 1875 he commanded the detached squadron, this being his last active employment. He was promoted to vice-admiral on 16 Sept. 1877, retired on 26 July 1881, and was advanced to the rank of admiral on 8 July 1884. At Queen Victoria's diamond jubilee of 1897 he was raised to the K.C.B.

Randolph published in 1867 a treatise on 'The Rule of the Road at Sea,' and in 1879 his 'Problems in Naval Tactics'; he was

also a corresponding member of the Royal United Service Institution and a fellow of the Royal Geographical Society. He died on 16 May 1907 at Hove, Brighton, and was buried there.

Randolph married, in 1851, Eleanor Harriet, daughter of the Rev. Joseph Arkwright of Mark Hall, Essex. She died in April 1907.

[O'Byrne's Naval Biography; The Times, 18 May 1907.] L. G. C. L.

RANSOM, WILLIAM HENRY (1824-1907), physician and embryologist, born at Cromer, Norfolk, on 19 Nov. 1824, was elder son of Henry Ransom, a master mariner of that town, who died in 1832. His mother, Mary Jones, was daughter of a Welsh clergyman. Educated at a private school at Norwich, Ransom was apprenticed at sixteen to a medical practitioner at King's Lynn. In 1843 he proceeded to University College, London, where Huxley was a fellow student. Writing to Herbert Spencer on 1 June 1886, Huxley points out that at the examination in 1845 Ransom came out first, winning an exhibition, and he second, with momentous results to himself. 'If Ransom,' Huxley continues, 'had worked less hard I might have been first and he second, in which case I should have obtained the exhibition, should not have gone into the navy, and should have forsaken science for practice' (*Life and Letters of T. H. Huxley*, 1900, ii. 133). After holding residential posts at University College Hospital, Ransom studied in Paris and Germany, graduating M.D. London in 1850. Then settling at Nottingham, he was from 1854 to 1890 physician to the Nottingham General Hospital. He became F.R.C.P. London in 1869, and fellow, respectively, of the Royal Medical and Chirurgical Society and University College, London, in 1854 and 1896. He was elected F.R.S. on 2 June 1870 for his knowledge of physiology and original observations in oology, his candidature being supported among others by Huxley, Paget, and Lister.

Ransom's chief contributions to pure science were made when he was comparatively young, his later activities being absorbed in professional work. He was author of nine papers of value on embryological subjects, of which the first, 'On the Impregnation of the Ovum in the Stickleback,' appeared in the 'Proceedings of the Royal Society' (vol. vii. 1854-5). Another, 'On the Ovum of Osseous Fishes,' was published in the 'Philosophical Transactions' for 1867. He was interested in

geology and assisted in the exploration of Nottinghamshire and Derbyshire caves, reading at the first meeting of the British Association at Nottingham, in 1866, a paper 'On the Occurrence of *Felis Lynx* as a British Fossil.' In 1892, when the British Medical Association met there, Ransom was president of the section of medicine, his address dealing with various aspects of vegetable pathology.

In 1870 Ransom devised a disinfecting stove (gas-heated) for the sterilisation of infected clothing, which was used extensively till steam methods were adopted. A presidential address to the Nottingham Medico-Chirurgical Society, 'On Colds as a Cause of Disease,' delivered on 4 Nov. 1887, attracted attention. His only independent publication, 'The Inflammation Idea in General Pathology,' appeared in 1906 (*Nature*, 29 Nov. 1906; *Brit. Med. Journ.* 23 June 1906).

Through his long career at Nottingham Ransom identified himself with the welfare of the place. Zealous in support of the volunteer movement, he served for fifteen years in the 1st Notts rifle corps. Interested in educational questions, he helped in the establishment of University College, Nottingham, of the governing body of which he was a member. He died at his residence, Park Valley, Nottingham, on 16 April 1907.

In 1860 he married Elizabeth, daughter of Dr. John William Bramwell of North Shields, who predeceased him. They had issue four sons and one daughter. The eldest son, Dr. W. B. Ransom (b. 5 Sept. 1860), succeeded his father as physician to the General Hospital, Nottingham, dying in 1909.

[*Brit. Med. Journ.*, 27 April 1907; *Lancet*, 27 April 1907; *Medico-Chirurgical Trans.* vol. xc.; *Roy. Soc. Catal. Sci. Papers*; *Report Brit. Assoc.* 1866.] T. E. J.

RASSAM, HORMUZD (1826-1910), Assyrian explorer, born at Mosul in Asiatic Turkey in 1826, was youngest son and eighth child of Anton Rassam, archdeacon in the Chaldean Christian community at Mosul, by his wife Theresa, granddaughter of Ishaak Halabee (of Aleppo). His father was a Nestorian or Chaldean Christian, and claimed to be of Chaldean race, but he was probably of Assyrian descent. The word 'Rassam' is Arabic for designer or engraver, and the family were originally designers of patterns for muslins, the staple product of Mosul. An elder brother, Christian, married

Matilda, sister of George Percy Badger [q. v. Suppl. I], the Arabic scholar, and became the first English consul at Mosul.

As an infant Hormuzd narrowly escaped death by the plague. In childhood he learned to write and speak both the Chaldean and Syrian language, which the native Christians used, and Arabic, the speech of the country. As a boy he was induced to serve as an acolyte in the Roman catholic church of St. Miskinta, but a project to send him to Rome to study the catholic faith came to nothing owing to his doubts of Roman doctrine. A brother Georges was excommunicated by the Roman church on that ground. Mrs. Badger, his brother's mother-in-law, finally converted him to protestantism and helped him in the study of English. In 1841 he accompanied an Austrian traveller on a scientific expedition to study the flora and fauna of the Assyrian and Kurdish mountains. Next year he became clerk to his brother Christian. In the summer Sir Austen Henry Layard [q. v. Suppl. I], who passed through Mosul on his way from Persia to Constantinople, lodged at Christian's house and made Hormuzd's acquaintance, with crucial effect on his career.

With Christian's permission Layard took Hormuzd with him in 1845, to make excavations in the mounds of Nimroud, the site of the Biblical Calah. Hormuzd won Layard's fullest confidence, and when Layard went to Bagdad to arrange for the transport of the antiquities to England, Hormuzd was left in charge, and all the accounts of the excavations passed through his hands. His services, however, were unpaid. After the discovery at Nimroud of the palaces of Aššur-nasir-āpli, Shalmaneser II, Tiglath-pileser IV, Sennacherib, and Esarhaddon, work was pursued from May 1847 with equal success at Kouyunjik (Nineveh).

In 1848 by Layard's advice Rassam came to England with a view to finishing his education at Magdalen College, Oxford. He came to know Pusey and the leaders of the Oxford Movement, but his sympathy with them was small. His stay in Oxford was short. While Charles Marriott [q. v.] was preparing him for matriculation, Layard recalled him to Assyria to assist in excavations at the expense of the trustees of the British Museum. He subsequently presented to Magdalen College a sculptured slab from Nineveh. Rassam had now a fixed salary, with an allowance for travelling. Arriving late in 1849 he pushed on vigorously with the work at

Kouyunjik, and the excavations at Nimroud were reopened. Rassam accompanied his patron to the ruins in Babylonia and returned to England in 1851, when Layard brought back his discoveries.

Next year the trustees of the British Museum sent Rassam out alone—Layard's health compelling his withdrawal. He worked at Nimroud, Kouyunjik, and tried again the mounds representing Aššur, the old capital of Assyria, now called Qala'a-Shergat. In all these places antiquities were found, many of them of considerable importance. His great discovery on this occasion, however, was the palace of Aššurbanipal at Kouyunjik—the North Palace—with a beautiful series of bas-reliefs, including the celebrated hunting-scenes. Among the numerous tablets were some supplying accounts of the Creation and Flood legends. A few of the slabs found in this edifice are now in the Louvre at Paris, but most of them are in the British Museum.

On returning to England, Rassam in 1854 accepted from the Indian government the post of political interpreter at Aden, leaving further excavating work to William Kennett Loftus [q. v.]. At Aden, where Rassam remained eight years, he soon served as postmaster as well as political interpreter. Later he became judge and magistrate without salary, and was given the rank of political resident and justice of the peace. Rassam's chief duty was to qualify the hostility of the neighbouring tribes to the British authorities and to one another. Forming a friendship with Seyyid Alaidrous, whose ancestor he described as the patron saint of Arabia Felix, he got into touch with the tribes of the interior with the best results. In 1861 he was sent by the Indian government to Zanzibar to represent British interests while the claim of the Sultan of Muscat to suzerainty over his brother, the Sultan of Zanzibar, was under investigation by the Indian government.

In 1864 an exciting episode in Rassam's career opened. Two years earlier Theodore, King of Abyssinia, had cast into prison at Magdala, Consul Charles Duncan Cameron [q. v.], Henry Aaron Stern [q. v.], and other British missionaries of the London Jews' Society. In 1864 Rassam was chosen for the perilous duty of delivering a friendly letter of protest to Theodore. Arriving at Massowah, he and two companions, Lieutenant Prideaux and Dr. Blanc, of the Indian army, were kept waiting there nearly a year before receiving permission to enter the

country, which even then was only granted in response to Rassam's threat to return to Aden. Rassam met Theodore at Damot on 28 Jan. 1866. At first the mission was well treated; the captives were set at liberty and reached Rassam's camp, while a letter of apology from the king was drafted (12 March 1866). Suddenly the king's conduct changed; he imposed fresh conditions (12 April) and claimed an indemnity for the liberation of the captives. Having re-arrested the prisoners, Theodore now seized the three members of the British mission and threw all, loaded with chains, into the rock-fortress of Magdala.

Rassam, whose personal relations with Theodore were not unamiable, succeeded in communicating with the frontier, and a military expedition was despatched to Abyssinia to effect the release of the captives, under Sir Robert Napier (afterwards Lord Napier of Magdala). On 2 Dec. 1867 Theodore heard of its landing. An ultimatum from the commander-in-chief destined for the king was intercepted by Rassam, who believed its receipt would lead to the massacre of himself and of his fellow-captives. Recognising his peril, Theodore ordered Rassam's chains to be taken off on 18 March 1868, and he and the three captives were released on the arrival of the British force before Magdala on 11 April 1868. Until his death Rassam suffered physically from his long confinement. On the 14th the fortress was taken by storm, and Theodore died by his own hand next day. Rassam narrated his strange experiences in his 'British Mission to Theodore, King of Abyssinia, with Notices of the Country traversed from Massowah through the Soudan and the Amhara and back to Annesley Bay from Magdala' (2 vols. 1869).

Returning to England, Rassam during a year's leave of absence married an English wife, and resigning his appointment at Aden travelled widely in the United Kingdom and the Near East. He then settled first at Twickenham and afterwards at Isleworth. In 1877 he was again employed by the British government in Asiatic Turkey, where he inquired into the condition of the Christian communities and sects in Asia Minor, Armenia, and Kurdistan. He revisited his native town of Mosul on 16 Nov. 1877. He gave a detailed account of his observations on the journey in his 'Asshur and the Land of Nimrod' (Cincinnati and New York, 1897).

Meanwhile, in 1876, with the help of Layard, then British ambassador in Turkey,

Rassam had obtained a firman from the Turkish government, on behalf of the trustees of the British Museum, for the continuation of the excavations in Assyria and Babylonia. He at once organised the work of exploration, and every year from 1876 until the end of 1882 he carried on excavations, not only at Kouyunjik (Nineveh) and Nimroud (Calah) but also at Balawat. In Babylonia the sites explored included the ruins of Babylon, Tel-Ibrahim (Cuthah), Dailem, and Abuhabbah (Sippar). Among the more important finds were the bronze gates of the Assyrian king Shalmaneser II (Balawat), the beautiful Sungod-stone, the cylinder of Nabonidus giving his date for the early Babylonian kings Sargon of Agadé and his son Naram-Sin, and a valuable mace-head with the name of king Sargani. The inscriptions included additions to the Creation and Flood legends, the first tablet of a bilingual series prefaced by a new and important version of the Creation story in Sumerian and Semitic Babylonian, and numerous other documents; the fragments, large and small, amounted, it was estimated, to close upon 100,000, though many of these were small, and consequently of little value. Among the imperfect documents was the cylinder of Cyrus the Great, in which he refers to the capture of Babylon. Rassam's important discoveries attracted world-wide attention, and the Royal Academy of Sciences at Turin awarded him the Brazza prize of 12,000 fr. for the four years 1879-82. His discovery of the site of the city Sippara is especially noticed among the grounds of the award. An allegation that Rassam's kinsmen had withheld from the British Museum the best of Rassam's finds was successfully refuted in 1893 in an action at law in which Rassam was awarded 50% damages for libel.

After 1882 Rassam lived mainly at Brighton, writing on Assyro-Babylonian exploration, on the Christian sects of the Nearer East, or on current religious controversy in England. Like most Oriental Christians, he was a man of strong religious convictions, and having adopted evangelical views became a bitter foe of the high church movement. He was fellow of the Royal Geographical Society, the Society of Biblical Archaeology, and the Victoria Institute.

An autobiography which he compiled before his death remains in manuscript. He died at his residence at Hove, Brighton, on 16 Sept. 1910, and was buried in the

cemetery there. By his wife Anne Eliza, daughter of Captain Spender Cosby Price, formerly of the 77th Highlanders, whom he married on 8 June 1869, he had issue a son and six daughters. The son, Anthony Hormuzd, born on 31 Dec. 1883, joined the British army, and is now captain in the New Zealand staff corps at Wellington.

[Rassam's published books and MS. autobiography; Clements Markham's Hist. of the Abyssinian Expedition, 1869; H. A. Stern's *The Captive Missionary*, 1868; Parliamentary Papers (Abyssinian), 1867-9; Lord A. Loftus's *Reminiscences* (2nd edit.), i. 206; Men of Mark, 1881 (with portrait); *The Times*, 17 Sept. 1910.] T. G. P.

RATHBONE, WILLIAM (1819-1902), philanthropist, born in Liverpool on 11 Feb. 1819, was eldest of six sons of William Rathbone (1787-1868) [see under WILLIAM RATHBONE (1757-1809)] by his wife Elizabeth Greg, and was the sixth William Rathbone in direct succession, merchants in Liverpool from 1730. After passing through schools at Gateacre, Cheam, and Everton, he was apprenticed (1835-8) to Nicol, Duckworth & Co., Bombay merchants in Liverpool. In October 1838 he went with Thomas Ashton (father of Baron Ashton of Hyde) for a semester at the University of Heidelberg, where he 'gained habits of steady work and study,' and acquired a knowledge of foreign politics. His high ideals of public duty were formed under the teaching of John Hamilton Thom [q. v.], who had married in 1838 his sister Hannah. From Heidelberg he made (in 1839) an Italian tour, and on his return obtained a clerkship in the London firm of Baring Brothers. In April 1841 the senior partner, Joshua Bates [q. v.], took him on a business tour to the United States; the impression of this visit, confirmed by two subsequent ones (his third visit, 1848, was with his first wife, whose parents were American by birth), made him an 'uncompromising free-trader.' At the end of 1841 he became a partner in his father's firm, Rathbone Brothers & Co. His philanthropic work began in 1849, when he acted as a visitor for the District Provident Society; in later life he said that in the House of Commons he was 'often far more tempted to take a low and sordid view of human nature than he had ever been in the slums.' His first experiment in district nursing was made in 1869, by the engagement for this work of Mary Robinson, who had attended his first wife in her fatal illness. He consulted Florence Nightingale [q. v. Suppl. II] about a

supply of nurses, who suggested that Liverpool should form a school to train nurses for itself. Hence the establishment by Rathbone of the Liverpool Training School and Home for Nurses, which began work on 1 July 1862. By the end of 1865 Liverpool had been divided into eighteen districts, each provided with nursing under the superintendence of ladies, who made themselves responsible for the costs entailed; for about a year Rathbone himself took the place of one of the lady superintendents during her absence. Long after, a colleague remarked that Rathbone was 'the one male member of the committee who knew what the homes of the poor were actually like.' The reform of sick nursing in the workhouses was also achieved by Rathbone, who secured for this in 1865 the invaluable services of Agnes Elizabeth Jones (1832-68). For three years he bore the whole expenses. His nursing reforms were extended to Birmingham and Manchester, and to London in 1874, when the National Association for providing Trained Nurses was formed, with Rathbone as chairman of its sub-committee for organising district nursing. In 1888-9 he was honorary secretary and subsequently vice-president of Queen Victoria's Jubilee Institute for Nurses, to which the Queen had devoted 70,000*l.* out of the Women's Offering. Meanwhile, during the cotton famine of 1862-3, caused by the civil war in the United States, he did much, in conjunction with his cousin, Charles Melly, to raise to 100,000*l.* the Liverpool contribution to the relief fund, and brought wise counsel to its distribution.

His political action began locally in 1852, on the liberal side. He took a leading part in 1857 in procuring the Liverpool address upholding the findings of the commissariat commissions appointed after the Crimean war. Gladstone's election in 1865 for South Lancashire owed much to his energy. In November 1868 he was elected as one of the three members for Liverpool. Among other matters he took part in shaping the bankruptcy bill (1869). He was especially interested in measures for local government and in the licensing laws, opposing 'prohibition,' and demanding not more legislation but stricter administration. He commissioned in 1892 Mrs. Evelyn Leighton Fanshawe to report on temperance legislation in the United States and Canada (published 1893). For Liverpool he sat till 1880, when he contested south-west Lancashire, and was defeated, but was returned in the following November at a bye-election for Carnarvonshire, sitting for

the county till 1885, and from 1885 for North Carnarvonshire. He followed Gladstone on the home rule question. In 1895 Rathbone retired from parliament. He was deputy-lieutenant for Lancashire.

In the foundation of the University College of Liverpool (opened in Jan. 1882) he was greatly interested; with his two brothers he founded a King Alfred chair of modern literature and English language; he was president of the college from 1892. He was also very active in the movement for establishing the University College of North Wales (opened Oct. 1884), of which he was president from 1891. He was actively concerned in the Welsh Intermediate Education Act of 1889. Liverpool gave him the freedom of the city on 21 Oct. 1891. In May 1895 he was made LL.D. by Victoria University.

Straightforwardness and pertinacity, with entire unselfishness, were leading features in Rathbone's character. With little of the bonhomie and none of the humour of his large-hearted father, seeming indeed to be a dry man, he had a tenderness of disposition which found expression rather in act than in word. Principled against indiscriminate giving, he was constantly liable to be overcome by personal appeal. A convinced unitarian in theology, he carried many traces of his Quaker antecedents. His manner of life was simple. He died at Greenbank, Liverpool, on 6 March 1902, and was buried in Toxteth cemetery. He married (1) on 6 Sept. 1847, Lucretia Wainwright (*d.* 27 May 1859), eldest daughter of Samuel Gair of Liverpool, by whom he had four sons, of whom two survived him, and one daughter; (2) in 1862, Emily Acheson (his second cousin), daughter of Acheson Lyle of Londonderry, who survived him with her two sons and two daughters.

Rathbone published: 1. 'Social Duties . . . Organisation of . . . Works of Benevolence and Public Utility,' 1867. 2. 'Local Government and Taxation,' 1875. 3. 'Local Government and Taxation,' 1883 (reprinted from the 'Nineteenth Century'). 4. 'Protection and Communism . . . Effects of the American Tariff on Wages,' 1884. 5. 'Reform in Parliamentary Business,' 1884. 6. 'Sketch of the History and Progress of District Nursing,' 1890.

His bust, by Charles Allen, was presented to University College, Liverpool. Another bust, by Hargreaves Bond, was presented (1889) to the Liverpool Reform Club. A bronze statue by (Sir) George Frampton,

R.A., was erected by public subscription in St. John's Gardens, Liverpool.

[The Times, 7 March 1902; Christian Life, 7, 12, and 29 March 1902; Memorials of Agnes E. Jones, 1871; Eleanor F. Rathbone's William Rathbone; a Memoir, 1905 (portrait); information from the Rev. J. Collins Odgers; personal recollection.] A. G.

RATTIGAN, SIR WILLIAM HENRY (1842-1904), Anglo-Indian jurist, born at Delhi on 4 Sept. 1842, was youngest son of Bartholomew Rattigan, who left his home, Athy, co. Kildare, at an early age and entered the ordnance department of the East India Company. Educated at the high school, Agra, he entered the 'unconvenanted' service of government in youth as extra assistant commissioner in the Punjab, acting for a short time as judge of the small causes court at Delhi. But being dissatisfied with his prospects he resigned, contrary to the wishes of his family, in order to study law. Enrolled as a pleader of the Punjab Chief Court on its establishment in 1866, he built up an extensive practice, first in partnership with Mr. Scarlett, and then on his own account.

Coming to England, he was admitted a student of Lincoln's Inn on 3 Nov. 1871, and was called to the bar there on 7 June 1873, also studying at King's College, London. Returning to Lahore, he speedily rose to be head of his profession there. He was for many years government advocate, and in 1880, 1881, 1882, and 1886, for varying short periods, he acted as a judge of the chief court. In Nov. 1886 he resigned his acting judgeship so as to continue his practice without further interruption. A linguist of unusual ability, Rattigan mastered in all five European languages, several Indian vernaculars, and Persian. German he studied assiduously, and he translated the second volume of Savigny's 'System of Roman Law—Jural Relations' (1883). In 1885 he took the degree of D.L., with first-class honours, at Göttingen.

In February 1887 Rattigan became vice-chancellor of the Punjab University, then on the verge of bankruptcy. He succeeded in regenerating the institution, and was reappointed biennially, retaining the vice-chancellorship till April 1895. He was made a D.L. of the university in Jan. 1896, and LL.D. of Glasgow in 1901. In 1891 he accepted the presidency of the Khalsa College committee, and by his energy and influence overcame dissension among the Sikhs, with the result

that an institution for their higher education on a religious basis was established at Amritsar in 1897. When he retired from India in April 1900 the Sikh council appointed him life president, and on his death a memorial hospital was erected at the college (opened in 1906). He was an additional member of the viceroy's legislative council in 1892-3 and of the Punjab legislative council in 1898-9.

A self-made man, without advantages of family influence, Rattigan made substantial contributions to legal literature amid his professional and public labours. He published 'Selected Cases in Hindu Law decided by the Privy Council and the Superior Indian Courts' (2 vols., Lahore, 1870-1), 'The Hindu Law of Adoption' (1873), 'De Jure Personarum' (1873), and he collaborated with Mr. Justice Charles Boulnois (1832-1912), of the Punjab chief court, in 'Notes on the Customary Law as administered in the Punjab' (1878). His most important book, 'A Digest of Civil and Customary Law of the Punjab' (Lahore, 1880), which reached a seventh edition (1909), was designed to classify material for a future codification, and rendered Rattigan a foremost authority upon customary law in Northern India. His other works were 'The Science of Jurisprudence' (Lahore, 1888), which, chiefly intended for Indian students, reached a third edition (1899); 'Private International Law' (1895); and a pamphlet on the international aspects of 'The Case of the Netherlands South African Railway' (1901). Rattigan was knighted in Jan. 1895, was made queen's counsel in May 1897, and was elected benchet of his inn in June 1903.

On settling in England in 1900 he practised before the privy council. At the general election of 1900 he unsuccessfully contested North East Lanark in the liberal-unionist interest; but at the bye-election on 26 Sept. 1901 he won the seat by a majority of 904. Speaking rarely, and chiefly on Indian matters, he was respected by all parties. He was killed in a motor-car accident near Biggleswade, on his way to Scotland, on 4 July 1904, and was buried in Kensal Green cemetery.

He married (1) on 21 Dec. 1861, at Delhi, Teresa Matilda (*d.* 9 Sept. 1876), daughter of Colonel A. C. B. Higgins, C.I.E., examiner of accounts, public works department; (2) at Melbourne, on 1 April 1878, her sister Evelyn, who survives. By his first marriage he had two daughters and four sons, and by his second marriage three sons.

There is a memorial window in Harrow Chapel, where Rattigan's sons were educated, and a tablet is in the cathedral at Lahore.

[Rattigan's legal works; the Punjab Magazine, Feb. 1895; Men of Merit, London, 1900; Glasgow Contemporaries at Dawn of XXth Century, Glasgow 1901; Punjab Civil Lists; The Times, 5, 6, 7, and 11 July 1904; The Biographer, Nov. 1901; Civil and Military Gazette, Lahore, 7, 9, and 22 July 1904; Pioneer, 7 July 1904; Law Times, 9 July 1904; family details kindly supplied by Lady Rattigan.] F. H. B.

RAVEN, JOHN JAMES (1833-1906), archaeologist and campanologist, born on 25 June 1833 at Boston, Lincolnshire, was eldest son of eight children of John Hardy Raven, of Huguenot descent, rector of Worlington, Suffolk, by his wife Jane Augusta, daughter of John Richman, attorney, of Lymington, Hampshire. A younger brother, the Rev. John Hardy Raven (1842-1911), was headmaster of Beccles school. John, after early training at home, entered St. Catharine's College, Cambridge, on 18 Oct. 1853, and migrated on 17 Dec. following to Emmanuel College (where he was awarded first an Ash exhibition and subsequently a sizarship). He graduated B.A. as a senior optime in the mathematical tripos of 1857, proceeding M.A. in 1860 and D.D. in 1872. In 1857 he was appointed second master of Sevenoaks grammar school, and was ordained curate of the parish church there. In 1859 he became headmaster of Bungay grammar school, an office which was for nearly 300 years in the gift of Emmanuel College. He improved the working of the school and raised money for a new building, which was opened in 1863. A commemorative tablet testifies to his share of the work. From 1866 to 1885 he was headmaster of Yarmouth grammar school. He served for some time as curate of the parish church, Yarmouth, and was from 1881 to 1885 vicar of St. George's in that town. In 1885 he was presented by the Master of Emmanuel to the consolidated vicarage of Fressingfield and rectory of Withersdale in Suffolk, and was admitted on 23 March 1895 (under a dispensation from the archbishop of Canterbury) to the vicarage of Metfield in the same county. He was chosen honorary canon of Norwich in 1888, and rural dean of Hoxne in 1896, and a co-opted member of the County Education Committee on its formation in 1902.

While a youth Raven began his lifelong

archæological study by examining the bells of the churches near his home at Worlington and by contributing to Parker's 'Ecclesiastical History of Suffolk' in 1854. He served from 1881 till his death on the committee of the Norfolk and Norwich Archæological Society, which he joined in 1871, was a vice-president of the Suffolk Institute of Archæology, and was elected F.S.A. on 23 April 1891. The best English campanologist of his time, he was president of the Norwich Diocesan Association of Ringers, and published books on 'The Church Bells of Cambridgeshire' (Lowestoft, 1869; 2nd edit. Camb. Antiq. Soc. 1881), 'The Church Bells of Suffolk' (1890), and 'The Bells of England' (in the 'Antiquary's Books' series, 1906). He died at Fressingfield vicarage on 20 Sept. 1906, and was buried in the churchyard. A reredos was erected to his memory in the church. His pupils at Yarmouth presented him with his portrait by Alfred Lys Baldry (now belonging to his eldest son at Fressingfield), and a tower at Yarmouth school commemorated his successful headmastership. His fine library of county and bell literature was sold at Fressingfield in Nov. 1906.

He married on 19 March 1860, at Mildenhall parish church, Suffolk, Fanny, youngest daughter of Robert Homer Harris of Botesdale, and had, with two daughters, seven sons, of whom three took holy orders.

Besides the works already mentioned, separate sermons, and contributions to periodicals, including 'Emmanuel College Magazine,' Raven published 'The History of Suffolk' (in the 'Popular County Histories' series, 1895), and 'Mathematics made easy: Lectures on Geometry and Algebra' (1897). He also compiled the 'Early Man' section of the 'Victoria County History of Suffolk,' and projected a volume, 'Sidelights on the Revolution Period,' for which he transcribed Archbishop Sancroft's commonplace book.

[Athenæum, 29 Sept. 1906; Emmanuel Coll. Mag., vol. xvii. no. 1; private information.]

T. C. H.

RAVERTY, HENRY GEORGE (1825-1906), soldier and Oriental scholar, born at Falmouth on 31 May 1825, was the son of Peter Raverty of co. Tyrone, a surgeon in the navy. His mother belonged to the family of Drown of Falmouth. Educated at Falmouth and Penzance, at fifteen or sixteen he showed an inclination for the sea, but a short voyage as a passenger from Penzance disillusioned him, and he resolved to become a soldier. The interest of Sir Charles Lemon secured him a cadetship,

and he sailed for India. Appointed to the Welsh fusiliers, he very soon (in 1843) exchanged into the 3rd Bombay native infantry. With his regiment he was present at the siege of Multan in 1848; served in Gujarat, and in the first frontier expedition in 1850 against tribes on the Suwât border. For his services at Multan and Gujarat he received a medal with two clasps, and a medal with one clasp for the north-west frontier. Raverty held a civil appointment as assistant-commissioner in the Punjab from 1852 to 1859. He was promoted major in 1863 and retired from the army next year.

Settling in England, first near Ottery St. Mary, and afterwards at Grampound Road, Cornwall, Raverty pursued till the end of his long life various Oriental studies which he had begun in India. Although he lacked academic training, he was gifted with scholarly instincts, and devoted himself to linguistic, historical, geographical, and ethnological study on scientific lines. In India he first learned Hindustani, Persian, Gujarati, and Marathi, and for his knowledge of these languages gained the 'high proficiency' prize of 1000 rupees from his government. A 'Thesaurus of English Hindustani Technical Terms' (1859) proved his linguistic aptitude in Hindustani. His transference to the north-west frontier at Peshawar in 1849 had meanwhile directed his chief attention to the Pushto or Afghan language, history, and ethnology. To the 'Transactions' of the Geographical Society of Bombay, Raverty contributed in 1851 'An Account of the City and Province of Peshawar,' illustrated with maps and sepia sketches. In order to acquire practical knowledge of the Pushto tongue he had to collect, arrange, and systematise almost the whole of the needful grammatical and lexical material. Raverty thus became 'the father of the study of Afghan.' His first efforts proved comprehensive and final. In 1855 he published his 'Grammar of the Pushto or Language of the Afghans,' which Dr. Dorn, the eminent orientalist of St. Petersburg, warmly commended. In 1860, besides a second and improved edition of the Grammar (3rd edit. 1867), he published his monumental 'Dictionary of the Pushto or Afghan Language' (2nd edit. 1867), and his admirable anthology of Pushto prose and poetry entitled 'Gulshan i Roh.' He was as well acquainted with the Pushtu literature as with the spoken language. In 1862 there followed 'Selections from the Poetry of the Afghans from the Sixteenth to the Nine-

teenth Century' in an English translation. After leaving India, in 1864, he published 'The Gospel of the Afghans, being a Critical Examination of a Small Portion of the New Testament in Pushtu'; in 1871 a translation of 'Æsop's Fables' into Pushtu, and in 1880 a 'Pushtu Manual.' Between 1881 and 1888 he issued in four instalments his ponderous work 'Notes on Afghanistan and Baluchistan,' in which he describes as many as three and twenty routes in those countries. Besides its geographical and topographical information, the book contains an important contribution to the ethnology of those regions, and much concerning the manners and customs of the tribes and clans. The 'Notes' were prepared at the request of the marquis of Salisbury when secretary of state for India in 1875-6.

Simultaneously Raverty was working at his translation of the 'Tabakāt i Nāsiri,' which was published in 1881. It is a rendering from Persian into English of Minhāj ibn Sirāj's work on general history, with special reference to the Muhammadan dynasties of Asia, and particularly those of Ghūr, Ghaznah (now parts of Afghanistan), and Hindustan. By his critical remarks and copious illustrative notes derived from his wide reading of other native authors, Raverty vastly enhanced the historical value and completeness of Minhāj's work.

Other of Raverty's valuable studies appeared chiefly in the 'Journal of the Asiatic Society,' Bengal. Among these papers were 'Remarks on the Origin of the Afghan People' (1854); 'Notes on Kafiristan and the Siah-Posh Kafir Tribes' (1858); 'On the Language of the Siah-Posh Kafirs of Kafiristan' (1864); 'An Account of Upper Kashghar and Chitral' (1864); 'Memoir of the Author of the Tabakāt i Nāsiri' (1882); 'The Mihran of Sind and its Tributaries—a Geographical Study' (1892); and 'Tibbat three hundred and sixty-five Years ago' (1895). 'Muscovite Proceedings on the Afghan Frontier' was reprinted from the 'United Service Gazette' in 1885.

Raverty died at Grampound Road, Cornwall, on 20 Oct. 1906. He married in 1865 Fanny Vigurs, only daughter of Commander George Pooley, R.N. She survived him without issue.

Raverty, whose frankness in controversy cost him many friends, received small recognition in his lifetime from his fellow-countrymen, but his immense labours gave him a high reputation among foreign Oriental scholars. At his death Raverty had seven important works either com-

pleted in manuscript or in preparation, viz.: 1. 'A History of Herat and its Dependencies and the Annals of Khurāsān from the earliest down to modern Times,' based upon the works of native historians, which are treated with critical acumen; the six bulky quarto volumes of MS., the result of fifty years' research, are now at the India office. 2. 'A History of the Afghan People and their Country' (the whole material collected and the composition just commenced). 3. 'A brief History of the Rise of the Isma'iliyah Sect in Africa.' 4. 'A History of the Mings and Hazarāhs of Afghanistan and other Parts of Central Asia.' 5. 'A Translation of the Ta'rikh i Alfī from the Persian.' 6. 'The Gospels in Pushtu' (completed). 7. 'An English-Pushtu Dictionary' (not completed).

[The Times, 26 Oct. 1906; Buckland's Dict. of Indian Biog.; Journal of the Royal Asiatic Soc., 1907, pp. 251-3; papers kindly lent by Major Raverty's widow.] E. E.

RAWLINSON, GEORGE (1812-1902), canon of Canterbury, writer on ancient history, born on 23 Nov. 1812, at Chadlington, Oxfordshire, was third son of Abraham Tysack Rawlinson by his wife Eliza Eudocia Albinia, daughter of Henry Creswicke, of Morton, Worcester. Sir Henry Creswicke Rawlinson [q. v.], was his brother. Educated at Swansea grammar school and at Ealing school, he matriculated in 1834 at Trinity College, Oxford, as a commoner, and in 1838 took a first class in the final school of classics, graduating B.A. in that year and proceeding M.A. in 1841. He played for Oxford in the first cricket match with Cambridge in 1836 and was president of the Union in 1840. He was elected fellow of Exeter College in 1840 and tutor in 1841. In 1841 and 1842 he was ordained deacon and priest, and gained the Denyer prize for a theological essay twice—in 1842 and 1843. In 1846 he vacated his tutorship on his marriage, and for a short time (1846-7) was curate of Merton, Oxfordshire. But he soon found ways of renewing his activities and interests in Oxford. He served on the committee of the Tutors' Association, a body formed to consider the proposals of the University Commission of 1852, with Church, Marriott, Osborne Gordon, Mansel, and others. In 1853, with Dean Lake, he laid before Gladstone the views of the Tutors' Association, and thus had an important influence in shaping the Oxford University Act of 1854. Gladstone's

interest in Rawlinson may be dated from this interview. In the newly organised examination of classical moderations Rawlinson was a moderator from 1852 to 1854, with Scott, Conington, Mansel, and others. He was an examiner in the final classical school in 1854, 1856, 1867; and in theology in 1874. In 1859 Rawlinson succeeded Mansel as Bampton lecturer, his subject being 'The Historical Evidences of the truth of the Scripture Records stated anew, with special reference to the doubts and discoveries of modern times' (1859; 2nd edit. 1860). In 1861 he was appointed Camden professor of ancient history. He held that post till 1889, and it left him leisure for writing and research. His interests in Oxford were not wholly academic. He was a pioneer in the attempt to establish friendly and useful connections between the university and the town. From 1860 to 1863 he was a guardian of the poor; he was a perpetual curator of the University Galleries, and an original member and first treasurer of the Oxford Political Economy Club. From 1859 to 1870 he held the office of classical examiner under the council of military education.

In 1872 the crown appointed him canon of Canterbury. Indistinctness of speech interfered with his efficiency as a speaker and preacher, so that Gladstone's choice must be taken as a recognition of his learning, broad-mindedness, and administrative capacity. His interest in Canterbury Cathedral was shown by valuable gifts and more particularly on the occasion of his golden wedding in 1896 by the presentation of a gold and jewelled paten and chalice. He was proctor in convocation for Canterbury from 1873 to 1898. In 1888, the year before he resigned the Camden professorship, he was preferred by the chapter of his cathedral to the rich rectory of All Hallows, Lombard Street.

Early in his career Rawlinson devoted himself to the preparation of an elaborate English edition of Herodotus. He arranged that his brother, Sir Henry Rawlinson, and Sir J. Gardner Wilkinson, should contribute special articles on historical, archaeological and racial questions, while he himself prepared the translation with short notes and other adjuncts of scholarship. The edition was dedicated to Gladstone and superseded all other editions at Oxford for many years; it was entitled 'The History of Herodotus. A new English version, edited with copious notes and appendices. Embodying the chief results, historical and ethnographical, which have been

obtained in the progress of Cuneiform and Hieroglyphical discovery. By G. Rawlinson . . . assisted by Sir H. Rawlinson and Sir J. G. Wilkinson' (4 vols. 1858-60; 2nd edit. 1862; 3rd edit. 1875). An abridgement in two volumes by A. T. Grant appeared in 1897, and the translation, edited by G. H. Blakeney, was reprinted in 'Everyman's Library' (2 vols.) in 1910. Pursuing his researches in this field, Rawlinson summarised for his generation in scholarly form the results of research and excavation in the East, in a series of works of considerable constructive ability which have hardly yet been superseded in English. The first was 'The Five Great Monarchies of the ancient Eastern World; or the history, geography, and antiquities of Chaldaea, Assyria, Babylonia, Media, and Persia. . . .' (4 vols. 1862-7; 2nd edit., 3 vols. 1871). This was followed by 'The Sixth Great Oriental Monarchy; or the geography, history, and antiquities of Parthia' (1873); to which was added 'The Seventh Great Oriental Monarchy; or the geography, history, and antiquities of the Sassanian or New Persian Empire' (1876). Supplementary to this series were 'The History of Ancient Egypt' (2 vols. 1881); and 'The History of Phœnicia' (1889).

Rawlinson was the champion of a learned orthodoxy which opposed the extremes of the literary higher critics by an appeal to the monuments and the evidence of archaeology. In 1861 he contributed to 'Aids to Faith,' the volume of essays written to counteract 'Essays and Reviews,' a paper 'On the genuineness and authenticity of the Pentateuch,' and he published in the same year 'The Contrasts of Christianity with Heathen and Jewish Systems, or nine sermons preached before the University of Oxford.' In 1871, at the request of the Christian Evidence Society, he delivered a lecture on 'The Alleged Historical Difficulties of the Old and New Testaments,' which appeared in the volume entitled 'Modern Scepticism.' As a commentator and expositor Rawlinson wrote for the 'Speaker's Commentary' on Kings, Chronicles, Ezra, Nehemiah, Esther, and the two Books of the Maccabees; and for Ellicott's 'Old Testament Commentary for English Readers' on Exodus. His last work was the life of his brother, entitled 'A Memoir of Major-general Sir H. C. Rawlinson. . . with an introduction by Field-Marshal Lord Roberts of Kandahar' (1898).

Rawlinson was a fellow of the Royal Geographical Society, a corresponding member of the Royal Academy of Turin and

of the American Philosophical Society. His health failed two years before his death, which took place suddenly from syncope on 6 Oct. 1902. He was buried in Holywell cemetery at Oxford. A portrait by his son-in-law, Wilson Forster, was presented to Trinity College, Oxford, in 1899.

Rawlinson married in 1846 Louisa, second daughter of Sir Robert Alexander Chermiside [q. v.], and had issue four sons and five daughters.

Besides the works already mentioned, large contributions to Dr. Smith's 'Dictionary of the Bible,' pamphlets among 'Present Day Tracts,' and numerous sermons, Rawlinson published: 1. 'A Manual of Ancient History from the earliest times to the Fall of the Western Empire,' 1869. 2. 'Historical Illustrations of the Old Testament,' 1871. 3 and 4 (for the R.T.S.): 'The Origin of Nations,' 1877; 'The Religions of the Ancient World,' 1882. 5. 'St. Paul in Damascus and Arabia,' 1877. 6. 'Egypt and Babylon from Scripture and profane sources,' 1885. 7, 8, 9 (for the 'Story of the Nations' series): 'Parthia,' 1885; 'Phœnicia,' 1885; 'Ancient Egypt,' 1887. 10. 'A Sketch of Universal History,' 1887. 11. 'Biblical Topography,' 1887. 12, 13, 14 (for the 'Men of the Bible' series): 'Moses, his Life and Times,' 1887; 'Kings of Israel and Judah,' 1890; 'Isaac and Jacob, their Lives and Times,' 1890. 15. Large contributions to the 'Pulpit Commentary.' 16. The article on 'Herodotus' in the 9th edition of the 'Encyclopædia Britannica.'

[The Times, 7 Oct. 1902; Athenæum, 11 Oct. 1902; Men and Women of the Time, 1899; Crockford's Clerical Directory.] R. B.

RAWSON, SIR HARRY HOLDSWORTH (1843–1910), admiral, second son of Christopher Rawson of Woolwich, J.P. for Surrey, was born at Walton-on-the-Hill, Lancashire, on 5 Nov. 1843. He was at Marlborough College from Feb. 1854 to Christmas 1855. Entering the navy on 9 April 1857, he was appointed to the Calcutta, flagship of Sir Michael Seymour [q. v.] on the China station. He served through the second Chinese war, being present in the Calcutta's launch at the capture of the Taku forts in 1858, and in 1860 was landed as aide-de-camp to Captain R. Dew of the Encounter, with whom he was present at the second capture of the Taku forts, at the battle of Palikao, and at the taking of Peking. He saw much further active service against the Chinese rebels; for the capture of Ning-po, which

place he afterwards held for three months against the rebels with 1300 Chinese under his command, and for Fungwha, where he was severely wounded, he was mentioned in despatches. He also was thanked on the quarter-deck for jumping overboard at night in the Shanghai river to save life. On 9 April 1863 he was promoted to sub-lieutenant, and a month later to lieutenant. In the same year he was one of the officers who took out to Japan the gunboat Empress, a present from Queen Victoria to the Mikado and the first ship of the modern Japanese navy. Rawson then qualified as a gunnery lieutenant, and after serving a commission as first lieutenant of the Bellerophon in the Channel, was appointed in Jan. 1870 to the Royal yacht, whence on 7 Sept. 1871 he was promoted to commander. In Aug. 1871 he gained the silver medal of the Royal Humane Society for saving life at Antwerp. As commander he served two commissions in the Hercules, in the Channel and in the Mediterranean, and on 4 June 1877 was promoted to captain. In Nov. following he was appointed to the Minotaur as flag-captain to Lord John Hay, commanding the Channel squadron; and, going to the Mediterranean in 1878, he received the thanks of the Admiralty for a report on the capabilities of defence of the Suez Canal, hoisted the British flag at Nicosia, Cyprus, and was for a month commandant there. Following this service he was again flag-captain in the Channel squadron until March 1882, and then was appointed to the Thalia for the Egyptian campaign, during which he served as principal transport officer. He was awarded the medal, the Khedive's star, the third class of the Osmanieh, and the C.B. From Feb. 1883 to Sept. 1885 he was again flag-captain to Lord John Hay, then commander-in-chief in the Mediterranean, and in Oct. 1885 became captain of the steam reserve at Devonport, where he remained till 1889. He was a member of the signal committee of 1886, was captain of the battleship Benbow in the Mediterranean from 1889 to 1891, and was an aide-de-camp to Queen Victoria from Aug. 1890 until promoted to flag rank on 14 Feb. 1892.

Rawson was a member of the international code signals committee from 1892 to 1895, in 1893 was one of the umpires for the naval manoeuvres, and in May 1895 was appointed commander-in-chief on the Cape of Good Hope and west coast of Africa station, with his flag in the St. George. He held this command until May 1898, and

during it organised and carried out two expeditions. In Aug. 1895 he landed the brigade which captured M'weli, the strong-hold of Mburuk, a rebellious Arab chief, for which service the general Africa medal with 'M'weli, 1895' engraved on the rim was awarded; in Aug. 1896 part of his squadron bombarded the palace at Zanzibar and deposed the pretender, Rawson receiving the brilliant star of Zanzibar, first class, in acknowledgment from the sultan; his action was officially approved, and he received the thanks of the admiralty. In Feb. 1897 he landed in command of the naval brigade of his squadron, with which, together with a force of Haussas, he advanced to and captured Benin city, in punishment for the recent massacre of British political officers. He received the K.C.B. for this service in May 1897, and the clasp for Benin. On 19 March 1898 he was promoted to vice-admiral.

Rawson commanded the Channel squadron from Dec. 1898 to April 1901, after which he was appointed president of the committee which investigated the structural strength of torpedo-boat destroyers. This was his last naval service. In Jan. 1902 he was appointed governor of New South Wales, 'a post for which his tact, kindness, and good sense were sturdy qualifications.' Sir Harry was a successful and popular governor, and in 1908 his term of office was extended by one year to May 1909. He was promoted to admiral on 12 Aug. 1903, and retired on 3 Nov. 1908; in June 1906 he was made a G.C.B., and a G.C.M.G. in Nov. 1909. He died in London, following an operation for appendicitis, on 3 Nov. 1910, and was buried at Bracknell parish church, a memorial service being held at St. Margaret's, Westminster.

Rawson married on 19 Oct. 1871 Florence Alice Stewart, daughter of John Ralph Shaw of Arrowe Park, Cheshire, and had issue five children. Lady Rawson died in the Red Sea on 3 Dec. 1905, while on passage out to Australia.

A cartoon by 'Spy' appeared in 'Vanity Fair' in 1901.

[The Times, 4 Nov. 1910. An engraved portrait was published by Messrs. Walton of Shaftesbury Avenue. Royal Navy List.]

L. G. C. L.

READ, CLARE SEWELL (1826-1905), agriculturist, the eldest son of George Read of Barton Bendish Hall, Norfolk, by Sarah Ann, daughter of Clare Sewell, was born at Ketteringham on 6 Nov. 1826.

His ancestors had been tenant-farmers in Norfolk since the end of the sixteenth century. He was educated privately at Lynn, and from the age of fifteen to twenty was learning practical agriculture upon his father's farm. Before he was of age he was managing the large farm of Kilpaison in Pembrokeshire, and was afterwards resident agent on the earl of Macclesfield's Oxfordshire estates. He returned to Norfolk in 1854 and took his father's farm at Plumstead, near Norwich, until 1865, when he succeeded a relative at Honingham Thorpe, and farmed about 800 acres there until Michaelmas 1896.

In July 1865 he was returned to parliament as conservative member for East Norfolk, which he continued to represent until the Reform Act of 1867, when Norfolk was divided into three constituencies. He sat for South Norfolk from 1868 to 1880, when he was defeated at the general election by one vote. He then declined to stand for North Lincolnshire and Cambridgeshire, but in Feb. 1884 was returned unopposed for West Norfolk, sitting until the dissolution of parliament in 1885, when he retired from the representation of the county. He unsuccessfully contested Norwich in July 1886.

In his first speech in parliament, in 1866, in support of Sir Fitzroy Kelly's motion for the repeal of the malt tax, he suggested, as an alternative, a beer tax of one penny per gallon upon all beer that was sold; that a licence should be paid by private brewers; and that all cottagers should be free to brew their own beer, a concession granted later. He strenuously supported and promoted all the acts of parliament passed for the suppression of cattle plague and all other imported diseases among live stock; advocated the inalienable right of the occupier of the land to destroy ground game; persistently contended for the compulsory payment of tenant farmers' improvements in the soil; argued that all property, and not land and buildings alone, should contribute to local as well as imperial burdens; and in 1876 carried a unanimous resolution in the House of Commons in favour of representative county boards.

In 1865 he served on the cattle plague commission, and for twenty years sat upon almost every agricultural committee of the House of Commons. In Feb. 1874 he was appointed by Disraeli parliamentary secretary to the local government board, but resigned in Jan. 1876, in consequence of

the government refusing to extend to Ireland the Cattle Diseases Act which had been passed for Great Britain. This, however, soon afterwards became law. Upon his resigning his government appointment, he was presented by the farmers of England with a silver salver and a purse of 5500*l.* at a dinner given at the Cannon Street Hotel on 2 May 1876.

On the appointment in June 1879 of the duke of Richmond's royal commission on agriculture, Clare Sewell Read and Albert Pell [q. v. Suppl. II] were made assistant commissioners to visit the United States and Canada to inquire into and report on the conditions of agriculture there, particularly as related to the production and exportation of wheat to Europe. They were away six months, and travelled 16,000 miles.

In 1848 Read won the Royal Agricultural Society's prize essay on the farming of South Wales, and in 1854 and 1856 obtained the society's prizes for similar reports on Oxfordshire and Buckinghamshire. He contributed numerous other papers to the Royal Agricultural Society's 'Journal,' and acted frequently as judge at the Royal, Smithfield, Bath and West of England, and other agricultural shows.

He also wrote a valuable article on the Agriculture of Norfolk for the 4th edition of White's 'History, Gazetteer and Directory' of that county (1883).

In January 1866 he joined the Farmers' Club (originally founded in 1842), and was an active member till his death, frequently reading papers at meetings, serving on the committee, and acting as chairman for two separate years, in 1868 and again in 1892 (jubilee year). He was also a member of the council of the central chamber of agriculture (of which he was chairman in 1869) and of the Smithfield Club.

When his intention to give up farming in Norfolk was made known, a county committee organised a fund for presenting him with his portrait. This picture, painted by J. J. Shannon, R.A., now hangs in the castle at Norwich. In his later years Read lived in London at 91 Kensington Gardens Square, where he died on 21 Aug. 1905, but he was buried in his native soil at Barton Bendish. In 1859 he married Sarah Maria, the only daughter of J. Watson, and had by her four daughters.

[The Times, 23 and 28 Aug. 1905; Mark Lane Express, 18 Aug. 1905; personal knowledge.] E. C.

READ, WALTER WILLIAM (1855-1907), Surrey cricketer, was born at Reigate on 23 Nov. 1855. He was educated at the Reigate Priory school, which was managed by his father. Showing early aptitude for cricket, he joined the Reigate Priory Club, and at the age of thirteen scored 78 not out against Tonbridge and the bowling of Bob Lipscombe. In 1873 Read was introduced to Charles William Alcock, the secretary of the Surrey cricket club, and from that date to 1897 was a regular member of the Surrey team. He assisted his father at Reigate Priory school until 1881, when he became assistant secretary to the Surrey cricket club, and thenceforth he devoted all his time to cricket. From 1883 he helped George Lohmann [q. v. Suppl. II] to restore Surrey to a leading cricketing position among the counties. In 1885 he became partner in a City auctioneering and surveying business. In his last years he was coach to young players at the Oval.

During his twenty-five years' career in first-class cricket (1873-97) Read gained triumphal success as a batsman, scoring no fewer than 46 centuries. At his best from 1885 to 1888, he scored in successive matches in June 1887 for Surrey v. Lancashire and Cambridge University respectively 247 and 244 not out, and 338 in 1888 for Surrey v. Oxford University. Between 1877 and 1895 Read played in 23 matches for Gentlemen v. Players, his best score being 159 in July 1885, and in twelve test matches in England against the Australians between 1884 and 1893, his most memorable performance in Australian matches being at Kennington Oval in August 1884, when going in tenth he scored 117. In this match William Lloyd Murdoch [q. v. Suppl. II] scored 211 for the Australians. Read twice visited Australia: in 1882-3 with Ivo Bligh's team, and in 1887-8 with G. F. Vernon's team. In the second tour Read averaged over 65 runs per innings in eleven-a-side matches. He took a team in the winter of 1891-2 to South Africa. Of strong physique, Read was a determined hitter, and a very attractive batsman who brought 'pulling' to a fine art. A very safe field, he shone especially at point, and he was also a useful 'lob' bowler. As a captain he had few superiors.

Read, who published a useful record called 'Annals of Cricket' in 1896, died on 6 Jan. 1907 at Colworth Road, Addiscombe Park, Croydon, and was buried at Shirley. He married and had issue. A painted portrait depicting Read at the wicket, by G. H. Barrable and Mr. Staples,

was exhibited at the Goupil Gallery in 1887; he also figures in 'Punch' (13 Aug. 1887) in 'Cricket at the Oval.'

M. Thornton.] W. B. O.

READE, THOMAS MELLARD (1832-1909), geologist, born on 27 May 1832 in Mill Street, Toxteth Park, Liverpool, where his father William James Reade kept a small private school, was of common descent from Staffordshire yeomen with Joseph Bancroft Reade [q. v.] and Sir Thomas Reade, deputy adjutant-general at St. Helena during Napoleon's captivity. His mother, Mary Mellard, of Newcastle-under-Lyme, was aunt to Dinah Maria Mulock [q. v.]. After private schools he began work at the end of 1844 in the office of Eyes and Son, architects and surveyors, Liverpool. At the beginning of 1853 he entered the engineer's office of the London and North Western railway company at Warrington, where he rose to be principal draughtsman. In 1860 he started on his own account in Liverpool as architect and civil engineer and built up a good business, being architect to the Liverpool school board during its existence from 1870 to 1902, and laying out the Blundellsands estate in 1868, on which he resided from 1868 till death. He died at his house, Park Corner, Blundellsands, on 26 May 1909, and was buried at Sefton, Lancashire.

Always fond of natural history, Reade began serious work in geology when about thirty-five years old, and lost none of the opportunities for that study which his profession offered. In addition to two books, he wrote nearly 200 papers and addresses, of which many were communicated to the Liverpool Geological Society, others to the 'Geological Magazine' and the Geological Society of London. Of these one group deals with the glacial and post-glacial geology of Lancashire and the adjoining counties. They record many important facts disclosed in excavations, which would otherwise have been lost. A very practical result of his studies was that when the tunnel under the Mersey was projected in 1873 he predicted that it would encounter a buried river channel filled with drift; his prophecy was verified in

1885. He also made valuable collections of specimens from boulders and of marine shells from the glacial drifts. In the later years of his life, co-operating with Mr. Philip Holland, Reade studied the mineral structure and changes of sedimentary, and especially slaty, rocks, forming for this purpose a collection of rocks, slices, sands and sediments. These are now in the Sedgwick Museum, Cambridge, as the gift of his son, Mr. Aleyn Lyell Reade. A third group of his papers dealt with questions of geomorphology, with which also his two books are occupied. In the earlier, on the 'Origin of Mountain Ranges' (1886), he discussed among other hypotheses that which attributes them to a localised crumpling of the earth's crust, caused by a shortening of its radius while cooling. Reade maintained them to be the slow cumulative result of successive variations of temperature in this crust, largely produced by the removal of sediment (like the transference of a blanket) from one part to the other; pointing out the necessary existence in a cooling globe of a 'level of no strain.' His second book, on the 'Evolution of Earth Structure' (1903), further defined and illustrated the above view, arguing that while the relative proportion of sea and land had been fairly constant through geological time, regional changes of level were due to alterations in the bulk of the lithosphere, caused by expansion and contraction. Though the majority of geologists have not as yet accepted his opinions on this question, all must agree that, as was usual with him, they are ably argued and demand careful consideration.

Reade became a Fellow of the London Geological Society in 1872, and was awarded its Murchison medal in 1896. He was three times president of the Liverpool Geological Society, was a past president of the Liverpool Architectural Society, an associate member of the Institution of Civil Engineers, and an honorary member of other societies.

He married on 19 May 1886 Emma Eliza, widow of Alfred Taylor, C.E., who predeceased him, and by whom he had three sons and one daughter. Of the former, Mr. Aleyn Lyell Reade is author of 'The Reades of Blackwood Hill' and 'Dr. Johnson's Ancestry' (privately printed, 1906), and 'Johnsonian Gleanings,' part i. (1909).

REDPATH, HENRY ADENEY (1848-1908), biblical scholar, born at Sydenham on 19 June 1848, was eldest son of Henry Syme Redpath, solicitor, of Sydenham, by his wife Harriet Adeney of Islington. In 1857 he entered Merchant Taylors' School, and won a scholarship at Queen's College, Oxford, in 1867, taking a second class in classical moderations in 1869 and a third class in literæ humaniores in 1871, graduating B.A. in 1871, and proceeding M.A. in 1874 and D.Litt. in 1901. Ordained deacon in 1872 and priest in 1874, Redpath, after being curate of Southam, near Rugby, and then of Luddesdown, near Gravesend, was successively vicar of Wolvercote, near Oxford (1880-3), rector of Holwell, Sherborne (1883-90), and vicar of Sparsholt, with Kingston Lisle, near Wantage (1890-8). In 1898, by an exchange, he became rector of St. Dunstan-in-the-East, City. Redpath was sub-warden of the Society of Sacred Study in the diocese of London, and examining chaplain to the Bishop of London (1905-8).

Redpath, who had learned Hebrew at Merchant Taylors' School, specialised, while a country parson, in the Greek of the Septuagint, completing and publishing the work which Edwin Hatch [q. v.] left unfinished: 'A Concordance to the Septuagint and other Greek Translations of the Old Testament' (Oxford, 1892-1906, 3 vols.). The value of his work was recognised both here and on the Continent (cf. ADOLF DEISSMANN, *The Philology of the Greek Bible*, 1908, pp. 69-78). Redpath was Grinfield lecturer on the Septuagint at Oxford (1901-5), and shortly before his death designed a 'Dictionary of Patristic Greek.'

As a biblical scholar he was conservative. He expounded his opposition to the 'critical' view of the Old Testament in 'Modern Criticism and the Book of Genesis' (1905), published by the Society for Promoting Christian Knowledge. An abler and more constructive work was his painstaking 'Westminster Commentary' on Ezekiel, with introduction and notes (1907). He was also a contributor to Hastings's 'Dictionary of the Bible' (1904, 4 vols.) and to the 'Illustrated Bible Dictionary.'

Redpath died at Sydenham on 24 Sept. 1908, and was buried at Shottermill, Surrey. He married at Marsh Caundle, Dorsetshire, on 5 Oct. 1886, Catherine Helen, daughter of Henry Peter Auber of Marsh Court, Sherborne. She died at Shottermill, on 26 Aug. 1898, leaving one son.

and 7 Oct. 1908; C. J. Robinson, Merchant Taylors' School list; private information.]
E. H. P.

REED, SIR EDWARD JAMES (1830-1906), naval architect and chief constructor of the navy, son of John Reed of Sheerness, was born there on 20 Sept. 1830, and after serving an apprenticeship with a shipwright in Sheerness dockyard was chosen in 1849 to enter the school of mathematics and naval construction which had been established at Portsmouth in 1848 with Dr. John Woolley [q. v.] as its principal. After passing through the school he received in 1852 an appointment as supernumerary draughtsman in the mould loft at Sheerness, but finding his duties, which were of a routine nature and involved no responsibility, irksome, he left the admiralty service in the same year. Reed devoted his leisure at this time to writing poetry, and turned to technical journalism; in 1853 he was offered and accepted the editorship of the 'Mechanic's Magazine.' In 1854 he submitted to the admiralty a design for a fast armour-clad frigate, but the need of such a type was not yet admitted and the design was refused. At the end of 1859 John Scott Russell [q. v.] called together a small body of naval architects, of whom Reed was one, in order to attempt the foundation of a technical society. The effort was immediately successful, and the Institution of Naval Architects was established early in 1860, Reed, who had been organising secretary from the first, being permanently appointed to the secretaryship. In 1862 he submitted to the admiralty designs for the conversion of wooden men-of-war into armour-clads on the belt and battery system, and was encouraged to proceed. The conversion of three ships was put in hand and carried out under Reed's supervision, and before their completion he was offered and accepted, in 1863, the post of chief constructor of the navy. With this appointment a new epoch of naval construction began. The earliest ironclads were very long and unhandy ships, mounting all their guns on the broadside. Reed's object was to produce shorter ships of greater handiness, and to develop their end-on fire without sacrificing their weight of broadside. The battle between guns and armour had already begun, and the demand on the one part for heavier armour and on the other for larger guns was insistent. The Bellerophon, the first ship designed by Reed after he took office, was typical of many others that followed, and marked a great advance

towards the realisation of the desired qualities. Launched in May 1865, she was a high freeboard ship, fully rigged as then seemed necessary to seamen; she was protected by a complete belt at the waterline, and amidships rose an armoured citadel enclosing the main battery and covering the vitals of the ship. An attempt to gain end-on fire was made by mounting a smaller battery behind armour in the bows, but in later ships this expedient was improved on by the introduction of recessed ports for the guns at the corners of the central battery. Structurally also the Bellerophon was an important ship, for in her Reed introduced a new system of framing, known as the longitudinal and bracket-frame system, which was better suited than the old method to the use of iron, which was still quite a novel material for the hulls of men-of-war.

At the same time an entirely different type of armoured ship was advancing in favour. This was the low freeboard monitor, with its heavy guns mounted in turrets, a type which had done well in the peculiar circumstances of the American civil war. Reed built several ships of this type, all of them in the main similar to the *Glatton*; but he fought strenuously against the idea of building large masted monitors as sea-going ships. He held, and indeed proved, that the low freeboard monitor would be dangerously lacking in stability under sail, and at the time when the Captain was building to the plans of Capt. Cowper Phipps Coles [q. v.], he put forward a design for a large seagoing monitor which should be entirely mastless. This was the *Devastation*, a ship whose design exercised a greater influence on the course of naval architecture perhaps than any other. Reed's plans for the ship, which was laid down in Nov. 1869, were modified in some, as he thought, important particulars, and, owing to a failure to agree with the admiralty on questions connected with the construction of turret ships, he resigned office in July 1870. The report of the committee on designs which sat after the loss of the Captain (7 Sept. 1870) was in many respects a justification of Reed's views, and directly reassured public opinion as to the safety of the *Devastation*. On resigning from the admiralty he joined Sir Joseph Whitworth [q. v.] at his ordnance works at Manchester; in 1871 he became chairman of Earl's Company, Hull, and in the same year began practice as a naval architect in London. He designed ships for several foreign navies, including

those of Turkey, Japan, Germany, Chili, and Brazil, and of these three, the *Neptune* in 1877, and the sister ships *Swiftsure* and *Triumph* in 1903, were bought into the royal navy. In Oct. 1878 he visited Japan at the invitation of the imperial government. He was also consulting naval engineer to the Indian government and to the crown colonies. Reed was a keen advocate of technical education, and while at the admiralty used his influence in favour of the Royal School of Naval Architecture and Marine Engineering, which was established in 1864. It was also in great measure due to his appreciation of the value of the work, and to his recommendation of it, that the support of the admiralty was given to William Froude [q. v.] in his model-experiments on the resistance and propulsion of ships. In 1876 he was elected a fellow by the Royal Society; he had received the C.B. in 1868, and was advanced to the K.C.B. in 1880, besides which he held several foreign decorations. From 1865 to 1905 he was a vice-president of the Institution of Naval Architects, and in addition was an active member of other technical societies.

In 1873 Reed attempted unsuccessfully to enter parliament as liberal candidate for Hull, and in the following year was returned as member for the Pembroke boroughs. From the general election of 1880 until 1895, when he was defeated, he sat for Cardiff, and was a lord of the treasury in the short Gladstonian administration of 1886. In 1900 he was again returned for Cardiff, but did not seek re-election in 1905. He served on several important parliamentary committees, and was chairman of the load-line committee of 1884, and of the manning of ships committee of 1894. He was for many years a J.P. for Glamorgan.

Reed's contributions both to general and to technical literature were numerous. His published volumes include 'Corona, and other Poems' (12mo, 1857); 'Letters from Russia in 1875' (first printed in 'The Times' 1876); 'Japan, its History, Traditions, and Religions: with a Narrative of a Visit in 1879' (2 vols. 1880); and a further volume of 'Poems' (1902). In 1860 he became editor of the 'Transactions of the Institute of Naval Architects,' to which he continued to contribute to the end of his life, his papers in vols. iv. to x., issued while he was chief constructor, being of especial interest. In 1869 he wrote 'Our Ironclad Ships,' which was in great measure a vindication

of his policy; and in the same year 'Ship-building in Iron and Steel,' for several years the standard treatise on the subject. In 1868 and 1871 he contributed papers on the construction of ironclad ships to the 'Philosophical Transactions'; and in 1871 wrote 'Our Naval Coast Defences.' In 1872 he founded a quarterly named 'Naval Science,' many articles in which were from his pen; he continued it till 1875. His 'Treatise on the Stability of Ships' was published in 1884, and 'Modern Ships of War,' in writing which he had Admiral E. Simpson as a collaborator, in 1888. He was in addition a frequent contributor to 'The Times' and other periodicals, and took an ardent part in many controversies on technical subjects. He died in London on 30 Nov. 1906, and was buried at Putney Vale cemetery.

Reed married in 1851 Rosetta, eldest daughter of Nathaniel Barnaby of Sheerness, and sister of Sir Nathaniel Barnaby, who succeeded him as chief constructor in 1870. Edward Tennyson Reed (*b.* 1860), for many years an artist on the staff of 'Punch,' is his only son.

A painted portrait by Miss Ethel Mortlock, exhibited at the Royal Academy in 1886, was presented by the engineer officers of the royal navy to Lady Reed. A cartoon portrait was published in 'Vanity Fair' for 1875, and a photogravure portrait is prefixed to the 'Transactions of the Institute of Naval Architects' for 1907.

[Trans. Inst. Nav. Architects, xlix. 313; Proc. Inst. of Civil Engineers, clxviii. pt. ii.; The Times, 1 Dec. 1906; Reed's own works.]

L. G. C. L.

REEVES, Sir WILLIAM CONRAD (1821-1902), chief justice of Barbados, born at Bridgetown, Barbados, in 1821 (the date is often given erroneously), was one of three sons of Thomas Philipps Reeves, a medical man, by a negro slave Peggy Phyllis. Reeves, cared for by his father's sister, received some education at private schools and attracted the notice of Samuel Jackman Prescod, a journalist. The boy was fond of reading. Prescod gave him employment on his paper, the 'Liberal.' Reeves learned shorthand, and mastering the details of management, was soon able on occasion to edit and manage the paper. He joined the debating club at Bridgetown, and proved ready in debate.

Disappointed in the hope of obtaining an official appointment, Reeves by the kindness of friends went to England, and became a student at the Middle Temple in May 1860, being called to the bar on 6 Jan. 1863.

While in London he acted as correspondent for the Barbados press. In 1864 he returned to Barbados to practise at the local bar. From May 1867 he acted for a short time as attorney-general of St. Vincent, an island which at that time was under the same governor as Barbados, and soon gained an assured position in Barbados.

In August 1874 Reeves entered the local house of assembly of Barbados as member for St. Joseph, and became solicitor-general. In April 1876, when the governor, Sir John Pope-Hennessy [q. v.], provoked a conflict between the crown (as represented by himself) and the legislature, Reeves resigned office and took up the cause of the old constitution of Barbados as against schemes of confederation and crown government. Reeves was acclaimed by all classes and colours as a Pym or Hampden. Equally in 1878 he opposed the proposal introduced by Sir George Strahan for the reform of the elective house of assembly by the introduction of crown nominees. He thus became the champion of the ancient Barbados constitution, and the general public marked their sense of his services by presenting him with an address and a purse of 1000 guineas.

In 1881, however, the next governor, Sir William Robinson, enlisted Reeves's cordial support in framing the executive committee bill. The enactment of this bill enabled the executive to secure a proper control in matters of finance and administration without interference with the traditions of the house of assembly. The governor acknowledged Reeves's support by appointing him attorney-general in Feb. 1882. Reeves was created K.C. in 1883. As attorney-general he helped in 1884 to carry out an extension of the franchise. Later in the year he went on long leave to recruit his health, returning to Barbados in 1885.

In 1886 Reeves became chief justice of Barbados. The promotion was a rare recognition of worth in a black man, and was well justified in the result. He was knighted in 1889. His judgments were clear and well worded. Several of them were collected in a volume by Sir William Herbert Greaves, a successor as chief justice, and Mr. Clark, attorney-general. Reeves died on 9 Jan. 1902, at his home, the Eyrie, St. Michael's, and was accorded a public funeral, with a service in the cathedral at Westbury cemetery.

Reeves married in 1868 Margaret, eldest daughter of T. P. R. Rudder of Bushey Park, St. Thomas, Barbados. He left one daughter, who was married and resided in Europe.

[Memoir by Valence Gale reprinted locally in 1902; information furnished by Chief Justice Sir H. Greaves; Barbados Globe and Barbados Agricultural Reporter, 10 Jan. 1902; The Times, 31 Jan. 1902; Who's Who, 1901.] C. A. H.

REICH, EMIL (1854–1910), historian, son of Louis Reich, was born on 24 March 1854 at Eperjes in Hungary. After early education at Eperjes and Kassa he went to the universities of Prague, Budapest, and Vienna. Until his thirtieth year he 'studied almost exclusively in libraries.' Then 'finding books unsatisfactory for a real comprehension of history, he determined to travel extensively in order to complement the study of books with the study of realities.' In July 1884 Reich, with his parents, his brother, and two sisters, emigrated to America, where after much hardship he was engaged in 1887 by the Appleton firm of New York in preparing their encyclopædia. On his father's death, his mother and one sister settled in Budapest; the brother and other sister settled in Cincinnati, the one as a photo-engraver, the other as a public school teacher. In July 1889 Reich went to France. At the end of the year he visited England. In February and March 1890 he delivered at Oxford four lectures, subsequently published under the title of 'Græco-Roman Institutions' (Oxford, 1890; French translation, Paris, 1891), in which he attempted to 'disprove the applicableness of Darwinian concepts to the solution of sociological problems.' His theory of the hitherto unsuspected influence of *infamia* on Roman law at first aroused opposition, but later was developed in England and France. Reich spent his time mainly in France till 1893, when he settled in England for good. There as a writer, as a lecturer to popular and learned audiences in Oxford, Cambridge, and London, and as a coach at Wren's establishment for preparing candidates for the civil service, he displayed remarkable vigour, versatility, and self-confidence. His width of interests appealed to Lord Acton, who described him as 'a universal specialist.' His work, although full of stimulating suggestions, was inaccurate in detail, and omission of essential facts discredited his conclusions. A lover of paradox, and a severe censor of established historical and literary reputations, Reich made useful contributions to historical criticism in his lectures on 'Fundamental Principles of Evidence' and in his 'The Failure of the Higher Criticism of the Bible' (1905), in which he combated modern methods of biblical criticism. Of a 'General History

of Western Nations,' the first part on 'Antiquity' was published in two volumes in 1908–9. There Reich waged war on the evolutionist theory of history; he attached little or no importance to race in national history, laid excessive stress on the geo-political and economic conditions, unduly subordinating the influences of heredity to that of environment. In this work (ii. 339, 340 footnote) Reich unjustifiably charged A. H. J. Greenidge [q. v. Suppl. II] with adopting without acknowledgment some researches of his own; the accusation called forth a stout defence from Greenidge's friends (see *The Times, Lit. Suppl.* 23 and 30 July, 13 and 20 Aug. 1908). His most successful published work was his 'Hungarian Literature' (1897; 2nd edit. 1906). In the dispute between British Guiana and Venezuela (1895–9) in regard to the Venezuelan boundary, Reich was engaged by the English government to help in the preparation of their case. A course of lectures on Plato at Claridge's Hotel, London, in 1906, which were attended by leading ladies of London society, brought him much public notoriety. He died after a three months' illness at his residence at Notting Hill on 11 Dec. 1910, and was buried at Kensal Green. He married in 1893 Céline Labulle of Paris, who, with a daughter, survived him. Reich was fond of music and was an accomplished pianist.

Reich's other published works were: 1. 'History of Civilization,' Cincinnati, 1887. 2. 'New Student's Atlas of English History,' 1903. 3. 'Foundations of Modern Europe,' 1904. 4. 'Success among Nations,' 1904 (translated into French, Italian, and Spanish). 5. 'Select Documents illustrating Mediæval and Modern History,' 1905. 6. 'Imperialism: its Prices; its Vocation,' 1905 (translated into Russian). 7. 'Plato as an Introduction to Modern Criticism of Life' (lectures delivered at Claridge's Hotel), 1906. 8. 'Success in Life,' 1906. 9. 'Germany's Swelled Head,' Walsall, 1907. 10. 'Atlas Antiquus,' 1908. 11. 'Handbook of Geography, Descriptive and Mathematical,' 2 vols. 1908. 12. 'Woman through the Ages,' 2 vols. 1908. 13. 'Nights with the Gods,' 1909 (a criticism of modern English society). Reich was editor of 'The New Classical Library,' and for that series compiled an alphabetical encyclopædia of institutions, persons, and events of ancient history in 1906; he published an abridgment of Dr. Seyffert's 'Dictionary of Classical Antiquities' (1908). He was also a contributor on Hungarian history

to the 'Cambridge Modern History,' and on Hungarian literature to the 'Encyclopædia Britannica' (11th edition).

[The Times, 13 Dec. 1910; English Mail, 15 Dec. 1910; Bevándorló, New York, 16 Dec. 1910; information kindly supplied by Mr. Lewis L. Kropf.] W. B. O.

REID, ARCHIBALD DAVID (1844-1908), painter, born in Aberdeen on 8 June 1844, was fourth of five sons (in a family of thirteen children) of George Reid, manager of the Aberdeen Copper Company, by his wife Esther Tait. An elder son is Sir George Reid, president of the Royal Scottish Academy from 1891 to 1902, and the youngest son is Mr. Samuel Reid, R.S.W. At the age of ten Reid entered Robert Gordon's Hospital, now Gordon's College, Aberdeen, which he left at fourteen for a mercantile career. The friendly and cultivated influence of John F. White, LL.D., miller, in whose counting-house he was employed, and the example of his brother George, drew him to artistic pursuits. Modelling and painting engaged his leisure. There were then no studios in Aberdeen, and his earliest practical training in art was received at the old Mechanics' Institute.

Abandoning commerce at twenty-three, Reid went to Edinburgh to attend the classes of the Trustees' Academy, and, later, the life-class of the Royal Scottish Academy. He remained three years in Edinburgh. He first exhibited at the Scottish Academy in 1870, and his contributions to its exhibitions of 1873-4 were specially remarked for their predisposition to tone. A visit to Holland, which he paid in 1874, lastingly affected his art. Four years later he went to Paris, and for a short time worked in Julien's studio. Next, with a commission from Dr. White, he visited Spain. In 1892 he was elected A.R.S.A., and five years afterwards a member of the Royal Institute of Painters in Oils, from which body, however, he soon resigned. He was also a member of the Royal Scottish Society of Painters in Water-colours. His work was rarely exhibited in London galleries.

Reid travelled much, as the titles of his pictures show: 'On the Giudecca, Venice,' 'A Court in the Alhambra,' 'The Scotch House, Campvere,' 'Auxerre, France,' the last of which was well reproduced in colours in the 'Studio' ('Royal Scottish Academy Number,' 1907). He always, however, kept closely in touch with his native city, which he made his permanent home. At one time he had a

studio in King Street there, but afterwards he used those at his brother's residence at St. Luke's, Kepplestone, which he occupied for some years before his death. Besides a natural predilection for Dutch art, he shared the friendship of many modern Dutch masters with his brother George, who had early in life studied under Josef Israels. Reid enjoyed also a long intimacy with George Paul Chalmers [q. v.], who painted many pictures in the Reids' studio.

Reid undertook a few commission portraits, the most masterly of them perhaps that of John Colvin, the sacrist at King's College, Aberdeen, where the picture now hangs; but landscapes and the scenery of his native shores were his main themes. Two of his sea-pieces are included in the Macdonald Bequest at Aberdeen. A large picture, 'A Lone Shore,' exhibited at the Royal Academy in 1875, was purchased for 300*l.* after his death by some friends and presented to the Aberdeen Art Gallery. Of his works in private collections may be mentioned a 'Harvest Scene' (Glasgow Loan Exhibition, 1878), 'Guessing the Catch,' and 'Before Service,' a view of the interior of King's College Chapel, Aberdeen, with figures of monks introduced. Towards the end of his life Reid produced many landscapes in charcoal. He etched a few plates, and some black-and-white illustrations by him are to be found in the files of 'Life and Work.'

An accomplished musician and possessed of a fine literary taste, Reid was a popular member of the Aberdeen club known as the 'New Deer Academy' (see *Memories Grave and Gay*, by JOHN KERR, LL.D., pp. 221-8). When out walking at Wareham, Dorsetshire, on 30 Aug. 1908, he died suddenly of heart failure, and was buried in St. Peter's cemetery, Aberdeen. He married in 1893 Margaret, daughter of George Sim, farmer, of Kintore, who survived him without issue.

A portrait painted by himself is in the Macdonald Bequest at Aberdeen.

[Private information; Aberdeen Free Press, 1 Sept. 1908.] D. S. M.

REID, SIR JOHN WATT (1823-1909), medical director-general of the navy, born in Edinburgh on 25 February 1823, was younger son of John Watt Reid, surgeon in the navy, by his wife Jane, daughter of James Henderson, an Edinburgh merchant. Educated at Edinburgh Academy, at the university there, and at the extra-mural medical school, he qualified L.R.C.S. Edinburgh in 1844. He entered the navy

as an assistant surgeon on 6 Feb. 1845, and after serving a commission on board the *Rodney* in the Channel was appointed in March 1849 to the naval hospital, Plymouth, and received the approval of the Admiralty for his services there during the cholera epidemic of that year. In Jan. 1852 he was appointed as acting surgeon to the *Inflexible*, sloop, in the Mediterranean; on 12 Sept. 1854 he was promoted to surgeon, and in June 1855 appointed to the London, line-of-battle ship, on the same station. In these two ships he served in the Black Sea until the fall of Sevastopol, and received the Crimean and Turkish medals with the Sevastopol clasp, and was also thanked by the commander-in-chief [see DUNDAS, SIR JAMES WHITLEY DEANS] for his services to the crew of the flagship when stricken with cholera in 1854. In 1856 he took the degree of M.D. at Aberdeen; and, after serving for a short time in the flagship at Devonport, was appointed in April 1857 to the *Belleisle*, hospital ship, on board which he continued during the China war of 1857-9, for which he received the medal. In Jan. 1860 he was appointed to the Nile, of 90 guns, and served in her for four years on the North American station, after which he went to Haslar hospital until promoted to staff surgeon on 5 Sept. 1866. After a year's further service in the Mediterranean, he was in June 1870 placed in charge of the naval hospital at Haulbowline, where he remained till 1873. During the concluding months of the Ashanti war (see HEWETT, SIR WILLIAM) he served on board the *Nebraska*, hospital ship, at Cape Coast Castle, for which he was mentioned in despatches, received the medal and, on 31 March 1874, was promoted to deputy inspector-general. In that rank he had charge of the medical establishments at Bermuda from 1875 to 1878, when he was appointed to Haslar hospital. On 25 Feb. 1880 he was promoted to be inspector-general and was appointed medical director-general of the navy. This post he held till his retirement eight years later, when the board of admiralty recorded their high opinion of his zeal and efficiency. He became an honorary physician to Queen Victoria in Feb. 1881 and to King Edward VII in 1901, was awarded the K.C.B. (military) on 24 Nov. 1882, and had the honorary degree of LL.D. conferred upon him by Edinburgh University at its tercentenary in 1884. A medical good service pension was awarded him in July 1888.

Reid died in London on 24 Feb. 1909, and

was buried at Bramshaw, Hampshire. He married, on 6 July 1863, Georgina, daughter of C. J. Hill of Halifax, Nova Scotia.

[The Times, 26 Feb. 1909; Men and Women of the Time, 1899; R.N. List.]

L. G. C. L.

REID, SIR ROBERT GILLESPIE (1842-1908), Canadian contractor and financier, born of Lowland parents at Coupar Angus, Perthshire, in 1842, received his early education there and was trained as a bridge-builder by an uncle. Entering into business on his own account, he made some successful contracts and with the proceeds emigrated to Australia in 1865. In Australia he engaged principally in gold mining and the construction of public works.

In 1871 Reid went to America, and ultimately settled at Montreal. He at once made a reputation by building the International Bridge across the Niagara river at Buffalo. He was subsequently entrusted with the construction of several bridges between Montreal and Ottawa on the line of the Montreal, Quebec, and Ottawa railway, which now forms part of the Canadian Pacific system. Another international bridge across the Rio Grande between Texas and Mexico greatly extended his fame. Other great bridges of his construction span the Colorado at Austin, Texas, the 'Soo' at Sault Ste. Marie, Ontario, and the Delaware at the famous Water Gap in Pennsylvania. In 1886 the directors of the Canadian Pacific railway, without inviting tenders, commissioned him to undertake the Lachine Bridge across the St. Lawrence above Montreal, three-quarters of a mile long. The work was completed in six months. The bridge across Grand Narrows, Cape Breton, was built for the Canadian government in connection with the railway in that island in 1889-90.

Reid was as active and efficient in the building of railways as in the construction of bridges. The difficult Jackfish Bay section of the Canadian Pacific railway on the rough and almost impassable northern coast of Lake Superior was his work.

Newfoundland, with which Reid's association began in 1890, was the scene of his most varied activities. He first contracted for the building of the Hall Bay railway (260 miles), which he undertook in 1890 and completed in 1893. He then contracted to build for the Newfoundland government the Western railway from Whitbourne Junction to Port-aux-Basques (500 miles). This was accomplished in 1897. The contract gave Reid the right to operate the whole road for ten years

from Sept. 1893. Meanwhile his firm had secured a charter for constructing an electric street railway in the city of St. John's, and had leased coalfields from the government. Owing to the geographical difficulties in organising an efficient transport system of the island and the financial embarrassment of the time the Newfoundland government made, in 1898, a new contract with Reid on a gigantic scale, which Mr. Joseph Chamberlain described as 'without parallel in the history of any country.' An effort to arrange terms of confederation with the Dominion of Canada had just failed, owing to the amount of the Newfoundland debt (\$16,000,000), and some heroic step was deemed necessary by the government. The agreement with Reid, dated 3 March 1898, and known as the 'Railway Operating Contract,' empowered him to work free of taxation all trunk and branch railway lines in the island for fifty years and gave him control of the telegraph system. Reid was to provide an improved mail service by eight steamboats plying in the bays and between the island and the mainland. For \$1,000,000, to be paid within a year after the signing of the contract, Reid was further to obtain the reversion of the whole railway system at the end of fifty years. The agreement at the same time transferred to Reid, for a consideration, the St. John's dry dock, the largest at that time on the Atlantic coast of British North America, and it conceded to him some 4,500,000 acres of land, including 'mines, ores, precious metals, minerals, stones, and mineral oils of every kind therein and thereunder' (sec. 17). The government promised to impose a duty of not less than one dollar a ton upon imported coal so soon as the contractor was able to produce not less than 50,000 tons per annum from his mines, provided he supplied coal to wholesale dealers at prices agreed upon (sec. 45). The government also reserved the right of imposing royalties upon minerals raised from the contractor's lands.

The transfer to Reid of the 'whole realisable assets' of the island was ratified by the Assembly, but there was strong opposition among the people. An effort was made to prevent the royal assent being given to the bill on the ground that it would interfere with the interests of the holders of Newfoundland government bonds. But Mr. Chamberlain (*Colonial Office Despatch*, No. 70, 5 Dec. 1898) traversed this plea, maintaining (sec. 20) that 'the debts of the colony have been incurred solely on the

credit of the colony,' and he could sanction 'no step which would transfer responsibility for them in the slightest degree to the imperial government.' The agitation continued. Sir James Spearman Winter [q. v. Suppl. II], whose government passed the contract, fell from power, and was replaced after a general election by a liberal government under (Sir) Robert Bond, who was supported by an overwhelming majority. On the accession of the new government to office Reid applied for permission to transfer all his interests under the contract to the Reid-Newfoundland limited liability company. Negotiations which lasted eighteen months followed between the new premier and Reid. By a new agreement, which was ratified by the House of Assembly in July 1901, Reid's former contract was materially revised. Reid surrendered the control of the telegraph, the reversion of the Newfoundland railway at the end of fifty years, and 1,500,000 acres of land. He received in exchange \$2,025,000 cash, and a further claim was referred to arbitration. The Reid-Newfoundland Company was duly authorised by the legislature, and to it Reid made over the property and privileges of the old contract which the new arrangement left untouched.

Of the 'Reid-Newfoundland Company,' with a capital of \$25,000,000, of which he held the largest share, Reid became the first president (9 Aug. 1901) and worked with his usual energy to ensure its financial success. If the terms of the contract justified to some extent the bestowal on Reid of the title 'Czar Reid,' he showed benevolence and beneficence in developing the resources of the colony. In 1907 he was knighted as a reward for his services to the island. Meanwhile Sir Robert kept up his residence in Montreal, where he retained large financial interests, being a director of the Canadian Pacific railway, of the Bank of Montreal, and the Royal Trust Company. His rugged constitution broke down under the strain of his labours in Newfoundland. He suffered from inflammatory rheumatism, and found no relief in the many health resorts to which he had recourse. He was in Egypt when his son, as his attorney, signed the contract of 1898. Keenly interested in his various enterprises to the last, he died of pneumonia at his home, 275 Drummond Street, Montreal, on 3 June 1908. His remains were cremated at the Mount Royal Crematorium. By a resolution of the Board of Trade of St. John's, Newfoundland, all stores and

public places of business were closed during the funeral.

Reid's integrity was unquestioned, his judgment was sound, and his disposition generous. His relations with labour were invariably harmonious: he never had a strike and never employed a private secretary. He left large sums to charitable and educational institutions. In 1865 he married Harriet Duff, whom he met on his way out to Australia. She survived him with three sons and a daughter. The eldest son, William Duff Reid, succeeded his father as president of the Reid Company, and the second, Henry Duff Reid, became vice-president.

[Morgan, *Canadian Men and Women of the Time*, 1898, 2nd edit. 1912; Prowse, *History of Newfoundland*, pp. 619-29 (portrait); *Canadian Mag.* xvi. 329-34 (portrait); *Montreal Gazette*, 19 June 1908; *Montreal Witness*, 3 June 1908; *Mon real Star*, 3 and 8 June 1908; *St. John's, Newfoundland, Royal Gazette*, 21 Dec. 1898; *Free Press*, 24 July 1901; *St. John's Daily News*, 25-29 July 1901; *St. John's Evening Herald*, 23 July 1901; *Toronto Mail*, 19 Aug. 1901; *Toronto Star*, 4 June 1908; personal information.] D. R. K.

REID, SIR THOMAS WEMYSS (1842-1905), journalist and biographer, born in Elswick Row, Newcastle-on-Tyne, on 29 March 1842, was second son of Alexander Reid, congregational minister of that town from 1830 to 1880, by his second wife, Jessie Elizabeth, daughter of Thomas Wemyss (d. 1845) of Darlington, a Hebrew scholar and biblical critic of distinction. After a short stay at Madras College, St. Andrews, where he had brain fever, Reid was educated at Percy Street Academy, Newcastle, by John Collingwood Bruce [q. v. Suppl. I]. In 1856 he became a clerk in the 'W. B.' [i.e. Wentworth Beaumont] Lead office at Newcastle. Cherishing as a boy literary aspirations, at fifteen he sent papers on local topics to the 'Northern Daily Express.' These attracted the notice of the proprietor, who had him taught shorthand. Reid did occasional reporting work at seventeen; and a local cartoon, labelled 'The Press of Newcastle,' depicted him at the time as a boy in a short jacket perched on a stool taking down a speech. Another boyish exploit was the foundation near his father's chapel of 'The West End Literary Institute,' which included a penny bank. In July 1861 he gave up his clerkship for a journalistic career, becoming chief reporter on the 'Newcastle Journal.' His brilliant descriptive report of the Hartley colliery accident in January 1862 was issued as a

pamphlet, and realised 40% for the relief of the victims' families.

In 1863 Reid varied reporting with leadership and dramatic criticism. In June 1864 he was appointed editor of the bi-weekly 'Preston Guardian,' the leading journal in North Lancashire; and in January 1866 he moved to Leeds to become head of the reporting staff of the 'Leeds Mercury,' a daily paper founded and for more than a century owned by the Baines family. He maintained a connection with that journal for the rest of his life.

From the autumn of 1867 till the spring of 1870 Reid was London representative of the paper. In order to gain admission to the press gallery of the House of Commons he had to become an occasional reporter for the London 'Morning Star,' then edited by Justin McCarthy. He subsequently took a leading part in the movement which resulted in 1881 in the opening of the gallery to the provincial press. An acquaintance with William Edward Baxter [q. v. Suppl. I], secretary to the admiralty, placed at his disposal important political information which gave high interest to his articles.

Reid at this time lived on intimate terms with Sala, James Macdonell [q. v.], W. H. Mudford, and other leading journalists. Meanwhile he sent descriptive articles to 'Chambers's Journal' and formed a life-long friendship with the editor, James Payn. To the 'St. James's Magazine,' edited by Mrs. Riddell, he sent sketches of statesmen which were republished as 'Cabinet Portraits,' his first book, in 1872.

On 15 May 1870 Reid returned to Leeds, to act as editor of the 'Leeds Mercury.' The paper rapidly developed under his alert control. In 1873 he opened on its behalf a London office, sharing it with the 'Glasgow Herald,' and arranged with the 'Standard' for the supply of foreign intelligence. His policy was that of moderate liberalism. A 'writing editor' with an extremely able pen, he was the first provincial editor to bring a newspaper published far from the capital into line with its London rivals alike in the collection of news of the first importance, and in political comments on the proceedings of parliament. He successfully challenged the views of 'The Times' as to the seaworthiness of the Captain, which was sunk with its designer, Captain Cowper Coles [q. v.], on 7 Sept. 1870; and he obtained early intelligence of Gladstone's intended dissolution of parliament in 1874. Reid upheld Forster's education bill against the radicals, and supported against the

teetotallers Bruce's moderate licensing bill. In the 1880 election at his suggestion Gladstone was invited to contest Leeds as well as Midlothian. With W. E. Forster, Reid's relations were always close, and he vigorously championed his political action in Ireland during 1880-2. The 'Mercury' under his editorship continued to support Gladstone when he took up the cause of home rule. Whilst at Leeds, Reid was also on friendly terms with Richard Monckton Milnes, Lord Houghton, at whose house at Fryston he was a frequent guest.

Reid made many journeys abroad, chiefly in his journalistic capacity. In 1877 he visited Paris with letters of introduction from Lord Houghton to the Comte de Paris and M. Blowitz, and was introduced to Gambetta. A holiday trip in Germany, Hungary, and Roumania in 1878 he described in the 'Fortnightly Review.' He went to Tunis as special correspondent of the 'Standard' in 1881, and narrated his experiences in 'The Land of the Bey' (1882).

In 1887 Reid withdrew from the editorship of the 'Leeds Mercury,' to which he continued a weekly contribution till his death, in order to become manager of the publishing firm of Cassell and Co. London was thenceforth his permanent home, and his work there was incessant. In January 1890 he added to his publishing labours the editorship of the 'Speaker,' a new weekly paper which he founded and which combined literature with liberal politics. A keen politician, he enjoyed the confidence of Gladstone and his leading followers, but his zeal in their behalf at times provoked the hostility of the extreme radical wing of the party. Reid became a strong supporter and a personal friend of Lord Rosebery, whose views he mainly sought to expound in the 'Speaker.' He was knighted on Lord Rosebery's recommendation in 1894 in consideration of 'services to letters and politics.'

In Sept. 1899 Reid ceased to be editor of the 'Speaker,' which in spite of its literary merits was in the financial respect a qualified success. Subsequently he wrote a shrewd and well-informed survey of political affairs month by month for the 'Nineteenth Century,' as well as weekly contributions to the 'Leeds Mercury.' He was elected president of the Institute of Journalists for 1898-9. He had become in 1878 a member of the Reform Club on the proposition of Forster and Hugh Childers [q. v. Suppl. I], and he soon took a prominent part in its management, long acting as chairman of committee. He was elected an honorary member of

the Eighty Club in 1892, at the instance of his friend Lord Russell of Killowen.

Meanwhile Reid, who received the degree of LL.D. from St. Andrews University in 1893, made a reputation in literature. During his first residence at Leeds he had visited Haworth and interested himself in the lives of the Brontës. Ellen Nussey, Charlotte Brontë's intimate friend and school-fellow, entrusted to him the novelist's correspondence with herself and other material which had not been accessible to Mrs. Gaskell. With such aid Reid wrote some articles in 'Macmillan's Magazine' which he expanded into his 'Charlotte Brontë: a Monograph' (1877), which drew from Swinburne high appreciation. Reid showed admirable skill, too, as the biographer of W. E. Forster (2 vols. 1888) and of Richard Monckton Milnes, first Lord Houghton (2 vols. 1890). In both works he printed much valuable correspondence, and Gladstone helped him by reading the proofs. He also published memoirs of Lyon Playfair, first Lord Playfair of St. Andrews (1899); of John Deakin Heaton, M.D., of Leeds (1883); and a vivid monograph on his intimate friend William Black the novelist (1902). A 'Life of W. E. Gladstone,' which he edited in 1899, includes a general appreciation and an account of the statesman's last days from Reid's own pen. He further enjoyed success as a novelist. His 'Gladys Fane: a Story of Two Lives' (1884; 8th edit. 1902), and 'Mauleverer's Millions: a Yorkshire Romance' (1886), each had a wide circulation. He also left 'Memoirs' including much confidential matter of a political kind; portions were edited by his brother, Dr. Stuart Reid, in 1905.

Reid died, active to the last, and almost pen in hand, at his house, 26 Bramham Gardens, South Kensington, on 26 Feb. 1905, and was buried in Brompton cemetery. He was twice married: (1) on 5 Sept. 1867 to his cousin Kate (*d.* 4 Feb. 1870), daughter of the Rev. John Thornton of Stockport; and (2) on 26 March 1873 to Louisa, daughter of Benjamin Berry of Headingley, Leeds, who survived him. There was one son by the first marriage, and a son and a daughter by the second. A portrait in possession of the family was painted by Mr. Grenville Manton.

[Memoirs of Sir Wemyss Reid, 1842-1885 (with portrait), edited by Stuart J. Reid, D.C.L., 1905 (the remainder of the autobiography is at present unpublished); Men of the Time, 1899; The Times, 27 Feb., 3, 4 March 1905; Speaker, 4 March; Newcastle Weekly Chronicle (portrait), 4 March; Leeds Mercury,

RENDEL, GEORGE WIGHTWICK (1833–1902), civil engineer, was the second son in the family of four sons and three daughters of James Meadows Rendel [q. v.] by his wife Catherine Jane Harris. Born at Plymouth on 6 Feb. 1833, he was educated at Harrow. On leaving school he lived for three years with Sir William (afterwards Lord) Armstrong at Newcastle in order to study engineering. He subsequently received his final training as an engineer in his father's office. As an assistant to his father, he was engaged on the building of the superstructure of the large bridges on the East Indian railway across the Ganges and Jumna at Allahabad. Like his younger brothers Stuart (afterwards Lord Rendel, *d.* 4 June 1913) and Hamilton Owen (*d.* 1902), George became in 1858 a partner in the firm of Sir William Armstrong & Co. at Elswick, and for twenty-four years, in conjunction with Sir Andrew Noble, he directed the ordnance works there.

During his twenty-four years at Elswick Rendel took a prominent part in the development of the construction and armament of ships of war, especially in the design of gun-mountings. To him is due the hydraulic system of mounting and working heavy guns, which was first tried in the fore-turret of H.M.S. Thunderer when she was re-armed before her completion in 1877. The experiment proved very successful, and about the same time the *Téméraire* was fitted with a special type of barbette mounting designed by Rendel. Another type was used in the Admiral class of battleships; and, with various improvements suggested by experience, his hydraulic system has been used for all the later warships of the British navy, as well as in some foreign navies. Rendel was one of the first (if not the first) in England to apply forced draught to war-vessels other than torpedo-boats, namely, in two cruisers built for the Chinese and one for the Japanese government in 1879. In 1881–2 he designed for the Chilean and Chinese governments a series of 1350-ton unarmoured 16-knot cruisers, carrying comparatively powerful armaments, protection being afforded by light steel decks and by coal-bunkers. Immediately afterwards he built for the Chilean navy the unarmoured protected cruiser *Esmeralda* (displacement 3000 tons, speed 18 knots per hour). He thus

is responsible for the introduction into the navies of the world of the cruiser class, intermediate between armour-clad men-of-war and the wholly unprotected war vessel. He further designed the twin-screw gunboats of the *Staunch* class, most of which were built at the Armstrong yard, and numerous similar gunboats for the Chinese navy.

In 1871 Rendel was appointed by the British government a member of the committee on designs of ships of war; and he was also a member of the committee appointed in Aug. 1877 to consider questions relating to the design of the *Inflexible*.

Rendel was elected a member of the Institution of Naval Architects in 1879, and became vice-president of that society in 1882. He was elected a member of the Institution of Civil Engineers in 1863, and in 1874 he contributed to its 'Proceedings' (xxxviii. 85) a paper on 'Gun-Carriages and Mechanical Appliances for working Heavy Ordnance,' for which he was awarded a Watt medal and Telford premium.

In March 1882 Rendel left the Armstrong firm to become an extra professional civil lord of the admiralty, while Lord Northbrook was first lord. The post was a new one, and the admission of 'a practical man of science' to the admiralty board was generally commended. Rendel resigned the office when Lord Northbrook retired in July 1885, owing to ill-health. In 1887 he rejoined the Armstrong firm. He and Admiral Count Albini became the managing directors in Italy of the Armstrong Pozzuoli Company, and Rendel took up his residence at Posilippo, near Naples. In the winter of 1887 he vainly offered his house there to the Emperor Frederick, who, then stricken by fatal illness, was recommended to try the air of South Italy. The recommendation, which came too late, brought Rendel the close friendship of the Empress, which lasted till her death. At Naples, too, Rendel formed a cordial intimacy with Lord Rosebery.

While he lacked the commercial instinct and had no great gift as an organiser, Rendel combined lucidity of intellect and general sagacity with an exceptionally fertile faculty of invention. He received the Spanish order of Carlos III in 1871, and the order of the Cross of Italy in 1876. He died at Sandown, Isle of Wight, on 9 Oct. 1902, and by his widow's wish, although he was not a member of the Roman catholic church, was buried at Kensal Green Roman catholic cemetery.

He was twice married: (1) on 13 Dec. 1859, at Brighton, to Harriet (1837-1877), third daughter of Joseph Simpson, British vice-consul at Cronstadt; by her he had five sons; (2) on 17 March 1880, at Rome, to Licinia, daughter of Giuseppe Pinelli of Rome, and had issue three sons and a daughter.

A portrait painted by H. Hudson and a bust by Mr. Alfred Gilbert are in the widow's possession. Lord Rendel owns a replica of the bust.

[Men of the Time, 1899; Minutes of Proc. Inst. Civ. Eng. cli. 421; Trans. Inst. Naval Arch. xlv. 332; Engineering, 17 Oct. 1902; information from Lord Rendel.] W. F. S.

RHODES, CECIL JOHN (1853-1902), imperialist and benefactor, born at Bishop Stortford in Hertfordshire on 5 July 1853, was fifth son of Francis William Rhodes (1806-1878), vicar of that parish, by his second wife, Louisa, daughter of Anthony Taylor Peacock, of South Kyme, Lincolnshire (*d.* 1 Nov. 1873). The family consisted of nine sons, four of whom joined the army, and of two daughters, both unmarried. There survive the three youngest sons, Major Elmhirst (*b.* 1858), formerly of the Berkshire regiment and director of army signalling in South Africa during the Boer war (1899-1901), Arthur Montagu (*b.* 1859), and Bernard (*b.* 1861), captain R.A., and the elder daughter Louisa (*b.* 1847). The eldest son, Herbert, was killed in Central Africa in 1879. The third and sixth sons, Basil and Frederick, died in infancy. The second son, Colonel Francis William, is noticed below. The fourth son, Ernest Frederick (*b.* 1852), captain R.E., died on 4 April 1907. The younger daughter, Edith Caroline (*b.* 1848), died on 8 Jan. 1905.

The father came of yeoman stock. The father's great-great-grandfather, William Rhodes (*d.* 1767), described as a prosperous grazier, left Cheshire about 1720, and purchased near London an estate, 'The Brill Farm,' which included the region now occupied by Mecklenburgh and Brunswick Squares and the Foundling Hospital, and was buried on 24 April 1767 in Old St. Pancras churchyard, where a monument of granite now stands bearing the inscription 'Erected to replace two decayed family tombs by C. J. R., 1890.' William Rhodes's only son, Thomas, churchwarden of St. Pancras in 1756 and 1757, married twice, and died in 1787, leaving a son, Samuel (1736-1794), of Hoxton, the possessor of brick and tile works marked 'Rhodes' Farm' in Carey's map of London (1819), in Islington

parish, and the purchaser of the Dalston estate now held by the trustees of the Rhodes family. Samuel's third son, William (1774-1843), married Margaret, daughter of Francis Cooper of St. Michael's, Crooked Lane, London, by Lucy his wife, daughter of Joseph Yates of Stoke Newington, and he settled at Leyton Grange in Essex; their eldest son was Cecil Rhodes's father. The latter, born in 1806, graduated B.A. from Trinity College, Cambridge, in 1830 (M.A. 1833) and was perpetual curate of Brentwood in Essex from 1834 until 1843, and vicar of Bishop Stortford from 1849 to 1876; he died at Fairlight, Sussex, on 28 Feb. 1878.

Cecil, 'a slender, delicate-looking, but not delicate, boy, of a shy nature,' was sent to Bishop Stortford grammar school in 1861. He won a silver medal for reading aloud, and he showed efficiency in charge of a class in his father's Sunday school. In 1869, at sixteen, his health broke down, and since, to his father's disappointment, he had no vocation for the church, he was sent out to his eldest brother, Herbert, then settled in Natal, growing cotton. He landed at Durban on 1 Oct. 1870. 'Very quiet and a great reader' he appeared to friends with whom he stayed in Natal on his way to his brother's rough quarters at Umkomaas. Forty-five acres of bush had been cleared and planted with cotton before Cecil's arrival; a few months later a hundred acres were planted, and the brothers won a prize at an important agricultural show. Herbert Rhodes was often away, and Cecil mainly ran the plantation, discovering a sympathy with native labourers and a turn for managing them which never failed him. He found congenial company in the son of the local resident magistrate, a retired soldier. In their spare time the youths tried to 'keep up their classics'; both cherished a dream that they should one day return to England and enter at Oxford 'without outside assistance.'

By this time the discovery of diamonds in the Orange Free State had resulted in the rush for Colesberg Kopje (now the Kimberley mine), Du Toit's Pan (later the De Beers mine), and other points in what is now the Kimberley division. The Rhodes brothers were drawn with the rest, Herbert starting for the diamond fields in Jan. 1871, while Cecil stayed behind to dispose of the stock and wind up their joint affairs. In Oct. 1871 he started for Colesberg Kopje in a Scotch cart drawn by a team of oxen, carrying a pick, two spades, several volumes of the classics, and a Greek lexicon.

At Kimberley as in Natal he was thrown much upon his own resources, for at the end of November his brother left for England and handed over to him the working of his claim. Rhodes is described in 1872 as 'a tall, fair boy, blue-eyed and with somewhat aquiline features, sitting at table diamond-sorting and superintending his gang of Kafirs near the edge of the huge open chasm or quarry which then constituted the mine'; and again as 'pleasant-minded and clever, sometimes odd and abstracted and apt to fly off at a tangent.' The 'claim' modestly flourished, and was added to; the brothers found themselves with a certain amount of ready money, and in the bracing air of the high veld Cecil's health was re-established.

In October 1873 Rhodes returned to England to fulfil his ambition of 'sending himself' to Oxford. He had hoped to enter University College, but the Master, Dr. G. G. (afterwards Dean) Bradley, finding him unprepared to read for honours, refused him admission, but gave him an introduction to Edward Hawkins [q. v.], provost of Oriel, whom he impressed. At Oriel he matriculated on 13 Oct. 1873, keeping Michaelmas term to 17 December, and living at 18 High Street. In November 1873 his mother died, the only human being with whom he is known at any time to have regularly corresponded. Early in the new year he caught a chill while rowing; a specialist found both the heart and the lungs affected, and entered against his name in his case book 'Not six months to live.' His Oxford career was thus interrupted, but it was not closed. He returned to South Africa and Kimberley, where his lungs soon ceased to trouble him; henceforth, indeed, his heart caused him his only physical anxiety, and that was never cured. A growing absorption in South African affairs left unmodified his resolve to graduate in the university, and until this ambition was gratified he revisited Oxford from time to time at no long intervals. In 1876 and again in 1877 he kept each term of the academic year, spending only his long vacations in South Africa. On 16 May 1876, too, he entered himself as a student at the Inner Temple, and although he was not called to the bar his name remained on the books till it was withdrawn on 17 Dec. 1889, to be restored on 20 Feb. 1891. In 1878 he kept Lent, Easter, and Trinity terms at Oxford, living at 116 High Street. He was back again in Michaelmas term, 1881, when he at length by dogged effort passed the ordinary

examination for B.A., and took that degree and proceeded M.A. on 17 Dec. He lodged at the time at 6 King Edward Street, where a tablet commemorates the fact. He retained his name on the college books, paying a composition fee. Though an indifferent horseman, he was master of the drag during his early sojourns at Oxford, and did a little rowing; otherwise he is remembered as making one in 'a set which lived a good deal apart from both games and work.' Although he was 'not a great reading man,' he was always a devourer of books, and his feeling for certain classical authors was strong. Marcus Aurelius was his constant companion, and at his South African home, Groote Schuur, there was (until 1902, when it disappeared) a copy of the 'Meditations' marked and annotated by his hand. He commissioned for his library new translations of the chief classical writers, which were sent him in typed script. Aristotle's 'Energieia the highest activity of the soul to be concentrated on the highest object' remained his perpetual watchword.

Meanwhile his South African career had made rapid progress. On his second advent in Kimberley in 1874 he took root there, and was soon counted with the more successful diggers. His brother Herbert early left the diamond fields to hunt and explore the interior; he was killed through the accidental firing of his hut in 1879, in what is now Nyassaland. In 1874, and for some years after, Rhodes was in partnership with Mr. Charles Dunell Rudd (b. 1844), who had been educated at Harrow and had after matriculating at Trinity College, Cambridge, in 1863 broken down through overtraining. Rudd and Rhodes gradually increased their holdings after the old regulation against the possession of more than one claim on the diamond fields was repealed. Rhodes specially concentrated his holdings in one of the two great mines of Kimberley, called after De Beers, the Dutch farmer, who originally owned the land. Rhodes was quickly recognised as one of the ablest speculators in the district, with one conspicuous rival or opponent in Barnett Isaacs, later known as Barney Barnato [q. v. Suppl. I], but from 1875 until his death he was greatly helped in all financial undertakings by Alfred Beit [q. v. Suppl. II]. Mr. Gardner Williams, afterwards general manager of the amalgamated industry (the De Beers corporation), describes Rhodes in these days as 'a tall, gaunt youth, roughly dressed, coated with dust, sitting moodily on a bucket, deaf to the clatter and rattle about him, his blue eyes fixed intently

on his work or on some fabric in his brain.' It was a life of vicissitude. There was camp fever, and other forms of epidemic, and during 1874 the reef fell in both in Colesberg Kopje and in De Beers, covering many claims under tons of shale. Floods prevailed, mining board taxation was heavy, there was constant litigation between claim holders and miners and the Griqualand West legislative council. Banks refused advances and bankruptcy was common. Many diggers left the fields, but Rhodes and his partners held on. Towards the end of October 1874 they successfully completed an undertaking to pump out Kimberley mine, and in 1876 they drained of water De Beers and Du Toit's Pan. A contemporary recalls how at a meeting of a mining board in 1876, when the members were 'fractious and impatient,' Rhodes, 'still quite a youth, was able to control that body of angry men.' As regards the diamond industry he, like his rival Barnato, already recognised that so long as individual diggers produced and threw upon the uncertain markets all the diamonds they could find, no real progress was possible, and that the remedy lay in an amalgamation of interests and the regulation of supply. To that end, but with different motives and ambitions, each was steadily working, Rhodes with De Beers mine, Barnato with Kimberley mine, as his base and nucleus. On 1 April 1880 the Rhodes group had established themselves as the De Beers Mining Company, with a capital of 200,000*l.*, while in the same year the Barnato Mining Company was formed to work the richest claims in Kimberley mine.

But Rhodes's ambitions were from the first other than commercial. During 1875 he spent eight months in a solitary journey on foot or ox-wagon through Bechuanaland and the Transvaal. The experience helped to shape his aims. He found the country to be not merely of merely of agricultural and of great mineral value, but also beautiful and healthy. The scattered Dutch farmers proved hospitable and he felt in sympathy with them. He aspired to work with the Dutch settlers and at the same time to secure the country for occupation by men of English blood and to make Great Britain the dominant influence in the governance of South Africa, and indeed of the world. In 1877 he had his first serious heart attack and made his first will, dated 19 Sept. 1877. The testator disposed of the fortune which he had not yet made to 'the establishment, promotion, and development of a Secret Society the aim and object whereof

shall be the extension of British rule throughout the world, the perfecting of a system of emigration from the United Kingdom and of colonisation by British subjects of all lands where the means of livelihood are attainable by energy, labour, and enterprise, and especially the occupation by British settlers of the entire continent of Africa, the Holy Land, the valley of the Euphrates, the islands of Cyprus and Candia, the whole of South America, the islands of the Pacific not heretofore possessed by Great Britain, the whole of the Malay Archipelago, the sea-board of China and Japan, *the ultimate recovery of the United States of America* as an integral part of the British Empire, the inauguration of a system of colonial representation in the imperial Parliament, which may tend to weld together the disjointed members of the empire, and finally the foundation of so great a power as hereafter to render was impossible and promote the best interests of humanity.' The form and substance of these aspirations are youthful, but they dominated Rhodes's life. A federation of South Africa under British rule, with Cape Dutch assent, was always before his eyes.

Just before leaving to graduate at Oxford in 1881 Rhodes had entered public life in South Africa. In 1880 the Act for absorbing Griqualand West in the Cape Colony created two electoral divisions at Kimberley and Barkly West. As one of two members for Barkly West, Rhodes was elected in 1880 and took his seat in the Cape legislature next year. (He retained the seat for life.) The battle of Majuba Hill on 27 Feb. 1881, with its sequel in the recognition anew of the independence of the Transvaal Republic, had just given an immense advantage to the Dutch claim to supremacy in the colony and had almost crushed the hope of a permanent British predominance. The foundation of the Afrikaner Bond in 1882 was but one fruit of a Dutch national movement, in sympathy with the Boer republic, which looked forward to independence of the British Empire [see HOFMEYER, JAN HENDRIK, Suppl. II]. In such unpromising conditions Rhodes entered Cape politics. His aim from the first was to maintain the widest powers of local self-government and at the same time to organise, confirm, and extend the area and force of British settlement and British influence, not by invoking the imperial factor, but by rousing in the average Briton a sense of the responsibilities of race and empire. In his first session he took a friend aside and, placing his hand on

a map of Africa, said 'That is my dream, all British.' But while he sought to bring home to Englishmen in South Africa the possibilities of new empire in South Africa, he desired to co-operate with the Dutch. In his second session he frankly remarked 'Members on the other side believe in a United States of South Africa, and so do I, but under the British flag.' Rhodes first spoke in the Cape Assembly on 19 April 1881. He championed the Basutos, his interest in whom led presently to a friendship with General Gordon, who invited him in 1884 to accompany him to Khartoum. On 25 June he spoke again, in opposition to the introduction of the Taal in the Cape parliament, for which he asserted that there was no real desire in the country. He impressed his hearers as 'a good type of English country gentleman'—nervous, ungainly, but of a most effective frankness. As a speaker he seemed to think, or rather dream, out loud. His vocabulary was poor, although he hit sometimes on a telling phrase; he had moments of a discursive obscurity. Yet men who had listened to the famous orators of the world found themselves strangely impressed by his speaking. A strong persuasiveness and candour, helped by his appearance, held any audience. But 'fundamental brain-work' had been done before he rose, and when trimmed of excrescences the ordered clearness of his sequences was perfect.

His political activities were soon concentrated on that northern expansion which formed a great part of his completed work. The Cape Colony was then bounded on the north by the Orange River, beyond which lay Bechuanaland, of vast extent and the only avenue to the coveted northern territories which were the objective alike of Rhodes and of the Transvaal Boers. By the Pretoria Convention of 1881 the westward expansion of the Transvaal was limited to a line east of the trade routes from Bechuanaland. This did not prevent a series of raids from the Transvaal by which, not by haphazard but by design, the republic sought to occupy Bechuanaland, and, if might be, the regions of the north, even of the west. Rhodes's first important step was to urge the appointment of a delimitation commission in 1881. On this he served. An offer was obtained in 1882 from Mankoroane of the whole of his territory, about half Bechuanaland, for the Cape government. To this proposal Rhodes secured the agreement of the chief men of Stellaland, a Boer raider's settlement consisting of 400 farms, 'with a raad and all the elements

of a new republic,' seated at Vryburg. Prolonged correspondence and a long appeal to the Cape Assembly on 16 Aug. 1883 did not avail to procure the acceptance of this offer, and it seemed certain that the Stellalanders and another group of Dutch immigrants, with two Bechuanaland chiefs, the opponents of Mankoroane, would be annexed by the Transvaal. Rhodes turned to the imperial government, and, after endless appeals, the force of his personality having impressed the high commissioner, Sir Hercules Robinson, he procured the declaration in 1884 of an imperial protectorate, the British flag being carried to the twenty-second parallel. On 27 Feb. 1884 a second convention signed in London gave definite frontiers on the eastern border of Bechuanaland, behind which the Transvaal covenanted to abide.

A few days later Bechuanaland was raided afresh by President Kruger. The imperial government promptly proclaimed the formal annexation of Bechuanaland, and sent up as resident the Rev. John Mackenzie, a veteran missionary. On 16 July Rhodes appealed once more, and this time with success, to the Cape Assembly, reminding them that Bechuanaland was 'the neck of the bottle and commanded the route to the Zambesi . . . We must secure it, unless we are prepared to see the whole of the north pass out of our hands. . . . I want the Cape Colony to be able to deal with the question of confederation as the dominant state of South Africa.' While those definitely committed to supporting the Dutch republics were not won over, a majority of the house concurred with Rhodes. Voters may have been influenced by the fact that that year, and within six months after the second convention of London was signed, a new factor entered South Africa, and by the supineness alike of the imperial and colonial governments all Damaraland and Namaqualand between twenty-six degrees south and the Portuguese border, 320,000 square miles in all, was occupied by Germany. The significance of the fact, if lost on the imperial government, impressed Rhodes and one other man, Jan Hendrik Hofmeyr [q. v. Suppl. II], leader of the Afrikaner Bond, who combined his Dutch sympathies with a deep antipathy to Germany. Despite the diversity between the two men's aims, Rhodes at once saw the wisdom of co-operation with a view to promoting northern expansion.

Towards the end of 1884 it was clear that Mackenzie, though loyal and upright, was scarcely the man for the time and place,

proclaiming as he did all Boer farms in Bechuanaland to be the property of the British government, and otherwise making too much of the imperial authority. The resident was recalled by the high commissioner, nominally for the purpose of conference, and Rhodes replaced him, by the style of deputy-commissioner. Reaching Rooi-Grand in Goshen, the lesser of the two Boer centres, on 25 August, he found Generals Joubert and Delarey just arrived from the Transvaal, and armed burghers preparing that night to advance on Mafeking and on Montsoia the local chief. All Rhodes could do was to warn the Boers that, in view of the convention, they were making war, in effect, on the British government, and that done, to retire on the larger concentration in Stellaland. Arriving at Commando Drift on 1 September, he went straight to the house of the Boer commandant, Van Niekirk, who had refused to acknowledge Mackenzie as resident. He informed Rhodes that 'blood must flow.' Rhodes replied 'Give me my breakfast and let us see to that afterwards.' Having dismounted, he stayed with Van Niekirk six weeks, and became godfather to his child. By 8 September he had recognised the titles of individual Boer settlers and reported to the high commissioner that the armed burghers had dispersed and that Stellaland had accepted the flag. But the return of Joubert to Pretoria was followed by a proclamation of President Kruger on 16 September, annexing the Mafeking region and so cutting off Cape Colony from access northwards. The imperial government moved. Sir Charles Warren's expeditionary force was sent to patrol Bechuanaland and the Transvaal frontier, and by 14 Feb. 1885 President Kruger met the general and Rhodes at Fourteen Streams in peaceful conference. This was the first meeting between Rhodes and Kruger, who henceforth typified for Rhodes the force which his policy of expansion might yet encounter. Bechuanaland south of the Milopo, with the Kalahari, now became part of the Cape Colony, while the territory to the north was constituted a protectorate. The expansion was thus at once both imperial and colonial, or colonial under imperial sanction, the ideal alike of Rhodes and of Sir Hercules Robinson. The high commissioner's despatches (*Bechuanaland Blue Book C. 4432*) testify how much the intervention and influence of Rhodes in keeping the country quiet, and insisting that the title of Stellalanders should not be cancelled nor the suscepti-

bilities of Kruger and his officers wounded by too much military parade, conduced to this result. The despatch of Lord Derby, the colonial secretary (No. 17 of September 1886), took the same view.

But Rhodes had no security that in the coveted hinterland itself the Transvaal and Germany might not combine against England. Germany's acquisition in the south-west had been followed by an attempt—frustrated by the governor of Natal—to occupy St. Lucia Bay in Zululand on the east. The Transvaal, while refusing customs and railway union with the Cape, on which Rhodes counted to smooth the way to federation, and seeking, though vainly, from President Brand an alliance defensive and offensive with the Orange Free State, had given German capitalists an exclusive right to construct railways within the republic, at a sensible cost to British prestige. The fear of such a conjunction was quickened by the discovery of gold on Witwatersrand in 1886, when the Transvaal leapt from beggary to wealth and importance. North of the twenty-second parallel meanwhile was the dominion of Lobengula, the able king of the warlike Matabele, and Boer and German emissaries were reported as coming and going about Gobulawayo, the king's kraal. Late in 1887 Kruger, in defiance of a convention signed at Pretoria on 11 June of that year, confirming the delimitation of Transvaal boundaries, sent up Piet Grobelaar with the title of consul to arrange terms with the Matabele king. Rhodes was apprised, and hurrying from Kimberley to Cape Town besought the high commissioner to proclaim a formal protectorate over the northern territories. The high commissioner declined this step on his own responsibility, but, acting on an alternative suggestion, sent the Rev. John Smith Moffat, assistant-commissioner of Bechuanaland, to Lobengula, and on 11 Feb. 1888 the king entered into a treaty which bound him to alienate no part of his country without the knowledge and sanction of the high commissioner. True to his principle, Rhodes looked first to the sinews of war, and while still hoping for annexation by the imperial government, sought to make sure of substantial assets in view of a possible alternative. Messrs. Rudd, James Rochfort Maguire, and Francis R. Thompson, to whom the north was well known, were advised to approach the king at Gobulawayo, and on the Unqusa river, on 30 Oct. 1888, Lobengula signed a concession, granting them mineral rights in all his territories and promising to grant no land con-

cessions from that day. It was by this time clear that Lord Salisbury's government would not undertake a protectorate over the northern territories. Rhodes asked whether a chartered company, roughly modelled on the old East India Company, would be acceptable, and was told that it would, and after much manœuvring on the part of *soi-disant* claimants to concessions the charter incorporating the British South Africa Company was granted on 13 July 1889. The territory under the new company's control which the company was empowered to develop lay to the north of the Transvaal and Bechuanaland, and vaguely extended to the Zambesi. It was soon named Rhodesia after the projector of the great scheme.

Meanwhile Rhodes was developing his material interests in the south. By 1885 the De Beers Mining Company, after a period of pecuniary embarrassment, had grown by the absorption of additional claims to be an enterprise of importance with a capital of 84,000*l.*, while the Kimberley Mine, practically controlled by Barnato; represented an even larger and a rival amalgamation. But the permanence of the diamond industry was still regarded as doubtful. The assistance of the Cape government, confidently expected, had been refused to the mining board. Diamonds were sinking in value. Only a final amalgamation could save the industry, the question being whether the De Beers or the Barnato Company should be supreme. Barnato's financial position was the stronger, and his ability at least equal to Rhodes's. But he had failed to secure the important interests of the *Compagnie Française* in the Kimberley Mine. On 6 July 1887 Rhodes sailed for Europe, obtained the necessary financial support in London, and going to Paris bought the entire assets of the French company for 1,400,000*l.* Barnato challenged the right of purchase; there was bickering and imminent litigation, when Rhodes appeared to weaken. He offered the French company shares to Barnato at cost price, taking payment in Kimberley mining shares; Barnato believed the day to be his. But the holding in the Kimberley Mine thus acquired was used by Rhodes to obtain other shares, until at last he had secured a controlling interest in the mine; and on 13 March 1888 both companies were amalgamated by the style of De Beers Consolidated Mines, with Rhodes as its chairman and virtual ruler. The trust deed which defined the powers conferred on its holders was singular.

Barnato had desired a trust deed limiting the activities of the company to diamond mining. Rhodes declared that the company should be legally capable of carrying out any business not in itself unlawful. There was a fresh encounter between the two men, who measured their wits against each other through a whole night, and Rhodes prevailed. The trust deed empowered De Beers Consolidated Mines to increase its capital as it could, to acquire what it could, and where it could. It could 'acquire tracts of country' in Africa or elsewhere together with any rights that might be granted by the valuers thereof, and spend thereon any sums deemed requisite for the maintenance and good government thereof. 'Since the time of the East India Company,' said Mr. (now Chief Justice Sir) James Rose-Innes during the litigation with shareholders which followed, 'no company has had such power as this. They are not confined to Africa; they are authorised to take any steps for the good government of any country. If they obtain a charter from the secretary of state, they could annex a portion of territory in Central Africa, raise and maintain a standing army, and undertake warlike operations.' Such was the corporation—the largest in the world—of which Rhodes found himself the master at thirty-six. At the same time Rhodes acquired large stakes in the gold mines of the Rand on the discovery of a reef there. His partner, Mr. Rudd, proceeded from Kimberley and obtained on their joint behalf interests in a gold-mining corporation which was soon known as the Consolidated Goldfields of South Africa.

Rhodes's energetic interest in the organisation of the Chartered Company was not diminished by his other activities. By arrangement with the Cape government the British South Africa Company undertook the construction of a railway line northwards from Kimberley to Fourteen Streams, then subsequently to the British Bechuanaland border and on to Vryburg. With a view to the occupation of the new territories a pioneer expedition was arranged in London with Mr. F. C. Selous, the famous hunter and explorer, while Dr. Leander Starr Jameson, relinquishing in 1890 a large medical practice at Kimberley which he had carried on since 1878, spent months of daring and adroit diplomacy in Lobengula's kraal, preparing the king for the establishment of Englishmen in Matabeleland and Mashonaland. On 11 Sept. 1890, after many hardships

and perils, Dr. Jameson hoisted the Union Jack on the site of the present Salisbury, and he became the company's administrator.

In addition to a holding acquired on Lake Nyassa, the company's range of operations was rapidly extended beyond the Zambesi, to the southern end of Lake Tanganyika. It was Rhodes's hope to push farther and connect Africa under the British flag from the Cape to Cairo. But the Anglo-German treaty of 1890, which extended German East Africa to the Congo, made this impossible. In 1892, when the retention of Uganda by the imperial government seemed doubtful, Rhodes protested against its surrender, and wrote to Lord Salisbury, the foreign secretary, offering to carry the telegraph from Salisbury to Uganda at his own expense. The offer was declined, but Uganda was retained. In 1893 came war with the Matabele, who were oppressing the neighbouring tribe, the Mashonas. A stubborn fight was waged, largely under the direction of Rhodes but immediately by Dr. Jameson, who as administrator of the company at Fort Victoria took the field. The company's victory, despite heavy loss, was assured by the submission of the Matabele chiefs (14 Jan. 1894). After the death of the Matabele chief Lobengula (23 Jan.) Rhodes brought three of his sons to Cape Town to be educated at his cost. The war confirmed the British possession of 440,000 square miles of territory.

On 17 July 1890 Rhodes became prime minister of the Cape in succession to Sir John Gordon Sprigg. He was maintained in power by Dutch and English votes practically for more than five years, and for that period was virtually dictator of South Africa. He was at the outset head of a 'ministry of all the talents.' John Xavier Merriman was treasurer-general, J. W. Sauer colonial secretary, and Sir James Sivewright commissioner of crown lands. The propriety of his combining the dual position as head of the British South Africa Company and of the Cape ministry was questioned (22 June 1893); but he at once made clear his readiness at any time to resign the premiership. While the development of the north occupied much of his attention, no colonial premier did so much to raise and broaden Cape politics. He carried through important reforms, notably in local education and in native policy, and went far to unite to their own consciousness the interests of British and Dutch in South Africa. The formidable Dutch political organisation, the Afrikander Bond, which sought openly the dominance

of the Dutch in Cape politics and furtively the establishment of a Dutch republic, with the Transvaal as basis, was coaxed into his service. It is said that of 25,000 Chartered Company shares reserved for him to dispose of at will, a large proportion were given to Dutch applicants. This is the nearest approach to anything like bribery which his career discloses. He admitted that he struck a bargain with Hofmeyr, the leader of the Bond, who pledged himself with some reluctance in the name of the Bond not to throw any obstacles in the way of northern expansion in return for Rhodes's support of a tariff to protect the agricultural interest of South Africa. He was entirely frank in his desire to identify Bondmen with the Chartered Company's work, and when seeking to create a local board of control in the colony, he offered its presidency to the most distinguished of living Dutchmen, the chief justice, now Lord De Villiers, whose sympathies were with the Boer republics. He attended a Bond banquet on Easter Monday 1891, to show that there was no longer anything antagonistic between the Bond and the mother country. He deprecated on the one hand too sentimental a regard for the Boer republics, and on the other any wish to interfere with the independence of neighbouring states, with which he counselled 'customs relations, railway communication, and free trade in products.' With equal candour he addressed the Bond by letter on 17 April 1891, defining his views about the settlement in the north.

In the early days of his ministry (Feb. 1891) Rhodes and the governor, Sir Henry (afterwards Lord) Loch [q. v. Suppl. I] had visited London to discuss South African affairs. He discouraged interference of the home government in local affairs, but he hoped for the realisation of an imperial federal scheme. That hope had led him in 1888 to subscribe a sum of 10,000*l.* to the funds of Parnell's followers. Rhodes admired Parnell's earnestness but stipulated that the Irish members should remain at Westminster. He made it clear that home rule was in his belief a step on the road to imperial federation. But he felt convinced that 'the future of England must be liberal' and gave to the funds of the English liberal party 5000*l.* (February 1891) on condition that the gift should be kept secret, and that Irish representation at Westminster should be preserved in any home rule bill. Misgivings of the liberal policy in Egypt caused him subsequent concern, but he

was assured that there was no intention of abandoning English rule there.

After a second visit to England early in 1893 differences within the Cape ministry compelled its reconstruction. Rhodes resigned his post of prime minister on 3 May, to resume office next day with a reconstructed ministry, which included Sir Gordon Sprigg, W. P. Schreiner, and others, but excluded almost all his former colleagues. An Act was soon passed abolishing the secretaryship for native affairs and amalgamating the duties with those of the prime minister.

Rhodes's native policy was always courageous. Technical education and temperance he encouraged. He restricted by an Act of 1892 the franchise to men who could read and write and had the equivalent of a labourer's wage, without respect of colour, thus making an end of the raw Kafir vote and its abuses; while in his Glen Grey Act of 1894 he introduced into native territories village and district councils in which natives could discuss educational and other matters, levy rates, and thus train themselves in the principles of self-government.

Towards the end of 1893 Rhodes made a tour through Mashonaland and Matabeleland. The war had closed, and Rhodes brought back encouraging reports of the results of the victory. A budget surplus of 334,161*l.* (14 June 1894) attested the colony's prosperity under Rhodes's rule. In June 1895 the legislature formally pronounced the absorption of British Bechuanaland in Cape Colony.

In the early months of 1895 he was once more in England, and was well received. On 2 Feb. he was admitted to the privy council, and though he was blackballed at the Travellers' Club (Jan.), he was in March elected by the Committee to the Athenæum.

At the end of 1895 Rhodes while still premier entered on a course of action which prejudiced his reputation. His disposition hardly suffered him to weigh advice, and his heart trouble, which taught him that he was doomed to an early death, made him favour impulsively 'short cuts' to his goal of a South Africa under sole British sway. He had sought in vain President Kruger's co-operation in a system of federation which should leave the independence of the republics intact while establishing a customs union, equal railway rates, and a common court of appeal, and he distrusted the capacity of those who should come after him to grapple with a problem still unsolved. During 1895 the usage by the Boer government of the

Uitlander population, to which that government owed most of its wealth and power, led to great tension between Briton and Boer. The episode which brought Rhodes's premiership to a disastrous close was the consequence, not the cause, of an intolerable situation. In December 1895 the mining population of Witwatersrand, including both Americans and English, at Johannesburg, resolved, in despair of a peaceful solution, to compass a reform of their status by recourse to arms. Rhodes was asked and agreed to give this irregular movement his support. As a large mine-owner, who was the practical head of the Consolidated Goldfields of the Rand, where his brother Francis William held joint local control, he was within his rights, but as prime minister of a neighbouring government he had no business to meddle in the matter. He did far more than become a party to the movement for reform. In the words of the finding of the subsequent Cape commission of inquiry: 'In his capacity of controller of three great joint-stock companies, the British South Africa Company, the De Beers Company, and the Consolidated Goldfields, he directed and controlled a combination which rendered a raid on President Kruger's territory possible.' On 23 September certain areas had been ceded to the British South Africa Company by native Bechuana chiefs near the frontier. Here, with Rhodes's approval, Dr. Jameson, who was acting as administrator of the South Africa Company, placed an armed force of 500 men. Meanwhile Rhodes gave money and arms and lent his influence to the movement within the Transvaal; Jameson hovering on the border was in close concert with the leaders of the reform party. The movement hung fire. The form of government which was to replace Kruger's rule was undetermined. On 27 December Jameson on his sole authority precipitated the crisis by crossing the Transvaal border with an armed force. In a conflict with the Boers near Krugersdorp (1 January) the raiders were captured. For the raid Rhodes had no responsibility, but he acknowledged his complicity in the preliminary movement and resigned his office of premier (6 Jan. 1896). Next month he arrived in London to interview Mr. Chamberlain, the colonial secretary.

The course of Rhodes's career was thenceforth changed. He returned to the Cape resolved to devote himself solely to the improvement of fruit and wine industries in Cape Colony and to the development of Rhodesia. He assumed the

office of" joint administrator with Lord Grey of the British South Africa Company, but resigned the directorship in May. In the interval most of his plans in the north had been defeated by the outbreak in March of a Matabele rebellion. Rhodes took command of one of the columns, and the fighting continued till August. Military operations had then driven the Matabele rebels to the Matoppos Hills, where they held an impregnable position. The prospect was one of a continued war, which might smoulder for years. Rhodes conceived the idea of ending the war by his own unarmed and unaided intervention. He moved his tent to the base of the Matoppos Hills, and lay there quietly surrounded by the rebels for six weeks. Word was sent to the natives that Rhodes was 'there, to have his throat cut, if necessary,' but as one trusting the Matabele, and anxious above all to 'have it out with them,' he was ready undefended to hear their side of the case. A council was held by the chiefs in the heart of the granite hills. Rhodes was told that he might attend it (21 August). Accompanied by Dr. Sauer and Johan Colenbrander, the scout and interpreter, he rode to the appointed place. There was a long discussion without result. A week later (28 August) another conference followed. Rhodes was accompanied by Colenbrander and his wife, by Mr. J. G. Macdonald and Mr. Grimmer, Rhodes's private secretary. At one point the young warriors got out of hand; Colenbrander thought that all was lost and bade the party mount and fly. But Rhodes stood his ground and shouted to the Matabele 'Go back, I tell you!' They fell back, and Rhodes asked the assembled chiefs 'Is it peace, or is it war?' They answered 'It is peace.' Riding home in silence, Rhodes said 'These are the things that make life worth while.' The rebellion came to an end after a final meeting with the chiefs (13 October). Next year Rhodes held an 'Indaba' of Matabele chiefs (23 June 1897) and the settlement was confirmed.

Meanwhile the Jameson raid and Rhodes's relation with it had roused both in South Africa and in England an embittered party controversy. The Cape parliament adopted a majority report of a select committee condemning Rhodes's action, while absolving him of any sordid motives (17 July 1896). On 11 Aug. 1896 a select committee of the British House of Commons was appointed to investigate the affairs of the British South Africa Company. Rhodes was examined at length (16 Feb.-5 March 1897),

and the report of the committee on 15 July pronounced Rhodes guilty of grave breaches of duty both as prime minister of the Cape and as acting manager of the company.

During the few years which remained to him Rhodes's best work was given to developing Rhodesia and consolidating the loyal party at the Cape, where he kept to the end his seat in the House of Assembly. In Rhodesia he brought the railway from Vryburg to Bulawayo (opened 4 Nov. 1897), and made arrangements for carrying the line to Lake Tanganyika as part of his scheme for connecting the Cape through a British line of communication with Cairo. On 21 April 1898 he was re-elected director of the company. He revisited Europe early next year, and then arranged to carry the African telegraphic land line through to Egypt, discussing the project with the German Emperor in Berlin and forming a highly favourable impression of the Kaiser. In the Cape general election of the same year and in the succeeding session he made some fine speeches which were loudly applauded, but his own action had for the time shattered the scheme of a Federal Union of South Africa, which was always his great objective. At the encanenia of 1899 the honorary degree of D.C.L. was conferred on him at Oxford. He had been offered the distinction at the encanenia of 1892, but was unable to attend at that time. The bestowal of the degree in 1899 elicited an unavailing protest in the university from resident graduates who resented his share in the raid [see CAIRO, EDWARD, Suppl. II]. The honour was one which Rhodes warmly appreciated, and he acknowledged it generously in the terms of his will, which he signed soon after he received the degree. On returning to Cape Town (19 July) he was received with great enthusiasm.

The South African war broke out on 11 Oct. 1899. Rhodes was then at Cape Town, but he at once made his way to Kimberley. Feeling that it was but right for the chief employer of workmen there to share the dangers of his employees, and impelled by a feeling, which events justified, that the Boers in their desire to catch him might be delayed on their advance down the ill-defended Cape Colony, Rhodes reached Kimberley just in time to be besieged (15 October). He took a man's part in organising the defence, and directed some needed measures of sanitation. The place was relieved on 16 Feb. 1900. From this trial he emerged apparently well, but his health was broken and

his days were numbered. On 20 July 1901 he arrived at Southampton on a last visit to Europe. He resided at Rannoch Lodge, in Perthshire, till 6 Oct., when he left for Italy and Egypt. On his return to London in Jan. 1902 he spent a day at Dalham, Suffolk, an estate which he had just bought in the belief that the air there was easier to breathe than elsewhere. Business called him back to Cape Town in Feb.; his malady grew critical, and moving from Groote Schuur to a cottage by the sea at Muizenberg, he died there after weeks of extreme suffering, courageously borne, on 26 March. He was forty-nine years and eight months old. By his direction he was buried in a hole cut in the solid granite of the Matoppos; he had chosen the spot during his negotiations with the Matabele chiefs in 1896.

Rhodes's work did not end with his death. His last will, his sixth, was dated 1 July 1899, with codicils of Jan. and 11 Oct. 1901 and 18 Jan. and 12 March 1902. By its provisions his beautiful residence, Groote Schuur, an old Dutch house, rebuilt on the slopes of Table Mountain, was left for the use of the premier of a federated South Africa. Dalham, the Suffolk estate, was bequeathed to his family, with a characteristic direction against any 'loafers' inheriting it. Save for minor personal bequests his entire fortune, amounting to 6,000,000*l.*, was given to the public service. Part of this money was left for the purpose of founding some 160 scholarships at Oxford, of the value of 300*l.* each, to be held by two students from every state or territory of the United States of America, and three from each of eighteen British colonies. Fifteen other scholarships of the value of 250*l.* were reserved for German students to be selected by the Emperor William II. The total scholarship endowment was 51,750*l.* a year. In selecting the scholars his trustees were enjoined to consider not only the scholastic attainments of candidates but their athletic capacity and moral force. One hundred thousand pounds was left to his old college, Oriel, and his land near Bulawayo and Salisbury was left to provide a university for the people of Rhodesia. Rhodes appointed among others as trustees for the execution of his will Lord Rosebery, lately prime minister of England, Lord Milner, then high commissioner of South Africa, Dr. Jameson, prime minister of the Cape, Alfred Beit, and Earl Grey, presently governor-general of the Dominion of Canada. Rhodes's last will embodied all that was practicable

of the boyish ideals of his first will made at twenty-four. Its benefactions stirred people less than the revelation of his ideals; and those who had been foremost in detraction admitted the purity of his motives. The last word on behalf of the Dutch was spoken on 28 June 1910 by Lord De Villiers, chief justice of the supreme court of South Africa, who, unveiling a statue at Cape Town, erected by public subscription, pronounced Rhodes to be a patriotic Englishman, a friend to the Dutch, the forerunner of the Union of South Africa.

Rhodes's impetuosity and impatience in act and speech gave in his lifetime an impression of him which was misleading. Like all statesmen he accepted the conditions of life as he found them, having much to do and little time, as he knew from his malady, to do it in. By nature he had the shy sensitive kindness of a boy. But while his nameless benefactions were many, he affected brutality and hardness, making it his principle to subordinate friendships and all individual claims to his schemes. Yet he was not in truth a hard man. Except in finance, where he was out-distanced by Alfred Beit, his mere aptitudes were not remarkable; in conventional accomplishments he was not well equipped. He had few ideas, but these he had worked for, testing their value by his life's experience, and wore them, so to say, next his skin. The ideas and dexterities which most cultivated men of affairs have about them, as it were ready made, were not his. His temperament was unequal, almost incalculable, combining extreme naïveté and simplicity with strokes of amazing and unexpected shrewdness. His work in its entire detail seemed to be done by others. While he apparently dreamed they really and on their own initiative drafted letters, designed meetings and conjunctions, supported or opposed policies, and drew up as it were programmes, which in a little he roused himself to act upon. Yet there was no end to the qualities he held in reserve. He seemed to muse, yet was suddenly alert with the perception of clairvoyance, revealing a grasp of detail in subjects where he had been rashly supposed ignorant. He talked anyhow; yet his felicity of phrase after columns of confused commonplace was uncanny. The subordinates who did so much of his work, apparently without consulting him, were lost without him. He was there, and the rest followed; he was not there, and nothing

was done. In a word he was 'dæmonic,' and the impression of greatness which he made on his subordinates is reflected in the view now taken of him by his countrymen. His life, however rightly or wrongly conducted in detail, is seen to have been steadily devoted to impersonal and public service and a cause which was really the greater friendliness of mankind.

Rhodes was over six feet high, enormously broad and deep chested, with a fair complexion, deep blue eyes, and light brown waving hair, which grew white in his later years. In his blood there was a Norse strain, and he had the look of a viking. His head was huge and the brow massive, and was compared erroneously to Napoleon's. The likeness was imperial but recalled rather the Roman empire than the French. Rhodes is best represented in sculpture in the statue by John Tweed at Bulawayo (unveiled 7 July 1904). A bust by Henry Pegram, A.R.A., is at Grahamstown (7 Nov. 1904), a statue by the same sculptor at Cape Town (1909), and a colossal equestrian statue by William Hamo Thornycroft, R.A., at Kimberley (1907). On 5 July 1912 Earl Grey dedicated to the public an elaborate monument to Rhodes outside Cape Town on the Groote Schuur slopes of Table Mountain, consisting of a columned Doric portico approached by a long flight of steps lined on each side by four lions of the Egyptian type from the chisel of John McAllan Swan; at the foot of the steps is the statue of 'Physical Energy' by George Frederick Watts, who originally presented it to Lord Grey for erection at Groote Schuur. An unfinished painting by Watts was presented to the National Portrait Gallery by the executors of the artist in 1905. Another portrait by Sir Hubert von Herkomer is in the Kimberley Club; a replica belongs to Lord Rosebery. A third by A. Tennyson Cole is in Oriel College Common room. A fourth by Sir Luke Fildes was left unfinished. Of several miniatures painted of him, none is so good as a photograph taken by Messrs. Downey in 1893, before the fine contour of his face was blunted by disease.

[No 'standard' or adequate biography of Rhodes has yet appeared. Sir Thomas Fuller's Cecil Rhodes: a Monograph and a Reminiscence (1910) is the most considerable study of the man and his career, and is a balanced and informed appreciation. The Life by Sir Lewis Michell, Rhodes's banker and one of his trustees (2 vols. 1910), though painstaking, does not exhaust the authorities accessible, and is not authorised by the Rhodes trustees.]

Cecil Rhodes's Private Life, by his private secretary, Philip Jourdan (1911), written by one of several young colonists—a Dutchman in this case—who acted for Rhodes in that capacity, abounds in intimate personal observation. Cecil Rhodes, his Political Life and Speeches, by Vindex, i.e. the Rev. F. Verschoye (1900), is the chief account of Rhodes's public career yet published, consisting largely of his speeches from 1881 to 1900 with an explanatory thread of narrative. Cecil Rhodes, by Imperialist (1897), is a popular account of his career up to the Jameson Raid, and has a chapter by Sir Starr (then Dr.) Jameson. Cecil Rhodes, by Howard Hensman (2 vols. 1911), is of a fugitive and popular type. See also With Rhodes in Mashonaland, by D. C. De Waal (Cape Town, Juta, 1895); article on Rhodes in The Empire and the Century, London, 1905, by Edmund Garrett, the best short impression; Lord Milner and South Africa, by E. B. Iwan Müller (Heinemann, 1902), also written from personal observation; Sir Percival Lawrence's On Circuit in Kaffirland; Rights and Wrongs of the Transvaal War, by E. T. Cook (1902); Sir Charles Dilke's Problems of Greater Britain (1890); English and South African papers of 27 March 1902 and of 16 and 17 April 1902; address at the grave in the Matoppos by the bishop of Mashonaland, and the archbishop of Cape Town's sermon, Cape Town Cathedral, 30 March 1902; Scholz and Hornbeck's Oxford and the Rhodes Scholarships, 1907. This article is further based on personal knowledge and association and on private information from Rhodes's brothers and sisters, from Sir Starr Jameson, and many other of Rhodes's associates.] C. W. B.

RHODES, FRANCIS WILLIAM (1851–1905), colonel, elder brother of Cecil John Rhodes [see above], born on 9 April 1851 at Bishop Stortford, entered Eton in 1865, where he was in the army class and in the cricket elevens of 1869 and 1870. After passing through Sandhurst he was gazetted lieutenant of the 1st royal dragoons in April 1873. He saw service in the Sudan as a member of the staff in 1884, and was present at the battles of El Teb and Tamai. He was mentioned in despatches, received the medal with clasp and bronze star, and was promoted captain in Oct. 1884. He accompanied the Nile expedition in 1884–5 for the relief of Khartoum as aide-camp to Sir Herbert Stewart [q. v.], and distinguished himself at the battles of Abu Klea and El Gubat, where his horse was shot under him. He was mentioned in despatches, and received two clasps and the brevet of major and lieutenant-colonel (Sept. 1885). Stewart described Rhodes as the best A.D.C. a general could have.

He next served in the Sudan expedition of 1888, and was present at the action of Gemaiza (20 Dec.); he was again mentioned in despatches, and received the clasp and the order of the Medjidie (3rd class). He was made colonel in Sept. 1889. From 1890 to 1893 he was military secretary to his schoolfellow, Lord Harris, governor of Bombay; he received the D.S.O. in 1891, and in 1893 accompanied as chief of staff the mission of Sir Gerald Herbert Portal [q.v.] to Uganda. On this perilous journey Rhodes nearly succumbed to blackwater fever.

On his recovery he went out in 1894 to the South African territory of Rhodesia, which, through his brother Cecil's exertions, had just been placed under the control of the newly incorporated British South Africa Company. He was made military member of the council of four in the new government of Matabeleland, of which Dr. L. S. Jameson was first administrator (18 July 1894). In Dr. Jameson's absence in Europe he acted as administrator that year. Next year he went to Johannesburg as representative of the Consolidated Goldfields, of which his brother was a director. In Sept. 1895 he was at Ramoutsa negotiating on behalf of his brother for the cession of native territory close to the Transvaal border, which soon came under the jurisdiction of the British South Africa Company (SIR LEWIS MICHELL, *Life of Cecil Rhodes*, 1910, i. 197). As one of the members of the Johannesburg reform movement for the protection of the Uitlanders he was one of the five signatories of the undated letter (Nov. 1895) to Dr. Jameson which ostensibly led to the Jameson raid. On the failure of the raid, he was arrested by the Boer government, tried for high treason, and sentenced to death (April 1896). The sentence was soon commuted to fifteen years' imprisonment. After being in prison in Pretoria until June, Rhodes and his companions were released on payment of a fine of 25,000*l.* each and on promising to abstain from politics for fifteen years. This latter condition Rhodes alone of the ringleaders refused to accept, and he was banished from the Transvaal. For his encouragement of the Raid, Rhodes was placed on the army retired list. In July he joined his brother Cecil in the war in Matabeleland.

In 1898 he went with General Kitchener's Nile expedition as war correspondent to 'The Times,' and was wounded at the battle of Omdurman. For his services in that campaign his name was restored to the active list (Sept. 1898).

On the outbreak of the war in South Africa in 1899 Rhodes went thither and served in the early battles in Natal. He was besieged in Ladysmith, where by his optimism and geniality he helped to keep his companions in good spirits (L. S. AMERY, *The War in South Africa*, iii. 175). In the fight on Wagon Hill (5-6 Jan. 1900) Rhodes displayed great courage, and took Lord Ava, who was mortally wounded, out of fire into cover (*ibid.* iii. 194). In May following he was intelligence officer with the flying column under Brigadier-general Bryan Thomas Mahon, which hurried to the relief of Mafeking (4-17 May 1900) (*ibid.* iv. 222). For his services in the war he was created a military C.B. In Jan. 1903 he was Lord Kitchener's guest at the Durbar at Delhi. In the same year he retired from the army, and was till his death managing director of the African transcontinental telegraph company.

Rhodes had a great knowledge of the continent of Africa, and aided with his experience of the Sudan Mr. Winston Spencer Churchill in preparing his 'The River War' (1899; new edit., by Rhodes, 1902). He also contributed an introduction and photographs to 'From the Cape to the Zambesi' (1905), by G. T. Hutehinson, whom he accompanied in that year to the Zambesi. The strain of this journey brought on the fatal illness of which he died, unmarried, at his brother's residence, Groote Schuur, Capetown, on 21 Sept. 1905. His body was brought to England for interment at Dalham, Suffolk. A memorial tablet was placed by his friends in Eton College chapel in October 1906, and prizes for geography have been founded at Eton in his memory.

[The Times, 22 Sept. 1905; Broad Arrow, 23 Sept. 1905; Anglo-African Who's Who, 1905; Official Army List; Amery, *Hist. War in South Africa*, esp. i. 163 seq. (portrait); Sir Lewis Michell, *Life of Cecil J. Rhodes*, 1910; Eton School Lists.] W. B. O.

RICHMOND AND GORDON, sixth DUKE OF. [See GORDON-LENNOX, CHARLES HENRY (1818-1903), lord president of the council.]

RIDDELL, CHARLES JAMES BUCHANAN (1817-1903), major-general R.A., meteorologist, born at Lilliesleaf, Roxburghshire, on 19 Nov. 1817, was third son of Sir John Buchanan Riddell, ninth baronet, by his wife Frances, eldest daughter of Charles Marsham, first earl of Romney. With the exception of a year at Eton, Riddell was educated at private

schools. In 1832 he entered the Royal Military Academy, Woolwich, passing thence (1834) into the royal artillery as second lieutenant. The following year he was transferred to Quebec, receiving promotion as first lieutenant in 1837, after which he returned to England, and was ordered to Jamaica, being however invalided back a year later.

In 1839 Riddell became identified with scientific research. The Royal Society and the British Association were deeply interested in the prosecution of inquiries in terrestrial magnetism and in meteorology, and it was decided to establish stations in certain colonies for the advancement of these objects. Riddell was selected for the post of superintendent of a magnetical and meteorological observatory at Toronto, subject to the instructions of the ordnance department and under Major (afterwards General Sir Edward) Sabine, R.A. [q.v.]. At the end of a year Riddell was invalided home, but he had done excellent service. Soon after, at Sabine's instance, he was appointed assistant superintendent of Ordnance Magnetic Observatories at the Royal Military Repository, Woolwich. During his four years' tenure of this post he assisted Sabine in the reduction of magnetic data and the issue of results of observations made by the directors of the affiliated observatories (see *Toronto Observations*, vol. i. Introduction; and *Rept. Brit. Assoc.* 1841, p. 340, and p. 26, 'Sectional Transactions'). He was elected a fellow of the Royal Society on 13 Jan. 1842.

In 1844 the admiralty published Riddell's 'Magnetical Instructions for the Use of Portable Instruments adapted for Magnetical Surveys and Portable Observatories, and for the Use of a Set of Small Instruments for a Fixed Magnetic Observatory.'

Subsequently he was placed on the staff at Woolwich. During the Crimean war he was deputy assistant quartermaster-general, and of him General Palliser reported that 'To his untiring energy throughout the late war the successful embarkation of the artillery without casualty and the provision of all the necessary supplies are to be mainly attributed.' Riddell served in the Indian Mutiny in 1857-8, commanding the siege artillery of Outram's force at the siege and capture of Lucknow, and the artillery of Lugard's column at the engagement of the Tigree; he was three times mentioned in despatches, was made a C.B., and received the medal with clasps. He retired in 1866 with the rank of major-general. Afterwards he lived quietly at Chudleigh, Devon-

shire. There he owned a farm, which he managed, and also engaged in parochial and educational work. He died at his home, Oaklands, Chudleigh, on 25 Jan. 1903, and was buried at Chudleigh. He married on 11 Feb. 1847 Mary (d. 1900), daughter of Sir Hew Dalrymple Ross [q.v.], and had issue one daughter.

[*Proc. Roy. Soc.* lxxv.; *Nature*, 5 March 1903; *The Times*, 26 Jan. 1903; *Burke's Baronetage*.] T. E. J.

RIDDELL, MRS. CHARLOTTE ELIZA LAWSON, known as MRS. J. H. RIDDELL (1832-1906), novelist, born on 30 Sept. 1832 at the Barn, Carrickfergus, co. Antrim, was the youngest daughter of James Cowan of Carrickfergus, by his wife Ellen Kilshaw. After her father's death Charlotte lived with her mother at Dundonald, co. Down, the scene of her novel 'Berna Boyle' (1884), and then came to London. Her mother died in 1856, and in 1857 Miss Cowan married J. H. Riddell, a civil engineer, of Winson Green House, Staffordshire. Her husband soon lost his money, and Mrs. Riddell began to write for a livelihood.

Her first novel, 'The Moors and the Fens,' appeared in 1858 (3 vols.; 2nd edit. 1866). She issued it under the pseudonym of F. G. Trafford, which she only abandoned for her own name in 1864. Novels and tales followed in quick succession, and between 1858 and 1902 she issued thirty volumes. The most notable is perhaps 'George Geith of Fen Court, by F. G. Trafford' (1864; other editions 1865, 1886), for which Tinsley paid her 800*l.* It was dramatised in 1883 by Wybert Reeve, was produced at Scarborough, and was afterwards played in Australia. From 1867 Mrs. Riddell was co-proprietor and editor of the 'St. James's Magazine,' which had been started in 1861 under Mrs. S. C. Hall [q.v.]. She also edited a magazine called 'Home' in the sixties, and wrote short tales for the Society for the Promotion of Christian Knowledge and Routledge's Christmas annuals. Her short stories were less successful than her novels.

Her husband died in 1880. Despite harass and misfortune her twenty-three years of married life were happy. After 1886 she lived in seclusion at Upper Halliford, Middlesex. She was the first pensioner of the Society of Authors, receiving a pension of 60*l.* a year in May 1901. She died at Hounslow on 24 Sept. 1906. There were no children of the marriage.

Mrs. Riddell, by making commerce the theme of many of her novels, introduced a

new element into English fiction, although Balzac had naturalised it in the French novel. She was intimately acquainted with the topography of the City of London, where the scenes of her novels were often laid. At the same time she possessed a rare power of describing places of which she had no first-hand knowledge. When she wrote 'The Moors and the Fens' she had never seen the district.

[The Times, 26 Sept. 1906; Helen C. Black, Notable Women Authors of the Day, 1893; W. Tinsley, Random Recollections of an Old Publisher, 1900, i. 93-6; Brit. Mus. Cat.]

E. L.

RIDDING, GEORGE (1828-1904), headmaster of Winchester and first bishop of Southwell, was born on 16 March 1828 in Winchester College, of which his father, Charles Henry Ridding (afterwards vicar of Andover), was then second master. His mother (*d.* 1832) was Charlotte Stonhouse, daughter of Timothy Stonhouse-Vigor, archdeacon of Gloucester, and grand-daughter of Sir James Stonhouse, eleventh baronet [q. v.]. Isaac Huntingford [q. v.], bishop of Gloucester and Hereford and warden of Winchester, was great-great-uncle and godfather. Ridding was a scholar of Winchester (1840-6), rising to be head of the school, while his three brothers won equal distinction as cricketers. In default of a vacancy at New College, he matriculated as a commoner at Balliol, where he rowed in the college boat and gained the Craven scholarship, a first class in classics and a second in mathematics, and a mathematical fellowship at Exeter College (all in 1851); he won the Latin essay and proceeded M.A. in 1853; and took the degree of D.D. in 1869. From 1853 to 1863 he was tutor of Exeter (of which college he was made an honorary fellow in 1890); there he took a considerable part on the liberal side in college and university politics.

On 14 Jan. 1863 Ridding was elected second master of Winchester; and on 27 Sept. 1866, when Dr. George Moberly [q. v.] resigned the headmastership, he was at once elected to succeed him. The time was ripe for reforms, educational and material, and Ridding was a wise and courageous reformer. Carrying on the policy initiated by Moberly, he established six additional boarding-houses, and transferred thither the 'commoners' (boys not on the foundation), who had hitherto been housed in an unsightly and insanitary block of buildings, which Ridding converted into much-needed class-rooms and a school library. Land was bought,

drained, levelled, and presented to the school as additional playing-fields, since called Ridding Field. A racquet court, three fives courts, and a botanical garden were likewise given to the school. A new bathing-place and a gymnasium were provided. Wykeham's chapel was re-seated and rearranged, with results which though artistically unfortunate, were held to be good for discipline; and 'Chantry,' a beautiful fifteenth-century building in the centre of the cloisters, was converted into a chapel for the smaller boys. The funds for carrying out his reforms were provided by Ridding out of his own salary and private property, to an extent estimated at 20,000*l.*, of which about half was eventually repaid to him. Educationally Ridding was a pioneer in the expansion of the curriculum of public schools. He was one of the founders of the headmasters' conference in 1870, and of the Oxford and Cambridge schools examination board in 1873; but he did not wait for the collaboration of other headmasters to carry out the reforms which he saw to be desirable. He more than doubled the staff of assistant masters. He greatly enlarged the scope of the mathematical teaching; he practically introduced the teaching of history, modern languages, and natural science, and made them, especially the first-named, vital elements in the education of the school. No separate 'modern side' was established; but opportunities were given in the upper part of the school for the development of special individual capacity. Ridding was himself a fine classical scholar and a stimulating teacher, and by a system of periodical inspection he kept the whole teaching of the school under his own eye. He had the gift of commanding both the respect and the affection of his pupils, and the perhaps rarer gift of carrying with him in a course of drastic reforms the co-operation and devotion of his assistant masters. His reforms were often viewed with disfavour by the fellows, who before 1871 constituted the governing body of the college, and were strenuously criticised by Wykehamists in general; but Ridding won his way, and the results justified him. The school rose in numbers from about 250 to over 400, and might have been much further enlarged but for Ridding's conviction that a school should not exceed the number with which a headmaster can keep in personal touch. The record of university successes was excellent; after his resignation he was entertained at

dinner by sixteen fellows of Oxford colleges who were the product of the last eight years of his rule at Winchester. In 1872 occurred the 'tunding row,' arising out of a somewhat excessive punishment of a stalwart 'inferior' by a prefect. The incident was trivial, but the victim's father appealed to 'The Times,' and an animated, though in general ill-informed, correspondence followed (*The Times*, Nov. and Dec. 1872). Two members of the governing body resigned; but neither Winchester nor the prefectorial system was affected by it. A further valuable extension of the activities of the school was the foundation, after the example of Uppingham, of a School Mission, first in 1876 at Bromley in East London, and subsequently in 1882 at Landport in Portsmouth, where the mission came into more intimate connection with the life of the school.

In 1883 Ridding refused the offer of the deanery of Exeter (while at Oxford he had refused a colonial bishopric); but in 1884 he was appointed the first bishop of Southwell, and consecrated on 1 May. Southwell was a new diocese, formed by separating the counties of Derby and Nottingham from the dioceses of Lichfield and Lincoln respectively. The cathedral town was so inaccessible that Ridding firmly declined to live in it, and rented Thurgarton Priory as his residence in place of the ruined episcopal palace. In population the diocese was the fifth in England, but it had no chapter, no diocesan funds, no common organisation; the two counties had diverse traditions, and much of the patronage remained in the hands of external bishops and chapters. Ridding's work was to bring unity and a corporate spirit out of diversity and jealousy, to create all kinds of diocesan organisations, to raise the intellectual standard of the clergy, and to stimulate spiritual life in neglected districts. As at Winchester, he was not understood at first, and encountered some opposition; but his sincerity, genuineness, and liberality (the whole of his official income was spent on the diocese) ultimately gained the affection and loyalty of both clergy and laity. He was emphatic in upholding the national church, and very definite in his advocacy of church principles. His independence and originality of thought made him a valued adviser of two successive archbishops; with Temple in particular he was united by cordial friendship, based on considerable resemblances of character. This same independence, on the other hand, often separated him from the main parties

of church thought. During the controversy of 1902 on religious education, he was not in accord with either the government or the opposition of the day, but strenuously advocated a universal system of state schools, accompanied by universal liberty of religious teaching.

With the exception of a long holiday (necessitated by overwork) in Egypt and Greece from December 1888 to April 1889, his work in his diocese was unbroken. In 1891 he refused translation to Lichfield. In 1893 occurred the great strike in the coal trade, lasting four months (July–Nov.), during which his efforts to restore peace were unceasing. In 1897 he presided at the Nottingham Church Congress. In 1902 repeated attacks of rheumatism and sciatica began to tell upon his health. In July 1904 he tendered his resignation; but before it had taken effect an acute crisis supervened, and on 30 Aug. he died at Thurgarton. He was buried just outside Southwell minster. Ridding was twice married: (1) on 20 July 1858 to Mary Louisa, third child of Dr. George Moberly [q. v.], then headmaster of Winchester; she died on the first anniversary of their marriage; and (2) on 26 Oct. 1876 to Laura Elizabeth, eldest daughter of Roundell Palmer, first earl of Selborne [q. v.].

Ridding published one volume of sermons, 'The Revel and the Battle' (1897); and after his death his 'Litany of Remembrance' (1905) and his visitation charges, 'The Church and Commonwealth' (1906), 'Church and State' (1912), were edited by his wife. His style, whether in writing or in speaking, was peculiar: full of thought, tersely and trenchantly expressed, but often difficult to follow from lack of connecting links and phrases. Nevertheless it was stimulating from its vigour and obvious sincerity, as well as from the unexpectedness which was a characteristic quality also of his teaching and conversation. His administrative powers are best shown by the results: as headmaster he earned the title (conferred on him by the conservative warden of New College, Dr. Sewell) of 'second founder of Winchester,' and as bishop he was the founder and organiser of the diocese of Southwell.

Ridding's portrait, painted by W. W. Oules, R.A., in 1879, as a wedding gift from old Wykehamists, hangs in Moberly Library, Winchester; it was engraved by Paul Rajon. Another portrait by H. Harris Brown in 1896 belongs to Lady Laura Ridding. A full-length memorial brass by T. B. Carter

was placed in Winchester College chapel by the warden and fellows in 1907; and a fine bronze statue, kneeling, by F. W. Pomeroy, A.R.A., was presented to Southwell Cathedral by the diocese and friends. There are engravings from photographs in 1897 and 1904. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1901.

[George Ridding, Schoolmaster and Bishop, by his wife, Lady Laura Ridding, with bibliography, 1908; Miss C. A. E. Moberly, *Dulce Domum*, 1911; articles in the *Church Quarterly Rev.*, July 1905, and *Cornhill Mag.*, Dec. 1904; personal knowledge.] F. G. K.

RIDLEY, SIR MATTHEW WHITE, fifth baronet and first **VISCOUNT RIDLEY** (1842-1904), home secretary, born at Carlton House Terrace, London, on 25 July 1842, was elder son in a family of two sons and one daughter of Sir Matthew White Ridley, fourth baronet, of Blagdon, Northumberland (1807-1877), M.P. for North Northumberland. His mother was Cecilia Anne, eldest daughter of Sir James Parke, Baron Wensleydale [q. v.]. Edward, the younger brother (b. Aug. 1843), became a judge of the high court in 1897. The Ridleys were an old Border family, originally of Willimoteswick and Hardriding. On 18 Nov. 1742 Matthew Ridley of Heaton married Elizabeth, daughter of Matthew White, who had purchased of the Fenwicks the estate of Blagdon, and owned much other landed property. Her brother Matthew was created a baronet in 1756 with special remainder in the absence of issue of his own to his sister's son, Matthew White Ridley. The latter in 1763 succeeded as second baronet, and inherited Blagdon and other of Matthew White's estates.

Ridley was at Harrow from 1856 to 1861. There he was in the football and shooting elevens, and became captain of the school in 1860. In the same year he gained a classical scholarship at Balliol College, Oxford, and matriculated on 12 Oct. 1861. Taking a first class in classical moderations in 1863 and in the final classical school in 1865, he in the latter year graduated B.A., and was elected a fellow of All Souls, proceeding M.A. in 1867. He vacated his fellowship in 1874, after his marriage.

Destined for a political career, Ridley in 1868 succeeded his father in the conservative interest as member of parliament for North Northumberland; his colleague was Lord Percy, afterwards seventh duke of Northumberland; they were returned unopposed. In 1874 they were again returned

without a contest. On his father's death on 21 Sept. 1877 he succeeded as fifth baronet and owner of the family estates. Next year under Lord Beaconsfield's administration he received his first official recognition, becoming under-secretary to the home office. At the general election of 1880 he was returned for the third time with Lord Percy, but now after a contest with a liberal opponent. The conservative government was defeated at the polls and went out of office. Ridley remained a private member until the summer of 1885, when in Lord Salisbury's first short administration he was made in September financial secretary to the treasury, retiring with his colleagues in Jan. 1886. Meanwhile the Redistribution Act of 1885 changed the Northumberland constituencies, and at the general election in Nov. 1885 Ridley stood for the Hexham division, where he was beaten by Miles MacInnes. At the next general election of July 1886 he stood for Newcastle-on-Tyne with Sir William Armstrong, but both seats were won by the liberal candidates, Mr. John Morley and James Craig. In the following August a bye-election at Blackpool gave Ridley an opportunity of returning to parliament, and he retained the seat until he was raised to the peerage in 1900. Lord Salisbury's second administration had been formed in the previous July. Ridley remained a private member until 1895. He was, however, created a privy councillor on the resignation of the conservative government in 1892.

Although Ridley took little part in the debates of the house, he won its respect, and early in 1895, when Arthur Wellesley (Viscount) Peel retired, was put forward on 10 April as the conservative candidate for the speakership, being proposed by Sir John Mowbray and seconded by John Lloyd Wharton, in opposition to the liberal candidate, William Court Gully (afterwards Viscount Selby [q. v. Suppl. II]). On a division Gully was elected by 285 votes against 274 for Ridley. It was asserted at the time that in the event of a change of government after the approaching general election, Sir Matthew would at once be placed in the chair. But when Lord Salisbury returned to office on 25 June, Gully was not disturbed, and Sir Matthew became home secretary in the new government. This post he filled until the dissolution of 1900.

Ridley's administration of the home office was thoroughly safe and consequently attracted little attention. In 1897, when he released from prison some men convicted of dynamite outrages, he defended himself

with effect against an attack from his own side, led by Mr. (later Sir) Henry Howorth and James Lowther [q. v. Suppl. II], but he was not otherwise molested. When the government was reconstituted after the general election (Sept. 1900) Sir Matthew, who was left a widower a year earlier, retired from political life. His last years were mainly spent at Blagdon.

Ridley was always active in the administration of his property. Throughout the north of England, where his influence was great, he was known as an extremely capable man of business. He was long a director of the North Eastern railway, and on the resignation of Sir Joseph Pease in 1902 he became chairman. He especially devoted himself to the development of the town of Blyth, which, originally part of the estates of the Radcliffe family forfeited to the Crown after the rising of 1715, had descended to Ridley with the other estates of Matthew White. In the eighteenth century it was an important place of export for coal, and from 1854 was under the control of the Blyth Harbour and Dock Company; but owing to shallowness of entrance and increase in the size of ships, trade fell off, and in 1883 amounted to only 150,000 tons. Ridley, after succeeding to the baronetcy, carried a bill through parliament for the creation of a board of commissioners with powers to develop the place. As chairman of this board Ridley soon transformed the harbour and dock. Trade returned, and ultimately reached a yearly average output of four million tons of coal. As principal proprietor Ridley benefited largely, but he contrived that the inhabitants should share in the prosperity. He gave an open space for public recreation, which in the year of his death he opened as the Ridley Park. He had already given sites, either as a free gift or at a nominal rent, for a mechanics' institute, a church, and a hospital, and he was occupied until the end on a large scheme of planting trees in convenient places. Ridley was chairman of the Northumberland quarter sessions from 1873, and of the county council from 1889; but he resigned both offices in 1895, when he became home secretary. He was also president of the National Union of Conservative Associations, and was president of the Royal Agricultural Society in 1888, when the meeting was at Nottingham; he joined the society in 1869. He was D.L. and J.P. for Northumberland, Provincial Grand Master of Freemasons for Northumberland from 1885, and he commanded the

Northumberland yeomanry from 1886 to 1895.

Ridley died at Blagdon on 28 Nov. 1904, and was buried there. He married on 10 Dec. 1873 Mary Georgiana, eldest daughter of Dudley Coutts Marjoribanks, first Lord Tweedmouth; she died on 14 March 1899, leaving two sons and two daughters. Ridley was succeeded as viscount by his elder son, Matthew (b. 1874), conservative M.P. for Stalybridge from 1900 to 1904.

A portrait of Ridley by Sir Hubert von Herkomer is at Blagdon. A cartoon by 'Ape' appeared in 'Vanity Fair' in 1881.

[The Times, and Daily Chronicle, 29 Nov. 1904; Foster's Alumni Oxon.; private information.] R. L.

RIEU, CHARLES PIERRE HENRI (1820-1902), orientalist, born at Geneva on 8 June 1820, was son of Jean Louis Rieu, first syndic of Geneva, whose memoirs he edited (Geneva, 1870). His mother was Marie Lasserre. On leaving school Charles entered the Académie de Genève in Nov. 1835, where he went through courses both in philosophy and science. At Geneva he first took up Oriental languages and became the pupil of Jean Humbert, who had studied under the French orientalist Sylvestre de Sacy. In 1840 Rieu proceeded to the university of Bonn, where he was inscribed in the philosophical faculty (30 Oct.). There he read Sanskrit with Lassen, and Arabic with Freytag and Gildemeister, and at the same time he acquired a thorough mastery of German. In 1843, on completing his studies, he received the degree of Ph.D. and published his thesis entitled 'De Abul-Alâ poetæ arabici vita et carminibus secundum codices Leidanos et Parisiensem commentatio' (Bonn, 1843). After a visit to Paris, where he was elected a member of the Société Asiatique on 8 Nov. 1844, he removed to St. Petersburg, and there in conjunction with Otto Bochtlingk he edited with German notes the text of 'Hemakandra's Abhidhānakintāmani' or Sanskrit dictionary (St. Petersburg, 1847). While engaged on this work he visited Oxford for the purpose of transcribing the unique manuscript in the Bodleian library.

In 1847 Rieu settled in London, and thanks to his eminent qualifications as an Arabic and Sanskrit scholar he secured the post of assistant at the British Museum in the department of Oriental manuscripts. Henceforth he was engaged on the important task of cataloguing the museum collections. In 1867 he became first holder of the office

of keeper of Oriental manuscripts, and in 1871 he completed the second part of the 'Catalogus codicum manuscriptorum orientaliū,' of which the first portion had been published by William Cureton [q. v.] in 1846. Besides Arabic and Sanskrit, Rieu had an extensive knowledge of Persian and Turkish. At the British Museum he drew up the 'Catalogue of Persian Manuscripts' (4 vols. 1879-95) and the 'Catalogue of Turkish Manuscripts' (1888). These volumes constitute an invaluable storehouse of information concerning Mohammedan literary history, and show a high degree of critical scholarship.

Rieu, who was for many years professor of Arabic and Persian at University College, London, received a congratulatory address from the University of Bonn on the jubilee of his doctorate (6 Sept. 1893). In 1894, despite his advanced age, he was elected Adams professor of Arabic in the University of Cambridge in succession to William Robertson Smith [q. v.]. Of a gentle and retiring disposition, he resigned his post at the British Museum in 1895, and died at 28 Woburn Square, London, on 19 March 1902. He married in 1871 Agnes, daughter of Julius Heinrich Nisgen, by whom he had issue five sons and two daughters. A portrait (c. 1887) by his son, Charles Rieu, is in the possession of his widow.

[The Times, 21 March 1902; Athenæum, 29 March 1902; Journal of the Royal Asiatic Society, July 1902, obit. notice by Prof. E. G. Browne; congratulatory address from Bonn University in Brit. Mus., 1893; private information from Mrs. Rieu.] G. S. W.

RIGBY, SIR JOHN (1834-1903), judge, born at Runcorn, Cheshire, on 4 Jan. 1834, was second son of Thomas Rigby of that place by his wife Elizabeth, daughter of Joseph Kendall of Liverpool. He received his early education at the institution which afterwards became Liverpool College, and matriculating at Trinity College, Cambridge, in Michaelmas term 1852, he was elected to an open scholarship there in 1854. In 1856 he graduated as second wrangler and second Smith's prizeman, taking a second class in the classical tripos. He became fellow of his college in the same year, and proceeded M.A. in 1859. He entered as a student at Lincoln's Inn on 17 Oct. 1855, and was called to the bar on 26 Jan. 1860. Starting as 'devil' in the chambers of Richard Baggallay, Q.C. [q. v. Suppl. I.], one of the leaders of the chancery bar, he rapidly acquired a large practice

both in chambers and in court, and in 1875 Baggallay, who was then attorney-general, made him junior equity counsel to the treasury, a post which is held to confer the reversion of a judgeship. Rigby, however, was not content to wait; he took silk in 1880 and attached himself to the court of Mr. Justice Kay [q. v. Suppl. I.], where he obtained a complete ascendancy both over his rivals and over the judge himself. Within a very few years he was in a position to confine his main practice to the court of appeal, the House of Lords, and the privy council, only going before the judges at first instance with a special fee. The rivals with whom he divided the work were Horace (afterwards Baron) Davey [q. v. Suppl. II.], Edward (afterwards Lord) Macnaghten, and Montague Cookson (afterwards Crackanthorpe). In May 1884 he was made a bencher of his inn.

In December 1885 he entered parliament as the liberal member for the Wisbech division of Cambridgeshire, and in the split which arose out of the introduction of the home rule bill of 1886 he followed Gladstone, and made a powerful speech in support of the second reading (28 May 1886). At the general election of that year he lost his seat, and did not return to the House of Commons until July 1892, when he was elected for Forfarshire. So little had his fame penetrated beyond legal circles, that he was denounced in his new constituency as an English carpet-bagger on the look-out for a county court judgeship. He was appointed solicitor-general by Gladstone on 20 Aug. 1892, receiving the honour of knighthood, and on 3 May 1894 he became attorney-general in succession to Sir Charles (afterwards Lord) Russell (of Killowen); a few weeks later he took the place in the court of appeal vacated by his old rival Sir Horace Davey, then appointed to be a lord of appeal, and was admitted to the privy council.

Rigby owed his success at the bar to a complete mastery of the science of equity, to his ingenuity and pertinacity, and to his impressive and rugged personality. 'He had a natural gift for rhetoric,' says a writer in 'The Times,' 'in which his fervid utterance seemed to contend with an almost pedantic desire to measure his words and give weight to every syllable.' He had a rare faculty of being at his best in a bad case, and of never losing confidence either in the integrity of his client or in his ultimate success with the court. During his short term as law officer he gave invaluable assistance to Sir William Harcourt

over the intricate details of the Finance Act of 1893. He was not so successful in his discharge of general parliamentary business. His unconventional ways, apparent lack of humour, and somewhat uncouth exterior at first provoked the ridicule of opponents. But the popularity which he enjoyed at the bar was ultimately assured him in the house. As solicitor-general he conducted at the central criminal court without success the prosecution of the directors of the Hansard Union. Rigby, who was entirely without experience of this branch of his profession, betrayed a bewilderment which was almost pathetic. The case, which lasted for twenty-four days, terminated on 26 April 1893 in the acquittal of all the defendants.

On the bench he did not altogether justify the high expectations that had been formed of him. He displayed his accustomed skill and ingenuity in the unravelling of complicated and contradictory statutes; he showed characteristic independence and individuality in coming to a conclusion, and his dissentient judgments were from time to time upheld by the House of Lords in preference to those of his colleagues. But his intellect, which was massive rather than flexible, failed to adapt itself to new demands. He resigned in October 1901, after showing signs of failing powers, the effect, as was believed, of a severe fall a year or two previously. He died on 26 July 1903 at Carlyle House, Chelsea, and was buried at Finchley. He was unmarried.

An oil painting by A. T. Nowell is in the possession of his family; cartoon portraits, by 'Stuff' and 'Spy' respectively, appeared in 'Vanity Fair' of 1893 and 1901.

[The Times, 27 July 1903; private information.] J. B. A.

RIGG, JAMES HARRISON (1821-1909), Wesleyan divine, born at Newcastle-on-Tyne on 16 Jan. 1821, was son of John Rigg, a methodist minister there, by his second wife Anne, daughter of James McMullen, Irish methodist missionary at Gibraltar. Brought up in straitened circumstances, the boy was for five years (1830-5) a pupil and for four years (1835-9) a junior teacher at the Kingswood school for preachers' sons near Bristol. In 1839 he became assistant in the Rev. Mr. Firth's Academy, Hartstead Moor, near Leeds, and having made an unsuccessful effort to conduct a school of his own at Islington, London, he became in 1843 classical and mathematical master at John Conquest's school at Biggleswade. In July 1845 he

entered the methodist ministry as probationer, and being ordained on 1 Aug. 1849, served in successive circuits at Worcester, Guernsey, Brentford, Stockport, Manchester, Folkestone, and Tottenham.

From an early date Rigg read widely and wrote much on religious and theological themes. A vigorous and clear style gave his writings influence in his denomination. He was a chief contributor to the 'Biblical Review' (1846-9), and frequently wrote in the Wesleyan newspaper, the 'Watchman.' Contributing to the first number of the 'London Quarterly Review,' a Wesleyan methodist periodical, in September 1853, he soon joined its editorial staff (1868), was co-editor with Dr. William Burt Pope [q. v. Suppl. II] (1883-6), and ultimately sole editor (1886-98). Rigg explained his theological position in three suggestive volumes: 'Principles of Wesleyan Methodism' (1850; 2nd edit. 1851), 'Wesleyan Methodism and Congregationalism contrasted' (1852), and 'Modern Anglican Theology' (1857; 3rd edit. 1880). In the last, which showed a keen interest in the historical development of the Church of England, he ably criticised the broad-church teaching of Maurice, Kingsley, and Jowett, but his differences with Kingsley were so considerably expressed that Kingsley sought his acquaintance, and Rigg stayed with him at Eversley (cf. Mrs. KINGSLEY'S *Life of Kingsley*, ii. 317-8). In 1866 he republished many periodical articles as 'Essays for the Times on Ecclesiastical and Social Subjects,' and in 1869 he issued 'Churchmanship of John Wesley' (new edit. 1879). His literary work was early valued in America. He acted as English correspondent of the 'New Orleans Christian Advocate' (1851) and of the 'New York Christian Advocate' (1857-76). In 1865 he received the degree of D.D. from Dickinson College, U.S.A.

In 1868 Rigg was appointed principal of the Westminster (Wesleyan) training college for day school teachers, and he held that post till 1903. In matters of education he acquired an expert knowledge and was an active controversialist. When the first elementary education act was passed in 1870, Rigg took the traditional Wesleyan view, opposing secularism and favouring denominational schools, although without sympathy for sectarian exclusiveness. From William Arthur [q. v. Suppl. II] and Hugh Price Hughes [q. v. Suppl. II], both of whom supported the transfer of Wesleyan schools to the school board as created in 1870, he differed profoundly. He pressed his views,

in correspondence, on the attention of Gladstone and W. E. Forster, and the Wesleyan conference supported him. In 1870 he was elected a member for Westminster on the first London school board, and served in that capacity till 1876. With the help of Professor Huxley and W. H. Smith, M.P., he secured the provision of a syllabus of religious instruction. In 1873 he summarised his attitude in 'National Education in its Social Conditions and Aspects.' Subsequently he was a member of the royal commission on elementary education (1886-8), over which Sir Richard Cross presided and which reported in favour of the school board management as against the voluntary system.

In the general administration of Wesleyan affairs Rigg was recognised to be a statesmanlike leader of liberal-conservative temper. Elected chairman of the Kent district in 1865, he was made a member of the legal hundred in 1866. In 1878 he was elected president of the Wesleyan conference, and the unusual distinction was paid him of re-election in 1892. From 1877 until 1896, with two brief intervals, he was chairman of the second London district, and from 1881 to 1909 he was treasurer of the Wesleyan Missionary Society. In controversies concerning the internal organisation of the Wesleyan church Rigg took a middle course. He met the demand of the 'progressive' section under Hugh Price Hughes for an enlarged participation of the laity in the work of the conference, by proposing and carrying the 'Sandwich Compromise' in 1890, which 'sandwiched' a representative lay session between the two sittings of the pastoral session. The compromise lasted till 1901, when the liberal section prevailed and conference was opened by ministers and laymen together, though the pastoral session still retained the privilege of electing the president. Rigg's proposal of 1894, in which Hughes supported him (*Methodist Times*, 8 Feb. 1894), to exempt chairmen of districts from circuit duties and leave them free to exercise supervision over the district, was rejected by the conference from a suspicion that Rigg's 'separated chairmen' had a colour of episcopacy. Rigg's own position in the matter was defined in his 'Comparative View of Church Organisation, Primitive and Protestant' (1887; 3rd edit. 1896). With Hughes and the progressive party Rigg's relations were often strained. Writing privately to Cardinal Manning, a colleague on the education commission, on the education question,

17 Dec. 1888, he described Hughes as 'your intemperate temperance coadjutor, our methodist firebrand.' The unauthorised publication of the letter in Purcell's 'Life' of the cardinal (1895) led to reprisals by Hughes, who wrote in the 'Methodist Times' an article on 'The Self-Revelation of Dr. Rigg.' At Rigg's request the letter was withdrawn from later editions of Purcell's book, and Hughes and he were reconciled.

Rigg, whose somewhat rough manner caused even friendly admirers to liken him to Dr. Johnson, never abated his literary energies amid his varied activities. For many years he was a member of the committee of the London Library. The chief publications of his later life were: 'The Living Wesley' (1875; re-issued as 'The Centennial Life of Wesley' in 1891); 'Discourses and Addresses on Religion and Philosophy' (1880); 'Character and Life-work of Dr. Pusey' (1893); and 'Oxford High Anglicanism and its Chief Leaders' (1895; 2nd edit. 1899), an interesting study and the only attempt made by a nonconformist to write a history of the Oxford movement. Rigg was a severe critic of Newman. There followed 'Reminiscences sixty Years ago' (1904), and 'Jabez Bunting, a short Biography' (1905). Rigg also wrote the article on 'Methodism' in the 'Encyclopædia Britannica' (9th edit.). He died on 17 April 1909, at 79 Brixton Hill, where he had lived since 1889, and was buried in Norwood cemetery.

He married, on 17 June 1851, Caroline, daughter of John Smith, alderman of Worcester. She died on 17 Dec. 1889, leaving two daughters and a son. The elder daughter, Caroline Edith, is head-mistress of the Mary Datchelor School and Training College, Camberwell; and the son, James McMullen, barrister-at-law, has contributed many articles to this Dictionary.

A marble medallion portrait by Adams-Acton is in possession of his daughter, Mrs. Telford, and a marble bust by the same sculptor, exhibited at the Royal Academy in 1892, is in Westminster Training College.

[J. H. Rigg: Life by John Telford (his son-in-law), 1909; Miss Hughes's Life of Hugh Price Hughes, 1904; Purcell's Life of Cardinal Manning, 1895; Men and Women of the Time, 1899; Report of Royal Commission on Education, 1888.] C. H. I.

RINGER, SYDNEY (1835-1910), physician, born at Norwich in 1835, was second son of John M. Ringer, a Norwich tradesman, who died when his children were very young, by his wife Harriet. His two

brothers became successful merchants in the East. Ringer, whose simple and retiring disposition always bore the impress of severely nonconformist training in youth, began his medical education as an apprentice in Norwich, and soon after entered the medical faculty of University College in 1854, graduating M.B. London in 1860 and M.D. in 1863. He became M.R.C.P. in 1863 and in 1870 F.R.C.P. After being resident medical officer for two years (1861-2) he was appointed assistant physician to University College Hospital in 1863, physician in 1865, and consulting physician in 1900. From 1864 to 1869 he was assistant physician to the Hospital for Sick Children. At University College he was successively professor of materia medica, pharmacology, and therapeutics (1862-78), professor of the principles and practice of medicine (1878-87), and Holme professor of clinical medicine (1887-1900).

Ringer was pre-eminent in two fields of work, namely clinical medicine and physiological research; at the outset of his career he confined his energies to medicine, but when his position as a physician was established his interest in physiological problems awakened, and for thirty years he worked incessantly at them both. He was an admirable clinical teacher and physician, but was more widely known as the author of 'A Handbook of Therapeutics' (1869), which reached its 13th edition in 1897. His experimental work covered a large area, some of the most important researches being into the influence of organic salts, especially calcium, on the circulation and beat of the heart; 'Ringer's solution' is widely known in connection with experiments on animals' hearts. He was also author of 'The Temperature of the Body as a Means of Diagnosis of Phthisis, Measles, and Tuberculosis' (1865; 2nd edit. 1873), of articles on parotitis, measles, and sudamina in Reynolds's 'System of Medicine' (vol. i. 1886), and of numerous papers in the 'Journal of Physiology.'

He was elected F.R.S. in 1885, and was an honorary member of the New York Medical Society and a corresponding member of the Academy of Medicine of Paris. He died of apoplexy on 14 Oct. 1910 at Lastingham, Yorkshire, and was buried there. He married Ann, daughter of Henry Darley of Aldby Park near York, and had issue two daughters.

[Brit. Med. Journ. 1910, ii. 1384; Proc. Roy. Soc. 84 A; private information.] H. D. R.

RIPON, first MARQUIS OF. [See ROBINSON, GEORGE FREDERICK SAMUEL (1827-1909), statesman.]

RISLEY, SIR HERBERT HOPE (1851-1911), Indian civil servant and anthropologist, was born on 4 Jan. 1851 at Akeley, Buckinghamshire, where his father, John Risley, was rector. His mother was Frances, daughter of John Hope, at one time residency surgeon of Gwalior. The Risley family for centuries held a high position in the county and in Oxfordshire. On 13 July 1863 he was elected in open competition a scholar of Winchester, a privilege which his ancestors had for many generations enjoyed by the mere right of founder's kin. He won there the Goddard scholarship and the Queen's gold medal, and on 30 July 1869 obtained a scholarship at New College, Oxford. He passed on 29 April 1871 the competitive examination for the Indian civil service, but he graduated B.A. in 1872 with a second class in law and modern history, before he joined the service on 3 June 1873. Posted to Midnapur as assistant collector he entered at once into the interests of district life, and until his death, despite the calls of duties in the secretariat, he cultivated an intimate knowledge of the peoples of India. At a 'domum' dinner at Winchester in 1910 he asserted that 'a knowledge of facts concerning the religions and habits of the peoples of India equips a civil servant with a passport to their affection.' His zeal for work and his literary power early attracted the attention of the government, and Sir William Wilson Hunter [q. v. Suppl. I], then engaged on the compilation of the 'Gazetteer of Bengal' as director-general of statistics, made Risley on 15 Feb. 1875 one of his assistants. The chapter on Chota Nagpur was written by him. Within five years of his arrival in India he rose from assistant secretary to be under-secretary in Bengal, and in 1879 was promoted to the imperial secretariat as under-secretary to the government of India in the home department. But despite this unusually rapid promotion his heart was still in the districts, and by his own wish he reverted to them, going to Govindpur in 1880, Hazaribagh, and then to Manbhum, where he superintended the survey of Ghatwali and other lands held on service tenure. In Jan. 1885 he was employed on the congenial task of compiling statistics relating to the castes and occupations of the people of Bengal. He thus acquired a wide acquaintance with scientific authorities in Europe, including Professor Popinard, whose system of anthropological research Risley applied to India. His work on 'Tribes and Castes of Bengal' (Calcutta, 1891-2) was well received by the

public as well as the government, and he was made an officier d'académie by the French government in 1891. Next year he received the C.I.E. In 1898 he was acting financial secretary to the government of India. In 1899 he was appointed census commissioner, and chapter vi. on Ethnology and Caste in vol. i. of the 'Imperial Gazetteer of India' (1907) is an epitome of his monumental contribution to the 'Census Report,' 1901, on that subject. From the date of his report a new chapter was opened in Indian official literature, and the census volumes, until then regarded as dull, were at once read and reviewed in every country. In 1901 he became director of ethnography for India, and next year secretary to the government of India in the home department, acting for a short time as member of council. He had served as member and secretary to the police commission in 1890, and his special knowledge was of great value to Lord Curzon in many administrative matters, including the partition of Bengal. When the administrative reforms suggested by Lord Morley came under the consideration of Lord Minto in 1908-9, Risley proved an admirable instrument for the work in hand. With clear judgment and rare facility of expression Risley excavated from an enormous mass of official documents the main issues on reform, enlarged councils, and administrative changes (cf. *Blue Books*, 1909), and he submitted the needful points to Lord Minto's council. Although every provincial government held different views, Risley directed the members of council to conclusions and compromises, and finally put their orders into resolutions, regulations, and laws. He was created C.S.I. in 1904 and K.C.I.E. in 1907. In 1910 he returned to England to fill the post of secretary in the public and judicial department at the India office in London.

Despite the pressure of his secretariat labours Risley continued to pursue his study of ethnography and anthropometry. He became president of the Royal Anthropological Institute in Jan. 1910. On the processes by which non-Aryan tribes are admitted into Hinduism he was recognised to be the greatest living authority, and he established by anthropometric investigation the fact that the Kolarians south of Bengal are not to be distinguished from their Dravidian neighbours. He strongly advocated the addition of ethnology to the necessary training of civilians for work in India. His chief contributions to literature, besides those already cited, were, 'Anthropometric Data' (2 vols. Calcutta,

1891) and 'Ethnographical Glossary' (2 vols. Calcutta, 1892); the 'Gazetteer of Sikkim: Introductory Chapter' (Calcutta, 1894); and 'The People of India' (Calcutta, 1908). His work completely revolutionised the native Indian view of ethnological inquiry. 'Twenty years ago in his own province of Bengal inquiries into the origin of caste and custom by men of alien creed were resented. Ethnology is now one of the recognised objects of investigation of the Vangiya Sahitya Parisat' (MR. J. D. ANDERSON in *Roy. Anthropol. Record*, Jan. 1912).

Risley died at Wimbledon on 30 Sept. 1911, pursuing almost to the last his favourite studies despite distressing illness. He was buried in the Wimbledon cemetery.

He married at Simla, on 17 June 1879, Elsie Julie, daughter of Friedrich Oppermann of Hanover, who survived him with a son, Crescent Gebhard, born in Oct. 1881, captain of the 18th King George's Own Lancers, Indian army, and a daughter, Sylvia.

[The Times, 3 Oct. 1911; Man, a monthly record of anthropological science, Jan. 1912; Buckland's Indian Biography; Parliamentary Blue Books, and official reports; Records of Buckinghamshire, vol. iii. no. 6.] W. L.-W.

RITCHIE, CHARLES THOMSON, first BARON RITCHIE OF DUNDEE (1838-1906), statesman, born on 19 Nov. 1838 at Hawkhill, Dundee, was the fourth son in a family of six sons and two daughters of William Ritchie, a landed proprietor, of Rockhill, Broughty Ferry, Forfarshire, head of the firm of William Ritchie & Son of London and Dundee, East India merchants, jute spinners, and manufacturers. His mother was Elizabeth, daughter of James Thomson. The Ritchies had been connected with the burgh of Dundee for two centuries. The second son, James Thomson Ritchie (1835-1912), became an alderman of the City of London, served as sheriff in 1896-7, was lord mayor from 1903 to 1904, and was created a baronet on 15 Dec. 1903. The father designed his sons for a business life, and Charles, after education at the City of London School, which he entered in September 1849 and left in July 1853, passed immediately into the London office of his father's firm. In 1858, while still under twenty, he married Margaret, a daughter of Thomas Ower of Perth. For the next sixteen years (1858-74) Ritchie's time was almost wholly absorbed by the business of the firm, of which he soon became a partner. His offices lay in the

East End of London, and he thus enjoyed opportunities of studying conditions of life among the poorer classes. He interested himself in politics, adopting a toryism which was from the first of a 'progressive' type. In 1874 he was elected in the conservative interest member for the great working-class constituency of the Tower Hamlets amid the tory reaction which followed Gladstone's first administration. For the first time the constituency, which had two members, returned a tory. Ritchie headed the poll with 7228 votes—a majority of 1328 over the liberal, J. D'Aguilar Samuda, who was his colleague in the representation. The older tories regarded him with some suspicion, and he was termed a 'radical' when, in meeting his constituents after his first session, he described his work in the House of Commons (report of speech in *Observer*, 3 Oct. 1874). In his second session he increased his popularity with the working classes of East London by securing the passage of a bill extending the application of the Bank Holiday Act of 1871 to dockyard and customs house employees (24 Nov. 1875).

During the Disraeli government of 1874–1880 and later he devoted much of his parliamentary activity to the grievances of the English sugar refiners and the colonial growers of cane-sugar, notably in the West Indies, owing to the bounties paid in European countries upon the exportation of sugar beet. On 22 April 1879 he moved that a select committee should be appointed to 'consider the question and to report whether in their opinion any remedial measures could be devised by Parliament.' He suggested 'a countervailing duty equivalent to the bounty.' He defined free trade as 'the circulation of commodities at their natural value,' the natural value being what they would bring in free competition, but he deprecated the identification of his opinion either with protection or what is called reciprocity.' The proposed duty would be only 'an establishment of the principles of free trade, which had been practically destroyed by the bounties.' The motion was opposed by Mr. (now Lord) Courtney, but the committee was appointed, and Ritchie became chairman of it. The result was a recommendation in favour of the abolition of the continental bounties by means of an international agreement. The inquiry began a campaign against the economic system which was exemplified in the policy of sugar-bounties. Ritchie followed up the question in the next parliament, and found himself in conflict

with Mr. Joseph Chamberlain, then president of the board of trade and an advocate of free imports. Many years later, in a speech at Tynemouth (21 Oct. 1903), when both Ritchie's and Mr. Chamberlain's views of free trade had undergone a reversal, Mr. Chamberlain recalled the curious 'chassé-croisé' which characterised their positions (*Imperial Union and Tariff Reform: Speeches by J. Chamberlain*, 1903, p. 109).

In the general election of March–April 1880 Ritchie was again chosen for the Tower Hamlets, no fewer than 11,720 votes being cast for him, but the first place at the poll was taken by a liberal, Mr. James Bryce, who obtained 12,020 votes. By vigorous criticism of the Gladstonian government, together with his work on the sugar bounty question, he acquired as a private member a reputation for business ability and a mastery of detail. After the Redistribution Act of 1885 Ritchie won the seat of St. George's-in-the-East. He was first elected on 20 Nov. 1885 and was re-elected on 6 July 1888.

In Lord Salisbury's first administration of June 1885 to Jan. 1886, Ritchie was first admitted to office, becoming financial secretary to the admiralty. During his seven months' tenure of this post he acted as chairman of a departmental committee to inquire into the general management and working of the dockyards and especially to investigate the causes of the slowness with which warships were turned out. The committee's recommendations resulted in a great acceleration in the process of shipbuilding and a considerable reduction in cost. Up to that time the construction and equipment of a first-class ironclad had taken on an average about seven years. The Royal Sovereign, a battleship of 14,000 tons, was built in two years and eight months (1888–91).

After the defeat of Gladstone's home rule government in July of 1886 and the return of the conservatives to power, Ritchie was appointed president of the local government board—at first without a seat in the cabinet. Mr. Henry Chaplin had been offered and had refused the post on the ground of its holder being excluded from the cabinet. But the conservatives had put the reform of local government among the first of the measures on their programme, and in April 1887, when the government decided to deal comprehensively with the subject, Ritchie received cabinet rank. For nearly a year he was occupied in the preparation of a voluminous measure dealing with the subject. On 19 March

1888 he introduced the local government bill (for England and Wales) into the House of Commons, in a speech which Gladstone called 'a very frank, a very lucid, and a very able statement.' It was a complicated measure, with its 162 clauses, its five schedules, and its eighty folio pages of amendments. The general aim almost amounted to a social revolution. In place of the nominated magistrates who in quarter sessions had hitherto managed the business of the county it established for administrative purposes councils elected by the ratepayers to be independent of any but parliamentary control. Their business was to include the levying of county rates, the maintenance of roads and hedges, lunatic asylums, industrial and reformatory schools, registration, weights and measures, and such matters as adulteration of food and drugs. The management of the county police, meanwhile, was transferred to a joint committee of quarter sessions and the county council, the appointment of chief constable remaining with quarter sessions. Together with the sanitary authorities already existing, the county councils were to enforce the provisions of the Rivers Pollution Act; and all such powers of the local government board as related to piers, harbours, electric lighting, gas and water, tramways, the administration of the Sale of Food and Drugs Acts, the settlement of boundary disputes, and so on, were to be transferred to them. They were also to have the power to promote emigration by making advances to emigrants, and their administration of funds raised by the imperial executive was further widened by the power to increase the contribution towards the cost of maintaining indoor paupers. The act further provided for the distribution of the 'county'—a geographical unit to be retained, as far as possible, as it existed—into equal electoral divisions, with one member for each, the number of divisions being fixed by the local government board, and the council being purely elective with co-opted aldermen.

London received separate treatment in the bill. Together with certain other large towns it was made a county in itself, and an elected council, with co-opted aldermen, superseded the Metropolitan Board of Works. The metropolitan police, however, were left under the control of the home office, as being a national and not a municipal force, and the City of London proper was to remain the same as a quarter sessions borough. While many of its

administrative duties were transferred to the London county council the City Corporation was exempted from the general condemnation of all unreformed corporations.

As originally drafted Ritchie's bill provided for the creation of district councils and included a readjustment of the licensing laws, making the county councils the licensing authority and authorising them to refuse the renewal of licences, with compensation to the licence holder. These clauses, which embodied the principle of compensation for interference with public houses, and so recognised a legal vested interest on the part of the licence-holder, were warmly contested by the temperance party, and, after considerable discussion, they were dropped (June 12). The establishment of district councils was relinquished also; but under the Local Government Act of 1894 this part of Ritchie's work was completed six years later by the liberals.

Some extreme Tories, particularly in the City of London, censured the bill, but its reception was generally favourable as being 'a great work of safe and moderate decentralisation' bound to 'reinvigorate the local energies of our people' (*The Times*, 20 March 1888). Ritchie's management of its complicated details in committee, his mastery of every point and phase of it, his good temper, and his clearness in explanation, constituted a parliamentary achievement of the first order, and when the bill was read a third time and passed on 27 July 1888, Sir William Harcourt, amid universal cheering, paid a warm tribute to the 'ability, the conciliatory temper, and the strong common-sense' he had displayed (*Hansard*, vol. 329, 3rd series). The bill received the royal assent on 13 Aug. 1888, and came into force next year. A similar bill for Scotland became law in Aug. 1889.

In addition to the Local Government Act, Ritchie was responsible, while at the local government board, for the Allotments Acts of 1887 and 1890; for the Infectious Diseases Notification Act of 1889; and for the Housing of the Working Classes Amendment and Consolidation Acts of July 1890. His power of mastering and classifying enormous masses of detail was again shown in his two Public Health Acts, involving the vast and complicated machinery which controls the sanitary condition of London. The first of these, introduced on 8 April 1891, was a consolidation bill which put in order the chaos of twenty-nine Acts already treating of the subject; the second

and more important was the public health amendment bill for the metropolis, which was read for a third time on 27 June 1891, and, in its final form, represented the results of the best sanitary knowledge of the day. Ritchie's poor law administration showed the sympathetic spirit with which he always approached the study of the welfare of the poorest classes.

Ritchie's six years at the local government board fully established his reputation as an administrator who brought to political work the sound common-sense trained in years of business life. At the general election of 1892 he was defeated in the contest at St. George's-in-the-East. A liberal government returned to power, and Ritchie was out of parliament until 1895. At a bye-election on 24 May of that year he was chosen for Croydon without a contest. The liberal government resigned in the following June, and in Lord Salisbury's third administration Ritchie again accepted a seat in the cabinet, being made president of the board of trade. In that capacity Ritchie was responsible for much useful legislation, touching the railway, marine, commercial, labour, and statistical departments of the board.

His first important measure was the Conciliation Act of 1896, which established conciliation boards for the settlement of labour disputes. The board of trade was authorised to formulate regulations of procedure and thus first exercised the power of negotiating in trade disputes. Between the passing of the Act in 1896 and the end of Ritchie's presidency in 1900, the number of cases so dealt with was 113, seventy of which were settled under the Act (*Official Memorandum of the Board of Trade*). In Feb. 1898 his personal intervention put an end to an eight months' strike in the engineering trade. Another useful measure of the same year (1896) was the Light Railways Act, which embodied experience gained by Ritchie on visits to France and Belgium. The Act provides that light railways may be proposed by any local authority and, if their proposals are approved by the commissioners appointed to consider them, they may take the necessary land, after paying a fair valuation, by compulsion, and may proceed with the work without obtaining parliamentary sanction. In 1897 Ritchie appointed a very important departmental committee on commercial intelligence, which was required to consider the best means whereby British manufacturers might obtain information as to the most favourable markets for their goods in the colonies

and in India. As a result of the committee's report, there was established in October 1899 a new intelligence branch of the commercial, labour, and statistical departments of the board of trade (*Board of Trade Memorandum*). A Merchant Shipping (Mercantile Marine Fund) Act which was passed by Ritchie in 1898 was based upon the recommendations of a committee appointed by Mr. James Bryce in 1894 and presided over by Mr. Leonard (now Lord Courtney). Its most important provision was an allowance to shipowners for carrying boys who enrol themselves in the royal naval reserve. The intention was to check the serious decline in the numbers of British-born merchant seamen, who were estimated to have decreased at the rate of more than a thousand annually during the past five years and were in regard to foreign sailors in the proportion of one to three. Under Ritchie's Act the British boy sailors in the reserve numbered 302 in 1899-1900, the first year of its operation, and 2230 on 31 March 1903.

The growth of fatal or serious accidents amongst railway servants (1896-8) led Ritchie to procure the appointment of a royal commission of inquiry, with the result that he passed in 1900 the Railway Employment (Prevention of Accidents) Act, which dealt fully with the means of increased protection. Ritchie's Companies Act of 26 June 1900, which was practically a bill passed by a select committee of the House of Commons appointed in 1894 (*Parliamentary Debates*, vol. 84, 4th series), endeavoured to strengthen the existing law against fraudulent and inflated companies.

At the general election of September 1900 Ritchie was returned for Croydon unopposed. The conservatives retained their majority, but in November 1900 Lord Salisbury made some changes in the ministry, and Ritchie was transferred from the board of trade to the home office in succession to Sir Matthew White Ridley [q. v. Suppl. II]. His administration of the board of trade, which had shown diligence, conciliatory spirit, and powers of clarifying confusion, had greatly improved the repute of the department.

As home secretary, one of Ritchie's earliest duties was to carry out the ancient ceremonies incident to the death, after a reign of sixty-three years, of Queen Victoria, with whom his personal relations were always cordial. Soon afterwards Ritchie undertook an elaborate and complicated

Factory and Workshop Act which, in its 163 clauses and seven schedules, consolidated and amended the whole of the Factory Acts since 1878. Another useful Act, the Youthful Offenders Act, provided that in some instances young offenders on remand should be committed to the charge of some responsible person, instead of being sent either to prison or to the workhouse; and also that when offences committed by children could be directly traced to the habitual and wilful negligence of parents or guardians, the latter should be liable to prosecution. On 30 Jan. 1902, also, he introduced a licensing bill, the first part of which strengthened the law against the individual drunkard, while the second authorised a summary refusal of licences of offending publicans on the annual applications for renewal. The bill also put all retail licences absolutely under the control of the justices and provided for the registration of all clubs (*Parliamentary Debates*, vol. 101, 4th series).

In August 1902 Lord Salisbury resigned the post of prime minister, and Mr. Balfour, his successor, reconstructed the cabinet. Ritchie accepted with reluctance the office of chancellor of the exchequer. In the first place, as he explained to Mr. Balfour, he unwillingly left a post which was very congenial; and secondly, he was apprehensive of the favour bestowed by the colonial secretary, Mr. Chamberlain, on colonial preference, with which he felt himself out of agreement, but in regard to which, as finance minister, he would have special responsibilities. His hope that the question would not soon arise in an acute form was disappointed. Mr. Chamberlain and a section of the cabinet argued for a reconsideration of the tariff system, with a measure of preference for the colonies, and the argument soon took a practical turn. Ritchie's predecessor, Sir Michael Hicks-Beach (afterwards Viscount St. Aldwyn), had in the budget of April 1902 imposed on corn an import duty of one shilling a quarter, which was estimated to bring in two and a half millions annually. Although it was regarded as little more than a registration duty, Mr. Chamberlain now desired to retain it as a first step towards granting preference to the colonies, and before leaving for South Africa in December he pressed the cabinet to continue it in this guise. Ritchie declined to commit himself to the imposition or remission of a particular tax so long before the end of the financial year. He declared in any case the shilling duty on corn to be a mere

incident in the budget, and that he had no objection to retaining it provided that it was not to be treated as a differentiation or preferential duty or as an earnest of a new fiscal policy which could only be adopted after mature consideration as part of a specifically declared policy. The cabinet decided in favour of Mr. Chamberlain's arguments; Ritchie registered his dissent, and was assured that the matter would come on later for further consideration. During Mr. Chamberlain's absence in South Africa Ritchie several times informed the prime minister of his inability to act on the decision of the cabinet. That information was communicated to Mr. Chamberlain on his return. Mr. Chamberlain replied that if he could not secure the corn duty for preferential purposes, he did not care to have it at all. The cabinet thereupon accepted Ritchie's recommendation to remit the duty.

On 23 April 1903 Ritchie introduced his first and only budget. The war in South Africa was at an end. The financial situation, however, did not allow the chancellor to remit all the war taxes, but, on the basis of the existing taxation, he budgeted for a surplus of 10,816,000*l.*, and therewith he took fourpence off the income-tax. At the same time he dropped the shilling a quarter duty on corn.

The abolition of the corn tax was resented by the supporters of Mr. Chamberlain and by a large section of the unionist party. On 15 May 1903 Mr. Chaplin headed a deputation to Mr. Balfour asking that it should be retained. The prime minister made a moderate reply, with which Ritchie stated that he was in complete agreement; but on the same day Mr. Chamberlain at Birmingham, in an impassioned speech in favour of a policy of preference, 'initiated the acute stage of the fiscal controversy' (BALFOUR, *Fiscal Reform Speeches*, p. 16). During the debate on the finance bill on 9 and 10 June 1903 the differences within the cabinet were more clearly defined. Ritchie declared himself to be a freetrader. He declined to be (see *Parliamentary Debates*, 4th series, vol. 123) 'a party to a policy which, in my opinion, would be detrimental to both the country and the colonies.' Ritchie's budget received the royal assent without alteration on 30 June.

The breach in the cabinet thenceforth developed rapidly. Mr. Chamberlain came to the conclusion that he could best forward his views as to imperial preference from without. He sent his resignation to Mr. Balfour from Birmingham on 9 September,

and it was accepted by the prime minister in a personal interview on 14 September. The cabinet met later in the day. As a result of its deliberations Ritchie and Lord George Hamilton resigned. They were without any knowledge of Mr. Chamberlain's earlier withdrawal, and were under the impression that he was committing the cabinet to a protective policy. Their resignations were published on 18 September with, to their astonishment, that also of Mr. Chamberlain. The duke of Devonshire alone of Mr. Balfour's free-trade colleagues had learned of Mr. Chamberlain's withdrawal before the cabinet meeting, and he remained for the time in the cabinet. Lord Balfour of Burleigh, the remaining free trade minister, resigned on the 21st. Much controversy ensued between Ritchie and his friends on the one hand and Mr. Balfour and the protectionists of the cabinet on the other. The prime minister, who in his endeavour to keep his party together had avoided any but indefinite pronouncements on the fiscal question, had yet in his 'Economic Notes on Insular Free Trade' (published September 1903, but circulated earlier as a cabinet memorandum) 'approached the subject from the free trade point of view.' Between him and Ritchie there was at the time no extreme divergence of view. It was solely the presence of Mr. Chamberlain in the cabinet that made Ritchie's retention of office impossible. Had Mr. Chamberlain's retirement been announced to Ritchie, the ground for his own resignation at the moment would have been removed. Mr. Balfour replied in later speeches that he and the majority of the cabinet inclined to some kind of change in the fiscal system, and that Ritchie and his free trade colleagues were in opposition on that point to the majority; that Mr. Chamberlain had already threatened resignation if preference were excluded from the official programme of the government, to which it was not admitted; and that Ritchie's dissent from views expressed by himself in a valedictory letter to Mr. Chamberlain (17 Sept. 1903) showed that he would have retired in any case a day or two after he actually did go (see BALFOUR, *Fiscal Reform Speeches*, p. 143). Ritchie and his friends retorted that Mr. Chamberlain's verbal announcements of resignation had been frequent in the heat of controversy and were not taken seriously. After the withdrawal of Ritchie and his friends the prime minister's pronouncements leant more decisively to the

side of the tariff reformers, with the result that the duke of Devonshire parted from him on 2 October. On 19 Oct. 1903 at Croydon, on 18 November at Thornton Heath, and finally at Croydon on 2 December, Ritchie defended his attitude throughout the fiscal controversy. 'So far as Mr. Balfour's policy of retaliation is concerned he had never said . . . that he would not be prepared to adopt it.' 'What he had said was, that "we will be no parties to any arrangement with the colonies which shall impose upon us the necessity for putting a tax upon the food of the people"' (speech at Thornton Heath in *Daily Chronicle*, 19 Nov. 1903).

With his resignation and his public explanation Ritchie's public life ceased, though in the sessions of 1904 and 1905 he spoke more than once in the House of Commons in support of free trade principles. On 10 Feb. 1905 he suffered a severe blow in the death of his wife after forty-seven years of mutual attachment and happiness. It is doubtful if he recovered from the shock. The resignation of Mr. Balfour's government came on 17 Dec. 1905, and five days later Ritchie was raised to the peerage as Baron Ritchie of Dundee, of Welders, Chalfont St. Giles, co. Buckingham, his country residence. But he was not to enjoy the honour long. A few days before Christmas he went to Biarritz on a visit to Lord and Lady Dudley, and while there was stricken with paralysis. He died at Biarritz on 9 Jan. 1906, and was buried at Kensal Green. He left nine children—two sons and seven daughters. A first-born son, William, predeceased him. His elder surviving son, Charles Ritchie, succeeded him in the peerage.

Ritchie was tall and very dark, with something of a Southerner's swarthinness of complexion. His portrait by John Pettie, R.A., belongs to the present Lord Ritchie. A bust by E. Roscoe Mullins was exhibited at the Royal Academy in 1889. A cartoon portrait by 'Ape' appeared in 'Vanity Fair' in 1885.

Ritchie was never as well known to the public as might have been expected from the usefulness of his political work. He lacked the qualities which make for popularity. Clear and persuasive as a speaker in the House of Commons, he was not an effective platform speaker. In his own constituency of Croydon he was mercilessly interrupted and several times shouted down when defending his fiscal views. But his grasp of complicated detail and his shrewd common-sense gave him substantial

influence in the inner circle of his party. An unconciliatory manner repelled many members of his own side, although his circle of personal friends was wide. He seldom entertained, and took scarcely any part in the social side of politics.

RITCHIE, DAVID GEORGE (1853-1903), philosopher, born at Jedburgh on 26 Oct. 1853, was only son of three children of George Ritchie, D.D., minister of the parish and a man of scholarship and culture, who was elected to the office of moderator of the general assembly of the Church of Scotland in 1870. His mother was Elizabeth Bradfute Dudgeon. The family was connected with the Carlyles, and in 1889 Ritchie edited a volume of 'Early Letters of Jane Welsh Carlyle.'

Ritchie received his early schooling at Jedburgh Academy. Not allowed to make friends with other boys of his own age, he never learned to play games, and lived a solitary life, concentrating his mind rather too early on purely intellectual subjects. He matriculated in 1869 at Edinburgh University, where he made a special study of classics under Professors W. Y. Sellar [q.v.] and J. S. Blackie [q.v. Suppl. I], while he began to study philosophy under Prof. Campbell Fraser, in whose class and in that of Prof. Henry Calderwood [q.v. Suppl. I] (on moral philosophy) he gained

the highest prizes. After graduating M.A. at Edinburgh in 1875 with first-class honours in classics, Ritchie gained a classical exhibition at Balliol College, Oxford, and won a first-class both in classical moderations (Michaelmas 1875) and in the final classical school (Trinity term, 1878). In 1878 he became a fellow of Jesus College and in 1881 a tutor. From 1882 to 1886 he was also a tutor at Balliol College. At Oxford Ritchie came under the influence of Thomas Hill Green [q.v.] and Arnold Toynbee [q.v.], and it was during his early life there that the foundations were laid both of his interest in idealistic philosophy associated with the name of Hegel, and also of his strong bent towards practical politics; his political philosophy was dominated by the belief that practical action must be derived from principles.

In 1894 Ritchie left Oxford on being appointed professor of logic and metaphysics at St. Andrews University. At the time the university was in the midst of a turmoil of conflicting interests which involved litigation and much party feeling. In this conflict Ritchie supported the side of progress, which ultimately prevailed. He remained at St. Andrews until his death on 3 Feb. 1903, and was buried there.

Ritchie was made hon. LL.D. of Edinburgh in 1898, and was president of the Aristotelian Society in 1898-9.

Ritchie married twice: (1) in 1881 Flora Lindsay, daughter of Col. A. A. Macdonell of Lochgarry, and sister of Professor A. A. Macdonell of Oxford (she died in 1888); (2) in 1889 Ellen, sister of Professor J. B. Haycraft. He left a daughter by the first marriage and a son by the second.

Both at Oxford and at St. Andrews Ritchie wrote much on ethics and political philosophy. One of his earliest writings was an essay on 'The Rationality of History,' contributed to 'Essays in Philosophical Criticism,' written in 1883 by a number of young men influenced largely by Hegel and his interpreters, and edited by Professor Andrew Seth (afterwards Pringle-Pattison) and Mr. R. B. (afterwards Viscount) Haldane. In 1885 he translated with Professor Richard Lodge and Mr. P. E. Matheson, 'Bluntschli's Theory of the State,' and he published 'Darwinism and Politics' in 1889. In 1891 was published his 'Principles of State Interference,' and in 1893 his 'Darwin and Hegel.' After leaving Oxford Ritchie published 'Natural Rights' (1895); 'Studies in Political and Social Ethics,' and 'Plato' (both in 1902). He was also a contributor

to 'Mind,' the 'Philosophical Review,' the 'International Journal of Ethics,' and kindred periodicals. After his death a collection of 'Philosophical Studies' was issued in 1905, edited with a memoir by Prof. Robert Latta of Glasgow.

Of an absolutely simple and unaffected nature, Ritchie pursued the truth he set himself to seek with an entire devotion. Despite his retiring manner, he had many friends. He held strongly that questions of ethics and politics must be regarded from the metaphysical point of view. For him the foundation of ethics necessarily rested on the ideal end of social well-being, and keeping this end in view, he proceeded to trace its history at different times, the manner in which it shapes itself in the mind of each individual, and the way in which it can be developed and realised. Ritchie was an advanced liberal with socialistic leanings. He considered that the ultimate value of religion depended on the ideal it set before mankind when represented in its highest form.

[Philosophical Studies, by D. G. Ritchie, with Memoir by Prof. Robert Latta, 1905; Prof. E. B. Poulton's Memoir of John Vriamou Jones, 1911.] E. S. H.

ROBERTS, ALEXANDER (1826-1901), classical and biblical scholar, born at Marykirk, Kincardineshire, on 12 May 1826, was son of Alexander Roberts, a flax-spinner. He was educated at the grammar school and King's College, Old Aberdeen, where he graduated M.A. in March 1847, being the Simpson Greek prizeman. He was presbyterian minister (1852-71) in Scotland and London. In 1864, being then minister at Carlton Hill, London, he was made D.D. of Edinburgh. He was also minister at St. John's Wood, and was a member of the New Testament revision company (1870-84). In 1872 he succeeded John Campbell Shairp [q. v.] in the chair of humanity at St. Andrews; he was made emeritus professor in 1899. He died at St. Andrews, Mitcham Park, Surrey, on 8 March 1901. He married on 2 Dec. 1852 Mary Anne Speid (d. 18 Jan. 1911), and had fourteen children, of whom four sons and eight daughters survived him.

Roberts co-operated with Sir James Donaldson as editor and part translator of the English versions of ecclesiastical writers published as the 'Ante-Nicene Christian Library' (1867-72, 24 vols.); he translated also the 'Works of Sulpitius Severus' (1895) in the 'Select Library of Nicene and Post-Nicene Fathers.' He

is best known for the series of works in which he maintains that Greek was the habitual speech of our Lord, a conclusion which has not met with general favour, despite the ability with which Roberts managed his case.

He published: 1. 'The Threefold Life,' 1858, 12mo. 2. 'Inquiry into the Original Language of St. Matthew's Gospel,' 1859. 3. 'Discussions on the Gospels,' 2 pts. 1862; 2nd edit. 1864. 4. 'The Life and Work of St. Paul practically considered,' 1867. 5. 'The Words of the New Testament,' Edinburgh, 1873 (in conjunction with William Milligan [q. v. Suppl. I], a work of textual criticism). 6. 'Hints to Beginners in Latin Composition,' Edinburgh, 1873. 7. 'The Bible of Christ and His Apostles,' 1879. 8. 'Companion to the Revised Version of the English New Testament,' 1881; 3rd edit. 1885 (reprinted, New York, 1881, with supplement by an American reviser). 9. 'Old Testament Revision,' 1883. 10. 'Greek the Language of Christ and His Apostles,' 1888. 11. 'A Short Proof that Greek was the Language of Christ,' Paisley, 1893.

[Who's Who, 1901; The Times, 11 March 1901; Athenæum, 16 March 1901; P. J. Anderson's Officers and Graduates of King's College, Aberdeen, 1893, p. 299; Calendar of St. Andrews University, 1910, p. 676; Alphabetical List of Graduates, Edinb. Univ. (1859-1888), 1889, p. 114; information from Mr. J. Maitland Anderson.] A. G.

ROBERTS, ISAAC (1829-1904), amateur astronomer, son of William Roberts, a farmer of Groes, near Denbigh, North Wales, was born at that place on 27 Jan. 1829; though in childhood he left Wales with his family for Liverpool, he retained a knowledge of Welsh through life. In 1844 he was apprenticed for seven years to the firm of John Johnson & Son, afterwards Johnson & Robinson, builders and lime burners, of Liverpool. One of the partners, Robinson, died in 1855, and Roberts was made manager. In the next year the surviving partner died. Roberts, after winding up the concern, began business for himself in 1859 as a builder in Liverpool, and being joined in 1862 by Mr. J. J. Robinson, son of his former master, the firm traded for a quarter of a century under the name of Roberts & Robinson, undertaking many large and important contracts in Liverpool and its neighbourhood. In 1888 Roberts retired with means sufficient to allow him to devote himself to scientific research. Whilst still occupied in business, very many branches of science had

engaged his attention. Geology was the first subject that he took up seriously. He became a fellow of the Geological Society in 1870, and at the British Association meeting of 1878 he read a paper on the filtration of water through triassic sandstone. Between 1882 and 1889 he made an elaborate series of experiments on the movement of underground water as affected by barometric and lunar changes. A paper on a different subject, 'the determination of the vertical and lateral pressures of granular substances,' which appeared in the 'Proceedings of the Royal Society' for 31 Jan. 1884, embodied the results of elaborate experiments made for the purpose of furnishing data to engineers and builders of storehouses.

Meanwhile his attention had been turned to astronomical observation. In 1878 he had a 7-inch refractor by Cooke at his home at Rock Ferry, Birkenhead, which he used for visual observation, but a few years later he applied himself with zeal to the advancing practice of stellar photography. In 1883, a year after his removal to Kennessee, Maghull, near Liverpool, he experimented in photographing stars with ordinary portrait lenses varying in aperture between three-eighths of an inch and five inches. After consideration of the results of these experiments and comparisons with the photograph of the nebula in Orion by Andrew Ainslie Common [q. v. Suppl. II], he ordered from Grubb of Dublin a 20-inch silver-on-glass reflector of 100 inches focal length, the photographs to be taken directly in the focus of the mirror to obviate any loss of light by a second reflection, and the photographic telescope to be mounted on the same declination axis as the 7-inch refractor, one being the counterpoise of the other (*Monthly Notices R.A.S.* xli. 99).

At the meeting of the Royal Astronomical Society of January 1886, Roberts, who was at the time the president of the local Astronomical Society at Liverpool, reported taking during the past year 200 photographs of stars which might be measured for position, as well as long exposure photographs of the Orion nebula, the Andromeda nebula, and the Pleiades. At the November meeting in the same year he presented a photograph of the Pleiades taken with his 20-inch reflector with exposure of three hours, which showed the stars Alcyone, Maia, Merope, and Electra surrounded by nebulosity extending in streamers and fleecy masses till it seemed almost to fill the spaces between the stars and extend far beyond them. This photograph was

accepted as revealing structure about the group never before seen or suspected. A photograph of the great nebula in Andromeda presented at the meeting of December 1888, which suggested that the object is of the spiral type, evoked considerable interest because it was supposed to illustrate the main idea of the nebular hypothesis. Photographs of the great nebula in Orion, presented a few months later, were equally successful. Roberts persistently urged the superiority of the reflector over the refracting telescope, a view which has since received much confirmation. In the early years of his work Roberts designed an instrument, the pantograver, an example of which was made for him by Mr. Hilger, for transferring mechanically the images on a photographic negative to a copper plate, to be used for making reproductions (*Monthly Notices*, Nov. 1888).

Roberts attended by invitation the Conference of Astronomers at Paris in 1887 which initiated the international survey of the heavens by photography, but took no part in the scheme, which was entrusted to professional astronomers at national observatories with instruments of a uniform type. In order to continue his work on the nebulae and star clusters in a clearer atmosphere than that of Liverpool, he finally settled in 1890 at Crowborough Hill, Sussex, in a house appropriately named Starfield. There Mr. W. S. Franks, an astronomer and skilful photographer, became his working assistant, and Roberts confined himself to organisation and supervision. Month by month for several years he exhibited at the Royal Astronomical Society splendid photographs of remarkable objects in the sky taken with his reflector. Two volumes of selections of Roberts's photographs of stars, star clusters, and nebulae, 125 reproductions in all, appeared respectively in 1893 and 1899. In 1896 Roberts, following the example of Professor Barnard in America, added to the equipment of his observatory cameras with portrait lenses of different types, in order to compare their photographic results with those of the reflecting telescope (cf. a discussion on the relative efficiency of the two methods between Roberts and Professor Barnard in *R.A.S. Monthly Notices*, lvi. 372, lvii. 10, lviii. 392). Between 1896 and 1902 Roberts prepared photographs of fifty-two regions of the sky called 'nebulous' by Sir William Herschel, made with his reflector and with a portrait lens of 5 inches aperture made by Messrs. Cooke of York. No diffused nebulosity was shown on forty-eight of

these plates, a result which was not confirmed by Dr. Max-Wolf of Heidelberg, who made special examination of several cases (*Monthly Notices*, lxiii. 303). Roberts's report of this research was presented in November 1902 (*Monthly Notices*, lxiii. 26).

Roberts joined the Royal Astronomical Society in 1882. In 1890 he was elected a fellow of the Royal Society, and in 1892 the honorary degree of D.Sc. was conferred on him by Trinity College, Dublin, on the occasion of its tercentenary. In 1895 the Royal Astronomical Society awarded the gold medal to Roberts for his photographs of star clusters and nebulae, the award being announced and the address being delivered by Captain (now Sir William) Abney, the leading authority on photography, who congratulated him on his 'conclusion that a reflector is better for his purpose than a refractor.' Roberts went to Vadso, Norway, on the Norse King, to observe the total solar eclipse of 9 August 1896, but an overcast sky prevented observations.

Roberts, who was a zealous liberal, interested himself in legislation affecting education. He was one of the governors of the University of North Wales. He died suddenly at Crowborough on 17 July 1904, and his cremated remains were entombed four years later in a stone in Birkenhead cemetery, Flaybrick Hill, Birkenhead, on 21 July 1908. After providing for his widow and other relatives, he left the residue of his large estate for the foundation of scholarships in the University of Liverpool and the university colleges of Wales, Bangor, and Cardiff.

He married (1) in 1875 Ellen Anne, daughter of Anthony Cartmel; and (2) in 1901 Dorothea Klumpke of San Francisco, a member of the staff of the National Observatory, Paris, who had been a fellow voyager on the Norse King in 1896. He had no children.

A photograph is in the British Museum series of portraits at South Kensington.

[Proceedings of the Royal Society, vol. lxxv.; Royal Astronomical Society Monthly Notices, vol. lxxvi and as quoted; private information.]

H. P. H.

ROBERTS, ROBERT DAVIES (1851-1911), educational administrator, born at Aberystwyth on 5 March 1851, was eldest son of Richard Roberts, timber merchant and shipowner of that town. His early training was sternly Calvinistic, but he quickly developed, with a studious temper, versatile human interests and a spirit of adventure. From a private school at Shrewsbury he proceeded to the Liverpool

Institute, and thence to University College, London. Here he distinguished himself in geology; he graduated B.Sc. in the University of London with first-class honours and scholarship in that subject in 1870. In 1871 he entered Cambridge University as foundation scholar of Clare College, graduating B.A. in 1875 as second (bracketed) in the first class of the natural science tripos. He proceeded M.A. at Cambridge and D.Sc. at London in 1878; and was from 1884 to 1890 fellow of Clare College. He became fellow of University College, London, in 1888.

Meanwhile Roberts was lecturer in chemistry at University College, Aberystwyth, during 1877, and in 1884 was appointed university lecturer in geology at Cambridge. In geological study, especially on its palaeontological side, Roberts showed originality and imaginative powers. His 'Earth's History: an Introduction to Modern Geology' (1893) was well received both at home and in the United States.

But Roberts was diverted from a pursuit in which he promised to achieve distinction by an ambition to organise and develop higher education among the classes that were at that time not touched by the universities. In 1881 he had become assistant and organising secretary to the syndicate at Cambridge which had been formed in 1873 to control the 'local lectures' or 'university extension' work. He was here engaged in association with Professor James Stuart and Professor G. F. Browne, afterwards bishop of Bristol. From 1885 to 1904 he was secretary to the London Society for the Extension of University Teaching, which, in the absence of a teaching university in London, had been founded as an independent organisation to direct the work in the metropolitan area. In 1891 he published his 'Eighteen Years of University Extension,' which contains an admirable account of the movement down to that date. In 1894 he returned to Cambridge to take full charge of the work under the Cambridge syndicate; and eight years later he became the first registrar of the Extension Board in the recently reconstituted University of London. This post he held till his death. The university extension movement owed much to Roberts's long service of more than thirty years. He sought to establish and maintain a high standard of 'extension' lecture, encouraging among the local committees continuous courses of study (often extending over three years).

Devoted to Wales, he actively interested

himself in the affairs of the principality. In the new Welsh University he served as junior deputy chancellor (1903-5) and as chairman (1910-11) of the executive committee of the court, on which he sat as one of the representatives of the college of his native town. He was J.P. for Cardiganshire, and high sheriff of that county (1902-3). To qualify himself for such public work he had become a student of the Middle Temple, and, though he was not called to the bar, he made a considerable study of law.

Long a lecturer for the Gilchrist Educational Trust, he acted as its secretary from 1899 till his death, bringing the organisation to a high state of efficiency and inaugurating valuable developments.

Roberts, who held many minor educational offices, showed exceptional skill and tact as an organiser, inspired others with his own enthusiasm, perseverance, and breadth of outlook, and devoted himself unsparingly to the improvement of the educational opportunities of all classes. While he was a fervent liberal in general politics, his wide sympathy made him equally at home among the Northumbrian miners and in Cambridge common-rooms.

In 1911 he was appointed secretary of the Congress of the Universities of the Empire which the University of London, with the co-operation of the other British universities, organised for the summer of 1912. In June 1911 he attended a preliminary conference of Canadian universities at Montreal, and was making active preparation at home when he suddenly died of calcification of the coronary arteries at his house at Kensington on 14 Nov. 1911. His body was cremated at Golder's Green, and was subsequently buried with public honours at Aberystwyth. In his memory two scholarships for the encouragement of university extension work were founded by public subscription, the administration of the fund being undertaken by the Gilchrist trustees.

Roberts married in 1888 Mary, eldest daughter of Philip S. King of Brighton. He left no children, and by his will he bequeathed the ultimate residue of his estate to Aberystwyth College to form the nucleus of a fund which should provide for its professors periodic terms of release from their duties.

P. M. W.

ROBERTS-AUSTEN, SIR WILLIAM CHANDLER (1843-1902), metallurgist, born at Kennington, Surrey, on 3 March 1843, was eldest son of George Roberts, of Welsh descent, who was in the service of the Hudson's Bay Company, by his wife Maria Louisa, daughter of William Chandler, M.D., of Canterbury, of an old Kentish family which had intermarried with the Hulses and Austens. In 1885 he assumed, by royal licence, at the request of his uncle, Major Nathaniel Lawrence Austen of Haffenden and Camborne, in Kent, the name of Austen. After education at private schools, where he early showed a taste for science, he entered the Royal School of Mines, South Kensington, at eighteen, with the view of qualifying as a mining engineer, and obtained the associateship there in 1865. The same year he joined Thomas Graham [q. v.], master of the mint, as private assistant. In 1870 (shortly after Graham's death) he was appointed to the new post of 'chemist of the mint,' and from 1882 to his death was 'chemist and assayer.' He filled temporarily the office of deputy master between the death of Sir Horace Seymour in June 1902 and the appointment of Mr. William Grey Ellison-Macartney next year. While assayer he was responsible for the standard fineness of about 150,000,000*l.* of gold coin, over 30,000,000*l.* of imperial silver coin, and about 10,000,000*l.* of bronze and colonial silver coin (T. K. ROSE). On all scientific and technical operations of coinage he became the leading authority in all parts of the world. From 1880 to 1902 Roberts-Austen was also professor of metallurgy at the Royal School of Mines, having succeeded Dr. John Percy [q. v.]. He proved an illuminating teacher.

Roberts-Austen freely placed his special knowledge at the public disposal, taking part in numerous official scientific inquiries. In 1897 he served on the treasury committee (of which Lord Rayleigh was chairman) to consider the desirability of establishing a national physical laboratory, and was in 1899 an original member of the war office explosives committee.

Roberts-Austen's researches largely dealt with alloys. He delivered five series of Cantor lectures at the Society of Arts (1884-90) on investigations in alloys, which are printed in the society's 'Journal.' In 1891 he exhibited at the Royal Society's soirée a new alloy of gold and aluminium which he discovered; it contained 78.4 per cent. of gold and 21.6 of aluminium, and was remarkable for its intense purple

colour. As the outcome of a research on the effects of admixture of impurities on the mechanical properties of pure metals, the alloys-research committee of the Institution of Mechanical Engineers was established (1889), Roberts-Austen becoming 'reporter' to the committee and supplying five reports, a sixth being under revision at his death. In the first (1891) he described his automatic recording pyrometer, 'by means of which the temperature of furnaces or masses of metal, and the exact time at which each change in temperature occurs, are recorded in the form of a curve on a moving photographic plate.' The work of alloys-research he thus initiated is now carried on at the National Physical Laboratory. The practical value of these labours led the council of the institution to enroll him an honorary life member (*Annual Report Inst. Mechan. Eng.* 1898, pp. 5, 30).

Roberts-Austen, who was elected a fellow of the Royal Society on 3 June 1875, served on the council (1890-2), and was Bakerian lecturer for 1896, his subject being the diffusion of metals (*Phil. Trans.* vol. 187 A.). An original member of the Physical Society in 1874, he was the first secretary, and he acted also as honorary general secretary of the British Association, 1897-1902. As president of the Iron and Steel Institute (1899-1901) he rendered signal services during his term of office. From his hand, on 18 July 1899, Queen Victoria accepted the institute's Bessemer gold medal in commemoration of the progress made in the metallurgy of steel during her reign. He was elected in 1901 an honorary member of the Institution of Civil Engineers (where he gave the Forrest lecture on 23 April 1902), was a vice-president of the Chemical Society and of the Society of Arts, and member of various foreign societies. The University of Durham conferred the honorary degree of D.C.L. in 1897, and Victoria University, Manchester, that of D.Sc. in 1901. In 1889 he was created a chevalier of the Légion d'Honneur, France, and was made C.B. in 1890 and K.C.B. in 1899.

At the Royal Institution, the British Association meetings, and at the Chemical and other societies, Roberts-Austen held a high reputation as lecturer and demonstrator. His attractive personality made him socially popular; he had a keen sense of humour and was an admirable mimic. He was an intimate friend of Ruskin, whose works influenced him greatly in early life. He died at the Royal Mint on 22 Nov. 1902, and was buried at Canterbury.

He married in 1876 Florence Maude, youngest daughter of Richard William Alldridge, of Old Charlton, Kent; he had no issue.

Roberts-Austen's chief independent publication was 'An Introduction to Metallurgy' (1891; 6th edit. revised, 1910), a work indispensable to researchers in metallurgy. He contributed the article 'Metallography' in the 'Encyclopædia Britannica,' 10th edition. The Royal Society's 'Catalogue of Scientific Papers' enumerates seventy-four papers by Roberts-Austen, a few jointly with other authors (1868-1900). They deal with the absorption of hydrogen by electro-deposited iron, the analysis of alloys by means of the spectroscope (with Sir Norman Lockyer), the action of the projectile and of the explosives on the tubes of steel guns, and memoirs on the physical properties of metals and alloys. Before the Society of Arts he read, in 1895, a paper with Mrs. Lea Merritt on 'Mural Painting by the Aid of Soluble Silicates and Metallic Oxides.'

E. J.

ROBERTSON, DOUGLAS MORAY COOPER LAMB ARGYLL (1837-1909), ophthalmic surgeon, born in Edinburgh in 1837, was son of Dr. John Argyll Robertson, surgeon and lecturer in the extra-academical school of medicine and president of the Royal College of Surgeons of Edinburgh in 1846. His father took a special interest in ophthalmic surgery and was one of the founders of the Edinburgh Eye Dispensary in 1822. Douglas was educated successively at the Edinburgh Institution, at Neuwied in Germany, and at the universities of Edinburgh and St. Andrews. He graduated M.D. at St. Andrews in 1857, and in the same year was appointed house surgeon at the Royal Infirmary, Edinburgh. He then went to Berlin to study ophthalmic surgery under von Graefe. On his return to Edinburgh he acted for several sessions as assistant to Prof. John Hughes Bennett [q.v.], and in that capacity conducted the first course of practical physiology held in the University of Edinburgh. He was succeeded by Prof. William Rutherford [q.v. Suppl. I]. In 1862 he was admitted F.R.C.S. Edin-

burgh, and published his observations on Calabar Bean in the 'Edinburgh Medical Journal.' He proved that its alkaloid, physostigmin, more commonly known as eserine, led to constriction of the pupil of the eye and thus provided a satisfactory myotic, the want of which had long been felt by oculists. This discovery attracted universal attention and made the young Edinburgh surgeon famous. In 1867 he was appointed assistant ophthalmic surgeon to the Royal Infirmary under Dr. William Walker, whose colleague he became in 1870. In 1882 Dr. Walker retired, and Argyll Robertson remained the sole ophthalmic surgeon to the Infirmary until 1897, when he was appointed consulting surgeon. He lectured on his subject for many years during each summer session. In 1869-70 he published in the 'Edinburgh Medical Journal' the records of the cases which showed that disease of the spinal cord is sometimes associated with loss of light reflex of the pupil, which still retains its movement on accommodation. This condition was christened by common accord 'the Argyll Robertson pupil,' and its value as an aid to diagnosis has steadily increased.

Robertson was president of the Royal College of Surgeons of Edinburgh for 1886-7. He was the first president (1893-5) of the Ophthalmological Society of Great Britain to be chosen from the ophthalmic surgeons who practised outside London; he presided over the International Ophthalmological Congress in Edinburgh in 1894, and over the Edinburgh Medico-Chirurgical Society in 1896. In 1896 the University of Edinburgh conferred upon him the honorary degree of LL.D. He was also surgeon oculist in Scotland to Queen Victoria and later to King Edward VII.

Argyll Robertson attained much repute as a golfer. He won the gold medal of the Royal and Ancient Club five times, and that of the Honourable Company of Edinburgh Golfers thrice. He was the first captain of the Royal Colleges Golf Club and presented to it a handsome scratch medal, which is known by his name and is awarded annually for the best scratch score. This medal he won himself on two occasions. He was also fond of shooting and was a member of the Royal Archers of the King's Body-Guard for Scotland, and he was a good curler and fisherman.

Robertson was one of the earliest in the United Kingdom to adopt ophthalmic surgery as an independent profession throughout his career; previously a surgeon adopted this branch of work after a longer or shorter

experience of general surgery. As an operator he was neat, rapid, and resourceful, and he introduced into practice several new methods of procedure, especially that of trephining the sclerotic for the relief of glaucoma.

On retiring from practice in 1904 he settled at Mon Plaisir, St. Aubyn's, Jersey, where he took charge of the eldest daughter of the Thakur of Gondal, a former pupil at Edinburgh, and afterwards his friend. In 1892 and 1900 Robertson visited India and on a third visit in the winter of 1908-9 he died at Gondal, India, on 3 Jan. 1909; he was cremated on the banks of the river Gondli, the Thakur Sahib himself kindling the funeral pyre of his guru and friend.

He married in 1882 Carey, fourth daughter of William Nathaniel Fraser of Findrack and Tornaveen, Aberdeenshire, but had no family.

His portrait, painted by Sir George Reid, was presented to him by members of his profession before he retired from practice. A replica hangs in the Surgeons' Hall at Edinburgh.

[Edinburgh Med. Journal, 1909, N.S. ii. 159 (with portrait); Lancet, 1909, i. 208; Brit. Med. Journal, 1909, i. 191, 252 (with portrait); Hole's Quasi Cursores, 1884 (with portrait).] D'A. P.

ROBERTSON, JAMES PATRICK BANNERMAN, BARON ROBERTSON of Forteviot (1845-1909), lord president of the Court of Session in Scotland, born in the manse of Forteviot on 10 Aug. 1845, was second son of Robert John Robertson, parish minister of Forteviot, Perthshire, by his wife Helen, daughter of James Bannerman, parish minister of Cargill, Perthshire. He was educated at the Royal High School, Edinburgh, of which he was 'dux,' or head boy, in 1860, and at Edinburgh University, where he specially distinguished himself as a political speaker in college debates, graduating M.A. in 1864. He became a member of the Juridical Society in 1866 (librarian 1868-9, president 1869-70), and passed to the Scottish bar on 16 July 1867. His progress was slow at first, but he gradually acquired a large practice. His interests were more in politics than law. 'Westminster seems to have been his real goal from the first' (*The Times*, 3 Feb. 1909). Early in life he lost sympathy with his presbyterian surroundings. At the disruption of the Scottish church (1843) his father had remained in the establishment, while his mother went out with those who formed the Free Church. Robertson himself, on

attaining manhood, joined the Scottish episcopal communion. He was the best speaker of his day at the bar. An ardent admirer of Disraeli, he did much to promote a conservative revival in Scotland, and at the general election of 1880 contested Linlithgowshire against Peter MacLagan, the sitting member, but lost by a large majority. He became Q.C. in 1885, was appointed solicitor-general for Scotland in the short-lived Salisbury government of 1885, and was returned for Buteshire at the general election of that year, but lost office when the liberals came in, in Feb. 1886. On the defeat of Gladstone on home rule in June 1886 and the consequent dissolution of parliament, he was re-elected for Buteshire. In Salisbury's second administration he became again solicitor-general for Scotland.

Robertson made his mark in the House of Commons at once. On 13 April 1887 he spoke with effect in support of the criminal law amendment (Ireland) bill. His speech, a defence of the bill on the analogy of the Scottish criminal law, was published under the title of 'Scotland and the Crimes Bill.' In 1889 he was appointed lord advocate, succeeding John Hay Athole Macdonald, who was made lord justice clerk, and he was sworn of the privy council. As lord advocate he carried the Local Government (Scotland) Act, 1889 (52 & 53 Vict. c. 60), by which 250,000*l.*, derived from probate and license duties, was to be annually applied to the relief of fees in elementary public schools, thus establishing free education in Scotland. In 1890 he received the honorary degree of LL.D. from Edinburgh University, of which three years later he became lord rector.

In 1891 Robertson succeeded John Inglis [q. v.] as lord president of the Court of Session, and in 1899, on the death of William Watson, Baron Watson [q. v. Suppl. I], he became a life peer, as Baron Robertson of Forteviot (14 Nov.), with a seat on the judicial committee of the privy council. He was elected an honorary bencher of the Middle Temple (24 Nov. 1899–18 Jan. 1900). As a judge in Scotland, Robertson had often shown that he found his position there uncongenial; but on the broader ground of the two final courts of appeal—the House of Lords and the judicial committee of the privy council—his acute and penetrating intellect had wider scope. In the privy council he was not infrequently charged with the duty of delivering the judgment of the board, especially in appeals from those parts of the empire where Roman-Dutch law prevails

(*The Times*, 3 Feb. 1909). In the House of Lords, on the appeal *Walter v. Lane*, he dissented (6 Aug. 1900) from Halsbury (Lord Chancellor) and other judges, and held that 'The Times' had no copyright in Lord Rosebery's speeches published by Lane in book-form from 'The Times' reports (*Law Reports, Appeals*, 1900, pp. 539–61). In 1904 he was one of the judges who heard the appeal by the minority of the Free Church of Scotland against the decision of the Court of Session in the litigation which followed the union (1900) of the Free Church and the United Presbyterians; and his judgment in favour of reversing the decision, and giving the property of the Free Church to the objecting minority, is a masterly statement of that side of the question (*Law Reports, Appeals*, 1904, pp. 515–764; see SHAND (afterwards BURNS), ALEXANDER, BARON SHAND, Suppl. II).

Robertson was chairman of the Irish University commission, and author of its report (1904), which, while recognising that the ideal system for Ireland would combine all creeds, recommended a virtually catholic university as the only practicable solution of the problem. He remained a keen politician to the last, but refused to follow Mr. Balfour on the fiscal question. He spoke in the House of Lords on the Duke of Devonshire's motion against Mr. Chamberlain's tariff proposals (22 July 1905). Describing himself as 'a loyal member of the tory party,' he attacked the Birmingham policy, which he predicted would ruin the party, and severely censured the tactics of Mr. Balfour, the conservative leader, whom he accused of mistaking 'cleverness' for statesmanship. As the tariff-policy developed Robertson's hostility increased. He died suddenly at Cap Martin on 2 Feb. 1909, and was buried at Elmstead, Kent.

Robertson married on 10 April 1872 Philadelphia Mary Lucy, daughter of W. N. Fraser, of Tornaveen, Aberdeenshire (d. 27 Jan. 1907). By her he had two sons—Robert Bannerman Fraser (b. 14 Feb. 1873), barrister-at-law (Middle Temple), who served in the imperial yeomanry in South Africa, and entered the army (capt. 21st lancers); Hugh (b. 27 Sept. 1879), who entered the army (14th hussars), and died in South Africa on 1 Feb. 1900—and one daughter, Philadelphia Sybil. A small sketch in oils of Robertson, which represents him addressing the House of Commons, is in the possession of his son.

of Advocates; Hansard, 3rd ser., vol. 150, pp. 847-83; 4th ser., vol. 150, pp. 500-11.]

G. W. T. O.

ROBINSON, FREDERICK WILLIAM (1830-1901), novelist, born in Spitalfields on 23 Dec. 1830, was second son of William Robinson of Acre Lane, Brixton, who owned much house property in London. His mother's surname was St. John. After education at Dr. Pinches' school at Clarendon House, Kennington, where (Sir) Henry Irving, (Sir) Edward Clarke, and J. L. Toole were also pupils, he acted for some time as his father's secretary. But he soon embarked upon a literary career, his first novel 'The House of Elmore,' begun before he was eighteen, being published in 1855. It met with success and was followed by upwards of fifty other efforts in fiction. 'Grandmother's Money' (1860; 2nd edit. 1862) secured a wide vogue, which was maintained in an anonymous series of semi-religious novels: 'High Church' (1860); 'No Church' (1861); 'Church and Chapel' (1863); 'Carry's Confession' (1865); 'Beyond the Church' (1866), and 'Christie's Faith' (1867). Meanwhile he was equally successful with two works of a different character: 'Female Life in Prison, by a Prison Matron' (1862) and 'Memoirs of Jane Cameron, Female Convict' (1863). These sketches and stories, based upon actual records, were so realistic in treatment as to be mistaken for literal history. Donations for prisoners reached Robinson, and his revelations led to improvement in the conditions of prison life. (These works are wrongly assigned by Halkett and Laing and by Cushing to Mary Carpenter [q. v.], the philanthropist.) Robinson was also a pioneer in novels of low life, which included 'Owen, a Waif' (1862; new edit. 1870); 'Mattie, a Stray' (1864; new edit. 1870); and 'Milly's Hero' (1865; 5th edit. 1869). Among his later works of fiction the best were 'Anne Judge, Spinster' (1867; last reissued in 1899), in which the dialogue is excellent; 'No Man's Friend' (1867; last edit. 1884); and 'The Courting of Mary Smith' (1886). 'Poor Humanity' (1868; last edit. 1884) was dramatised by the author and played with some success at the Surrey Theatre with Creswick in the chief rôle, a returned convict. Robinson's last complete novel, 'The Wrong that was done,' appeared in 1892, and a volume of short stories, 'All they went through,' in 1898. Robinson contributed to the 'Family Herald,' 'Cassell's Magazine' and other periodicals, and for some years wrote dramatic criticisms for

the 'Daily News,' the 'Observer,' and other papers. His novels appeared in the three-volume form, and with the extinction of that mode of publication his popularity waned. A disciple of Defoe and Dickens, he wrote too rapidly to put such power as he possessed to the best purpose. Yet his work found constant readers in Dante Gabriel Rossetti and other men of note.

In 1884 Robinson brought out a weekly penny magazine, called 'Home Chimes,' which was heralded by a sonnet from Mr. Theodore Watts-Dunton, and contained contributions by Swinburne, Mow Thomas, and Phil Robinson. In February 1886 the paper was converted into a fourpenny monthly, and was carried on in that form till the end of 1893. Much early work by Mr. J. M. Barrie, Mr. J. K. Jerome, and Mr. I. Zangwill, in whom the editor inspired great attachment, appeared in it. Robinson's friends of an older generation included, besides Swinburne and Mr. Watts-Dunton, Ford Madox Brown, Philip Bourke Marston and his father, and Sir Henry Irving. Chess-playing was among his accomplishments. He died at Elmore House, St. James's Road, Brixton, on 6 Dec. 1901, and was buried in Norwood cemetery. His wife, whose maiden name was Stephens, survived him, with six sons and five daughters. A portrait painted by C. W. Pittard, in possession of the family, is not a satisfactory likeness.

G. LE G. N.

ROBINSON, GEORGE FREDERICK SAMUEL, first MARQUIS OF RIPON (1827-1909), governor-general of India and statesman, was the second son but sole surviving child of Frederick John Robinson [q. v.], who was created Viscount Goderich on 28 April 1827, and Earl of Ripon on 13 April 1833. His father's elder brother was Thomas Philip Robinson, second Earl de Grey (1781-1859), lord-lieutenant of Ireland from 1841 to 1844. His mother was Lady Sarah Albinia Louisa (*d.* 1867), daughter of Robert Hobart, fourth earl of Buckinghamshire [q. v.].

Born on 24 Oct. 1827 at 10 Downing

Street, during the brief tenure of the office of prime minister by his father, George began life with every advantage that high position and political opportunity could offer. His parents anxiously devoted themselves to his care and education, and they preferred private tuition under their direct supervision to public school or university. From 1833 until he succeeded to his father's earldom in 1859 the boy was known by the courtesy title of Viscount Goderich. His father combined conservative instincts with growing liberal aspirations, and his son was to repeat many of his official experiences. As a boy Goderich discussed with his father the stirring political controversies of the day touching religious disabilities, freedom of speech and of meeting, protection, colonial relations, financial strictness, and franchise reform. Many years later, in Feb. 1886, he asserted 'I have always been in favour of the most advanced thing in the liberal programme' (DASENT'S *Life of John Lubbock*).

In 1849 Goderich began a public career as attaché to the special mission—which proved brief and abortive—of Sir Henry Ellis (1777–1855) [q. v.] to Brussels to open negotiations for peace between Austria and Piedmont. For the next two years Goderich devoted himself to social and county work. As a young man he was greatly influenced by the Christian socialist movement which F. D. Maurice, Charles Kingsley, and Thomas Hughes initiated in 1849, and with Tom Hughes he formed a lifelong friendship. When the Christian socialists encouraged the strike of engineers in Lancashire and London early in 1852, Goderich showed his sympathy by sending the strikers 500l. In November of the same year the Christian socialists first gave effect to their endeavour to provide working men with opportunities of advanced education at the Hall of Association, in Castle Street East, Oxford Street. Goderich lectured on entomology (*Working Men's College*, ed. LEWELYN DAVIES, 1904, p. 16). During 1852, also, he wrote a plea for democracy entitled 'The Duty of the Age' which he submitted to Hughes, Charles Kingsley, and J. M. Ludlow, members of the Christian Socialist Publication Committee, and they passed the manuscript for press. When, however, Frederick Denison Maurice, chairman of the committee, read the tract after an edition was printed off, he condemned its extreme radical tendency and gave orders, which were carried out, for the suppression of the pamphlet (MAURICE,

Life of F. D. Maurice, ii. 125–30). At a later period Goderich took an active part in inaugurating the volunteer movement, becoming in 1860 honorary colonel of the first volunteer battalion Prince of Wales's own (West Yorkshire regiment) and subsequently receiving the volunteer decoration.

Goderich first engaged in active politics in July 1852, when he was returned with James Clay as liberal member for Hull. Both were however unseated on petition on grounds of treating. In the following April, at a bye-election at Huddersfield, Goderich successfully contested the seat against another liberal. He represented the constituency for four years, till the end of the parliament. On 29 Jan. 1855 he voted for John Arthur Roebuck's motion for an inquiry into the condition of the army and the conduct of the war in the Crimea, and on the fall of Lord Aberdeen's ministry of all the talents and Lord John Russell's failure to form a ministry, he gave his support to Palmerston until the dissolution of 1857 which followed Cobden's defeat of the ministers on Chinese affairs. On 30 March 1857 he was returned without opposition, but with a conservative colleague, Edmund B. Denison, for the West Riding of Yorkshire. His seat had just been vacated by Cobden. During the session he urged an extension of open competition by means of examination for posts in the civil service. His father's death in Jan. 1859 soon removed him to the upper house as Earl of Ripon, and in the following November his uncle's death made him also Earl de Grey.

From this time Earl de Grey and Ripon, whom Earl Granville in a letter (15 Aug. 1884) to Gladstone described depreciatively as 'a very persistent man with wealth,' rapidly advanced in public life (cf. FITZMAURICE, *Lord Granville*, ii. 364). He received his first recognition from his party by his appointment as under-secretary for war in June 1859, in Palmerston's second administration. For six months in 1861 (Jan. to July) he filled a similar position at the India office, but he returned to the war office and remained under-secretary until on the death of his chief, Sir George Cornwall Lewis, on 13 April 1863, he succeeded to the headship of the war office, with a seat in the cabinet. He was admitted at the same time to the privy council. On 16 Feb. 1866, shortly after Palmerston's death had made Lord Russell prime minister, Ripon succeeded Sir Charles Wood (afterwards Viscount Halifax) at the India office.

Ripon's position as one of the official leaders of the liberal party was thus assured, and when Gladstone formed his first ministry on 9 Dec. 1868, Ripon became lord president of the council, being appointed K.G. next year. On Lord Salisbury's installation as chancellor of Oxford in 1870 Ripon was made hon. D.C.L. During 1870, as president of the council, Ripon was technically responsible for the education bill which his deputy, W. E. Forster, carried with difficulty through the House of Commons. In 1871 a new and vaster responsibility was placed on him. The United States and the United Kingdom at length agreed to appoint a joint high commission for the settlement of American claims against Great Britain in regard to the depredations of the Alabama and other privateering vessels, which had sailed from English ports to aid the South in the late American civil war. Ripon was appointed chairman, to the disappointment of Lord Houghton and others. His colleagues were Sir Stafford Northcote, Sir Edward Thornton, British minister at Washington, Sir John Alexander Macdonald, representative of Canada, and Professor Mountague Bernard. On 8 March 1871 the American case was opened before the commission at Washington. The negotiations proceeded rapidly, and a satisfactory treaty, which among other things referred the American claims to an international tribunal, was signed at Washington on 8 May. Ripon had emphatically declined to discuss indirect losses (see LANG'S *Sir Stafford Northcote*, ii. 9), and an ambiguous clause in the treaty led to subsequent controversy, but the end was a reaffirmation of Ripon's action. For his conduct of the negotiations nothing but praise was due. Northcote wrote enthusiastically of his 'excellent sense, tact, and temper' (MORLEY'S *Life of Gladstone*, bk. vi. ch. ix.). His services were rewarded by promotion to a marquissate on 23 June 1871. On 19 March 1873 he was made lord-lieutenant of the North Riding.

In Aug. 1873 Ripon caused general surprise by resigning his cabinet office on the ground of 'urgent private affairs.' The 'private affairs' concerned his spiritual struggles, of which his intimate friends were kept in ignorance. Hitherto he had been a zealous freemason, and on 23 April 1870 had become Grand Master of the Freemasons of England. That office he resigned without explanation in Aug. 1874. Next month, on 7 Sept., he was received into the Roman catholic com-

munion at the Brompton Oratory. The step, which caused widespread astonishment, was the fruit of anxious thought. During the conservative administration of 1874-80 Ripon lived much in retirement. But he was active in the affairs of the religious community which he had joined, and was thenceforth reckoned as authoritative a leader of the Roman catholic laity in England as the duke of Norfolk. Both men joined in 1878 in urging on Manning Newman's claims to the cardinalate (PURCELL'S *Life of Manning*, ii. 554). John Hungerford Pollen [q. v. Suppl. II], who had gone through the same religious experiences, became Ripon's private secretary in 1876, and was on confidential terms with him.

On Gladstone's return to power in April 1880 Ripon fully re-entered public life and proved that his religious conversion had in no way impaired his devotion to public duty (cf. CARDINAL BOUENE, *The Times*, 12 July 1909). On 28 April he was appointed governor-general of India on the resignation of Lord Lytton. Ripon's health seemed hardly robust enough for the office, but he gained strength after settling in India. He took over charge at Simla on 8 June 1880.

A critical position in Afghanistan at once confronted him. Sir Donald Stewart, after recognising Wali Sher Ali as independent governor of Kandahar, had joined forces with General Roberts at Kabul, expecting to evacuate Afghanistan in the near future. The attitude of the Afghan nobles and people was one of sullen tranquillity, while Lepel Griffin [q. v. Suppl. II], chief political agent of the government of India, was waiting to complete negotiations with Abdur Rahman, who was secretly exciting the nobles to fresh hostilities and demanding assurances as to British intentions with regard both to Kandahar and to his own bearing towards his late allies the Russians. Lord Ripon acted with vigour. Under his orders Abdur Rahman was proclaimed Amir at Kabul on 22 July, after he had been informed (14 June) that he could have no political relations with any foreign power except the English, while if any such power interfered and 'such interference should lead to unprovoked aggression on the Kabul ruler,' he would receive aid in such a manner and at such a time as might be necessary to repel it, provided he followed British advice. This cautious intimation has stood the test of time, and was reaffirmed by Lord Curzon in the formal treaty of 21 March 1905, concluded with

Abdur Rahman's son and successor. Meanwhile the unexpected happened. Ayub Khan, Sher Ali's younger son, who had been holding Herat, took advantage of Stewart's absence, and defeated General Burrows at Maiwand on 27 July 1880. Lord Ripon again showed no wavering. He authorised the march of Roberts from Kabul to Kandahar. The Afghans were routed; Stewart in September withdrew his troops from Kabul; and before the year closed Kandahar was evacuated and in due course reunited to Kabul by the Amir. Each step in this policy was fiercely contested at home and in India, but the viceroy carried it out without faltering, and without incurring any of the predicted evil consequences.

The three other main episodes of Ripon's Indian administration—his dealings with the press, his development of schemes of self-government, and the Ilbert bill—call for a more qualified judgment than Ripon's triumphant policy in Afghanistan. The Vernacular Press Acts, ix. and xvi. of 1878, passed by Lord Lytton's government, were capable of amendment, but to Lord Ripon's strong liberalism they were wholly objectionable as conflicting with British traditions of the freedom of the press, and they were hastily repealed in 1882. Lord Ripon scarcely realised the differences between the conditions attaching to the press in the two countries. The vernacular press of India did not further discussion, but was used by political intriguers to spread false reports and create an attitude of hostility not against a party in the state but against the reign of law and order. None of the effective safeguards which the hostility of public opinion to untruth and extravagance provides in England are available in India. After nearly thirty years' experience, press restrictions 'for the better conduct of the press' were re-imposed by Viscount Morley, a liberal secretary of state for India, in 1910, and Lord Ripon's action in 1882 was proved so far to be too uncompromising.

Ripon's efforts to encourage the development of self-government in India were similarly marred by the tendency to judge India by British standards. The viceroy made clear his point of departure when he announced in the 'Gazette of India,' dated 4 Oct. 1882, that 'only by removing the pressure of direct official interference can the people be brought to take sufficient interest in local matters.' In the next few years the provincial governments passed laws entrusting local bodies with education, dispensaries, and the concern of other local

requirements, but it was found impossible to expect or seek for self-government in rural or small urban areas without official guidance. The educated classes in India welcomed the reform. But although Ripon gave new force to the transfer of public duties to local boards, little progress was effected, as is shown by the report of the royal commission on decentralisation presided over in 1907 by Mr. C. E. Hobhouse, a sympathiser with Ripon's aims. Section 806 of the report puts the matter thus: 'Those who expected a complete revolution in existing methods in consequence of Lord Ripon's pronouncement were inevitably doomed to disappointment. The political education of any people must necessarily be slow, and local self-government of the British type could not at once take root in Indian soil.'

In the racial controversy over the 'Ilbert bill' which Ripon's action fanned he showed no better appreciation of Indian conditions. On 23 Feb. 1882 he declared in council that he would 'be very glad if it was possible to place the law in regard to every person not only on the same footing, but to embody it in the very same language whether it relates to Europeans or natives.' At the time the Criminal Procedure Code, which amended and consolidated the law based on Macaulay's famous Indian Law Commission, was being enacted. By chapter xxxiii. of this Act only magistrates who were justices of the peace, or judges who were European British subjects, or judges of the highest court of appeal, were empowered to try (with jurors or assessors) Europeans and Americans charged with criminal offences. Although there was no general demand for a change of law, on 30 Jan. 1883 Sir Courtenay Ilbert, then legal member, introduced into the council, in the spirit of Lord Ripon's declaration, a bill 'to remove from the Code at once and completely every judicial disqualification which is based merely on race distinctions.' Lord Ripon, in the course of subsequent debates in March 1883, added fuel to the fire by the imputation that the opposition to the bill was 'really opposition to the declared policy of parliament about the admission of natives to the covenanted civil service.' British planters and traders felt that justice and not privilege was at stake. They had no complaint whatever against the admission of Indians by competition. What they feared was trial by inexperienced Indian magistrates. During several months violent and unreasonable speeches and memorials on both

sides agitated India. Eventually a compromise which would have been accepted at the outset was arrived at, and jurisdiction over Europeans was given to certain qualified native officials, while the right was reserved of the accused person to trial by a jury of which half should be Europeans. There was no further attempt to 'remove at once and completely every judicial disqualification.'

Apart from these errors of somewhat hasty language which, while gratifying native feeling, had the unfortunate effect of alienating the Anglo-Indian population, Ripon's administration was excellent. He was a good man of business, hard-working, of transparent honesty, and loyal to his colleagues in council and his subordinates. Ably served by Sir Evelyn Baring (afterwards Earl Cromer), he developed the system of provincial settlements introduced by Lord Mayo in 1871. Local governments were no longer limited to a fixed grant, they were encouraged to be careful in collection and economical in expenditure by being entrusted with the whole product of some sources of revenue and a share in other receipts. Although the Bengal Tenancy Act was not passed until 1885, that important measure was made ripe by Lord Ripon for legislation. In education important reforms were introduced as the result of the comprehensive report of the commission of 1882 which he appointed. He left India in December 1884, having prepared the ground for the reception of the Amir of Afghanistan at Rawalpindi in April 1885, by his successor, Lord Dufferin.

At home, tory opponents had attacked Ripon's 'policy of sentiment,' and on his return he spoke vigorously in defence of his Indian administration (cf. Ripon's speech at National Liberal Club on 29 Feb. 1885). He at once resumed his place among the liberal leaders. Gladstone's brief return to office, Feb. to Aug. 1886, brought him back to the cabinet as first lord of the admiralty. He supported Gladstone's home rule policy, and was rewarded by the bestowal on him of the freedom of the city of Dublin in 1898. Lord Morley received the distinction at the same time. In Gladstone's fourth ministry of 1892, and in that of Lord Rosebery of 1894, he took charge of the colonial office. His approval of the Matabele war of 1894 strained the allegiance of many of his own party. When the unionists resumed office in 1895, Ripon entered on a period of comparative inactivity. On Mr. Balfour's

resignation and the formation of the ministry of Sir Henry Campbell-Bannerman, 5 Dec. 1905, Lord Ripon accepted the privy seal with the post of leader of the party in the lords, which the recent illness of Lord Spencer had left vacant. The task which devolved upon him at the advanced age of seventy-eight was no light one. Supporters of the liberal party in the house were few, while the opposition was powerfully represented. The liberal measures which had to be recommended to the chamber were peculiarly distasteful to the majority of its members. The House of Lords rejected the government's education bill of which Lord Crewe had charge in 1907, the licensing bill in 1908, and other measures. Lord Ripon faced his difficulties with characteristic tact and courage, and while he endeared himself by his geniality and good-humour to his small band of followers he commanded the respect of his foes. He seldom spoke at great length, but the clear and pithy sentences in which he wound up the debates, and embodied his long experience of business and the traditions of the upper house, carried weight. Within the cabinet his wide knowledge of foreign and colonial affairs was of value to his party on its resumption of power after long exclusion. The death of Lord Kimberley in 1902, the enforced withdrawal of Lord Spencer in the same year, and the retirement of Lord Rosebery from official life gave him exceptional prestige. On 9 Nov. 1906 he replied for the government, in the absence, through mourning, of Campbell-Bannerman, the prime minister, at the lord mayor's annual banquet. In 1908, when Mr. Asquith succeeded Campbell-Bannerman, Lord Ripon at length retired. He resigned the leadership of the upper house to Lord Crewe on 14 April 1908, and the office of lord privy seal on 8 Oct. At a lunch given to him at the Savoy Hotel by the Eighty Club on 24 Nov. 1908 he delivered his farewell address to his political friends. In reviewing his fifty-six years of public life he said 'I started at a high level of radicalism. I am a radical still.' On 9 July 1909 he died of heart failure at Studley Royal, Ripon. His body was placed in the vault beneath the church of St. Mary the Virgin in Studley park on 14 July, and a solemn requiem mass was sung at Westminster Cathedral in the presence of a large congregation.

On 8 April 1851 he married his cousin, Henrietta Anne Theodosia, eldest daughter of Henry Vyner of Gauthby Hall, Horncastle, and granddaughter of Thomas Philip,

second Earl de Grey. He was succeeded in the title by his only son, Frederick Oliver, Earl de Grey (b. 29 Jan. 1852).

Portraits were painted by Sir Edward Poynter, P.R.A., in 1886; by Sir Hubert von Herkomer (for presentation) in 1894; and by G. F. Watts, R.A., in 1896. Cartoon caricatures by 'Ape' and 'Spy' appeared in 'Vanity Fair' in 1869 and 1892 respectively.

ROBINSON, SIR JOHN (1839-1903), first prime minister of Natal, son of George Eyre Robinson, was born at Hull, Yorkshire, in 1839, and came out to Natal with his parents in 1850. Coming to a colony which was only seven years old, where there were as yet no secondary schools, he had little chance of education, apart from the stimulus of 'cultured parents.' Entering the office of the 'Natal Mercury,' which his father started, he cherished leanings towards the life of a missionary, and then towards the law; but he finally accepted the career of journalism, and by the time of his majority was able to take over the active management of the paper from his father, whose health had failed (31 March 1860). In September 1860 he entered into partnership with Mr. Richard Vause, afterwards a prominent mayor of Durban; but himself remained editor.

Arranging for the conduct of the 'Mercury' during his absence, in 1861 he journeyed to England by the east coast of Africa, Mauritius, and the Red Sea, whence he passed through Egypt, Palestine, Syria, certain of the Levant and Mediterranean ports to Athens, Rome, and Paris. He stayed some five months in the United Kingdom, where he studied the International Exhibition of 1862, and lectured on the colony; he also visited part of the Continent before setting out for Natal again. Six months after his return in 1863 he was elected to the council for Durban, thus becoming one of the twelve elected members of the old legislative council, with the work

of which he had been familiar in the first instance as reporter.

But Robinson devoted himself chiefly to his newspaper and literary work. The 'Natal Mercury' passed from a weekly paper to three issues a week, and thence to a daily paper. He contributed to the neighbouring press at Capetown, and to home journals such as the 'Cornhill Magazine,' where his first article, 'A South African Watering Place,' appeared in 1868. He also found time to write a good novel, 'George Linton' (1876). He maintained a reputation as a lecturer, but this work became gradually merged in the more absorbing claims of the political platform.

After some fifteen years' experience of administration by the crown, Robinson formed a strong opinion in favour of responsible government for Natal. He had been impressed by the troubles of the Langalibalele affair in 1873; he was a delegate for Natal at the South African Conference in London in 1876, and then had to face the Zulu campaign in 1879. Convinced that it was his mission to obtain self-government for the colony, he was opposed by his friend Sir Harry Escombe [q. v. Suppl. I], and his policy was defeated in the elections of May 1882, when he lost his seat for Durban. He was nevertheless back in the council in 1884, and in 1887 was chosen as their representative at the Colonial Conference in London of that year. On the occasion of this visit to England he was received by Queen Victoria and presented the colony's loyal address. In 1888 he represented Natal in the South African Customs Conference which led to the formation of the Customs Union. He was created K.C.M.G. in 1889. But he always kept before him the ideal of a self-governed colony, and his writings and speeches gradually convinced his opponents; in 1892 he had the satisfaction of finding Escombe fighting by his side. He was one of the representatives who proceeded to England in that year to press the colonists' views.

Robinson's efforts proved successful, and on 4 July 1893, when the new régime began, he assumed office as the first prime minister of Natal, with the portfolios of colonial secretary and minister of education. The gradual organisation of a responsible administration was effected quietly, and Robinson's nearly four years of office were uneventful. In March 1897 he resigned on account of failing health, hastening his retirement so that his successor might accept the invitation to Queen

Victoria's Diamond Jubilee. He went to England that summer in a private capacity, and thence on to Rome, of which he was fond, and which he revisited in 1900.

In 1898 the legislature voted him a pension of 500*l.* a year. For the rest of his life he mainly lived in retirement at his home, the Gables, Bayside, Durban, where he died on 5 Nov. 1903. He was buried at the Durban cemetery; the staff of the 'Mercury' bore him to his grave.

Robinson's life was governed by the highest ideals and motives. As a journalist he aimed not only at style and lucidity but at justice and temperance of statement.

He married in 1865 Agnes, daughter of Dr. Benjamin Blaine of Verulam, Natal, who survived him; he had issue three sons and four daughters. A statue of him was erected in the Town Gardens of Durban, and some scholarships were also founded from the money subscribed.

In addition to the work cited, Robinson published: 1. 'The Colonies and the Century,' 1899. 2. 'A Lifetime in South Africa,' 1900.

[Natal Mercury, 6 and 7 Nov. 1903; Natal Witness, 6 Nov. 1903; South Africa, 7 Nov. 1903; Henderson's Durban, p. 217; Natal Blue Books, 1882 sqq.] C. A. H.

ROBINSON, SIR JOHN RICHARD (1828-1903), journalist, born on 2 Nov. 1828 at Witham, Essex, was second son of eight children of Richard Robinson, congregational minister, by his wife Sarah, daughter of John Dennant, also a congregational minister, of Halesworth, Suffolk. At eleven he entered the school for the sons of congregational ministers, then at Lewisham, but now at Caterham. Withdrawn from school on 26 June, 1843, he was apprenticed to a firm of booksellers at Shepton Mallet. His ambitions, however, were directed towards journalism, and his first effort was a descriptive account (in the 'Daily News,' 14 Feb. 1846) of a meeting of Wiltshire labourers to protest against the corn laws. After reporting for the 'Bedford Mercury,' he obtained a post on the 'Wiltshire Independent' at Devizes, and soon sent regular reports of the local markets to the 'Daily News.' In 1848 Robinson went to London. Having become a unitarian, he was made sub-editor of a unitarian journal, the 'Inquirer,' and did most of the work for John Lalor [q. v.], the editor. His next post was on the 'Weekly News and Chronicle,' under John Sheehan [q. v.], and in 1855 he became editor of the 'Express,' an evening paper in the same

hands as the 'Daily News.' At the same time he was a prolific contributor elsewhere. He cherished a deep interest in movements for freedom throughout Europe. He had a profound reverence for Mazzini, who asked to make his acquaintance after reading an appreciation of himself from Robinson's pen. He also knew Kossuth, Garibaldi, and other revolutionary leaders.

In 1868, when the price of the 'Daily News' was reduced to one penny, Robinson was appointed manager. Under his direction the fortunes of the paper, which had been falling, quickly rose. He saw that the public demanded news not only quickly but in an attractive form. At the opening of the Franco-German war he instructed his correspondents to telegraph descriptive details and not merely bare facts, and after the war was well in progress he secured with exemplary promptitude the services of Archibald Forbes [q. v. Suppl. I], who long remained a valuable contributor. At the prompting of another correspondent, John Edwin Hilary Skinner [q. v.], he started the 'French Peasants Relief Fund,' which reached a total of 20,000*l.*

On 22 June 1876 Mr. (afterwards Sir) Edwin Pears of Constantinople contributed to the 'Daily News' the first of a series of letters describing Turkish atrocities in Bulgaria. Public indignation was roused, and Robinson sent out an American journalist, Januarius Aloysius MacGahan, who was accompanied by Mr. Eugene Schuyler, the American consul-general in Turkey, to make inquiries. Pears's charges were corroborated, and Robinson's services were warmly acknowledged by Bulgarians. In 1887 Robinson became titular editor, the actual night editing being carried on chiefly by Peter William Clayden [q. v. Suppl. II]. In 1893 he was knighted. The fortunes of the paper meanwhile declined. In 1896 (Sir) E. T. Cook became editor with undivided control of policy, and Robinson resumed his post of manager. During 1899 and 1900 the editor supported the South African war. The sympathies of Robinson were with the Boers. Early in 1901 the paper was sold to a new proprietor of pro-Boer sentiment, and the engagement of the editor, (Sir) E. T. Cook, was terminated. On different grounds Robinson's management then came to an end (Feb. 1901). At a dinner given him by the former proprietors he was presented with a service of plate and his portrait was painted by E. A. Ward (now owned by his son, Mr. O. R. Robinson).

Robinson was an habitué of the Reform Club, and formed one of the circle in which

James Payn, William Black, Sir Wemyss Reid, and George Augustus Sala were conspicuous. He was an excellent raconteur and mimic, a great reader, especially of modern French literature, and a regular 'first night' visitor to the leading theatres.

In 1854 Robinson became a professional member of the Guild of Literature and Art, a society which was founded by Charles Dickens and his friends for the benefit of authors and artists. The guild failed to fulfil the aims of its founders, and Robinson with Frederick Clifford [q. v. Suppl. II], as the last surviving trustees, arranged for its dissolution in 1897. In 1897 he was chairman of the Newspaper Press Fund dinner, and in 1898 of the Newspaper Society dinner; the former body represents journalists, and the latter proprietors. No other active journalist has filled the double office.

Robinson died in London on 30 Nov. 1903, and was buried in Highgate cemetery. He married on 14 July 1859 Jane Mapes (d. 1876), youngest daughter of William Granger of the Grange, Wickham Bishops, Essex; he had one son and one daughter.

[The Times, and Daily News, 2 Dec. 1903; F. Moy Thomas, *Recollections of Sir J. R. Robinson*, 1904; *Memoirs of Sir Wemyss Reid*, 1905, pp. 253-5; G. W. Smalley's *Anglo-American Memories*, 1911; private information; personal recollections.]

W. B. D.

ROBINSON, PHILIP STEWART, 'PHIL ROBINSON' (1847-1902), naturalist and author, born at Chunar, India, on 13 Oct. 1847, was eldest son in a family of three sons and three daughters of Julian Robinson, Indian army chaplain and editor of the 'Pioneer,' by his wife Harriet Woodcocke, daughter of Thomas Sharpe, D.D., vicar of Doncaster and canon of York. After education at Marlborough College (August 1860 to Midsummer 1865), he was from 1866 to 1868 librarian of the free library, Cardiff. He resigned this post to go to India, where he assisted his father in editing the 'Pioneer' in 1869; he was appointed editor of the 'Revenue Archives' of the Benares province in 1872, and became in 1873 professor of literature and of logic and metaphysics in Allahabad College. He was also censor of the vernacular press. Returning to England in 1877, he joined the staff of the 'Daily Telegraph' as leader writer.

In 1878 he was correspondent of the 'Daily Telegraph,' both in the second Afghan campaign and in the Zulu war. Between

1878 and 1893 he acted as publisher's reader for Messrs. Sampson Low and Co., and edited and prepared for the press Stanley's 'Through the Dark Continent' (1878). From 1881-2 he was special commissioner of the 'New York World' in Utah, and later in 1882 went to Egypt as war correspondent of the 'Daily Chronicle.' Subsequently he made lecturing tours through the United States and Australia, and in 1898 was correspondent at first of the 'Pall Mall Gazette' and then of the Associated Press in Cuba during the Spanish-American war. The hardships of the Cuban campaigns, including imprisonment and fever, undermined his health, and in his last year he wrote very little beyond occasional articles for the 'Contemporary Review' and for 'Good Words.' He died on 9 Dec. 1902. He married in 1877 Elizabeth King, by whom he had issue, a daughter and a son.

Robinson was one of the pioneers of Anglo-Indian literature, and was foremost in inaugurating the literature descriptive of animate nature in India. His essays on the common objects of Indian scenery abound in keen observation and whimsical humour and show literary skill and taste. His work, which found many imitators, anticipated Mr. Rudyard Kipling's early devotion to Indian themes. Robinson's published works include: 1. 'Nugæ Indicæ, or on Leave in my Compound,' Allahabad, 1871; subsequently published with additions and a preface by (Sir) Edwin Arnold, under the title of 'In my Indian Garden' (three editions, London, 1878; 8th edit. 1893). 2. 'Under the Punkah,' 1881; 3rd edit. 1891. 3. 'Noah's Ark, or Mornings at the Zoo,' 1881. 4. 'Under the Sun,' Boston, 1882. 5. 'The Poet's Birds,' 1883. 6. 'Sinners and Saints: a Tour across the States and round them,' 1883 (new edit. 1892). 7-9. The 'Indian Garden' series, which enjoyed the largest circulation of any of Robinson's books: 'Chasing a Fortune,' 18mo, 1884; 'Tigers at Large,' 18mo, 1884; and 'The Valley of Teetotum Trees,' 18mo, 1886. 10. 'The Poet's Beasts,' 1885. 11. 'Some Country Sights and Sounds,' 1893. 12. 'The Poets and Nature,' 1893. 13. 'Birds of the Wave and Woodland,' 1894. 14. 'In Garden, Orchard and Spinney,' 1897. 15. 'Bubble and Squeak,' 1902. 16. (With Edward Kay Robinson and Harry Perry Robinson) 'Tales by Three Brothers,' 1902.

[Allibone's Dict. of Eng. Lit.; Who's Who, 1902; Cardiff Free Libraries Annual Reports;

information from brother, Mr. Harry Perry Robinson, and Sampson Low, Marston & Co.]
W. B. O.

ROBINSON, VINCENT JOSEPH (1829–1910), connoisseur of oriental art, born in London on 5 March 1829, was eldest of three sons of Vincent Robinson, sailing ship-owner and merchant, by his wife Elizabeth Hannah. A younger brother, Henry, was president of the society of civil engineers and professor of civil engineering at King's College, London, from 1880 to 1902. Of his two sisters, Elizabeth Julia Robinson d. 1904) obtained repute as an etcher; a posthumous exhibition of her work being held at the Fine Art Gallery, Bond Street, in 1905.

After education at private schools at Kilburn and Finchley, Vincent studied at King's College, London. On his father's premature death he extricated his affairs from confusion, and soon built up a prosperous concern as a merchant and commission agent. Interesting himself in the industrial arts of India, Robinson dealt largely in oriental ware of fine character, and at the same time studied the problem of preserving the artistic handicrafts of India. Sir George (then Dr.) Birdwood, who on his return from Bombay entered the India office in 1871, gave Robinson much encouragement. At the Paris exhibition of 1878 Robinson showed some oriental carpets which attracted general attention, and he published in 1882, under the title of 'Eastern Carpets' (London, large 4to), reproductions of the patterns of these and other carpets from water-colour drawings by his sister; Sir George Birdwood supplied descriptive notices. The work preceded the more authoritative treatises of Wilhelm Bode (Leipzig, 1890) and Alois Riegl (Leipzig, 1891). Published originally at three guineas, the price soon rose to ten (cf. *Encycl. Brit.* 11th edit., v. 396–7, s.v. 'Carpets'). Robinson's example, in part at least, led the Austrian Commercial Museum to prepare and publish its monumental work on 'Oriental Carpets' (Vienna, 1892–6; English edition by Sir Caspar Purdon Clarke), to which Robinson was a contributor.

Robinson was director of the Indian section of the Paris Exhibition, 1889, and was made a knight of the Legion of Honour. He was elected F.S.A. the same year (6 June), and he was created C.I.E. in May 1891. About 1878 his business was turned into the limited liability company which, trading in Wigmore Street, still bears his name. He was at first managing director, but soon severed his direct connection with

the firm. With his sister, Elizabeth Julia, his lifelong companion, he devoted himself to collecting treasures of decorative art in France, Spain, Italy, and Egypt. In 1894–5 he made a long tour in India.

His collections were first housed at Hopedene, a house near Dorking, built by Mr. Norman Shaw, R.A., but in October 1896 he purchased Parnham House, a fine old Tudor mansion near Beaminster, Dorsetshire, which he restored. There he classified his possessions, describing their main features in 'Ancient Furniture and other Objects of Art, illustrative of a Collection formed . . . at Parnham House, Dorset' (4to, 1902). On the death, on 16 Oct. 1904, of his sister, to whose memory he erected a market-cross at Beaminster, he built another residence, Netherbury Court, overlooking the village churchyard where she was buried. There he died unmarried on 21 Feb. 1910, and was buried by his sister's side. The artistic contents of Parnham were sold there by auction (2–9 Aug. 1910), realising 13,510l. Blunt and plain-spoken, Robinson helped to revive in Europe the taste for oriental art.

[Robinson's writings; The Times, 23 Feb. and 10 Aug. 1910; Times of India, 1 March 1910; Frank Archer's *An Actor's Notebooks*, 1912 (with photograph); Birdwood's *Handbook to the British Indian Section 1878*; papers lent by his nephew, Mr. Keith Robinson; personal knowledge.] F. H. B.

ROGERS, EDMUND DAWSON (1823–1910), journalist and spiritualist, born at Holt, Norfolk, on 7 Aug. 1823, was only surviving child of John Rogers and Sarah Dawson his wife.

After education at the Sir Thomas Gresham grammar school in his native town, and working for six years as chemist's apprentice and then as a chemist on his own account, he went in 1845 as surgeon's dispenser to Wolverhampton. He soon afterwards joined the staff of the 'Staffordshire Mercury,' published at Hanley, and in 1848 went to Norwich to take charge of the 'Norfolk News,' a weekly periodical founded in 1845. On 10 Oct. 1870 he started for the proprietors of the 'Norfolk News' the first daily paper in the eastern counties, the 'Eastern Counties Daily Press,' which since May 1871 has been known as the 'Eastern Daily Press.' Removing early in 1873 to London, he established the National Press Agency in Shoe Lane (now in Tudor Street); this he managed until his retirement on a pension in 1894. In his early days in London Rogers helped to

produce a weekly paper, 'The Circle'; later he produced on his own account 'The Tenant Farmer' and 'The Free Speaker' (1873-4).

Rogers, who had been brought up a strict Wesleyan, was introduced by Sir Isaac Pitman [q. v. Suppl. I] to Swedenborg's writings, which greatly influenced his religious views; later he was led to study mesmerism and mesmeric healing. He had also while living at Hanley made the acquaintance of Joseph Barker [q. v.]. Convincing himself of the genuineness of spiritualistic manifestations, he helped to form in 1873 the British National Association of Spiritualists. On 8 Jan. 1881 he founded a weekly journal, 'Light,' which became the leading organ of spiritualism and psychical research, and was its editor from 1894 till his death. In 1882 Rogers, Prof. W. F. Barrett, and others joined in establishing the Society for Psychical Research; among the original members were F. W. H. Myers [q. v. Suppl. I], Prof. Henry Sidgwick [q. v. Suppl. I], Edmund Gurney [q. v.], and William Stainton Moses [q. v.]. Rogers was a member of the council from 1882 to 1885. Although painstaking and cautious in psychical research, Rogers, to whom spiritualism was of vital importance, had little sympathy with what he considered the anti-spiritualistic bias of the Psychical Research Society, and resigned his membership in its early years, although he subsequently became an honorary member in 1894. In 1884 he was a founder of the London Spiritualist Alliance, of which he was president from 1892 to death.

On his eightieth birthday he was presented with an album consisting of an illuminated address signed by 1500 spiritualists from all parts of the world. In July 1907 his health failed, and he died at Finchley on 28 Sept. 1910. He was buried in the Marylebone cemetery, Finchley. His 'Life and Experiences,' an autobiography, came out in 1911. Rogers married, on 11 July 1843, Sophia Jane (d. 1892), daughter of Joseph and Ann Hawkes, and had issue two sons and four daughters. The younger surviving daughter, Alice, married in January 1908 Mr. Henry Withall, treasurer and vice-president of the London Spiritualist Alliance.

His portrait in oils, painted by James Archer, R.S.A. [q. v. Suppl. II], in 1901, was presented by the artist to the London Spiritualist Alliance.

[Light, 8 Oct. 1910 (obit. memoir), 15 Oct., and following issues (autobiography); published

separately as *Life and Experiences of Dawson Rogers*, 1911 (portraits); *Mystic Light Library Bulletin*, Feb. 1912; *Journ. Soc. Psych. Research*, Oct. 1910, xiv. 372; Rogers's horoscope by John B. Shipley (Saraastro) in *Modern Astrology*, March 1911, pp. 106-109; J. S. Farmer's 'Twixt Two Worlds', pp. 147 seq.; F. Podmore, *Modern Spiritualism*, 1902, ii. 176-8; private information.] W. B. O.

ROGERS, JAMES GUINNESS (1822-1911), congregational divine, one of thirteen children of Thomas Rogers (1796-1854), of Cornish birth, by his wife Anna, daughter of Edwin Stanley, of Irish birth (connected, through her mother, with the Guinness family), was born on 29 December 1822 at Enniskillen, where his father (like his mother, originally an Anglican) was a preacher in the service of the Irish Evangelical Society (congregational). His father, a successful preacher, removed to Armagh, and in 1826 to Prescott, where he was 'on terms of close intimacy with the unitarian minister,' Gilbert William Elliott. His first schooling was at Silcoates, near Wakefield. Through the kindness of his relative, Arthur Guinness (1768-1855), grandfather of Baron Ardilaun and of Viscount Iveagh, he entered Trinity College, Dublin, where he was a contemporary of William Digby Seymour [q. v.], and latterly was engaged as teacher in an English school. After graduating B.A. in 1843 he entered the Lancashire Independent College, Manchester, where he had as contemporaries Robert Alfred Vaughan [q. v.] and Enoch Mellor; the latter appears to have influenced him most. Leaving in 1845, he was ordained on 15 April 1846, and became minister of St. James's chapel, Newcastle-on-Tyne, where he had to combat the rationalistic spirit engendered by Joseph Barker [q. v.] and came under the spell of Edward Miall [q. v.]. In 1851 he removed to the pastorate of Albion Chapel, Ashton-under-Lyne, then known as 'Cricketty,' from its situation off Crickets' Lane (a fine Gothic structure now takes its place). His ministry here was one of great power, and he was the means of erecting new school premises. In 1857 charges of heresy were brought against Samuel Davidson [q. v. Suppl. I], who as one of his tutors had taken part in the ordination of Rogers. The main point was an alleged impugning of the Mosaic authorship of the Pentateuch. Nothing contributed more to the expulsion of Davidson from his chair in the Lancashire Independent College than a bitter pamphlet,

'Dr. Davidson: His Heresies, Contradictions, and Plagiarisms. By Two Graduates' [namely, Mellor and Rogers] (1857). Long after, Rogers wrote of Davidson: 'The controversies of later years separated us, but they never led me to forget or under-rate the benefit I derived from his patient, painstaking, and most valuable labours' (*Autobiog.* 1903, p. 70); this contradicts the tone of the pamphlet, but Rogers was a man who mellowed in many respects as time went on. In 1865 he was chairman of the Lancashire Congregational Union. In the same year he removed to the pastorate of Clapham (Gratton Square) congregational church. Here he ministered till 1900. His denomination honoured him by making him chairman of the Surrey Congregational Union (1868), of the London Congregational Union, and of the Congregational Union of England and Wales (1874). His influence extended beyond his own body, till he came to be regarded, almost as Calamy had been in the early eighteenth century, as the representative of sober yet convinced nonconformity, and was trusted as such by leading authorities in church and state. His friendship with Gladstone was not merely political, but rested on a common feeling of the necessary religious basis for public movements. Edinburgh University made him an honorary D.D. in 1895. He retained his interest in public affairs and his power of address almost to the last. After a short period of failing health he died at his residence, 109 North Side, Clapham Common, on 20 August 1911, and was buried at Morden cemetery, Raynes Park.

He married in 1846 Elizabeth (*d.* 1909), daughter of Thomas Greenall (1788-1851), minister of Bethesda Church, Burnley (1814-48). His three sons and one daughter survived him.

His publications include: 1. 'The Life of Christ,' 1849 (twelve lectures). 2. 'The Ritual Movement. A Reason for Disestablishment,' 1869. 3. 'Why ought not the State to give Religious Education?' 1872. 4. 'Nonconformity as a Spiritual Force,' 1874. 5. 'Facts and Fallacies relating to Disestablishment,' 1875. 6. 'Anglican Church Portraits,' 1876 (a book of merit). 7. 'The Church Systems of England in the Nineteenth Century,' 1881, 1891. 8. 'Friendly Disendowment,' 1881. 9. 'Clericalism and Congregationalism,' 1882 (Jubilee lecture, Congregational Union). 10. 'Present-day Religion and Theology; . . . Down-grade Controversy,' 1888. 11. 'The Forward Movement of the Christian Church,' 1893. 12. 'The Gospel

in the Epistles,' 1897. 13. 'The Christian Ideal: a Study for the Times,' 1898. 14. 'An Autobiography,' 1903 (five portraits; vivid impressions, with lack of dates). 15. 'The Unchanging Faith,' 1907 (his best book; has a Quaker publisher). He also edited the 'Congregationalist' (1879-86) and the 'Congregational Review' (1887-91).

[Autobiography, 1903; The Times, 21 Aug. 1911; Who's Who, 1911; Congregational Year Book, 1912; B. Nightingale's Lancashire Nonconformity, 1891, ii. 159, iv. 161, 245.]

A. G.

ROLLS, CHARLES STEWART (1877-1910), engineer and aviator, born on 28 Aug. 1877 at 35 Hill Street, Berkeley Square, London, was third son of John Allan Rolls, first Baron Llangattock (1837-1912), of The Hendre, Monmouth, by his wife Georgiana Marcia, fourth daughter of Sir Charles FitzRoy Maclean, ninth baronet, of Morvaren.

After education at Eton from 1890 to 1893, where he specialised in practical electricity, he matriculated from Trinity College, Cambridge, in 1895, graduating B.A. in mechanical engineering and applied sciences in 1898, and proceeding M.A. in 1902. Rolls was a cyclist from boyhood, riding the high bicycle, and obtaining considerable reputation in the amateur racing field; he won his 'half-blue' for cycling at Cambridge in 1896, and was captain of the university racing team in 1897.

After leaving the university Rolls made a study of practical engineering; he spent some time at the L. & N. W. railway works at Crewe, obtained a third engineer's (marine) certificate and for a time was engineer on his father's yacht 'Ave Maria.' Already in his first year as an undergraduate Rolls had interested himself in the then recent French invention of the motor car. In Dec. 1895 he purchased and imported into England a $3\frac{1}{2}$ h.p. Peugeot car, then the most powerful made. Sir David Salomons, the Hon. Evelyn Ellis, and Mr. T. R. B. Elliot were the only Englishmen who previously owned automobiles. The traffic legislation at the time forbade self-propelled vehicles to travel faster than four miles an hour, and a man carrying a red flag had to precede them on highways. On procuring his car Rolls set out from Victoria station, London, for Cambridge, and was stopped by a policeman owing to the absence of a red flag. He made the journey to Cambridge in $11\frac{3}{4}$ hours—travelling at $4\frac{1}{2}$ miles an hour. In Aug. 1896 the Locomotives on Highways Act freed motor traffic of some

of its restrictions. The maximum speed, which was then limited to twelve miles an hour, was raised to twenty by a new Act of 1903. Rolls was prominent among the Englishmen whose sedulous experiments in driving brought motor cars into general use in Great Britain. He met with many hairbreadth escapes, but his courage was indomitable. He tested with intelligent eagerness the numerous improvements in mechanism, with a view to increased speed, which the French pioneers devised. Joining the Self-propelled Traffic Association, he was soon a member of the Automobile Club of France, which was started in 1895, and in 1897 he became a member of the (Royal) Automobile Club in London, serving on the committee till 1908. He soon took part in the races and reliability trials organised by both these clubs. In 1900 he won on a 12 h.p. Panhard the gold medal of the English club for the best performance on the part of an amateur in the thousand miles motor trip between London and Edinburgh. In the next few years he competed in the French motor races between Paris and Madrid, Vienna, Berlin, Boulogne, and Ostend, and in 1905 he was the British representative in the race in France for the Gordon Bennett trophy.

Meanwhile he had formed in London a business, 'C. S. Rolls & Co.,' for the manufacture of motor cars in England, and was joint general manager with Mr. Claude Johnson. The two joined in March 1904 Mr. F. H. Royce, an electrical and mechanical engineer, who had greatly developed the efficiency of the vehicle, and they established the company of 'Rolls-Royce, Ltd.' Mr. Royce became engineer-in-chief, Rolls technical managing director, and Mr. Johnson managing director. Works were constructed in 1898 at Derby. The Rolls-Royce cars proved exceptionally powerful, and from 1906 onwards Rolls drove in racing competitions one of his own cars with great success. He broke the record in 1906 for the journey from Monte Carlo to London with a 20 h.p. Rolls-Royce car, driving 771 miles on end from Monte Carlo to Boulogne in 28 hours 14 minutes.

In 1903 he had become a captain in the motor volunteer corps, afterwards reconstituted as the army motor reserve. He was a delegate for the Royal Automobile Club and the Roads Improvement Association at the International Road Congress in 1908. Aeronautics meanwhile had caught Rolls's attention. In the course of 1901 he began

making balloon ascents, which before his death reached a total of 170. He helped to found the Aero Club in England in 1903, and joined the Aero Club of France in 1906. On 1 Oct. of the last year, in the Gordon Bennett international balloon race, he was the British representative, and crossing the Channel from Paris was awarded the gold medal for the longest time spent in the air. At the end of 1908 he visited Le Mans in France to study Wilbur Wright's experiments with his newly invented aeroplane. He was one of the first to fly with Wright, and he published an account of the experience in 'Un vol en aéroplane Wright,' an article in 'La Conquête de l'Air,' Brussels (Nov. 1908).

Acquiring a Wright aeroplane for use in England, he was soon an expert aviator. In June 1910 he made a great reputation by a cross-Channel flight in a Wright aeroplane. He left Dover at 6.30 on the evening of 2 June, and arrived at Calais at 7 o'clock; a quarter of an hour later, after circling round the semaphore station at Sangatte, he started on the homeward journey without touching French soil, and reached Dover at five minutes past eight, at the point from which he set out. This record exploit attracted universal attention.

Next month he took part in a flying tournament at Bournemouth, and was killed on 12 July 1910 through the collapse of the tail-plane of his machine while he was making a steep gliding descent to the aerodrome. He was the first Englishman to be killed while flying on an aeroplane. He was buried at Llangattock-Vibon-Avel church, near Monmouth. A bronze statue over sixteen feet high, by Sir William Goscombe John, R.A., representing Rolls in the costume in which he flew across the Channel, was unveiled by Lord Raglan in Agincourt Square, Monmouth, on 19 Oct. 1911. Another statue by W. C. May was unveiled at Dover on 27 April 1912. A stained glass window in joint memory of Rolls and of Cecil A. Grace, who disappeared while flying on an aeroplane from Calais to Dover on 22 Nov. 1910, was unveiled at Eastchurch church, Kent, on 26 July 1912. Rolls, who was unmarried, was a fellow of the Royal Geographical Society and of the Royal Metallurgical Society as well as an associate member of the Institute of Mechanical Engineering.

He frequently lectured on motors and the history and development of mechanical road locomotion, and besides the publications mentioned contributed a chapter on 'The Caprices of Petrol Motors' in the

Badminton volume on 'Motors' (1902, pp. 164 seq.) and the article on pleasure motors to the eleventh edition of the 'Encyclopædia Britannica.' A paper read by Rolls at the Automobile Club of Great Britain and Ireland was privately printed in 1904. An article, 'My Voyage in the World's Greatest Airship,' was also privately reprinted from the 'London Magazine' (May 1903). Rolls was an accomplished amateur musician and actor, and a good football player.

[The Times, 13-18 July 1910; 20 Oct. 1911; Pearson's Mag., July 1904; M.A.P., art. by Rolls entitled In the Days of my Youth; Page's Engineering Biographies, 1908; Aero-naut. Journ., July 1910 (portrait); Motors, in Badminton Series, 1902; a life of Rolls by Lady Llangatlock is in preparation.]

C. J.

ROOKWOOD, first BARON. [See SELWIN-IBBETSON, SIR HENRY JOHN (1826-1902), politician.]

ROOPER, THOMAS GODOLPHIN (1847-1903), writer on education, born at Abbots Ripton, Huntingdonshire, on 26 Dec. 1847, was son of William Henry Rooper, rector of Abbots Ripton, by his third wife, Frances Catherine, younger daughter of John Heathcote of Conington Castle, Huntingdonshire. Rooper's father was a liberal high churchman. In 1862 Rooper was sent to Harrow into the boarding-house of Dr. H. M. Butler, recently appointed headmaster. In his essay 'Lyonesse' Rooper vividly describes his school days at Harrow (1862-1866), where he began his lifelong study of botany, being one of the founders of the school scientific society. In October 1866 he went to Balliol College, Oxford, taking a second class both in classical moderations in 1868 and in the final classical schools in 1870. To Benjamin Jowett [q. v. Suppl. I], T. H. Green [q. v.], and his college friend, Bernard Bosanquet, his chief intellectual debt was due. He felt that Green's teaching laid the foundation of the beliefs in which he lived and worked. As an undergraduate Rooper intended to take orders, but in 1872 conscientious difficulties deterred him, though he remained till death a communicant lay member of the Church of England. From 1871 to 1877 he was private tutor to Herbrand Russell (afterwards eleventh duke of Bedford), gaining experience in teaching, studying German education, and acquiring a knowledge of history, literature, and science. After teaching for a few months Dr. Butler's young children at Harrow, he was appointed in Nov.

1877 inspector of schools under the Education Department, and spent the rest of his life in the public service, successively in Northumberland, in the Bradford district, and in the Southampton district, including the Isle of Wight.

His influence upon the teachers, the inspectorate, public opinion, and the policy of the board of education grew steadily from year to year. The specific service which he rendered to English elementary education lay mainly (1) in his efforts for the improvement of the teaching of geography, (2) in his encouragement of manual training, (3) in his influence upon methods of teaching in infant schools, (4) in the reforms which he secured in the professional and general education of younger teachers, and (5) in the closer adaptation of the course of study in rural schools to the conditions of country life, especially by the practical encouragement of school gardens. To improve the teaching of geography he wrote two papers, organised a geographical exhibition at Bradford in 1887, and in 1897 founded a Geographical Society at Southampton. Manual training he regarded as a necessary part of general education. He prepared himself for the advocacy of this educational reform by studying Dr. Goetze's work in Leipzig, and by attending Slöjd classes at Nääs. His ideas on the subject were set forth in four important papers. He made a special study of the subject of drawing in infant schools, and of reforms in the methods of teaching children in the lower classes of the elementary schools. Both in the West Riding and in Southampton and the Isle of Wight he initiated classes for ex-pupil teachers, which met an urgent local need, and were subsequently taken over by the local education authorities. In the movement for the improvement of the curriculum of rural schools, Rooper played an unobtrusive but highly influential part. He was unsparing in his attendance at meetings held to advance the cause of rural education, and by the establishment of a school garden at Boscombe provided a model for imitation in other parts of England. His experiments in this field had influence upon the improvement of rural education in Canada. In all these activities Rooper was almost lavish in the financial aid which he privately gave to educational experiments at their critical stage. And in every case he mastered the practical technique of the improvements which he advocated, not only by visits to foreign countries, but by strenuous private

study and by investigation in different parts of England. He constantly examined the house of education at Ambleside for his friend, Miss Mason, the founder of the Parents' National Educational Union, for the meetings of which many of his best addresses were prepared. And in the last years of his life he devoted much time and labour to the foundation of the Hartley University College at Southampton.

Rooper's official work began while the elementary schools were still cramped by the narrow traditions of formal training, and by the effects of the system of 'payment by results.' He was one of the inspectors who breathed a new spirit into the methods of English elementary education. Always exacting a high standard, he rose above formalism and routine. He threw himself into every movement likely to interest teachers in their profession and to humanise their work.

Rooper died unmarried at Southampton on 20 May 1903, from spinal tuberculosis, and was buried in the old cemetery there. A memorial tablet is at Hartley University College, Southampton; a memorial scholarship was founded at the same college, and a memorial prize for geography at the Bradford grammar school.

Rooper's chief publications were: 1. 'The Lines upon which Standards I. and II. should be taught under the Latest Code' (Hull and London), 1895. 2. 'School and Home Life' (Hull and London), 1896; new edit. 1907. 3. 'Reading and Recitation,' written in conjunction with Mr. F. B. Lott (Hull and London), 1898. 4. 'Educational Studies and Addresses,' 1902. 5. 'School Gardens in Germany' (in 'Board of Education's Special Reports on Educational Subjects, vol. 9), 1902. He also contributed papers to 'Hand and Eye,' a manual training magazine.

The 'Selected Writings of Thomas Godolphin Rooper,' edited by R. G. Tatton (1907), contains an excellent memoir and good portrait, and a selection of papers already published in Nos. (2) and (4) above, together with 'Handwork in Education,' 'Practical Instruction in Rural Schools,' and other essays.

[Memoir by R. G. Tatton in Rooper's Selected Writings, 1907; family information; personal knowledge.] M. E. S.

ROOSE, EDWARD CHARLES ROBSON (1848-1905), physician, born at 32 Hill Street, Knightsbridge, London, on 23 Nov. 1848, was grandson of Sir David Charles Roose, and was third son of Francis Finley

Roose, solicitor, by his wife Eliza Burn. He entered at Trinity Hall, Cambridge, but left the university without a degree. He then went to Guy's Hospital, London, and afterwards spent some time in Paris. He obtained the licence of the Society of Apothecaries in 1870, and in the same year he was admitted L.R.C.P. and L.R.C.S. Edinburgh. In 1872 he became M.R.C.S. England; M.R.C.P. Edinburgh in 1875, and F.R.C.P. Edinburgh in 1877. He graduated M.D. at Brussels in 1877.

Roose first practised at 44 Regency Square, Brighton. In 1885 he migrated to 49 Hill Street, Berkeley Square, London. Here he built up a large and fashionable practice, which his medical attainments hardly justified. He owed his professional success to his social popularity. Later in life he became director of a company interested in Kent coal which involved him in litigation. He emerged from it honourably, but the anxiety led him to limit his professional work, and he retired to East Grinstead, Sussex, where he died on 12 Feb. 1905.

He married in 1870 Edith, daughter of Henry Huggins, D.L.; she died in 1901.

Roose published the following compilations, which, in spite of a wide circulation, had no genuine scientific value: 1. 'Remarks upon some Disease of the Nervous System,' Brighton, 1875. 2. 'Gout and its Relations to Diseases of the Liver and Kidneys,' 1885; 7th edit. 1894; translated into French from the third edition, Paris, 1887; and into German from the fourth edition, Vienna and Leipzig, 1887. 3. 'The Wear and Tear of London Life,' 1886. 4. 'Infection and Disinfection,' 1888. 5. 'Nerve Prostration and other Functional Disorders of Daily Life,' 1888; 2nd edit. 1891. 6. 'Leprosy and its Prevention as illustrated by Norwegian Experience,' 1890. 7. 'Waste and Repair in Modern Life,' 1897.

[The Times, 13 Feb. 1905; Medical News, New York, 1905, vol. 86, p. 418.] D'A. P.

ROSS, SIR ALEXANDER GEORGE (1840-1910), lieutenant-general, born at Meerut in the East Indies on 9 Jan. 1840, was eldest of four sons of Alexander Ross of the Bengal civil service (1816-1899) by his wife Isabella, third daughter of Justin McCarty of Carrignavan, co. Cork, Ireland. The father was a descendant of the Rosses of Auchlossin, a branch of the ancient Nairnshire family of Kilravock; he retired from the Bengal civil service after serving as puisne judge of the high court of the

North-West Provinces. His grandfather, also Alexander Ross, went to India as a writer in 1795, and died in 1856 after holding the appointments of resident at Delhi, governor of the Agra presidency, president of the supreme council, and deputy-governor of Bengal. Of his three brothers, Justin Charles, lieutenant-colonel of the Royal 'Bengal' engineers, C.M.G., LL.D. of Edinburgh University, was some time inspector-general of irrigation in Egypt; William Gordon, lieutenant-colonel of the Royal 'Bengal' engineers, retired in 1889, and George Edward Aubert was a barrister-at-law practising at Allahabad.

Ross was brought to England in infancy, and after education at private schools in Edinburgh proceeded to the Edinburgh Academy, where he took many prizes and whence he passed to Edinburgh University. In 1857 his father, while at home on furlough at the outbreak of the Mutiny in India, procured a cadetship for his son, who accompanied him to Calcutta at the end of that year. On arriving in India Ross was attached to the 35th foot, and served with that corps at the attack on Arrah in 1858, receiving the Mutiny medal. On the formation of the Bengal staff corps in 1861 he was posted to the first Sikh infantry of the Punjab frontier force, and served in that regiment in every capacity until his death in 1910, when he was its colonel-in-chief.

In 1867 Ross, then a lieutenant, was selected to raise and equip a mule train for service in the Abyssinian expeditionary force under Sir Robert Napier, afterwards Lord Napier of Magdala [q. v.]. Ross was present at the capture of Magdala and was honourably mentioned in despatches, receiving the medal for the campaign. Ten years later he served throughout the Jowaki expedition on the north-west frontier of the Punjab, first as second-in-command of the 1st Sikhs, and when its commandant, Major Rice, was severely wounded, he assumed command of the regiment. Here again he was mentioned in despatches and received the medal with clasp. He commanded the 1st Sikhs in the Afghan war of 1878-9, including the capture of Ali Musjid, again being mentioned in despatches and receiving the Afghan medal with Ali Musjid clasp. In the campaign against the Mahsud Waziris in 1881 Ross was second-in-command of the 1st Sikhs, and in the Zhob valley expedition in 1890 he commanded the Punjab frontier force column; in both expeditions he was mentioned in despatches.

Ross, who was promoted lieutenant-

general in 1897, was created C.B. in 1887 and K.C.B. in 1905. After his retirement he lived at 16 Hamilton Road, Ealing, where he died on 22 June 1910; he was buried in Ealing cemetery. He married on 1 Oct. 1870, at Simla, his father's first cousin, Emma Walwyn, daughter of Lieutenant-general George Edward Gowan. C.B., colonel commandant of the royal (Bengal) horse artillery. An only child, Alexander Edward, joined the Indian Forest Department.

ROSS, SIR JOHN (1829-1905), general, son of field-marshal Sir Hew Dalrymple Ross [q. v.] by his wife Elizabeth Margaret, daughter of Richard Graham of Stone House, near Brampton, Cumberland, was born at Stone House on 18 March 1829. He entered the army as second lieutenant of the rifle brigade on 14 April 1846. In 1847 he proceeded to Canada with his regiment, being promoted lieutenant on 29 Dec. 1848. Returning home in 1852, he was promoted captain on 29 Dec. 1854. He accompanied the rifle brigade to the Crimea in 1854; was present at the battles of Alma and Inkerman and siege of Sevastopol, and remained at the seat of war until Feb. 1855. He was mentioned in despatches and received the medal with three clasps, the brevet of major (6 June 1856), the Turkish medal and the fifth class of the Medjidie. He was nominated A.D.C. to Major-general Lawrence at Aldershot in 1856. Proceeding to India in July 1857, he served throughout the Mutiny. He took part in the action of Cawnpore, and the siege and capture of Lucknow, where he helped to raise the camel corps (10 April 1858), consisting of volunteers chiefly from the rifle brigade. Joining Sir Hugh Rose's force in central India, he commanded the corps at the actions of Gowlowlie and Calpi (23 May 1858), in the operations in Central India, and at Jugdespore (20 Oct.). The camel corps was finally disbanded at Agra in April 1860, after having marched over 3000 miles (cf. Despatches, *Lond. Gaz.* 25 May 1858, 22 Feb., 18 April, and 9 Sept. 1859). Ross was awarded the medal with two clasps, a brevet of lieutenant-col. (20 July 1858), and the C.B. (28 Feb. 1861). In the campaign on the north-west frontier of India (1863-4) Ross served with the rifle brigade, and was in the action of Shubkuddar (2 Jan.

1864). He received the medal with clasp, and was promoted colonel on 3 April 1865. Subsequently he commanded the Laruf field force as brigadier-general during the operations in the Malay Peninsula in 1875-6, and took part in the capture of Kota-Lana (4 Jan. 1876). On bringing the operations to a successful issue he was mentioned in the general orders of the government of India (*Lond. Gaz.* 18 Feb. and 23 Feb. 1876), and was given the medal with clasp.

Ross held the command of the Saugor district at Jubbulpore in 1874, and of the Presidency district at Fort William (1875 and 1876-9). He became major-general on 1 Oct. 1877 (antedated in '*London Gazette*,' 1 March 1870). The Indian expeditionary force which was sent to Malta by Lord Beaconsfield's orders in 1878 during the Eastern crisis was under Ross's command. During the Afghan war of 1878-80 he led the second division of the Kabul field force which defeated the enemy at Shekabad, and was accorded for the service the thanks of the governor-general in council and of the commander-in-chief in India. He accompanied Sir Frederick (afterwards Lord) Roberts in the march from Kabul to Kandahar in command of the infantry division, and was present at the battle of Kandahar (*Lond. Gaz.* 30 July and 3 Dec. 1880). He received the thanks of both houses of parliament, was nominated K.C.B. on 22 Feb. 1881, and was awarded the medal with clasp and bronze decoration. From 1881 to 1886 he held the command of the Poona division of the Bombay army, and in the latter year was promoted lieutenant-general (12 Jan.). In 1888 he was appointed commander-in-chief in Canada, and in the following May served as administrator pending the arrival of the governor-general, Sir Frederick Stanley (afterwards sixteenth earl of Derby) [q. v. Suppl. II]. He was nominated G.C.B. on 30 May 1891. He was appointed colonel of the Leicestershire regiment on 6 Feb. 1895, and colonel commandant of the rifle brigade on 29 July 1903. He received the reward for distinguished service, and retired on 18 March 1896. He died on 5 Jan. 1905 at Kelloe, Berwickshire. He married in 1868 Mary Macleod, daughter of A. M. Hay, but obtained a divorce in 1881. He had issue one son and one daughter.

[*The Times*, 6 Jan. 1905; H. B. Hanna, *The Second Afghan War*, vol. iii. 1910; *Dod's Knightage*; *Hart's and Official Army Lists*; *Pratt's People of the Period*; *Rifle Brigade Chronicle*, 1905.] H. M. V.

ROSS, JOSEPH THORBURN (1849-1903), artist, born at Berwick-on-Tweed on 15 May 1849, was youngest child of two sons and two daughters of Robert Thorburn Ross, R.S.A. (1816-1876), by his wife Margaret Scott. The parents removed to Edinburgh for good when Joseph was a baby. Having been educated at the Military Academy, Hill Street, Edinburgh, he was engaged for a time in mercantile pursuits in Leith and Gloucester, but eventually, after a successful career as a student in the Edinburgh School of Art and the life school of the Royal Scottish Academy (1877-80), he devoted himself to painting as a profession. He first exhibited in 1872, but an unconventional strain in his work retarded its official recognition, and it was not till 1896 that he was elected an associate of the Royal Scottish Academy. Portraiture, incident (but not anecdote), fantasy, landscape, and the sea were all treated by him, and if at times decorative intention and realism were imperfectly harmonised, and the execution and draughtsmanship, though bold, lacked mastery, the colour was nearly always beautiful and the result novel and interesting. But it was in sketches made spontaneously for themselves or as studies for more ambitious pictures that he was at his best. He worked in both oil and water-colour and possessed instinctive feeling for the proper use of each medium. Ross was familiar with the best art on the Continent, travelling much in Italy, and he was a frequent exhibitor at some of the leading exhibitions abroad, his '*Serata Veneziana*' winning a diploma of honour at Dresden in 1892. He was unmarried and resided at Edinburgh with his sisters. He died from the effects of a fall in his Edinburgh studio on 28 Sept. 1903.

Shortly afterwards, at a memorial exhibition of his work held in Edinburgh, his admirers purchased '*The Bass Rock*,' one of his most important pictures, and presented it to the National Gallery of Scotland. One of his two sisters, Christina Paterson Ross, R.S.W. (1843-1906), was well known as a water-colour painter. His other sister, Miss Jessie Ross, Edinburgh, has three portraits of her brother, two when a child by his father, and one in oils painted by Mr. William Small in 1903.

[Scotsman, 29 Sept. 1903; Exhib. catalogues; R.S.A. Report, 1903; introd. to cat. Memorial Exhibition, 1904, by W. D. Mackay, R.S.A.; Scottish Painting, by J. L. Caw; private information.] J. L. C.

ROSS, WILLIAM STEWART, known by the pseudonym of 'SALADIN' (1844-1906), secularist, born at Kirkbean, Galloway, on 20 March 1844, was son of Joseph Ross, a farm servant and a presbyterian. In early life Ross developed a love for poetry and romance. After being educated at the parish school of New Abbey, Kirkcudbrightshire, and at Hutton Hall Academy, Caerlaverock, he became usher at Hutton Hall, and in 1861 was for a short time master at Glenesslin school, Dunscore. After two years as assistant at Hutton Hall Academy, during which he occasionally contributed to newspapers and periodicals, he went in 1864 to Glasgow University to prepare for the Scottish ministry. There he showed much promise as a debater at the Dialectical Society. Conscientious scruples prevented the completion of his theological course. While at the university he sent fugitive pieces in poetry and prose to the 'Dumfries-shire and Galloway Herald,' of which Thomas Aird [q. v.] was editor, and to the 'Dumfries and Galloway Standard,' edited by William McDowall [q. v.]. The favourable reception of a novel, 'Mildred Merlock,' which was published serially in the 'Glasgow Weekly Mail,' and brought him forty guineas, finally led him to seek a livelihood from his pen.

On the invitation of the publisher Thomas Laurie, Ross went to London to assist in the publishing of educational works. In 1872 he turned writer and publisher of educational works on his own account at 41 Farringdon Street, calling his firm William Stewart & Co. Many works on English history and literature came from his pen and press. He published books by John Daniel Morell [q. v.], John Miller Dow Meiklejohn [q. v. Suppl. II], and issued 'Stewart's Local Examination' series, and 'Stewart's Mathematical' series of handbooks, as well as four educational magazines, of one of which, the 'School Magazine,' he succeeded Dr. Morell as editor.

In London Ross entered with enthusiasm into the free-thought movement, assisting Charles Bradlaugh [q. v. Suppl. I] in the 'National Reformer' in his struggle for liberty of thought and speech. The publication by Bradlaugh and Mrs. Besant of Knowlton's neo-Malthusian pamphlet, 'The Fruits of Philosophy,' in 1877-8 alienated Ross's sympathies, and he subsequently contributed to the rival free-thought newspaper, the 'Secular Review.' This was amalgamated in June 1877 with the 'Secularist' under the joint editorship of Mr. Charles Watts and Mr. G. W. Foote, and in 1880 Ross

became joint editor with Watts, and finally in August 1884 sole editor and proprietor. The name of the journal was changed in January 1889 to the 'Agnostic Journal and Secular Review.' Ross, who wrote for the paper under the pseudonym of 'Saladin,' raised the circulation of the journal by his literary energy and business ability. An outspoken writer on both theology and sociology, he embodied much pungent criticism in 'God and his Book' (1887; new edit. 1906), and in 'Woman, her Glory and her Shame' (2 vols. 1894; new edit. 1906).

Ross was also an enthusiastic writer of verse. His narrative poems, 'Lays of Romance and Chivalry' (1881, 12mo) and 'Isaure and other Poems' (1887), are full of fervour, and betray the influence of Sir Walter Scott. Ross won the medal for the best poem commemorating the unveiling by Lord Rosebery of the statue to Robert Burns at Dumfries in 1879, and also the gold medal for the best poem describing the visit of Kossuth to the grave of Burns.

Ross died of heart failure at Brixton on 30 Nov. 1906, and was buried at Woking cemetery. His wife (born Sherar), who was a teacher at Hutton Hall, survived him with three sons and a daughter.

Stewart Ross), 1883; Biograph, 1879, ii. 155; H. R. Hithersay and G. Ernest, Sketch of the Life of Saladin, 1872.] W. B. O.

ROSSE, fourth EARL OF. [See PARSONS, SIR LAURENCE (1840-1908).]

ROUSBY, WILLIAM WYBERT (1835-1907), actor and theatrical manager, born at Hull on 14 March 1835, was son of a London commercial man. He made his first appearance on the stage as a 'boy-prodigy,' at the Queen's Theatre, Hull, as Romeo, on 16 July 1849, under the management of Mr. Caple, who took a great interest in him and gave him a thorough theatrical training. Before he was sixteen Rousby appeared at Glasgow, Edinburgh, and Liverpool in such characters as Romeo, Hamlet, Othello, Macbeth, and Shylock.

After an engagement at Norwich he joined Samuel Phelps at Sadler's Wells Theatre, and there, as Malcolm in 'Macbeth,' made his first appearance on the London stage on 27 Aug. 1853. He at once achieved success, and while with Phelps he played Lucius in 'Virginus,' Laertes in 'Hamlet,'

Master Waller in 'The Love Chase,' Ly-sander in 'A Midsummer Night's Dream,' and the Dauphin in 'Henry V.' At the royal command performance at Windsor Castle on 10 Nov. 1853 he played the duke of Bedford in 'Henry V.'

Rousby was still under nineteen when he proceeded to the Theatre Royal, Jersey, to play leading parts there. He afterwards starred in the provinces, where he was likened to Edmund Kean. In 1860 he commenced a series of dramatic recitals, and he also impersonated at the principal provincial theatres leading characters in 'Richard III,' 'The Man in the Iron Mask,' 'The Lady of Lyons,' 'Still Waters Run Deep,' and 'Hamlet.'

At the Theatre Royal, Manchester, in Sept. 1862, he played Harry Kavanagh in Falconer's 'Peep o' Day,' and in 1864, at the same theatre, at the Shakespearian tercentenary anniversary festival, he played Romeo in 'Romeo and Juliet' with Henry Irving as Mercutio, Charles Calvert as Friar Laurence, and Mrs. Charles Calvert as Juliet.

In 1868 he married Clara Marion Jessie Dowse [see ROUSBY, CLARA MARION JESSIE]. On the introduction of William Powell Frith, R.A. [q. v. Suppl. II], who had seen them act in Jersey, Tom Taylor [q. v.], the dramatist, engaged them for the Queen's Theatre, Long Acre. They appeared on 20 Dec. 1869 as Bertuccio and Fiordelisa in 'The Fool's Revenge,' Taylor's adaptation of Hugo's 'Le Roi s'amuse.' Rousby's performance was well received, despite a tendency to over-elaboration. On 22 Jan. 1870 he played Courtenay, earl of Devon, in Tom Taylor's 'Twixt Axe and Crown,' in which his wife achieved a popular triumph. In February 1871 he played Orlando to his wife's Rosalind, and on 18 April 1871 Etienne de Vignolles in Taylor's 'Joan of Arc.' At Drury Lane, under Falconer and F. B. Chatterton's management, he acted King Lear to his wife's Cordelia (29 March 1873). At the Princess's Theatre, under Chatterton's management, he was Cosmo in Miss Braddon's 'Griselda' (13 Nov. 1873) and John Knox in W. G. Wills's 'Mary Queen of Scots' (23 Feb. 1874).

After the death of his wife in 1879 Rousby became proprietor and manager of the Theatre Royal, Jersey, where he reappeared from time to time in his old parts in such plays as 'Jane Shore,' 'Trapped,' and 'Ingomar.' He was also manager of St. Julian's Hall, Guernsey, and to the end of his life gave dramatic recitals in the island. Finally retiring from the stage

in 1898, he died at Guernsey on 10 Sept. 1907, and was buried at the Mont-à-l'Abbé cemetery, Jersey. His second wife, Alice Emma Maud Morris, whom he married on 5 July 1880, survived him without issue. An oil portrait painted by Richard Goldie Crawford in 1896 belongs to the widow.

In his prime Rousby was a conscientious actor, with a good voice and a mastery of correct emphasis, but he gave an impression of stiffness and self-consciousness, which grew on him and prevented him from rising high in his profession.

[The Era, 1853-4; 14 Sept. 1907; Guernsey Gossip, 18 Sept. 1907; Pascoe's Dramatic List, 1879; Scott and Howard's Blanchard, 1891; see art. ROUSBY, CLARA MARION JESSIE.]

J. P.

ROUTH, EDWARD JOHN (1831-1907), mathematician, born at Quebec on 20 Jan. 1831, was son of Sir Randolph Isham Routh [q. v.], commissary-general in the army, by his second wife, Marie Louise, sister of Cardinal Elzéar Alexandre Taschereau [q. v.] and first cousin of Sir Henri Elzéar Taschereau [q. v. Suppl. II], chief justice of Canada. Martin Joseph Routh [q. v.], president of Magdalen College, Oxford, recognised a distant relationship by leaving Edward a bequest on his death in 1854.

When eleven years of age Routh was brought to England, and was educated first at University College school, and later at University College, London, where the influence of Augustus De Morgan led him to devote himself to mathematics. He matriculated at London University in 1847, winning an exhibition; he graduated B.A. as a scholar in 1849, and carried off the gold medal for mathematics and natural philosophy in the examination for M.A. in 1853.

Meanwhile he entered Peterhouse, Cambridge, as a 'pensioner' on 1 June 1850, and read with the great coach of that time, William Hopkins [q. v.]. James Clerk-Maxwell [q. v.] entered at Peterhouse in the same term with Routh, but migrated to Trinity at the end of his first term, from, it is said, an anticipation of future rivalry. In the mathematical tripos of 1854 Routh came out senior wrangler with Clerk Maxwell as second. In the examination for the Smith's prizes, the two, for the first time on record, divided the honours equally between them.

On graduating B.A. in January 1854 Routh commenced 'coaching' in mathematics, at first assisting William John Steele, a fellow of Peterhouse, who had a

high reputation and a large connection. Routh was elected fellow of Peterhouse next year, and was appointed college lecturer in mathematics, a post which he retained till 1904. He was also assistant tutor from 1856 to 1868 and was at various times junior dean, junior bursar, and prælector of his college.

In 1857 he was invited to the Royal Observatory, Greenwich, with a view to a vacant post there as a first assistant. He did not take the appointment, but at Greenwich he met Hilda, eldest daughter of Sir George Biddell Airy [q. v. Suppl. I], the astronomer-royal, whom he married on 31 Aug. 1864.

For more than thirty years Routh's chief energies were spent at Cambridge in preparing private pupils for the mathematical tripos. On Steele's early death he became the chief mathematical coach in the university, and the successes of his pupils were unprecedented. In the tripos of 1856 Charles Baron Clarke, his first pupil [q. v. Suppl. II], was third wrangler. In 1858 two pupils, Slessor (Queens') and (Sir) Charles Abercrombie Smith, were respectively first and second wrangler and first and second Smith's prizemen. In the following years, pupils of his were senior wranglers twenty-seven times and Smith's prizemen forty-one times. In the tripos of 1862 fifteen of his nineteen pupils were in the list of thirty-two wranglers, seven among the first ten. From 1862 to 1882 inclusive he had an unbroken succession of twenty-two senior wranglers (two in 1882, one in January and one in June under new regulations), and he had four more in 1884, in 1885, in 1887 (when four seniors were bracketed), and in 1888, when he retired. His senior wranglers included Lord Justice Stirling (1861), Lord Justice Romer (1863), Lord Rayleigh (1865, chancellor of Cambridge University), Lord Moulton (1868), John Hopkinson (1871), (Sir) Donal McAlister (1877, principal of Glasgow University), (Sir) Joseph Larmor (1880, M.P. for Cambridge University); and of other wranglers may be mentioned (Sir) J. J. Thomson, O.M., (Sir) C. A. Parsons, Lord Justice Buckley, and (Sir) Richard Solomon. Of the 990 wranglers between 1862 and 1888, 480 were Routh's pupils. On Routh's retirement from his work as private coach in 1888 his old pupils presented Mrs. Routh with her husband's portrait by (Sir) Hubert von Herkomer (*The Times*, 5 Nov. 1888).

Apart from his personality, which inspired his pupils with implicit confidence

in his powers, and his lucidity of exposition, Routh owed his success as a teacher to his perception of the relative proportions in which the many subjects of the tripos should be studied; to his capacity for showing his pupils how to learn and how to use their knowledge, and to his practice of continually testing their work by causing them to reproduce what they had been learning.

Despite his absorption in teaching Routh kept fully abreast of current advances in mathematical knowledge and made many original investigations. Elected fellow of the Cambridge Philosophical Society in 1854, an original member of the London Mathematical Society in 1865, a fellow of the Royal Astronomical Society in 1866, and of the Royal Society in 1872, he contributed to the 'Proceedings' of these societies as well as to the 'Mathematical Messenger' and the 'Quarterly Journal of Mathematics', numerous papers on varied topics in geometry, dynamics, physical astronomy, wave motion, vibrations, and harmonic analysis. As early as 1855 he had joined Lord Brougham in preparing a separate volume, 'An Analytical View of Newton's Principia,' and in 1860 he supplied an urgent want by issuing a masterly elementary treatise on 'Rigid Dynamics' (7th enlarged edit. 2 vols. 1905; German transl., Leipzig, 1898, with pref. by Prof. Klein of Göttingen). Other important contributions by Routh to mathematical literature were a treatise on 'Statics' (1891, 2 vols.; revised edit. 1896; enlarged edit. 1902) and 'Dynamics of a Particle' (1898). These three dynamical treatises constitute an encyclopædia and bibliography on the subject which have no equal either here or abroad. In 1877 Routh won the Adams prize with his 'Treatise on the Stability of a Given State of Motion, particularly Steady Motion,' which he wrote in a Christmas vacation. Since the publication of Hamilton's equations of motion and Sir William Thomson's (Lord Kelvin) theory of the 'ignorance of co-ordinates' no greater advance has probably been made in dynamics than by Routh's theorem of the 'Modified Lagrangian Function,' first given in this essay. A large part of the work on equations of motion in Thomson and Tait's 'Natural Philosophy' was rewritten for the second edition in the light of Routh's developments of the theme.

Routh took little part in academic business, but he served for four years (1888-92) on the council of the senate of Cambridge University, and also on the Board of Mathematical Studies. He examined in the

mathematical triposes of 1860, 1861, 1888, 1889, 1893, and 1900, besides acting as examiner in London University from 1859 to 1864 and again from 1865 to 1870. To the last he actively opposed the changes in the Cambridge mathematical tripos which were effected in 1907.

In 1883 he and his friend, W. H. Besant, St. John's College, were the first to take the new Cambridge degree of Sc.D., and in the same year his college elected him one of its first honorary fellows under the new statutes. He was made hon. LL.D. of Glasgow in 1878, and hon. Sc.D. of Dublin in 1892. He was also a fellow of the Geological Society from 1864 and of London University.

Routh died at Cambridge on 7 June 1907, and was buried at Cherrihinton. His wife survived him. By her he had five sons and one daughter. The eldest son, Edward Airy, a lieutenant in the royal artillery, died in 1892 from the effects of service in Egypt; and the youngest, Rupert John, in the Indian civil service, died at the beginning of a promising career in September 1907. George Richard Randolph is an H.M. inspector of schools; Arthur Lionel, a lieutenant in the royal artillery; and Harold Victor, professor of Latin at Trinity University, Toronto.

A replica of the portrait by Sir Hubert von Herkomer was presented by Mrs. Routh to Peterhouse in 1890, and it hangs in the hall.

Besides the works cited, Routh published 'Solutions of Senate House Problems' with Henry William Watson [q. v. Suppl. II] (1860).

J. D. H. D.

ROWE, JOSHUA BROOKING (1837-1908), antiquary and naturalist, born at Plymouth on 12 June 1837, was only son of Joshua Brooking Rowe of Brixton, near Plymouth, printer and bookseller of Plymouth, by his second wife, Harriett Caroline, daughter of Captain Charles Patey, R.N. Samuel Rowe [q. v.], writer about Dartmoor, was his uncle. After education at a private school in Plymouth the younger Joshua was in 1860 admitted a solicitor, and practised for many years in Plymouth in partnership with Francis Bulteel, and latterly with W. L. Munday.

Through life he devoted his leisure to literary and scientific research. A paper on 'The Mammals, Birds, Reptiles, and

Amphibians of Devon,' which he read before the Plymouth Institution in 1862, was issued separately next year. Subsequently he published much on archaeological topics, and encouraged local archaeological study. In 1862 he helped to form the Devon Association, of which he was president in 1882, and joint honorary secretary from 1901 till death. To the 'Transactions' of the association he contributed over fifty papers. In 1875 he was elected F.S.A., of which he was a local secretary. He was also a fellow of the Linnean Society, and a member of numerous antiquarian societies, being a founder of the Devon and Cornwall Record Society.

From 1882 he resided at Plympton St. Maurice, where he was active in local affairs. He transcribed the parish registers for publication in the 'Parish Magazine.' On 28 June 1908 he died at Plympton St. Maurice, and was buried in the churchyard there.

In December 1864 he married at St. Andrew's, Plymouth, Sara Foale, daughter of Henry Crews, of Plympton, by whom he had no issue.

A photograph hangs in the Exeter public library, to which he bequeathed his library of about 10,000 volumes, pamphlets and manuscripts, including an unpublished history of Plympton St. Mary.

Rowe revised Samuel Rowe's 'Perambulation of . . . Dartmoor' (Exeter, 1896), and also published: 1. 'The Cistercian Houses of Devon,' Plymouth, 1878. 2. 'The History of Plympton Erle,' Exeter, 1906. 3. 'The Ecclesiastical History of Plymouth,' 4 parts; Plymouth, 1873-4-5-6. He wrote for many local periodicals, and was joint editor of 'Devon Notes and Queries,' some of his contributions to which were reprinted separately. The article on the 'Mammals of Devon,' for the Devon volume of the 'Victoria County Histories,' is by him.

[Trans. of Devonshire Association, vol. 40, 1908; Devon and Cornwall Notes and Queries, 1908, v. 121; private information.]

H. T.-S.

ROWLANDS, DAVID, 'DEWI MON' (1836-1907), Welsh scholar and poet, son of John and Margaret Rowlands, was born on 4 March 1836 at Genfron, Rhosybol, Anglesey. Two years later, his father moved to the farm at Ty Cristion, Bodedern. After a village education he was apprenticed at thirteen, and spent some time in shops at Holyhead and Hatfield. But at the instance of the

Rev. W. Griffith, Holyhead, he became an independent preacher, and in 1853 entered Bala Congregational College. Thence he went in 1856 to New College, London; he returned to Bala in 1857 for a year as assistant-tutor, and in 1858 became a member of the Congregational College at Brecon, graduating B.A. at London University in 1860. His first pastorate was at Llanbrynmair (1861-6); he was then for four years (1866-70) minister of the English church at Welshpool, and for two (1870-2) of the English church at Carmarthen. From 1872 to 1897 he was one of the tutors of Brecon College, and from 1897 head of the institution. He died at Brecon on 7 Jan. 1907.

Rowlands, whose bardic name was 'Dewi Môn,' was of versatile gifts, an able preacher and teacher, a skilful writer of Welsh and English verse, and a conspicuous figure in Welsh literary and political life. In his later years the critical state of his health kept him somewhat in retirement. His chief works are: 1. 'Caniadau Serch' (Welsh lyrics), Bala, 1855, published when he was nineteen. 2. 'Sermons on Historical Subjects,' London, 1870. 3. 'Grammadeg Cymraeg,' Wrexham, 1877, a short Welsh grammar. 4. 'Gwersi mewn Grammadeg,' Dolgelly, 1882, a manual of lessons in grammar. 5. A Welsh version of the 'Alcestis' of Euripides, 1887, sent in for competition at the Aberdare eisteddfod of 1885; it divided the prize with another version and both were printed in one volume at the cost of the Marquis of Bute. 6. 'Telyn Tudno,' Wrexham, 1897, containing the life and works of his brother-in-law, the poet Tudno (Thomas Tudno Jones). Rowlands worked much with the composer Joseph Parry, [q. v. Suppl. II], and supplied English words for the opera 'Blodwen' and the oratorios 'Emmanuel' and 'Joseph'; he was also literary editor of Parry's 'Cambrian Minstrelsie' (Edinburgh, 1893). He was one of the four editors of the hymns in 'Y Caniedydd Cynulleidfao' (London, 1895), the hymn and tune book of the Welsh congregationalists, and in 1902 was chairman of the Congregational Union of Wales. He took a leading part in Breconshire politics and was a member of the committee which drafted the county scheme of intermediate education. He married (1) in 1864, Mary Elizabeth, daughter of William Roberts of Liverpool, by whom he left a son, Wilfred; (2) in 1897, Alice, step-daughter of J. Prothero, of Brecon.

J. E. L.

ROWTON, BARON. [See CORRY, MONTAGU WILLIAM LOWRY (1838-1903), politician and philanthropist.]

RUNDALL, FRANCIS HORNBLow (1823-1908), inspector-general of Indian irrigation, born at Madras on 22 Dec. 1823, was youngest son of the seven children of Lieut.-colonel Charles Rundall, of the East India Company's service, judge advocate-general of the Madras army, by his wife Henrietta Wryghte. The second of his three brothers, Captain John William, Madras engineers, died on active service in the second Burmese war on 12 Nov. 1852.

Educated at Kensington grammar school and at the East India Company's military seminary at Addiscombe (1839-41), he was gazetted to the Madras engineers on 10 Dec. 1841, and after the usual course at Chatham reached India on 23 Dec. 1843. He was adjutant of the Madras sappers and miners for a few months, but in Sept. 1844 joined the public works department as assistant to General Sir Arthur Thomas Cotton [q. v. Suppl. I] in his surveys for the irrigation of the Godavery delta. After brief duty in Tanjore, to acquire knowledge of the great Cauvery works, he assisted Cotton in the construction of the Godavery works from 1845 to 1851. Warmly attached to his chief, he shared both his religious fervour and his enthusiastic belief in irrigation and navigable canals for India. He was appointed district engineer of Vizagapatam and Ganjam in 1851 (when also he was promoted captain) and district engineer of Rajamahendri in May 1855, a position which gave him charge of the further Godavery works then in progress.

In 1859 Rundall became superintending engineer of the northern circle and departmental secretary to the Madras government. He was soon serving in addition as consulting engineer to the government for the Madras Irrigation Company's works. In 1861 he was gazetted lieutenant-colonel and granted special leave to be chief engineer to the East India Irrigation and Canal Company, then constructing the Orissa canals on plans laid down by Cotton. Though water was supplied from 1865, the works were not sufficiently advanced to be effective in the terrible famine of the following year, but under Rundall they constituted

an excellent form of relief labour. Cotton's sanguine estimates had to be largely exceeded; the cultivators were slow to avail themselves of the water supply; rates had to be lowered to an unremunerative figure; the company failed to raise further capital, and the canals were taken over by the government in 1869. Though no financial success, they are of great value in time of drought.

From July 1867 Rundall was chief irrigation engineer and joint secretary to the Bengal government, and the Son canals, which had also been projected by the East India Irrigation and Canal Company, for the service of the Shahabad, Gaya, and Patna districts, were commenced under his orders. By them more than half a million acres are annually watered, and they yield about 4 per cent. on the capital invested. From April 1872 he was inspector-general of irrigation and deputy secretary to the government of India, and was thus brought into close touch with the progress of irrigation throughout the country. He gained a reputation for enthusiasm, soundness of judgment, and accuracy in estimates. During his service, which terminated in April 1874, he had only once taken leave home.

Rundall, who had been promoted colonel in June 1868 and major-general in March 1869, was created a C.S.I. in Dec. 1875, and was made colonel commandant of the royal engineers in 1876. He became lieutenant-general at the end of 1878, and general in Nov. 1885, being placed on the unemployed supernumerary list in July 1881.

At the invitation of the Khedive Ismail, Rundall examined the delta of the Nile in 1876-7, and submitted plans and estimates for irrigation. His proposals, which included the construction of a mighty dam not far from the site of the present one at Assouan, were frustrated by the bankruptcy of the country. Rundall's services were engaged by a syndicate formed in 1883 to construct a Palestinian canal admitting of the passage of the largest vessels from the Mediterranean to the Red Sea, by way of the Jordan Valley and the Gulf of Akaba, but the project did not mature (cf. his 'The Highway of Egypt: Is it the Suez Canal or any other Route between the Mediterranean and the Red Sea?' London 1882). After retirement he lectured on Indian irrigation at the Chatham school of military engineering, and some of the lectures were privately printed (Chatham, 1876). He also wrote the following pam-

phlets, 'Notes on Report of Ganges Canal Committee' (Cutlack, 1860); 'Memo. on the Madras Irrigation Company's Works at Kurnool' (Dorking, undated); and a 'Review of Progress of Irrigation Schemes in relation to Famine Aspects,' placed before a Parliamentary select committee in 1878.

He died at Moffat, N.B., at the house of his son-in-law, the Rev. Francis Wingate Pearse, headmaster of St. Ninian's school, on 30 Sept. 1908, and was buried at Moffat cemetery. He married on 8 Dec. 1846 Fanny Ada, daughter of Captain W. G. Seton-Burn, 3rd light dragoons, and had three daughters and two sons, of whom the eldest is Colonel Frank Montagu Rundall, C.B., D.S.O., late 4th Gurkha rifles.

Gaz. of India, 1908, articles on Orissa and Son canals; Journ. of Royal Engineers, vol. viii. Dec. 1908; The Times, 1 Oct. 1908; information kindly supplied by Colonel F. M. Rundall.] F. H. B.

RUSDEN, GEORGE WILLIAM (1819-1903), historian of Australia and New Zealand, born at Leith Hill Place, Surrey, on 9 July 1819, was third son of the Rev. George Keylock Rusden and Anne, only daughter of the Rev. Thomas Townsend. While yet a lad he emigrated to New South Wales in 1834 with his father, who was appointed chaplain for the Maitland district.

Rusden first tried his hand at pastoral work, but he soon turned to politics; from 1841 onwards he wrote for the press and lectured. On 4 July 1849 he became under the New South Wales government agent for national schools at Port Phillip; later he was transferred to Moreton Bay. When in 1851 the new colony of Victoria was constituted, he was appointed (10 Oct.) chief clerk in the colonial secretary's office, and on 11 Oct. 1852 clerk to the executive council. On 18 Nov. 1856, when a full parliament of two chambers was established, he became clerk of parliaments. In 1853 he joined the national board of education for Victoria and the council of the Melbourne University. Always deeply interested in Shakespeare, he had much to do with the establishment of the Shakespeare scholarships at that university in 1864.

Having gradually formed the idea of writing a history of Australasia, Rusden visited England in 1874 with a view to

finding support for the enterprise, and was much encouraged by Anthony Trollope; in the latter part of 1878 he visited New Zealand in connection with the history which he was writing of that part of the empire. In 1882, having retired on pension, he again visited New Zealand and then came on to England to take up his residence and see to the publication of his histories, both of which came out in 1883. Their publication produced an unfortunate episode: an action for libel was brought against Rusden by the Hon. John Bryce, a member of the New Zealand legislature, respecting whose action during the Maori wars the historian had used severe and unguarded criticism. The most eminent counsel at the bar were engaged, and the case lasted eight days during March 1886. A jury cast Rusden in 5000*l.* damages, afterwards reduced by consent to about half that amount on a new trial at which Rusden himself conducted his case with marked ability. At the second hearing Rusden retracted his statements. The press was on the whole unfavourable to Rusden, who was held to be guilty of serious indiscretion.

About 1893 Rusden returned to Melbourne to spend the rest of his life. He divided his time between his literary work and municipal affairs; but his health gradually failed, and he died at his house, Cotmandene, South Yarra, on 23 Dec. 1903. Rusden was of striking appearance and was a genial and interesting companion.

Rusden's chief works were his 'History of Australia' (3 vols. 1883) and 'History of New Zealand' (3 vols. 1883); revised editions of both were published at Melbourne in 1895-7. These works offer a broad survey of the growth of two great colonies, but Rusden's defect of critical faculty better adapts them to the use of the public man than of the student.

Rusden also published: 1. 'Moyarra, an Australian Legend,' a poem, Maitland, 1851. 2. 'National Education,' 1853. 3. 'Discovery, Survey, and Settlement of Port Phillip,' 1872. 4. 'Curiosities of Colonisation,' 1874. 5. 'William Shakespeare: his Life, Work and Teaching,' Melbourne, 1903. Among many pamphlets which he issued under his own name or the pseudonyms of 'Vindex' or 'Yittadavin' the most interesting are his 'Character of Falstaff' (1870) and a 'Letter to "The Times" on the Law of Libel' (1890).

[Melbourne Argus and Age, 24 Dec. 1903; Athenæum, 6 Feb. 1904; Mennell's Dict. of Australas. Biog.; Early Victorian Blue Books; his own evidence in Bryce v. Rusden

(pp. 264 seq.); Brit. Mus. Cat.: personal knowledge.] C. A. H.

RUSSELL, HENRY CHAMBERLAINE (1836-1907), astronomer, born at West Maitland, New South Wales, on 17 March 1836, was son of the Hon. Bourne Russell. After education at the West Maitland grammar school and at Sydney University, where he graduated B.A. in 1858, he was appointed (1 Jan. 1859) an assistant at the Sydney observatory, and succeeded to the position of government astronomer in August 1870. The first years of his directorship were devoted to the enlargement and re-equipment of the observatory, and to the establishment throughout the colony of a very large number of meteorological stations, furnished in great part with instruments designed and made by him, and maintained by volunteer observers who were drawn into the work by Russell's enthusiasm. Throughout his life he devoted much time to the discussion of the great mass of observations furnished by these volunteers. His proof that the River Darling loses very much more water than can be accounted for by discharge and evaporation led to important gain in knowledge of the underground water systems of the country.

Russell's first great service to astronomy was the organisation of the Australian observations of the transit of Venus in 1874. He equipped four parties, and prepared the account of the whole work which appeared in 1892. He represented Australia at the congress summoned to meet in Paris in 1887 to consider the construction of a photographic chart of the sky. He promised the co-operation of the Sydney observatory, and at once ordered the necessary objective, but with characteristic resource decided to construct the mounting at his observatory. To Sydney the committee of the astrographic chart entrusted the zone of south declination 54° to 62°. The carrying forward of this work, very considerable for an observatory of modest resources, fully occupied the later years of Russell's directorship. He could not complete it, but he left it well established, and on the way to completion.

Russell took an active part in initiating technical education in New South Wales; he was a fellow of the University of Sydney, and vice-chancellor in 1891. He was four times president of the Royal Society of New South Wales, and first president of the Australasian Association for the Advancement of Science. He was elected F.R.S. in 1886, and was created C.M.G. in 1890.

His published works include: 'Climate of New South Wales: Descriptive, Historical, and Tabular' (Sydney, 1877); 'Photographs of the Milky Way and Nebulae taken at Sydney Observatory 1890' (fol. Sydney, 1891); 'Description of the Star Camera at the Sydney Observatory' (4to, Sydney, 1892); 'Observations of the Transit of Venus, 9 Dec. 1874; made at Stations in New South Wales' (4to, Sydney, 1892), with many volumes of astronomical and meteorological observations published from the Sydney observatory, and a great number of papers in the memoirs and monthly notices of the Royal Astronomical Society, the Royal Society of New South Wales, and other scientific societies.

Russell resigned the position of government astronomer in 1905, and died at Sydney on 22 Feb. 1907. He married Emily Jane, daughter of Ambrose Foss of Sydney, in 1861; she survived him with one son and four daughters.

[Proc. Roy. Soc., A. 80, 1908; Monthly Notices Roy. Astr. Soc. lxxviii. 241, 1908.]

A. R. H.

RUSSELL, THOMAS O'NEILL (1828-1908), a founder of the Gaelic movement in Ireland, born at Lissanode, Moate, co. Westmeath, in 1828, was son of Joseph Russell, a gentleman farmer who belonged to the Society of Friends. After a sound elementary education at the national school he assisted in the management of his father's extensive farm. About 1850 he found employment in Dublin in a small business firm of W. R. Jacob, a Quaker, which subsequently developed into one of the greatest concerns in Ireland. Russell soon travelled for the firm, and subsequently he followed the same calling for other houses in Ireland, France, and America.

In 1858 he was an occasional contributor to the newly established 'Irishman,' an advanced nationalist organ. There he urged the revival of the ancient Irish tongue. This became the foremost aim of his career. He learned Irish and soon wrote it with facility. His association with the 'Irishman' during the Fenian activity exposed him to risk of arrest. Migrating to America, he remained in the United States for nearly thirty years. There he obtained employment as a commercial traveller, and in that capacity he visited every state of the Union. He regularly contributed to the 'Chicago Citizen' and corresponded with the Irish press, invariably writing on the Irish language. He also lectured on the same theme.

In 1895 he returned to Ireland with a moderate competence, and at once began to organise opinion in Dublin by means of essay and lecture in the interests of a Gaelic revival. To his efforts to arouse in Irishmen a sense of the value of their ancient language and music was largely due the inauguration of the Gaelic League in 1893 and of the Feis Ceoil (Irish musical festival) in 1897. He died on 15 June 1908 in Synge St., Dublin, and was buried in Mount Jerome cemetery. Russell was helped in his propaganda by his splendid physique, his fiery enthusiasm, and his command of forcible language.

Apart from his contributions to the press Russell published two novels, descriptive of Irish life, of which the first, 'Dick Massey' was issued at Glasgow in 1860 (under the pseudonym of 'Reginald Tierney') and has run through numerous editions. It is a homely story, not without serious faults of composition and construction, but it hit the popular taste. Russell's other works are: 1. 'True Hearts' Trials,' a novel, Glasgow 1873; new edit. Dublin 1907. 2. 'Speech of Robert Emmet translated into Irish,' New York, 1879. 3. 'Beauties and Antiquities of Ireland,' 1897. 4. 'Teanga Thíoramhuil na h-Eireann,' Dublin, 1897. 5. 'A Selection of Moore's Irish Melodies, translated by Archbishop McHale,' edited, with additions, Dublin, 1899. 6. 'Fíor Chláirséach na h-Eireann, or the True Harp of Ireland,' edited by Russell, Dublin, 1900. 7. 'An Borama Laigean, or the Leinster Tribute, put into modern Irish,' Dublin, 1901. 8. 'The Last Irish King,' a drama in three acts, Dublin, 1904. 9. 'Red Hugh,' a drama in three acts, Dublin, 1905. 10. 'Is Ireland a Dying Nation?' Dublin, 1906.

[Literary Year Book, 1906; Journal of National Literary Society of Ireland, 1900-4, p. 128; Irish Independent, 1908; personal knowledge.]

D. J. O'D.

RUSSELL, WILLIAM CLARK (1844-1911), novelist, born at New York on 24 Feb. 1844, was son of Henry Russell [q. v. Suppl. I], vocalist and song composer, by his wife Isabella daughter of Charles Lloyd of Bingley Hall, Birmingham. From his mother, who was a relative of the poet William Wordsworth [q. v.], and herself a writer of verse, Clark Russell mainly inherited his taste for literature. After education at private schools at Winchester and Boulogne he joined the British merchant service in 1858, and served as an apprentice on board the sailing vessel Duncan Dunbar.

He made several voyages to India and Australia, and while off the coast of China in 1860 he witnessed the capture of the Taku forts by the combined British and French forces. His life on shipboard was marked by privations which seriously undermined his health. Nevertheless from these early experiences Clark Russell gathered the material which was to be his literary stock-in-trade.

In 1866 he retired from the merchant service, and after a few months in a commercial calling he adopted a literary career. He began by writing a tragedy in verse, which was produced at the Haymarket Theatre in 1866, but proved a failure. Subsequently he took up journalism. In 1868 he served as editor of 'The Leader,' and in 1871 he wrote for the 'Kent County News.' But he soon settled down to writing nautical tales of adventure, which was henceforth his main occupation. His first novel, 'John Holdsworth, Chief Mate' (1875), at once attracted attention, and the still more popular 'Wreck of the Grosvenor' (1877; new edit. 1900) established his reputation as a graphic writer of sea stories. While these early works brought him little profit owing to the sale of the copyright to the publishers, they served as useful advertisement. For thirty years a constant stream of more or less successful novels flowed from his fertile pen; in all he produced fifty-seven volumes.

Meanwhile Clark Russell continued to contribute articles on sea topics to the leading journals. In 1880 he received an invitation from Joseph Cowen [q. v. Suppl. I] to join the staff of the 'Newcastle Chronicle,' and later for a brief period he was editor of 'Mayfair.' In 1882 he accepted the offer of a post on the 'Daily Telegraph,' and for seven years he was a regular contributor to that paper under the pseudonym of 'A Seafarer.' The tragedies and comedies of the sea were his principal theme, and his masterly account of the wreck of the Indian Chief on the Long Sand (5 Jan. 1881) enhanced his growing reputation as a descriptive writer. Many of his fugitive articles in the 'Daily Telegraph' were reprinted in volume form under such titles as 'My Watch Below' (1882) and 'Round the Galley Fire' (1883).

A zealous champion in the press of the grievances of the merchant seamen, Clark Russell urged that the hardships of their life were practically unchanged since the repeal of the Navigation Acts in 1854, and that despite the Merchant Shipping Act of 1876 [see PLIMSOLL, SAMUEL, Suppl. I] ships were still sent to sea undermanned

and overladen. In response to this agitation further acts of parliament to prevent unseaworthy vessels putting to sea were passed in 1880, 1883, 1889, and 1892. In 1885 Clark Russell protested against the seamen and firemen not being represented on the shipping commission, which was appointed by Mr. Chamberlain (*Contemporary Review*, March 1885). In 1896 the Duke of York (afterwards King George V) expressed his opinion that the great improvement in the conditions of the merchant service was due in no small degree to Clark Russell's writings (cf. preface to CLARK RUSSELL's *What Cheer!* 3rd edit. 1910).

Latterly severe attacks of rheumatoid arthritis considerably reduced his literary activity, and compelled him to retire first to Ramsgate and subsequently to Deal. His last years were spent at Bath. Although crippled by disease, he continued working up to the last. He died at Bath on 8 Nov. 1911. He married in 1868 Alexandrina, daughter of D. J. Henry of the Institute of Civil Engineers, younger brother of Sir Thomas Henry [q. v.], police magistrate. She survived him with one son, Mr. Herbert Russell, writer on naval subjects, and three daughters.

Sir Edwin Arnold [q. v. Suppl. II] wrote of Clark Russell as 'the prose Homer of the great ocean,' while Algernon Charles Swinburne [q. v. Suppl. II], with characteristic exaggeration, called him 'the greatest master of the sea, living or dead.' Clark Russell's novels rendered the same benefit to the merchant service that those of Captain Marryat [q. v.] did to the royal navy. They stimulated public interest in the conditions under which sailors lived, and thereby paved the way for the reform of many abuses. His descriptions of storms at sea and atmospheric effects were brilliant pieces of word painting, but his characterisation was often indifferent, and his plots were apt to become monotonous.

In addition to the works already mentioned the following are a few of his best-known novels: 1. 'The Frozen Pirate,' 1877. 2. 'A Sailor's Sweetheart,' 1880; 4th edit. 1881. 3. 'An Ocean Tragedy,' 1881. 4. 'The Death Ship,' 1888; new edit. 1901. 5. 'List, ye Landsmen,' 1894; 2nd edit. 1899. 6. 'Overdue,' 1903. He also published popular lives of 'Dampier' ('Men of Action' series, 1889), 'Nelson' ('Heroes of the Nations' series, 1890; new edit. 1905), and 'Collingwood' (1891), which was illustrated by Frank Brangwyn, A.R.A. His poems and naval ballads were collected into a volume entitled 'The Turnpike Sailor,

or Rhymes on the Road' (1907), of which a third edition appeared in 1911 under the title of 'The Father of the Sea.'

[The Times and Daily Telegraph, 9 Nov. 1911; Athenæum, 11 Nov. 1911; Harper's Mag., June 1888; Idler, Aug. 1892; A National Asset, by Capt. W. J. Ward, prefixed to Clark Russell's Father of the Sea (portrait), 1911; private information.] G. S. W.

RUSSELL, Sir WILLIAM HOWARD (1820-1907), war-correspondent, was born at Lily Vale, in the parish of Tallaght, county Dublin, on 28 March 1820. His father, John Russell, came of a family which had been long settled in county Limerick, and was agent in Dublin for a Sheffield firm. His mother was Mary, daughter of John Kelly, a grazier, who owned a small property at Lily Vale. Near by the house in which Russell was born some ruins, known as Castle Kelly, suggested a family prosperity, which was already only a legend at the time of Russell's birth. John Russell was a protestant, and Mary Kelly a Roman catholic. In the early years of Russell's life misfortune broke up the business of his father, who migrated to Liverpool, where he tried more than one occupation. Young William Russell was brought up first by his grandfather Kelly, and then in Dublin by his grandfather William Russell. John Russell's wife and younger son, John Howard Russell, both died in Liverpool. William Howard Russell, after starting life as a Roman catholic, was converted to the protestant faith by his grandfather in Dublin. He was educated at Dr. E. J. Geoghegan's school in Hume Street, Dublin (1832-1837), and entered Trinity College, Dublin, in 1838. He left Trinity College in 1841 without a degree, yet he acquired a good knowledge of the classics and a real liking for them, which did not desert him through life. His tutor frequently spoke of the possibility of his taking a fellowship.

In 1841 he was invited to help in reporting the Irish general election for 'The Times.' He was ignorant of journalism, except for some slight work on the Dublin 'Evening Mail.' At Longford, being anxious to pick up information from both sides as to some events he had missed, he was led by his mother wit straight to the hospital. There he found all the information he desired, and more. At the end of the elections he went to London to read for the bar, and was for two terms junior mathematical master at Kensington grammar school. J. T. Delane, the editor of 'The Times,' next asked him to report the episodes of

the repeal agitation in Ireland in 1843. Russell attended many of the 'monster meetings' and had some amusing encounters with O'Connell, who more than once good-humouredly denounced the 'Times' Server.' His vivacious work was so much appreciated by Delane that he became attached to 'The Times' regularly as a reporter. He reported O'Connell's trial and the 'railway mania,' and was engaged fairly frequently in the Press gallery of the House of Commons. In 1845 he joined the staff of the 'Morning Chronicle.' In the autumn of 1848 he rejoined 'The Times.' In June 1850 he was called to the bar at the Middle Temple, but he never applied himself seriously enough to the work to succeed, though it was some years before he ceased to take an occasional brief. In 1850 he accompanied the Schleswig-Holstein forces in their campaign against the Danes and was present at the decisive battle of Idstedt.

The great opportunity of his life came in 1854, when the Crimean war broke out. With this war his name will always be connected. He landed at Gallipoli on 5 April 1854, and within a few days predicted the sufferings of the Crimea, as he found the management of the commissariat and medical departments infamous. His letters from here and from Varna were resented by the headquarters' staff, and when the army reached the Crimea he was an outcast, not authorised to draw rations, and knowing that his irregular and indeed unprecedented position might be challenged at any moment and that he might be removed from the theatre of war. He had lost most of his clothes, and by a freak of irony wore a commissariat cap. If he had not had great personal charm, which made friends for him rapidly, he could scarcely have contrived to do his work in the early days of the campaign, when he was dependent for food and shelter on the liberality of chance acquaintances. His letters to 'The Times' from the Crimea were narratives of remarkable ease, never disdaining any subject as too small, yet always relevant and appropriate. In writing of the battle of Balaclava (25 Oct. 1854) he applied to the English infantry the phrase 'the thin red line' which has since passed into the language. But the letters which moved Englishmen to an intensity of indignation, not before or since produced by such a means, were those describing the sufferings of the British army in the winter of 1854-5. It was these which made the public aware of the true condition of the army, which largely inspired the heroic

work of Florence Nightingale [q. v. Suppl. II] and others, and which caused a stream of 'comforts' to be despatched from home to the stricken troops. Russell's letters to 'The Times' were no doubt also the chief cause of the fall of the Aberdeen ministry (29 Jan. 1855). The question whether he was unjust to Lord Raglan, the commander-in-chief in the Crimea, may remain a matter of opinion. The blame for the sufferings of the troops of course belonged much more to the government which had made war without preparing for it than to Lord Raglan. Russell always denied, however, that he had attacked Lord Raglan, who was the first general to conduct a war under the eyes of newspaper correspondents. As to Russell's service to the army on the whole there are not now two opinions. Lord Raglan complained that his published letters, especially during the siege of Sevastopol, revealed much that was of advantage to the enemy. But in Sir Evelyn Wood's words Russell 'saved the remnant' of the army (KINGLAKE'S *Crimea*, 6th edit. 208-11, 226-7). On his return home he was created an honorary LL.D. of Trinity College, Dublin.

Russell's next experience of fighting was in India, where he accompanied Sir Colin Campbell (Lord Clyde) in the campaign of 1858 against the mutineers. Colin Campbell put all the information of headquarters at his disposal. Delane attributed the cessation of indiscriminate executions to Russell's first letter from Cawnpore.

In 1860 Russell founded the 'Army and Navy Gazette,' which he edited, and in which he owned the chief interest, to the end of his life. In spite of this occupation he was still able to work on important occasions for 'The Times.' In March 1861 he sailed for the United States to inquire into the dispute between North and South which culminated in the civil war. 'The Times' supported the Southern cause, but Russell had not been long in the country before he discovered that his sympathies were strongly with the North. A visit to the South made him dislike the 'peculiar institution' of slavery so intensely that he was unable to tolerate even the most indirect excuses for it. After his return to the North he watched the disorderly recoil of the federal troops at the first battle of Bull Run (21 July 1861). He wrote a faithful description of what he saw, and when his narrative was published in the United States such a storm of anger broke about his head that he doubted whether his life was safe. He was now as un-

popular in the north as in the south, and it was no doubt difficult for him to pursue his work usefully. He returned to England without warning in April 1862, much to the displeasure of Delane. He received a pension of 300*l.* a year from 'The Times' in 1863, but he remained an occasional contributor to the paper till his death.

In 1866 he was present at the last phase of 'the seven weeks' war' between Austria and Prussia. He saw the battle of Königgrätz (3 July); and was impressed by the deadly effectiveness of the 'needle-gun,' the adoption of which he recommended with much earnestness. He took the field again in 1870, when he accompanied the army of the Crown Prince of Prussia (afterwards the Emperor Frederick III) in the Franco-German war. He was treated with such consideration that Matthew Arnold satirically imagined him in 'Friendship's Garland' as being hoisted into the saddle by the old King of Prussia, while Bismarck was at the horse's head and the Crown Prince held the stirrup. In this war Russell became conscious that all the conditions of his work had been changed by the telegraph since Crimean days. Speed in transmission now earned more praise than skilful writing or acute judgments. He was frequently beaten in the competition by Archibald Forbes [q. v. Suppl. I] and other correspondents. Russell's last campaign was with Sir Garnet (afterwards Lord) Wolseley, for the 'Daily Telegraph,' during the Zulu war in South Africa in 1879.

Meanwhile Russell unsuccessfully contested Chelsea in the conservative interest in 1869. He was one of the companions of King Edward VII when Prince of Wales in journeys through the Near East in 1869 and through India in 1875-6. Of both tours Russell published full narratives. With King Edward he remained on terms of intimacy till his death. He revisited Canada and the United States in 1881, was in Egypt through the rebellion of Arabi Pasha and the beginnings of the British occupation in 1882, and in 1889 travelled in South America.

Russell may be said to have invented the office of the modern special correspondent. He was distinguished throughout his career by great moral courage, but he was often reckless in his statements. He wrote at white heat, when his indignation or pity was moved. When he felt it his duty to speak out no thoughts of his own comfort or of friendship restrained him. His personal qualities carried him through many difficulties of his own making. He was

matchless 'good company' and a renowned story-teller. His literary friends included Douglas Jerrold, Dickens, Thackeray, and Shirley Brooks. Thackeray used to say that he would pay a guinea any day to have Russell dining at his table at the Garrick Club.

Russell was knighted in 1895, and was created C.V.O. in 1902. He received orders from France, Prussia, Austria, Turkey, Greece, and Portugal. He died on 10 Feb. 1907 at 202 Cromwell Road, Kensington, W., and was buried at Brompton cemetery.

He was married twice, first on 16 Sept. 1846 to Mary Burrowes, a great-niece of Peter Burrowes [q. v.] the Irish judge. By this marriage he had two daughters and two sons. Mrs. Russell died on 24 Jan. 1867. Russell married his second wife, the Countess Antoinetta Malvezz, on 18 Feb. 1884. There were no children of this marriage. His widow, who survived him, received a civil list pension of 80*l.* in 1912.

Russell published the following works, which are mostly a reprint or recasting of his journalistic work: 1. 'The War from the Landing at Gallipoli to the Death of Lord Raglan,' 2 vols. 1855 and 1856. 2. 'The British Expedition to the Crimea,' 1858; new edit. 1877. 3. 'Rifle Clubs and Volunteer Corps,' 1859. 4. 'My Diary in India in the years 1858-9,' 2 vols. 1860; new edit. 1905. 5. 'The Battle of Bull Run,' New York, 1861. 6. 'A Memorial of the Marriage of Albert Edward Prince of Wales and Alexandra Princess of Denmark,' 1863. 7. 'My Diary North and South: Canada, its Defences, Conditions, and Resources,' 3 vols. 1863-5. 8. 'General Todleben's History of the Defence of Sebastopol: a Review,' 1865. 9. 'The Atlantic Telegraph,' 1866. 10. 'The Adventures of Dr. Brady,' 3 vols. 1868. 11. 'My Diary in the East, during the Tour of the Prince and Princess of Wales,' 1869 (2 editions). 12. 'My Diary during the Last Great War,' 1874. 13. 'The Prince of Wales's Tour; with some Account of Visits to the Courts of Greece, Egypt, Spain; and Portugal,' illustrations by S. P. Hall, 1877. 14. 'The Crimea 1854-5'; comments on Mr. Kinglake's 'Apologies for the Winter Troubles,' 1881. 15. 'Hesperothen. Notes from the West, being a Record of a Ramble in the United States and Canada,' 2 vols. 1882. 16. 'A Visit to Chile and the Nitrate Fields of Tarapaca,' 1890. 17. 'The Great War with Russia: the Invasion of the Crimea: A Personal Retrospect'; reprinted from the 'Army and Navy Gazette,' 1895.

On 9 Feb. 1909 a memorial bust of Russell by Mr. Bertram Mackennal was unveiled in the crypt of St. Paul's Cathedral. A cartoon portrait by 'Ape' appeared in 'Vanity Fair' in 1875.

[Russell's published works; his private diaries and correspondence; reminiscences of friends; The Life of Sir William Howard Russell, by the present writer (London, 2 vols. 1911); Herbert Paul's History of Modern England, i. 370-1; S. M. Mitra's Life of Sir John Hall, 1911.] J. B. A-s.

RUSSELL, WILLIAM JAMES (1830-1909), chemist, born at Gloucester on 20 May 1830, was son of Thomas Pougher Russell (1775-1851), a banker at Gloucester, and was grandson of Priestley's friend, William Russell (1740-1818) [q. v.]. His mother was Mary (1790-1877), fourth daughter of Col. James Skey. Educated at private schools at Bristol and Birmingham, he entered University College, London, in 1847, studying chemistry under Thomas Graham [q. v.] and Alexander Williamson [q. v. Suppl. II]. For two years a demonstrator at Owens College, Manchester, under Frankland (1851-3), he proceeded thence to Heidelberg University, becoming a pupil of Bunsen and graduating Ph.D. in 1855. In 1857 he became assistant to Prof. Williamson and carried out researches on the analysis of gases, the results of which were communicated to the Chemical Society. For Henry Watts's 'Dictionary of Chemistry' he wrote the article on 'Gas Analysis' (1868). Other investigations comprised the determination of the atomic weights of cobalt and nickel; memoirs on absorption spectra; and papers on the action of wood and other substances on a photographic plate in darkness (see *Philosophical Transactions, Royal Society*, vol. 197, B. 1905). From 1868 to 1870 he was lecturer in chemistry at the medical school, St. Mary's Hospital, London, and subsequently (1870-97) held a similar post at St. Bartholomew's. He was (1860-70) professor of natural philosophy at Bedford College, London, and in later life was chairman of the council.

Following a long period of honorary service at the Chemical Society, Russell became president, 1889-91. Elected F.R.S. on 6 June 1872, he was Bakerian lecturer in 1898. One of the founders of the Institute of Chemistry, he was president 1894-7. He died at Ringwood on 12 Nov. 1909. Russell married in 1862 Fanny, daughter of Abraham Follett Osler [q. v. Suppl. II], by whom he had issue

one son and one daughter; the latter married Dr. Alexander Scott, F.R.S.

Carey Foster); The Times, 13 Nov. 1909; S. H. Jeyess's *Russells of Birmingham*, 1911, p. 268 (with photograph).] T. E. J.

RUTHERFORD, WILLIAM GUNION (1853–1907), classical scholar, was born at Glasgow on 17 July 1853, the second son of Robert Rutherford, minister of the United Presbyterian church at Mountain Cross, in Peeblesshire, and his wife Agnes, daughter of William Gunion, a Glasgow merchant. A younger brother, John Gunion Rutherford, C.M.G. (b. 1857), has had a distinguished career in Canada as a veterinary surgeon in the service of the Dominion.

After receiving Latin lessons from a dominie William was sent to Glasgow High School, and thence to St. Andrews University, where Lewis Campbell [q. v. Suppl. II] was Greek professor. In April 1873 he went to Oxford as an exhibitor of Balliol, and in 1874 was in the first class in classical moderations, but he chose natural science for his final school (in which he took a second class), reading at the same time much Greek on his own account. He graduated in Dec. 1876, and at once became a classical master at St. Paul's school.

In 1878 he published a 'First Greek Grammar,' which soon came into wide use. It owed something to Cobet's study of Attic forms, but much also to original research. In deference to convention some spurious forms were retained, but these disappeared from later editions. Working on the same lines, Rutherford produced in 1881 'The New Phrynichus,' the greatest contribution of English scholarship to the study of Attic usage in vocabulary and inflexions. This was followed in 1883 by an edition of 'Babrius' with critical dissertations and notes.

Rutherford's reputation as a scholar was now established, and in the same year he was elected fellow and tutor of University College, Oxford. Before he went into residence the headmastership of Westminster fell vacant, and at the instigation of Benjamin Jowett [q. v. Suppl. I] Rutherford became a candidate. He was elected and entered on office in September 1883.

Coming to the school as a reformer, Rutherford met with opposition from the sentiment of some Old Westminsters. Especial objection was taken to his abolition

of 'water,' that is to say, rowing on the Thames. Though in this matter his judgment was at one with the Westminster staff, he took no shelter behind that fact. Nor did he waver in any of his more vital improvements, and the opposition gradually died away. In school he was a strong disciplinarian, a character which did not prevent him from becoming in the end extremely popular with the boys. He was a great teacher, always treating words as the vehicle of thought, using them with reverent precision, and in translation showing 'a horror of looseness, poverty of vocabulary, and English idiom all stuccoed over with a base convention' (J. S. PHILLIMORE). Though he was not much given to the practice of verse composition, his prologues to the Westminster plays were marked by Terentian ease and grace. In 1884 St. Andrews gave him the honorary degree of LL.D. He had taken orders on going to Westminster, and in 1901 published under the title of 'The Key of Knowledge' some of his sermons preached at the school services in Westminster Abbey.

In 1889, in an edition of the fourth book of Thucydides, Rutherford exemplified a theory that the current texts of Greek authors are disfigured by ascripts imported from the margins. Some of his corrections have been accepted, but not all are necessary. Afterwards his view of the time at which the interpolations took place was modified in face of the evidence of the Egyptian papyri. His first recension of the newly discovered 'Mimiambi' of Herondas (1892) was a somewhat hasty piece of work which did not add to his reputation. In connexion with his work on Attic he had studied the scholia to Aristophanes, and he now visited Italy to examine the Ravenna manuscript. In 1896 he published a revised text of the scholia with a translation and notes, promising a third volume to deal with the conclusions which he had drawn. His health having begun to fail, early in 1899 he went with his wife on a voyage to New Zealand. The benefit was not lasting, and in July 1901 he gave up his headmastership and retired to Little Hallands, near Bishopstone, which had been for some years his country house.

The third volume on the Aristophanic scholia came out in 1905 under the title of 'A Chapter in the History of Annotation.' It supplied no formal proof of the theory of ascripts, but threw light on it by tracing the history of Greek studies from the earliest commentators to the fall of Constantinople, and was a vigorous protest against the

spirit which ranks the annotation with the text.

Rutherford was profoundly dissatisfied with the revised version of the New Testament. His sense of Hellenistic Greek told him that the author of the Pauline epistles thought in one language and wrote in another. In 1900 he brought out a new translation of the Epistle to the Romans. He began a new translation of the Epistles to the Thessalonians and to the Corinthians. He completed the work as far as 2 Cor. viii. 24, when on 19 July 1907 he died somewhat suddenly at Little Hallands. He was buried in Bishopstone churchyard. His last work was published posthumously with a biographical sketch by his friend Spenser Wilkinson.

Rutherford, though an admirer of Cobet and Blass, had too independent a genius to be any man's disciple. His fame as a scholar rests chiefly on his studies of Attic, of Aristophanes, and of New Testament Greek. His translations of St. Paul have to contend against some theological prejudice, but he was more learned and acute than any of his critics.

Rutherford married, on 3 Jan. 1884, Constance Gordon, daughter of John Thomson Renton, of Bradston Brooke, Surrey. His wife with three daughters survives him.

A crayon portrait by J. Seymour Lucas, R.A., is in Ashburnham House, Westminster School. A portrait in oils by the same artist, for which Old Westminsters subscribed in 1901, is with Mrs. Rutherford for her life and will ultimately come to the school. The cartoon by 'Spy' in 'Vanity Fair,' 3 March 1898, is a remarkable likeness.

[Personal knowledge; Spenser Wilkinson's biog. sketch, noticed supra.] J. S.

RUTLAND, seventh DUKE OF. [See **MANNERS**, LORD JOHN JAMES ROBERT (1818-1906), politician.]

RYE, MARIA SUSAN (1829-1903), social reformer, born at 2 Lower James Street, Golden Square, London, on 31 March 1829, was eldest of the nine children of Edward Rye, solicitor and bibliophile of Golden Square, London, by his wife Maria Tuppen of Brighton. Edward Rye of Baconthorpe, Norfolk, was her grandfather. Of her brothers, Edward Caldwell Rye [q. v.] was an accomplished entomologist, and Walter, solicitor, antiquary, and athlete, has published many works on Norfolk history and topography and was mayor of Norwich in 1908-9.

Miss Rye received her education at home and read for herself in the large library of her father. Coming under the influence of Charles Kingsley's father, then vicar of St. Luke's, Chelsea, she devoted herself at the age of sixteen to parochial work in Chelsea. She was early impressed by the disabilities of her sex, and by their lack of opportunity of employment outside the teaching profession. In succession to Mary Howitt [q. v.], she soon became secretary of the association for promoting the married women's property bill, which was brought forward by Sir Thomas Erskine Perry [q. v.] in 1856 but was not fully passed till 1882. She joined the Women's Employment Society on its foundation, but, disapproving of the women's franchise movement which the leading members supported, soon left it. In 1859 she undertook a private law-stationer's business at 12 Portugal Street, Lincoln's Inn, in order to give employment to middle class girls. At the same time she helped to establish the Victoria printing press in association with her business in 1860 (under the charge of Miss Emily Faithfull), and the registry office and telegraph school in Great Coram St., with Miss Isa Craig [q. v. Suppl. II] as secretary. The telegraph school anticipated the employment of girls as telegraph clerks.

Miss Rye's law-stationer's business prospered, but the applications for employment were far in excess of the demands of the concern. With Miss Jane Lewin, Miss Rye consequently raised a fund for assisting middle class girls to emigrate, and to the question of emigration she devoted the rest of her life. She founded in 1861 the Female Middle Class Emigration Society (absorbed since 1884 in the United British Women's Emigration Association; cf. her *Emigration of Educated Women*, 1861). Between 1860 and 1868 she was instrumental in sending girls of the middle class and domestic servants to Australia, New Zealand, and Canada, and she visited these colonies to form committees for the protection of the emigrants.

From 1868, when she handed over her law business to Miss Lewin, Miss Rye devoted herself exclusively to the emigration of pauper children, or, in a phrase which she herself coined, 'gutter children.' After visiting in New York the Little Wanderers' Home for the training of derelict children for emigrant life which Mr. Van Meter, a baptist minister from Ohio, had founded, she resolved to give the system a trial in London. Encouraged by the earl of Shaftesbury and 'The Times'

newspaper and with the financial support of William Rathbone, M.P. [q. v. Suppl. II], she purchased in 1869 Avenue House, High Street, Peckham, and with her two younger sisters, in spite of public opposition and prejudice, took there from the streets or the workhouses waifs and strays from the ages of three to sixteen. Fifty girls from Kirkdale industrial school, Liverpool, were soon put under her care; they were trained in domestic economy and went through courses of general and religious instruction. At Niagara, Canada, Miss Rye also acquired a building which she called 'Our Western Home.' It was opened on 1 Dec. 1869. To this house Miss Rye drafted the children from Peckham, and after further training they were distributed in Canada as domestic servants among respectable families. The first party left England in October 1869. Poor law children were subsequently received at Peckham from St. George's, Hanover Square, Wolverhampton, Bristol, Reading, and other towns. By 1891 Miss Rye had found homes in Canada for some five hundred children. She personally accompanied each batch of emigrants, and constantly visited the children already settled there. The work was continued with great success for over a quarter of a century, and did much to diminish the vicious habits and the stigma of pauperism. Lord Shaftesbury remained a consistent supporter, and in 1884 the duke of Argyll, then governor-general of Canada, warmly commended the results of Miss Rye's pioneer system, which Dr. Barnardo [q. v. Suppl. II] and others subsequently adopted and extended.

In 1895, owing to the continuous strain, Miss Rye transferred the two institutions in Peckham and Niagara with their funds to the Church of England Waifs and Strays Society. That society, which was founded in 1891, still carries on her work. In her farewell report of 1895 she stated that 4000 English and Scottish children then in Canada had been sent out from her home in England. She retired with her sister Elizabeth to 'Baconsthorpe,' Hemel Hempstead, where she spent the remainder of her life. There she died, after four years' suffering, of intestinal cancer on 12 Nov. 1903, and was buried in the churchyard. Of powerful physique and resolute character, Miss Rye cherished strong religious convictions, and her dislike of Roman catholicism often led her into controversy. She received a civil list pension of 70*l.* in 1871.

RYE, WILLIAM BRENCHELEY (1818-1901), keeper of printed books in the British Museum, born at Rochester on 26 Jan. 1818, was the younger son of Arthur Rye, a medical practitioner in that city. He was educated at the Rochester and Chatham Classical and Mathematical School, but the death of his father in 1832 left him with slender means, and in 1834 he came to London and entered the office of a solicitor, where he met John Winter Jones [q. v.], afterwards principal librarian of the British Museum, who in 1838, soon after his own appointment, obtained for him a subordinate post in the library there. His diligence and efficiency gained for him the good opinion of Sir Anthony Panizzi, then keeper, who in 1839 secured his appointment as a supernumerary assistant, and in 1844 he was placed on the permanent staff. On the bequest to the nation in 1846 of the splendid library of Thomas Grenville, Rye was entrusted with its removal to the British Museum and afterwards with its arrangement there. At a later date he selected and arranged the library of reference in the new reading-room opened in 1857, and he devised the plan showing the placing of the books which is still in use. He became an assistant-keeper in the department of printed books in 1857, and succeeded Thomas Watts in the keepership in 1869, but failing health and eyesight compelled him to retire in July 1875. The Weigel sale of block-books and incunabula in 1872, at which some important purchases were made, was the chief event of his brief term of office.

Rye's tastes were antiquarian rather than literary, and he possessed a great store of information relating to old English literature and to mediæval architecture and antiquities. He also practised etching. He edited for the Hakluyt Society in 1851, with an introduction and notes, Richard Hakluyt's translation of Fernando de Soto's Portuguese narrative of the 'Discovery and Conquest of Terra Florida,' but his principal work was 'England as seen by Foreigners in the Days of Elizabeth and James the First' (1865), a collection of the narratives of

foreign visitors, with a valuable introduction, and etchings by himself. He contributed to the early volumes of 'Notes and Queries,' and papers on 'A Memorial of the Priory of St. Andrew at Rochester' and 'Visits to Rochester and Chatham of Royal, Noble, and Distinguished Personages, English and Foreign, 1300-1783,' to the 'Archæologia Cantiana,' as well as others to the 'Antiquary,' in which that on 'Breuning's Mission to England, 1595,' appeared in 1903. The etchings which he contributed to the 'Publications of the Antiquarian Etching Club' (1849-1854) were brought together in a privately issued volume in 1859. His collections for a 'History of Rochester,' in three quarto volumes, are in the British Museum.

Rye, who in his last years was totally

blind, died at West Norwood, from an attack of bronchitis, on 21 Dec. 1901, and was buried in Highgate cemetery. He married twice; secondly, on 13 Dec. 1866, Frances Wilhelmina, youngest daughter of William Barker of Camberwell, by whom he left two sons and one daughter. The elder son, William Brenchley Rye (1873-1906), became an assistant librarian in the John Rylands Library, Manchester; the younger, Reginald Arthur Rye, is Goldsmiths' Librarian of the University of London, and author of 'The Libraries of London' (2nd edit. 1910).

[Library Association Record, Jan. and Feb. 1902, by Dr. Richard Garnett, reprinted privately with corrections; Athenæum, 4 Jan. 1902; information from Mr. Reginald A. Rye.]

R. E. G.

S

SACKVILLE - WEST, SIR LIONEL SACKVILLE, second **BARON SACKVILLE OF KNOLE** (1827-1908), diplomatist, born at Bourn Hall, Cambridgeshire, on 19 July 1827, was fifth son of George John West, fifth Earl de la Warr, by his marriage with Lady Elizabeth, daughter and co-heiress of John Frederick Sackville, third duke of Dorset, and Baroness Buckhurst by creation in 1864. His elder brother Mortimer (1820-1888) was created Baron Sackville in 1876. Privately educated at home, Lionel served as assistant précis writer to the fourth earl of Aberdeen when secretary of state for foreign affairs in 1845, and after further employment in the foreign office was appointed attaché to the British legation at Lisbon in July 1847. He was transferred successively to Naples (1848), Stuttgart (1852), Berlin (1853), was promoted to be secretary of legation at Turin 1858, and was transferred to Madrid in 1864. In November 1867 he became secretary of embassy at Berlin, and in June 1868 was transferred to Paris in the same capacity with the titular rank of minister plenipotentiary. He served under Lord Lyons [q. v.] throughout the exciting incidents of the Franco-German war, following him to Tours when the capital was invested by the German forces, and returning with him to Paris on the conclusion of peace. He was left in charge of the British embassy during the first weeks of the Commune, when the ambassador had accompanied the French ministry to Versailles. In September 1872

he was promoted to be British envoy at Buenos Ayres, but remained in charge of the embassy at Paris until 7 November and did not arrive at his new post until September 1873. In January 1878 he was transferred to Madrid, where he served for over three years, acting as the plenipotentiary of Great Britain and also of Denmark in the conference which was held in 1880 to define the rights of protection exercised by foreign legations and consulates in Morocco. In June 1881, shortly after the assassination of President Garfield, he was appointed to succeed Sir Edward Thornton [q. v. Suppl. II] as British envoy at Washington, and then entered upon the most eventful and, as it turned out, the final stage of his diplomatic career. The feeling in the United States towards Great Britain had improved since the settlement of outstanding questions provided for by the Treaty of Washington in 1871, and the reception given to West was cordial. But he soon found that the influence in congress and in the press of the Irish Fenian party formed a serious bar to the satisfactory settlement of important questions. The measures taken by the British government for the protection of life and property in Ireland after the 'Phoenix Park murders' of 1882 caused intense excitement among sympathisers with the Fenian movement in the United States. The publication in the American press of incitements to murder and violence, and the arrests in the United Kingdom

of Irishmen, naturalised citizens of the United States, on a suspicion of crime, involved West in disagreeable correspondence between the two governments, and when some of those who had taken part in the Phoenix Park murders were traced and convicted, there were veiled threats against the British minister's life at the time of their execution. A trip in the president's yacht was deemed a wise precaution.

The discussion of various questions connected with Canada, especially the seizure by United States cruisers of Canadian vessels engaged in the pelagic seal fishery, and the measures taken by the Canadian government to protect their fishing rights in territorial waters against incursions by United States fishermen, occupied much of West's attention in succeeding years. In June 1885 he was made K.C.M.G. In 1887 he was called upon to discuss in conference with the United States secretary of state and the German minister the questions which had arisen in regard to the status of the Samoan Archipelago, but the negotiations did not result in an agreement, and the matter was left to be settled at Berlin in 1889. In October 1887 the English government decided to send out Mr. Joseph Chamberlain on a special mission for the purpose of negotiating jointly with West and Sir Charles Tupper (the Canadian high commissioner in England) a treaty for the settlement of the questions connected with the fishery rights in the seas adjacent to British North America and Newfoundland. A treaty was concluded on 15 Feb. 1888, but it failed to obtain confirmation by the United States Senate. It was however accompanied by a provisional arrangement for a *modus vivendi* under which United States fishing vessels were admitted for two years to fishing privileges in the waters of Canada and Newfoundland on payment of a moderate licence fee; thus the risk of serious friction was for the time removed.

During the seven years of his residence at Washington, West, who combined unflinching good temper and unaffected geniality of manner and disposition with a singular power of reserve and laconic speech, had enjoyed unqualified popularity, and had maintained excellent personal relations with the members of the United States government. Yet in the autumn of 1888 his mission was brought to an abrupt and unexpected close. In September of that year, six weeks before the presidential election, he received a letter from California purporting to be written by a British subject naturalised

in the United States, expressing doubts whether the writer should vote for the re-election of President Cleveland on account of the hostile policy which the democratic president appeared to be bent on pursuing towards Canada, and asking for advice. West unguardedly answered that any political party which openly favoured Great Britain at that moment would lose in popularity, and that the democratic party in power were no doubt fully alive to that fact, but that he had no reason to doubt that President Cleveland if re-elected would maintain a spirit of conciliation. West was the victim of a political trick. The letter sent to him was an imposture, and on 22 Oct. his reply was published in the 'New York Tribune,' an organ of the republican party, for the purpose of discrediting the democratic president with the Irish party. For a foreign representative to advise a United States citizen as to his vote was obviously a technical breach of international conventions. At first the United States government showed no disposition to treat the matter otherwise than as one admitting of explanations and expressions of regret, which West freely tendered. The popular excitement, however, increased as the date of the election approached; copies of West's letter were distributed broadcast for the purpose of influencing votes against President Cleveland, and unfortunately West admitted the reporters of the 'New York Herald' and 'New York Tribune' to interviews. West disclaimed the statements attributed to him in the newspapers, but the United States government held them, in the absence of a published repudiation, to justify the immediate delivery to West of his passports. His mission consequently terminated on 30 Oct. 1888. Lord Salisbury, then foreign secretary, protested against the United States government's action in a note to the United States minister in London. 'There was nothing in Lord Sackville's conduct' (wrote Lord Salisbury) 'to justify so striking a departure from the circumspect and deliberate procedure by which in such cases it is the usage of friendly states to mark their consideration for each other.' To this the American secretary of state replied in a long despatch of justification, which, whatever may be thought of the technical arguments adduced, fails to remove the impression that West's abrupt dismissal was in reality an electoral device, adopted in the unavailing hope of averting the imminent defeat of the party in power.

Benjamin Harrison, the republican candidate, was elected.

West on the death (16 Oct. 1888) of his elder brother Mortimer, first Baron Sackville, had succeeded to the title by special remainder a fortnight previous to his departure from the United States, and had inherited the historic property of Knole Park near Sevenoaks, where he passed the rest of his life. He retired from the diplomatic service on pension in April 1889, was made G.C.M.G. in September following, and lived at Knole till his death there on 3 Sept. 1908. There is at Knole an excellent portrait of him in pastel by Mr. Philip Laszlo.

Lord Sackville was not married. While an attaché at Stuttgart in 1852 he had formed an attachment for a Spanish lady, whom he met during a visit to Paris, and who subsequently left the stage to live with him, but with whom, as she was a strict catholic and already married to a husband who survived her, he was unable to contract any legal union. He had by her two sons and three daughters. The daughters joined him at Washington, their mother having died some years previously, in 1871, and were received there and in English society as his family. The two sons were established on an estate in Natal. The younger, Ernest Henri Jean Baptiste Sackville-West, claimed on his father's death to be the legitimate heir to the peerage and estates, but his action, after long delays in collecting evidence on either side, was finally dismissed by the probate division of the high court in February 1910. The title and entailed property consequently descended to Lord Sackville's nephew, Lionel Edward (eldest son of Lieutenant-colonel the Hon. William Edward Sackville-West), who had married Lord Sackville's eldest daughter.

[The Times, 4 Sept. 1908; Lord Sackville's Mission, 1895; Lord Augustus Loftus, Diplomatic Reminiscences, 2 ser. i. 374; papers laid before Parliament; Foreign Office List, 1909, p. 404.] S.

ST. HELIER, BARON. [See JEUNE, FRANCIS HENRY (1843-1905), judge.]

ST. JOHN, SIR SPENSER BUCKINGHAM (1825-1910), diplomatist and author, born in St. John's Wood, London, on 22 Dec. 1825, was third of the seven sons of James Augustus St. John [q. v.] by his wife Eliza Agar, daughter of George Agar Hansard of Bath. Percy Bolingbroke St. John [q. v.] and Bayle St. John [q. v.] were elder brothers, and Horace Stebbing

Roscoe St. John [q. v.] and Vane Ireton St. John (see below) were younger brothers. After education in private schools, Spenser wrote 'innumerable articles' on Borneo, to which the adventures of Sir James Brooke [q. v.], rajah of Sarawak, were directing public attention, and he took up the study of the Malay language (St. John's *Life of Sir James Brooke*, p. 129). He was introduced to Sir James Brooke on his visit to England in 1847, and he accompanied Brooke as private secretary next year, when Brooke became British commissioner and governor of Labuan. Lord Palmerston, an acquaintance of St. John's father, allowed him 'in a roundabout way 200l. a year' (*ib.* p. 130). Thenceforth St. John and Brooke were closely associated. St. John was with Brooke during his final operations in 1849 against Malay pirates, and he accompanied Brooke to Brunei, the Sulu archipelago, and to Siam in 1850. Although St. John deemed some of his chief's dealings with the natives high-handed and ill-advised, he in a letter to Gladstone defended Brooke against humanitarian attack in the House of Commons. While the official inquiry into Brooke's conduct, which the home government appointed, was in progress at Singapore, St. John acted temporarily as commissioner for Brooke (1851-5), and visited the north-western coast of Borneo and the north-eastern shore, ascending the principal rivers. Appointed in 1856 British consul-general at Brunei, St. John explored the country round the capital, and penetrated farther into the interior than any previous traveller. He published his full and accurate journals, supplemented by other visitors' testimonies, in two well-written and beautifully illustrated volumes entitled '*Life in the Forests of the Far East*' (1862; 2nd enlarged edit. 1863).

In November 1859 St. John revisited England with Brooke, and after returning to Borneo became chargé d'affaires in Hayti in January 1863. He remained in the West Indies twelve years. During his residence in Hayti the republic was distracted by civil strife, and by a war with the neighbouring state of Santo Domingo, and St. John frequently took violent measures against native disturbers of the public peace. On 28 June 1871 he became chargé d'affaires in the Dominican republic, and he was promoted on 12 Dec. 1872 to the post of resident minister in Hayti. His leisure was devoted to a descriptive history of the country, which was finally published in 1884 as '*Hayti*;

or the Black Republic' (2nd edit. 1889; French translation 1884). St John gave an unfavourable but truthful account of the republic and its savage inhabitants (cf. A. BOWLER, *Une Conférence sur Haïti*, Paris, 1888).

For nine years (from 14 Oct. 1874 till 1883) St. John was minister residentiary in Peru and consul-general at Lima. In 1875 he went on a special mission to Bolivia, and in 1880-1 witnessed the war between Peru and Chile. With the ambassadors of France and Salvador he negotiated an armistice in January 1881, and by his diplomatic firmness helped to protect Lima from destruction after the defeat of the Peruvians by Chile. He was created K.C.M.G. on 20 March 1881. In May 1883 St. John was sent to Mexico to negotiate the resumption of diplomatic relations with Great Britain. An agreement was signed at Mexico on 6 Aug. 1884, and was ratified, not without much opposition, mainly by his tact. He was appointed envoy extraordinary and minister plenipotentiary to Mexico on 23 Nov. 1884, and remained there till 1893. In 1886 a mixed commission was appointed to investigate British financial claims on the Mexican government, and in 1887 a long-standing dispute was equitably terminated under St. John's guidance. From 1 July 1893 to January 1896 St. John was at Stockholm as minister to Sweden. He was created G.C.M.G. in 1894. Retiring from the diplomatic service in 1896, St. John spent his last years in literary pursuits. He died on 2 Jan. 1910 at Pinewood Grange, Camberley, Surrey. He married, on 29 April 1899, Mary, daughter of Lieutenant-colonel Fred. Macnaghten Armstrong, C.B., of the Bengal staff corps, who survived him.

St. John's chief work, besides those mentioned above, was his authentic 'Life of Sir James Brooke, Rajah of Sarawak' (1879). He also wrote 'Rajah Brooke' (1899) for the 'Builders of Britain' series. St. John drew upon his early experiences in the Malay archipelago in two vivacious volumes, 'Adventures of a Naval Officer' (1905) and 'Earlier Adventures' (1906), both of which he attributed to a fictitious Captain Charles Hunter, R.N. A final publication was a collection of sympathetic but rather colourless 'Essays on Shakespeare and his Works' (1908), edited from the MSS. and notes of an unnamed deceased relative.

St. John bequeathed his portrait of Brooke by Sir Francis Grant (1847) to the National Portrait Gallery.

VANE IRETON SHAFESBURY ST. JOHN

(1839-1911), Sir Spenser's youngest and last surviving brother, pursued a literary and journalistic career. He was a pioneer of boys' journals, starting and editing the 'Boys of England' and similar periodicals. He was also the author of 'Undercurrents: a Story of our own Day' (3 vols. 1860) and of many story books for boys. He died at Peckham Rye in poor circumstances on 20 Dec. 1911. He was twice married, and had seventeen children.

SALAMAN, CHARLES KENSINGTON (1814-1901), musical composer, born at 11 Charing Cross, London, on 3 March 1814, was the eldest son and one of the fourteen children of Simeon Kensington Salaman, a member of a Jewish family of German and Dutch origin, by his wife Alice Cowen, an amateur pianist. Mrs. Julia Goodman [q. v. Suppl. II] was his eldest sister. Another sister, Rachel, married Sir John Simon (1818-1897) [q. v.], while a third, Kate (1821-1856), attained some reputation as a miniature-painter, and exhibited at the Royal Academy. After being educated privately Charles gave early evidence of musical talent, and had his first lessons on the piano from his mother. In 1824 he was awarded second place in the competition for studentship at the new Royal Academy of Music, but preferred to study the pianoforte independently, first with Stephen Francis Rimbault and then (1826-1831) under Charles Neate, the friend of Beethoven. Meanwhile in 1828 he studied under Henri Herz in Paris, and to him and to Neate his earliest compositions were dedicated in the same year. As a boy he played duets with Liszt and came to know Clementi. His first public appearance was at Lanza's concert at Blackheath, in June 1828. He composed the ode (with words by Isaac Cowen, his uncle) for the Shakespeare Festival at Stratford-on-Avon, 30 April 1830. In 1831 he commenced his long career as a pianoforte teacher. In May 1833 he gave his first annual orchestral concert at the Hanover Square rooms, when Mendelssohn's Concerto in G Minor was first rendered in public by a player other than the composer. At his annual orchestral concerts he introduced many distinguished artists and classical novelties.

On 9 November 1835 he instituted, with Henry Blagrove and others, the 'Concerti da Camera,' a chamber music organisation. In 1838 he visited the Continent, played at Vienna, Munich, Homburg, and other places, and made the acquaintance of Schumann, of Mozart's widow and son, of Thalberg, and of Czerny. At Mainz he published his popular pianoforte romance, 'Cloelia.' From 1846 to 1848 he resided in Rome, conducting Beethoven's Symphony No. 2 for the first time there and composing his 'Saltarello' and several songs with Italian words. He was elected an honorary member of the Academy of St. Cecilia. Returning to London, he resumed his teaching, and founded the first Amateur Choral Society in 1849. In 1855 he began a series of musically illustrated lectures in London and the provinces, taking as his first topic 'The History of the Pianoforte and its Precursors.' At the Polytechnic Institution (10 May 1855) he gave this lecture before Queen Victoria, Prince Albert, and their children. In 1858 he founded the Musical Society of London, which lasted till 1868, and of which he was honorary secretary till 1865. In 1874 he was one of the founders of the Musical Association, and for three years its secretary and afterwards a vice-president. He gave his last concert in 1876 and soon retired from active work, but he maintained his vigour until near his death, in London, on 23 June 1901. He was buried in the Jewish cemetery at Golder's Green, Hendon. He married on 24 Dec. 1848 Frances Simon of Montego Bay, Jamaica, by whom he had three sons and two daughters. His eldest son, Malcolm Charles Salaman, is well known as a dramatic and art critic.

Salaman's compositions are numerous, including songs and orchestral and pianoforte pieces. In his later years he made an annual custom of publishing a song on his birthday, and he wrote close on one hundred songs. The most famous is his beautiful setting of Shelley's 'I arise from dreams of thee,' written at Bath in 1836, when he was twenty-two, and published in an album called 'Six Songs' (1838). Some of his songs were written for Hebrew, Greek, and Latin words. A deeply religious man, he composed and arranged in 1858 the choral and organ music for the psalms and service of the synagogue of the Reformed Congregation of British Jews; some of his settings of the psalms were used as anthems in cathedrals. His literary ability was favourably shown in 'Jews as they are' (1882),

in his published lectures, and in many articles contributed to the musical journals.

Among portraits of Salaman are a three-quarter length (oils) by his sister, Mrs. Julia Goodman, 1834, in the possession of Mr. Malcolm C. Salaman; a sketch, seated at piano (oils), by S. Starr, 1890, in the possession of Brandon Thomas; a marble medallion in high relief, by Girometti, Rome, 1847; and a lithograph, by R. J. Lane, A.R.A., after S. A. Hart, R.A., published in 1834.

Salaman; Musical Keepsake for 1834; Concordia, 1875-6.] J. C. H.

SALAMAN, JULIA. [See GOODMAN, MRS. JULIA (1812-1906), portrait painter.]

SALISBURY, third MARQUIS OF. [See CECIL, ROBERT ARTHUR TALBOT GASCOYNE- (1830-1903), prime minister.]

SALMON, GEORGE (1819-1904), mathematician and divine, born at Cork on 25 Sept. 1819, was only son of Michael Salmon, linen merchant, by his wife Helen, daughter of the Rev. Edward Weekes. Of three sisters one, Eliza, married George Gresley Perry [q. v. Suppl. I], archdeacon of Stow. Salmon, after attending Mr. Porter's school in Cork, entered Trinity College, Dublin, in 1833, where he had a brilliant career, winning a classical scholarship in 1837 and graduating as first mathematical moderator in 1838. He attended some divinity lectures in 1839, as scholars of the house were bound to do, and was persuaded to sit for a fellowship, without much preparation, in 1840. He obtained Madden's prize, i.e. was next in merit to the successful candidate, and in 1841 was elected fellow of the college, under the old system of public examination, conducted *viva voce* and in Latin, his general scholarship gaining him success at an earlier age than was customary.

Salmon settled down at once to the work of a college don (M.A. 1844), and was ordained deacon in 1844, and priest in 1845. His work was mainly mathematical, but in

1845 he was appointed divinity lecturer as well, and his long life was devoted to these two diverse lines of study. For many years he was a college tutor; from 1848 to 1866, the period during which his mathematical books were written, he was Donegal lecturer in mathematics.

Salmon's first mathematical paper, 'On the properties of surfaces of the second degree which correspond to the theorems of Pascal and Brianchon on Conic Sections,' was published in the 'Philosophical Magazine' in 1844. In 1847 there appeared his 'Conic Sections,' the work which made him known as a mathematician to a wide circle (6th edit. 1879). Admirably arranged, and constructed with an unerring sense of the distinction between important principles and mere details, it exhibited more fully than any other book of the time at once the power of the Cartesian co-ordinates and the beauty of geometrical method; and for half a century it was the leading text-book on its subject. It was followed in 1852 by a treatise on the 'Higher Plane Curves' (3rd edit. 1879), a subject of which little was then known, and which was introduced to the ordinary student by Salmon's labours. The investigations of Cayley and Sylvester into the invariants of quantics were beginning to attract attention; and Salmon proceeded to apply their results to geometrical theory, the result being his 'Lessons Introductory to the Modern Higher Algebra' (1859; 4th edit. 1885), in which he incorporated much original matter. Finally in 1862 appeared the 'Geometry of Three Dimensions' (5th edit. 2 vols. 1912), in which the sections upon the general theory of surfaces are specially remarkable (the work was translated into French, German, and Spanish). Upon these four treatises his fame as a mathematician rests, while many minor papers by him appeared in the learned journals. Salmon's methods made little use of the calculus, or of the quaternion analysis invented by his contemporary, Sir W. R. Hamilton [q.v.]; nor, again, did he ever handle the non-Euclidean geometry. His strength lay in his complete mastery of geometric and algebraic processes, and this, coupled with his indefatigable industry as a calculator, enabled him to produce original work of permanent value. In later life, the theory of numbers fascinated him; and he spent many odd half-hours in determining the number of figures in the recurring periods in the reciprocals of prime numbers. His last mathematical paper was upon this subject ('Messenger of Mathematics,' 1873),

but he never published his latest results, and he used to speak of his calculations as a useless amusement.

Salmon's mathematical labours by no means exhausted his energies, and he took a large share in the work of the Divinity School of Trinity College from 1845 to 1888. He proceeded B.D. and D.D. in 1859, and from 1866 to 1888 he was regius professor of divinity. He played an active part in the reconstruction of the Irish Church after its disestablishment in 1870, and enjoyed a unique position in the General Synod and as a member of the Representative Church body, his skill as a debater and his ability in the management of the church's finance being equally remarkable.

Salmon's first publication on a theological subject was a sermon on Prayer (1849), the precursor of a long series of printed discourses. His preaching always commanded attention, but his sermons (of which five volumes were published) were better to read than to hear, for his voice was hardly effective in a large building. In 1852 Archbishop Whately made him an examining chaplain, and the archbishop's influence upon Salmon's theological opinions seems to have been considerable. Both men were strong Protestants, and viewed the rise of the Oxford movement with suspicion and dislike, Salmon co-operating with Whately and others in the issue of 'Cautions for the Times' (1853), intended as a counterblast to the famous 'Tracts.' He was also a frequent contributor to the 'Catholic Layman,' which dealt with the Roman catholic controversy, and he printed anonymously three short 'Popular Stories' (Dublin 1854) written in the same interest. This preparation bore fruit later on, when, as divinity professor, he lectured on the points at issue between Romanism and Anglicanism; and his lectures formed the material of 'The Infallibility of the Church' (1889; 2nd edit. 1890), a trenchant and brilliant polemic which exhibited his learning, his humour, and the vigour of his controversial methods. Salmon founded no school of theological thought, deeply as he was revered by his pupils, his genius being analytic and even destructive rather than constructive and synthetic; but his tendency was towards a liberal evangelicalism, which distrusted (and more and more as years went on) the appeal to any authority other than that of the individual conscience.

The studies by which he became most widely known as a divine lay, however, outside the sphere of dogmatic theology,

and his work as a New Testament critic attracted a larger audience. His numerous articles in the 'Dictionary of Christian Biography' (1877-87) show his grasp of the history of the second century; and his 'Introduction to the New Testament' (1885; 7th edit. 1894) was acclaimed on its publication as a powerful reply to the dissolvent speculations of German criticism. Conservative in tendency, the book is destructive of extravagant theories of Christian origins rather than a positive statement of the results which a sober scholarship is prepared to maintain. The same characteristic of the author's method was apparent in his criticisms of Hort's reconstruction of the Greek text of the New Testament, which appeared in 1897 ('Thoughts on the Textual Criticism of the New Testament'), criticisms of which the sagacity has since been widely recognised. During the last ten years of life, Salmon spent much time upon the Synoptic problem, and his illuminating notes were carefully edited after his death in 1907 by a former pupil, N. J. D. White, under the title 'The Human Element in the Gospels.'

In 1888 Salmon was appointed provost of Trinity College by Lord Salisbury, on the recommendation of the lord-lieutenant of Ireland (Lord Londonderry), with the unanimous approval of the fellows. In 1892 he presided with dignity over the tercentenary festival of Dublin University. A conservative in politics, he was also conservative of academic tradition, and as provost he rather opposed than promoted changes in the university system under which he had been trained. He was *de facto* as well as *de jure* master of the college. The admission of women to university degrees, which was carried in the last year of his life, was almost the only important reform, introduced into the academic system under his rule, which was distasteful to him.

Salmon received many academic honours, besides those which his own university bestowed. He was a member of the Royal Irish Academy (1843), which awarded him the Cunningham medal in 1858, besides being a foreign member of the Institute of France, and honorary member of the Royal Academies of Berlin, Göttingen, and Copenhagen. He was fellow of the Accademia dei Lincei of Rome (1885); was made hon. D.C.L. Oxford (1868), LL.D. Cambridge (1874), D.D. Edinburgh (1884), D.Math. Christiania (1902); was fellow of the Royal Society (1863), which awarded him the royal medal in 1868 and the Copley medal in 1889;

became F.R.S. Edinburgh, and was on the original list of the fellows of the British Academy (1902). He was president of the Mathematical and Physical Section of the British Association in 1878. He was also chancellor of St. Patrick's Cathedral (1871), and was presented with the freedom of the city of Dublin in 1892.

Hospitable and kindly, Salmon had many friends and interests. In youth a competent musician and a chess player of remarkable powers, he cultivated both recreations until an advanced age. He was always an omnivorous reader (except in the two departments of metaphysics and poetry, for which he had no taste), and had a special affection for the older novelists, being accustomed to recommend the study of Jane Austen as a liberal education. The homely vigour and the delightful wit of the long letters which he was accustomed to write to his friends entitle him to rank as one of the best letter-writers of the last century.

Salmon died in the Provost's House on 22 Jan. 1904, and was buried in Mount Jerome cemetery.

Salmon married in 1844 Frances Anne, daughter of the Rev. J. L. Salvador of Staunton, Herefordshire (*d.* 1878); of his four sons and two daughters the eldest son (Edward William) and the younger daughter (Fanny Mary) survived him.

A striking portrait of Salmon, painted by Benjamin Constant, at the request of the fellows of the college, in 1897, is preserved in the Provost's House at Dublin; and an earlier portrait (by Miss Sara Purser in 1888) belongs to the common room at Trinity. A posthumous bas-relief of his head, in bronze (by A. Bruce-Joy), forms part of the memorial in St. Patrick's Cathedral; while a seated statue in marble executed by Mr. John Hughes for Trinity College was unveiled on 14 June 1911. The Salmon fund (for poor students), and the Salmon exhibitions for members of the Divinity School, were endowed by him at Trinity while he was provost, in addition to other benefactions to the college. A window is dedicated to his memory in the church at the Riffel Alp, where he had spent several vacations.

Among Salmon's works, in addition to those already described, and apart from pamphlets, occasional sermons, and articles in reviews or magazines, are the following: 1. 'Sermons preached in Trinity College Chapel,' 1861. 2. 'The Eternity of Future Punishment,' 1864. 3. 'The Reign of Law,' 1873. 4. 'Non-miraculous Christianity,' 1881; 2nd edit. 1887. 5. Commentary on

Ecclesiastes in Ellicott's Old Testament Commentary, 1884. 6. 'Gnosticism and Agnosticism,' 1887. 7. Introduction to 'Apocrypha' in the 'Speaker's Commentary,' 1888. 8. 'Cathedral and University Sermons,' 1900; 2nd edit. 1901.

[Memoirs by the present writer in The Times (23 Jan. 1904), The New Liberal Review (March 1904), and Proc. Brit. Acad. (1904); obit. notices of the Royal Society (1904, by C. J. Joly), of the London Math. Soc. (1904, by Sir R. S. Ball), and in Nature (4 Feb. 1904); funeral sermons by the present writer and Bishop Chadwick of Derry (Dublin, 1904); Celebrities at Home in The World (6 Dec. 1899), by F. St. J. Morrow; Review of the Churches, by G. T. Stokes (15 June 1892); Minutes of Royal Irish Academy (1903-1904); Reminiscences in Weekly Irish Times, by Canon Staveley (9 July 1904); Dublin University Calendars; personal knowledge.]

JOHN OSSORY.

SALOMONS, Sir JULIAN EMANUEL (1835-1909), Australian lawyer and politician, born at Edgbaston, Birmingham, on 4 Nov. 1835, was only son of Emanuel Solomons, a Jewish merchant of that city. Emigrating to Australia in youth, he was at first employed in a book-selling establishment in Sydney, and was for some time secretary of the Great Synagogue there. The Jewish community of Sydney interested themselves in him and he returned with their aid to England to be trained for a barrister. He entered at Gray's Inn on 14 Oct. 1858, and was called to the bar on 26 Jan. 1861. He then returned to New South Wales, and after admission to the bar of the colony in the same year, practised with success before the supreme court and rose quickly in his profession, being counsel for the crown in many important cases. A brilliant lawyer and an analytical reasoner rather than an eloquent advocate, he showed to advantage in examination and cross-examination and was witty and prompt in repartee. His prosecution in 1866 of Louis John Bertrand, a dentist, for the murder of a bank clerk named Henry Kinder—a trial which caused vast excitement—laid the foundation of his reputation. But he chiefly devoted himself to civil business.

Salomons was nominated a member of the legislative council of New South Wales on 5 Aug. 1869, and resigned on 15 Feb. 1871. He was reappointed on 7 March 1887, and took a prominent part in the debates of the chamber till 21 Feb. 1899, when he again resigned. From 18 Dec. 1869 to 15 Dec. 1870 he was solicitor-general in the Robertson ministry which merged into that

of (Sir) Charles Cowper, and was representative of the government in the upper house with a seat in the cabinet from 11 Aug. to 5 Dec. 1870. From 7 March 1887 to 16 Jan. 1889 he was vice-president of the executive council and representative of (Sir) Henry Parkes's ministry in the legislative council and held the like office in (Sir) George Dibbs's ministry from 23 Oct. 1891 to 26 Jan. 1893.

On 16 Aug. 1881 he was appointed a royal commissioner to inquire into the Milburn Creek Copper Mining Company scandal. In 1886 he was nominated chief justice on the death of Sir James Martin; but owing to the hostile attitude of some members of the supreme court bench he gave up the office without being sworn in. He took a prominent part in the federation campaign, but opposed the commonwealth enabling bill. He acted as agent-general for the colony in London from 25 March 1899 to 13 May 1900, and on his return to Australia he retired from public and professional life, but was appointed in 1903 standing counsel to the commonwealth government in New South Wales. He died at his residence at Woollahra on 6 April 1909, and was buried in the Hebrew portion of the Rookwood general cemetery.

On 13 July 1891 Salomons was knighted by patent. He was a Q.C. of New South Wales, and from 1899 till death a bencher of Gray's Inn. He was a trustee of the Sydney National Art Gallery and the National Park of New South Wales.

Salomons married on 17 Dec. 1862 Louisa, fourth daughter of Maurice Salomons of Lower Edmonton, Middlesex; she survived him with two daughters. A half-length oil portrait by Mr. Percy Bigland belongs to his daughter, Mrs. J. T. Wilson, in Sydney.

SALTING, GEORGE (1835-1909), art collector and benefactor, was elder son of Severin Kanute Salting and Louise Flerup, both of Danish origin. The father was born at Copenhagen on 3 Oct. 1805, and died at Chertsey on 14 Sept. 1865. The son George was born on 15 Aug. 1835 at Sydney, New South Wales, where the father had become a partner in the firm of Flower, Salting, Challis & Co., merchants.

They lived in Macquarie Street. George, with his younger brother, William Severin (b. 18 Jan. 1837, d. 23 June 1905), at first went to a school in Sydney until 1848, when George was sent home to Eton. His parents followed him to England two years later. He seems to have left no impression on his contemporaries at Eton save that of 'a pale, lean, tall, eccentric person,' although a contemporary portrait shows him as a handsome youth. Shooting was the only form of sport for which he cared. The whole family returned to Sydney in 1853, on account of George's health, contrary to the wishes of his Eton tutor, who saw in him the making of a good classical scholar. The brother William was at the same time withdrawn from Brighton College. A tutor was brought out for the two boys, and he complained of George's dreamy poetic temperament, which hindered continuous application. In the Lent term of 1854 Salting entered the newly founded University of Sydney with a scholarship for general proficiency. After a career in which he especially distinguished himself in classics, he graduated B.A. in 1857. When George and his brother left the university their father acknowledged their debt to its training by founding 'The Salting Exhibition,' tenable for three years by any pupil of the Sydney grammar school.

The Saltings returned to England in 1857, and settled in Rutland Gate. In October 1857 George matriculated from Balliol College, Oxford, but left after one term, owing apparently to his mother's death and its effect upon his father. The father gave up his London house and spent the autumn of 1858 in Rome. This sojourn moulded George's future career. While in Rome he devoted his whole time to the galleries, churches, and architectural monuments or to available books on the artistic and archaeological treasures of the city. To other modes of study he added photography, then a serious undertaking, which involved his wheeling on a truck about the streets the apparatus together with a kind of tent, in which to develop his plates. Early in 1859 the party went to Naples and then to Florence. After a short visit to Australia they settled at a house named Silverlands, near Chertsey, where the father died (14 Sept. 1865). Thereupon George took for himself a suite of rooms over the Thatched House Club at the bottom of St. James's Street. There he remained unmarried and living with the utmost simplicity until death.

D.N.B. 1901-1911

On his father's death Salting inherited a fortune generously estimated at 30,000*l.* a year. Thenceforth he devoted himself exclusively to collecting works of art, to which he brought a rare judgment and an unflinching zeal. His severe training in Rome had prepared him for the vocation, which he was encouraged to pursue by the example of his friend Louis Huth, of Charles Drury Edward Fortnum [q. v. Suppl. I], and of (Sir) Augustus Wollaston Franks [q. v. Suppl. I], who had lately given a new seriousness to the study of medieval and renaissance art. But Salting was unique among the collectors of his time in consecrating the whole of his time and money to the pursuit, to the exclusion of every other interest.

For more than forty years Salting when in London spent each afternoon on a pilgrimage from one dealer to another, examining their wares with the greatest deliberation. When an object was selected as a desirable purchase, the price involved tedious negotiation, which Salting seems purposely to have prolonged so as to give him continuous occupation. Where he felt uncertain of his own judgment, he would walk to one or other of the museums or to a fellow collector, to obtain an opinion. At times he bought objects that on examination did not prove to be of good enough quality for his taste, and he would cause dealers embarrassment by offering these, which he called 'marbles' in allusion to schoolboy usage, in part payment for something of higher quality.

In the early days of his occupation of the Thatched House Club his purchases went there, but when the limited space proved inadequate even as storage, he lent his main collection of oriental porcelain to South Kensington (Victoria and Albert Museum), and subsequently many purchases went thither direct from the dealer.

Chinese porcelain was Salting's first serious interest, probably owing to the influence of Louis Huth. Here he formed what is without doubt one of the great collections of the world. It is especially valuable and important as presenting, perhaps more satisfactorily than any other, a complete series of the strictly artistic productions of the Chinese in this material. He cared but little for the historical interest of the wares or for tracing their history; in his taste Chinese porcelain was confined to what he considered beautiful, without regard either to antiquity or to the evolution of the manufacture. To a limited extent he collected Japanese art products, but never with the same enthusiasm. His eclectic mind and sensitive eye evidently failed to

find in them the same satisfaction. In the province of Western art he was fairly catholic: Italian and Spanish majolica, small sculptures in all materials, enamels, jewellery, bronze statuettes and medals, and all the varied productions of the artist craftsmen of the Middle Ages and Renaissance—these he collected with persistency and unflinching enthusiasm, and in many of the classes his collection is unrivalled. Pictures and drawings had less attraction for him, though he bought both, and he developed in his later years a passion for pictures by Corot, paying the inflated prices of the day. Another phase of collecting more in keeping with his normal tastes was that of English miniature portraits. Of these he had a superb series, many of them of high historical interest, and by the great artists from Tudor times to the eighteenth century. In addition he had also a few admirable antiques, bronzes, terra cottas, and the like. No matter what new style of collecting he took up, he sought only the finest specimens of their kind.

Although Salting was a familiar figure at Christie's sale rooms, and was well known to the great foreign collectors and dealers, his reputation hardly became a continental one until the Spitzer sale in 1893. To attend this sale he spent some time in Paris, where he endeavoured to lead the same simple life as at home, while bidding for himself in the sale room and spending there some 40,000*l.* on fine works of art.

Salting died in his rooms at the Thatched House Club on 12 Dec. 1909, and was buried at Brompton cemetery. Though he was not generally suspected of possessing any genius for finance, he left a fortune of 1,287,900*l.* net, a sum vastly greater than that inherited from his father. Despite his procastinating and undecided character, which led intimate friends to foretell that he would die intestate, he made a will dated 11 Oct. 1889. There were small bequests of money to the London hospitals, and to relatives and friends, the residuary legatee of his pecuniary estate being his niece, Lady Binning, daughter of his late brother. But he divided his collections among the National Gallery, the British Museum, and the Victoria and Albert Museum (at South Kensington), the main portion going to the last. The trustees of the first two had the power to select such of his pictures and prints and drawings as they thought fit. The bequest to the Victoria and Albert Museum was conditional on the objects being 'not distributed over the various sections, but

kept all together according to the various specialities of my exhibits.' This reasonable condition serves the double purpose of providing the most appropriate monument of a munificent benefactor, and enables the public to measure the importance of the gift, which would have been impossible if the collection had been distributed over the whole museum. Further, such an arrangement provides in the future the means of judging of the standard of taste prevailing in the nineteenth century. The Salting collection was first opened to the public at South Kensington on 22 March 1911.

[Eton College Register; Sydney University Register; The Times, 14, 15, 17, 23, 25, 28, 31 Dec. 1909; 26 and 28 Jan. 1910, and 23 March 1911; private information from relatives and friends; personal knowledge; there is a good portrait from a photograph in The Salting Collection (V. & A. Museum), 1911.] C. H. R.

SALVIN, FRANCIS HENRY (1817-1904), writer on falconry and cormorant-fishing, born at Croxdale Hall on 4 April 1817, was fifth and youngest son of William Thomas Salvin, of Croxdale Hall, Durham, by his wife Anna Maria, daughter of John Webbe-Weston, of Sutton Place, Surrey. Educated at Ampleforth, a Roman catholic school in Yorkshire, he served for several years in the militia, joining the 3rd battalion of the York and Lancaster regiment in 1839 and retiring with the rank of captain in 1864. In 1857 he inherited from his uncle, Thomas Monnington Webbe-Weston, the fine old Tudor mansion Sutton Place, near Guildford, but he usually lived at Whitmoor House, another residence on the estate. An early love of hawking was stimulated by an acquaintance with John Tong, assistant falconer to Col. Thomas Thornton (1757-1823) [q. v.].

In 1843 Salvin made a highly successful hawking tour with John Pells (employed by the hereditary grand falconer of England) through the north of England; and when quartered with his regiment at remote places in Ireland he used to fly falcons at rooks and magpies. Near Fermoy in 1857 he killed in four months eighty-four of these birds. He also for some years kept goshawks and made successful flights with them at mountain hares, rabbits and water-hens. He invented a portable bow-perch for these birds. He was a prominent member from 1870 of the old Hawking Club which met on the Wiltshire downs.

Salvin was also the first to revive successfully in England the old sport of fishing

with cormorants. In 1849 he took with four birds in twenty-eight days some 1200 large fish at Driffild, Kilney, and other places in the north of England. His famous cormorant, 'Izaak Walton,' brought from Rotterdam, was stuffed in 1847 by John Hancock and is now in the Newcastle-on-Tyne Museum. Another, 'Sub-Inpector,' the first known instance of a cormorant bred in confinement (*Field*, 27 May 1882), was exhibited at the Fisheries Exhibition, South Kensington, in 1883, and was sent to the Zoological Gardens after Salvin's death, surviving till 1911. This bird and its master are depicted in a drawing by F. W. Frohawk (reproduced in the *Field*, 18 Oct. 1890) now in the possession of Mr. Charles Sibeth.

Salvin had great power over animals. He tamed two young otters to follow him like dogs and sleep in his lap, and at one time kept a wild boar with collar and bell. He was active in field sports when past seventy.

He died unmarried on 2 Oct. 1904, at the Manor House, Sutton Park, Guildford, and was buried in St. Edward's cemetery, Sutton Park.

Salvin, who was a frequent contributor to the '*Field*,' collaborated in two works on falconry. The first, '*Falconry in the British Isles*' (1855; 2nd edit. 1873), written in conjunction with William Brodrick of Chudleigh, has been pronounced the best modern English work on the subject. The figures of hawks, drawn by Brodrick, are said to bear comparison with the work of Josef Wolf [q. v.] the animal painter. The text of the second edition is to be preferred, but the illustrations are inferior to those of the original (*Quarterly Review*, July 1875).

Salvin also assisted Gage Earle Freeman [q. v. Suppl. II] in '*Falconry: its Claims, History, and Practice*' (1859); the '*Remarks on training the Otter and Cormorant*' appended to it being wholly his. Both books are now out of print and much sought after. A portrait of Salvin by Mr. Hinks of Farnham is in the possession of Mr. Charles Sibeth of Lexham Gardens, Kensington. He is also represented in J. C. Hook's '*Fishing by Proxy*,' exhibited at the Royal Academy in 1873.

SAMBOURNE, EDWARD LINLEY (1844-1910), artist in black and white, born at 15 Lloyd Square, Pentonville, London, on 4 Jan. 1844, was only surviving child of Edward Mott Sambourne, by his wife Frances Linley, of Norton, Derbyshire, a member of the well-known family to which Elizabeth Anne Linley, wife of Richard Brinsley Sheridan [q. v.] belonged [see LINLEY, THOMAS, the elder]. His father's father had left England for the United States and had been naturalised an American citizen. His father, born at Easton, Pennsylvania, in 1802, eventually carried on a wholesale furrier's business in St. Paul's Churchyard, London.

Sambourne was educated at the City of London school (September 1855 to Easter 1856) and afterwards at Chester Training College school (1857-60). At the age of sixteen he entered as an apprentice the marine engine works of Messrs. John Penn & Son, Greenwich. He had already shown a talent for drawing, which was encouraged by his father's sister, Mrs. Barr, herself an accomplished artist; and at Greenwich he continued to amuse himself and his friends by drawing caricatures and fanciful sketches. In 1867 one of these drawings was shown by Sambourne's fellow apprentice, Alfred Reed, to his father, German Reed, who in turn submitted it to his friend Mark Lemon, the editor of '*Punch*.' Mark Lemon found promise in it and offered the young artist work on '*Punch*.' Sambourne's first drawing appeared in '*Punch*,' 27 April 1867 (lii. 159). Retiring from Penn's works, he soon became a regular contributor, and was in 1871 made a full member of the staff. In the meantime he studied technique and had attended the School of Art at South Kensington, although only for a fortnight. In '*Punch*' he was soon set to illustrate the '*Essence of Parliament*,' and this work gradually developed in his hands into a second weekly cartoon. On Sir John Tenniel's retirement towards the end of 1900 Sambourne succeeded him as cartoonist-in-chief.

Sambourne also made his mark as an illustrator of books. He illustrated Sir Francis Burnand's '*New Sandford and Merton*' (1872); James Lynam Molloy's '*Our Autumn Holiday on French Rivers*' (1874), and the 1885 edition of Charles Kingsley's '*Water Babies*,' which contains

Sambourne's best work in this line. In 1883 he designed and executed for the Fisheries Exhibition a diploma card which earned the enthusiastic praise of Tenniel (SPIELMANN, *Hist. of Punch*, p. 534). In 1900 he was one of the royal commissioners and sole juror for Great Britain in class 7 of the fine arts at the Paris exhibition.

In the autumn of 1909 Sambourne fell ill, and on 3 Nov. of that year his last cartoon appeared in 'Punch' (cxxxvii. 317). Two previously executed full-page drawings appeared in the 'Punch' almanack for 1910. He died at his home, 18 Stafford Terrace, Kensington, on 3 Aug. 1910, and his remains were buried, after cremation, in the graveyard of St. Peter's church, near Broadstairs.

Sambourne is entitled to a very high place among 'black-and-white' artists. His career as a contributor to 'Punch' extended over nearly forty-three years, and the marked growth of his powers may be studied in the pages of that journal. His youthful contributions show ingenuity and a certain grotesque humour, but little artistic merit. In his middle period the grotesqueness and the humour increased, with the addition of a great, but somewhat mechanical, vigour of execution. Only in his later period, fortunately a prolonged one, did he achieve that combination of artistic grace and dignity with an extraordinary firmness and delicacy of line which is the mark of his best work. He did not aim at Tenniel's massive simplicity, nor did his strength lie in the portrayal of living persons by way of caricature; but in imaginative designs, especially where his subject permitted him to introduce classically draped female figures, or where his ingenious and fertile fancy could invent and harmonise in a large and balanced composition a great variety of details, he was without a rival. So sure and accurate were his hand and eye that he could accomplish Giotto's feat of drawing a perfect circle. Fond of sport and outdoor exercise, Sambourne was a delightful companion noted for his *bonhomie* and good stories.

Sambourne married on 20 Oct. 1874 Marion, eldest daughter of Spencer Herapath, F.R.S., of Westwood, Thanet; by her he had a son, Mawdley Herapath, and a daughter, Maud Frances (Mrs. L. C. R. Messel), who has contributed sketches to 'Punch.' A portrait of Sambourne (1884), by Sir George Reid, R.S.A., is in the possession of the city of Aberdeen. A caricature portrait of him by Leslie Ward ('Spy') in 1882 is in the 'Punch' room.

[Punch, vols. lii.-cxxxviii.; Spielmann's History of Punch, 1895; Who's Who, 1910; The Times, 4 Aug. 1910; baptismal register, St. Philip's church, Clerkenwell.] R. C. L.

SAMUELSON, SIR BERNHARD, first baronet (1820-1905), ironmaster and promoter of technical education, born at Hamburg, where his mother was on a visit, on 22 Nov. 1820, was eldest of the six sons of Samuel Henry Samuelson (1789-1863), merchant, by his wife Sarah Hertz (*d.* 1875). Bernhard's grandfather, Henry Samuelson (1764-1813), was a merchant of London. In his infancy his father settled at Hull. Educated at a private school at Skirlaugh, Yorkshire, he showed mathematical aptitude, but he left at fourteen to enter his father's office. At home he developed a love of music and a command of modern languages. He was soon apprenticed to Rudolph Zwilchenhart & Co., a Swiss firm of merchants, at Liverpool. There he spent six years. In 1837 he was sent to Warrington by his masters to purchase locomotive engines for export to Prussia. The experience led him to seek expert knowledge of engineering, and it suggested to him the possibility of expanding greatly the business of exporting English machinery to the Continent. In 1842 he was made manager of the export business of Messrs. Sharp, Stewart & Co., engineers, of Manchester. In this capacity he was much abroad, but owing to the railway boom at home in 1845, the firm gave up the continental trade. Next year Samuelson went to Tours and established railway works of his own, which he carried on with success till the revolution of 1848 drove him back to England.

In 1848 Samuelson purchased a small factory of agricultural implements at Banbury, which the death of the founder, James Gardner, brought into the market. Samuelson developed the industry with rare energy, and the works, which in 1872 produced no less than 8000 reaping-machines, rapidly became one of the largest of its kind. A branch was established at Orleans. The business, which was turned into a limited liability company in 1887, helped to convert Banbury from an agricultural town into an industrial centre. Meanwhile Samuelson in 1853 undertook a different sort of venture elsewhere. At the Cleveland Agricultural Show he met John Vaughan, who had discovered in 1851 the seam of Cleveland ironstone, and now convinced Samuelson of the certain future of the Cleveland iron trade. Samuel-

son erected blast-furnaces at South Bank, near Middlesbrough, within a mile of the works of Bolekow & Vaughan at Eston. These he worked until 1863, when they were sold, and more extensive premises were built in the neighbourhood of Newport. Samuelson, whose interest in practical applications of science grew keen, studied for himself the construction of blast-furnaces and resolved to enlarge their cubical capacity at the expense of their height. By 1870 eight furnaces were at work, most of them of greater capacity than any others in the district. In 1872 between 2500 and 3000 tons of pig-iron were produced weekly. In 1871 a description of the Newport ironworks which he presented to the Institution of Civil Engineers won him a Telford medal.

In 1887 the iron-working firm of Sir B. Samuelson & Co., Ltd., was formed with a nominal capital of 275,000*l*. Sir Bernhard was chairman of the company until 1895, when he handed over the chairmanship to his second son, Francis. The blast furnaces were in 1905 producing about 300,000 tons of pig iron annually, and the by-products from the coke ovens started in 1896 averaged about 270,000 tons of coke, 12,000 tons of tar, 3500 of sulphate of ammonia, and 150,000 gallons of crude naphtha.

An important extension of Samuelson's commercial energies took place in July 1870. He then built the Britannia ironworks at Middlesbrough, his third manufacturing enterprise (which subsequently became part of the property of Messrs. Doman Long & Co.). The site was twenty acres of marsh land, which was only adaptable to its purpose after being covered with slag. In the Britannia works there was installed the largest plant at that date put into operation at one time, and their output of iron, tar, and by-products was soon gigantic. One of Samuelson's endeavours which bore tribute to his mechanical ambition came to nothing. He was anxious to make steel from Cleveland ore—an effort in which no success had yet been achieved. He learned on the Continent of the Siemens-Martin process, and now spent some 300,00*l*. in experimenting with it. In 1869 he leased for the purpose the North Yorkshire ironworks at South Stockton; but the attempt proved unsuccessful, though the trial taught some useful lessons to ironmasters.

Samuelson, who was a considerate employer of labour, took part in developing Middlesbrough and the Cleveland district, identifying himself with local institutions

and effort. But his home was at Banbury, and he was prominent there in public affairs. Seeking a parliamentary career, he represented the place and district in parliament for more than thirty years. He was a zealous upholder of liberal principles, was loyal to his party, and a staunch supporter of Gladstone. He was first elected for Banbury by a majority of one vote in Feb. 1859, but he was defeated at the general election two months later. In 1865 however he was again elected, and an allegation that he was not of English birth and therefore ineligible was examined and confuted by a committee of the House of Commons. He retained the seat in 1868, 1874, and 1880. In 1885, when the borough was merged in the North Oxfordshire division, he was returned for that constituency, and he sat for it until 1895, when he retired and was made a privy councillor. Although he supported home rule, he lost sympathy with the ultra-radical sentiment which increased in the party during his last years. Through life Samuelson cherished free-trade convictions, yet in his last years he reached the conclusion that 'a departure from free trade' was 'admissible with a view to widening the area of taxation.' In a paper read before the Political Economy Club in London on 5 July 1901; the chief conclusions of which he summarised in a letter to 'The Times' (6 Nov.), he urged a 'tariff for revenue,' and sketched out the cardinal points of the tariff reform movement before they had been formulated by Mr. Joseph Chamberlain.

In the House of Commons Samuelson, who gave expert advice on all industrial questions, was best known by his strenuous advocacy of technical instruction. His chief public services were identified with that subject. He thoroughly believed in the need among Englishmen of every rank of a strict scientific training. In 1867 he investigated personally and with great thoroughness the conditions of technical education in the chief industrial centres of Europe and made a valuable report (*Parl. Papers*, 1867). He was in 1868 chairman of a committee of the House of Commons to inquire into the provisions for instruction in theoretical and applied science to the industrial classes; and he was a member of the duke of Devonshire's royal commission on scientific instruction (1870), being responsible for that part of the report which dealt with the Science and Art Department. In 1881 he had full opportunity of using his special study to the

public advantage on being made chairman of the royal commission on technical instruction. He was also a member of Viscount Cross's royal commission on elementary education in 1887, and next year of the parliamentary committee for inquiring into the working of the education acts.

His activity in other industrial inquiries was attested by a series of reports which he prepared in 1867 for the foreign office, on the iron trade between England and France, when renewal of the commercial treaty between the two countries was under consideration. He was chairman of parliamentary committees on the patent laws (1871-2) and on railways (1873). He was a member of the royal commission for the Paris exhibition of 1878, and received in that year the cross of the Legion of Honour. In 1886 he was chairman of the Associated Chambers of Commerce of the United Kingdom.

His scientific attainments were acknowledged by his election as a fellow of the Royal Society in 1881. He was a member of the council in 1887-8. He joined the Institution of Mechanical Engineers in 1865, and the Institution of Civil Engineers in 1869. He was one of the founders of the Iron and Steel Institute in the latter year, and was president of that body in 1883-5.

In 1884 Samuelson presented to Banbury a technical institute, which was opened by A. J. Mundella on 2 July 1884. Mundella then announced that a baronetcy had been conferred on Samuelson for his services to the education of the people. The benefactor's portrait by Sir Hubert von Herkomer, of which a replica hangs in the reading room, was presented to him on the same occasion.

Samuelson, who was long an enthusiastic yachtsman, died of pneumonia at his residence, 56 Princes Gate, S.W., on 10 May 1905, and was buried at Torre cemetery, Torquay. He was succeeded in the baronetcy by his eldest son, Henry Bernhard, formerly M.P. for Frome. Samuelson married (1) in 1844 Caroline (d. 1886), daughter of Henry Blundell, J.P., of Hull, by whom he had four sons and four daughters; and (2) in 1889 Lelia Mathilda, daughter of the Chevalier Leon Serena and widow of William Denny of Dumbarton.

Samuelson published at Gladstone's request a memoir on Irish land tenure (1869), and a report on the railway goods tariffs of Germany, Belgium, and Holland, presented to the Associated Chambers of Commerce Birmingham, 1885). Besides

his presidential address (1883), he contributed to the 'Journal of the Iron and Steel Institute' papers on the Terni steel-works (1887, pt. i. p. 31) and on the construction and cost of blast-furnaces in the Cleveland district (*ib.* p. 91).

An oil painting by Gelli of Florence belongs to the eldest son, and a bronze bust by Fantachiotti of Florence, of which there are terra-cotta replicas, belongs to the second son, Francis. Sir Bernhard's eldest son added to the Queen Victoria Memorial Hospital at Mont Boron, Nice, the 'Sir Bernhard Samuelson memorial annexe' for infectious cases, with twenty beds; a replica of Fantachiotti's bust is on the façade. An addition was also made in Sir Bernhard's memory to the Middlesbrough infirmary. A memorial painted window has been placed in Over Compton church, Sherborne, Dorsetshire, by Sir Bernhard's eldest daughter, Caroline, wife of Colonel Goodden.

[Banbury Guardian, Yorkshire Post, and The Times, 11 May 1905; Journal of the Iron and Steel Institute, 1905, pt. i. p. 504; Engineer, and Engineering, 12 May 1905; Burke's Peerage and Baronetage; private information.] W. F. S.

SANDBERG, SAMUEL LOUIS GRAHAM (1851-1905), Tibetan scholar, born on 9 Dec. 1851 at Oughtibridge in Yorkshire, was fifth child in a family of five sons and two daughters of Paul Louis Sandberg (d. 1878), then vicar of Oughtibridge, by his wife Maria (1815-1903), daughter of James Graham of the diplomatic service and grand-daughter of Dr. James Graham (1745-1794) [q. v.], a London doctor. Both parents were distinguished by linguistic talents. The father, whose ancestors came to England from Sweden, had won the Tyrwhitt Hebrew scholarship and other successes at Cambridge, and was conversationally acquainted with as many as thirteen languages, including Arabic, Syriac, and Hindustani. He was in India as a missionary from 1843 to 1849, becoming principal of Jai Nārāyan's College at Benares. From 1874 till his death in 1878 he was rector of Northrepps in Norfolk. His widow, a writer of devotional works and a philanthropist, who died in April 1903, aged eighty-eight, received the exceptional title of honorary life member of the Church Missionary Society. She was acquainted with seven languages, including Hindustani (*The Times*, 27 April 1903).

Young Sandberg, after attending Liver-

pool College (1861-3) and Enfield School, Birkenhead (1863-7), graduated B.A. of Dublin University at nineteen in 1870. His tastes were linguistic and mathematical, with a leaning towards Asiatic languages, such as Chinese and Japanese. He developed an aversion for the medical profession, for which he was originally destined, and on leaving Dublin University was admitted a student at the Inner Temple on 9 June 1871, and was called to the bar on 30 April 1874, and joined the northern circuit. His practice was insignificant, and he mainly divided his time between journalism, the preparation of an elaborate treatise entitled 'The Shipmaster's Legal Handbook,' which he failed to publish, and private tuition. A year's prostration by Maltese fever (1877-8), contracted while travelling with a pupil, was followed in 1879 by his ordination as a clergyman. He was curate of St. Clement's, Sandwich, from 1879 to 1882, and chaplain of the Seckford Hospital, Woolbridge, from 1882 to 1884. In 1885 he went to India as chaplain on the Bengal establishment, and held charges at Kidderpur (1886), Dinapur (1886-7), Calcutta (1887 and 1892-4), Dacca (1887-8), Jhansi (1888-9), Muradabad (1890), Roorkee (1890), Howrah (1890-1), Cuttack (1891-2), Sabathu (1894-6), Nowgong (1897-8), Barrackpore (1898-9), St. John's, Calcutta (1899-1901), Darjeeling (1901-2), Calcutta (1903), and Cuttack (1903-4). When on a holiday at Darjeeling he made his first acquaintance with the Tibetan language, and in 1888 he published at Calcutta a 'Manual of the Sikkim-Bhutia Dialect' (2nd edit. enlarged, Westminster, 1895). He learned much of the secret explorations of Tibet in progress during the next seventeen years, and wrote in the press and the magazines about the topography of Tibet and routes through the country. In 1901 he issued at Calcutta 'An Itinerary of the Route from Sikkim to Lhasa, together with a Plan of the Capital of Tibet.' On the eve of the British expedition in 1904 he published a systematic treatise, 'The Exploration of Tibet: its History and Particulars from 1623 to 1904' (Calcutta and London). Sandberg drafted the letter from Lord Curzon, the viceroy, to the Grand Lama, the rejection of which precipitated the expedition of 1904.

To Tibetan philology Sandberg's contributions were equally notable. In 1894 there appeared at Calcutta his 'Manual of Colloquial Tibetan,' a practical work

embodying much useful information. His most important philological work was his share in 'A Tibetan-English Dictionary' (Calcutta, 1902), which he was commissioned in 1899 by the Bengal government to prepare in conjunction with the Rev. A. W. Heyde from the materials collected by Sarat Chandra Das. The work was not final or faultless, but it was far more complete than any other.

His writings relating to Tibet also included the following magazine articles: 'The City of Lhasa' (*Nineteenth Century*, 1889); 'A Journey to the Capital of Tibet' (*Contemporary Review*, 1890); 'Philosophical Buddhism in Tibet' (*ibid.*); 'Monks and Monasteries in Tibet' (*Calcutta Review*, 1890); 'The Great Lama of Tibet' (*Murray's Magazine*, October 1891); 'The Exploration of Tibet' (*Calcutta Review*, 1894); 'The Great River of Tibet: its Course from Source to Outfall' (*ibid.* 1896); 'Note to Gait's Paper on Ahom Coins' (*Proc. Asiatic Soc. of Bengal*, 1896, pp. 88 sq.); 'Monasteries in Tibet' (*Calcutta Review*, 1896); and 'A Tibetan Poet and Mystic,' i.e. Milaraspā' (*Nineteenth Century*, 1899).

Sandberg at the same time proved the width of his interests in 'A Neglected Classical Language (Armenian)' (in *Calcutta Review*, 1891), and in 'Bhotan, the Unknown Indian State' (*ibid.* 1898). He was especially concerned in the condition of the Eurasians, whose cause he espoused in 'Our Outcast Cousins in India' (*Contemp. Rev.* 1892). His modesty and reticence concealed the extent of his attainments, which included a thorough knowledge of the Italian language and literature.

In the August of 1904 Sandberg was attacked by tubercular laryngitis, and was invalided home. He died at Bournemouth on 2 March of the following year. He married in 1884 Mary Grey, who died without issue in 1910.

[Ecclesiastical and Official records of services; *The Times*, 6 March 1905; *The Homeward Mail*, 11 March 1905; see also notices of father in the *Liverpool Albion*, 1878, and mother in *The Times* for 27 April 1903; private information.] F. W. T.

SANDERSON, SIR JOHN SCOTT BURDON-, first baronet (1828-1905), regius professor of medicine at Oxford. [See BURDON-SANDERSON.]

SANDERSON, EDGAR (1838-1907), historical writer, born at Nottingham on 25 Jan. 1838, was son of Edgar Sanderson

by his wife Eliza Rumsey. The father, who was a direct descendant of Bishop Robert Sanderson [q. v.], had at first a lace-factory at Nottingham, but afterwards kept private schools at Stockwell and Streatham Common. The younger Sanderson was educated at the City of London School and at Clare College, Cambridge, where he won a scholarship. He graduated in 1860 as fourth in the 2nd class of the classical tripos, proceeding M.A. in 1865. After holding a mastership in King's Lynn grammar school he was ordained deacon in 1862 and priest in 1863. At first curate of St. Dunstan's, Stepney, and second master of Stepney grammar school, he held successively curacies at Burcombe-cum-Broadway, Dorsetshire (with a mastership at Weymouth school), and at Chieveley, Berkshire. From 1870 to 1873 Sanderson was headmaster of Stockwell grammar school; from 1873 to 1877 of Macclesfield; and from 1877 to 1881 of Huntingdon grammar school. Thenceforth he lived at Streatham Common, and occupied himself in writing educational manuals and popular historical works. He died at 23 Barrow Road, Streatham Common, on 31 Dec. 1907, and was buried at Norwood cemetery. He married in 1864 Laetitia Jane, elder daughter of Matthew Denycloe, surgeon, of Bridport. She died in October 1894, leaving two sons and four daughters.

Sanderson had a retentive memory and a faculty for lucid exposition. His chief works, all of which were on a comprehensive scale and enjoyed a large circulation, were: 1. 'History of the British Empire,' 1882; 20th edit. 1906: a well-arranged handbook. 2. 'Outlines of the World's History, Ancient, Mediæval and Modern,' 1885, issued both in four parts and in one volume; revised edit. 1910. 3. 'History of the World from the Earliest Historical Time to 1898,' 1898. 4. 'The British Empire in the 19th Century: its Progress and Expansion at Home and Abroad,' 6 vols. 1898-9 (with engravings and maps); reissued in 1901 as 'The British Empire at Home and Abroad.'

[Private information; The Times, 1 Jan. 1908; Guardian, 8 Jan. 1908; Crockford's Clerical Directory; Introduction by Mr. Roger Ingpen to Sanderson's abridgment of Carlyle's Frederick; note in Mrs. Valentine's Cameos of Engl. Literature, 1894; Sanderson's works.]

G. LE G. N.

SANDHAM, HENRY (1842-1910), painter and illustrator, born in Montreal

on 24 May 1842, was son of John Sandham by his wife, Elizabeth Tait. The father had emigrated from England to Canada as a house decorator.

Sandham taught himself art in youth, with some aid from Vogt, Way, Jacobi, and other Canadian painters. He early entered the photographic studio, in Montreal, of W. Notman, whose partner he became. Here he executed his first public artistic work for the 'Century Magazine' of New York. Recognising his ability, Mr. Notman recommended him to the notice of J. A. Fraser, R.C.A., under whose tuition Sandham quickly came to the front. He then travelled in Europe to study the classical works and settled in Boston on his return in 1880. In this year the Royal Canadian Academy was founded by the Marquis of Lorne and Princess Louise, and Sandham was chosen as a charter member.

In the United States Sandham had great success as a painter of battle and historical scenes. He also painted many portraits of distinguished persons, and continued to work at illustrations. His best-known pictures are 'The March of Time,' to commemorate the grand army of the republic, now in the National Gallery, Washington; 'The Dawn of Liberty,' in the town hall, Lexington, U.S.; portrait of Sir John A. Macdonald, in the Parliament Buildings, Ottawa. Others are hung in the Parliament Buildings, Halifax, N.S., in the Smithsonian Institute, Washington, and the State House, Boston. 'Some of his figure groups are most skillfully handled. He was an excellent draughtsman' (MOMUND MORRIS). His greatest success was in the medium of water colours. He excelled also in colour work for book and magazine illustrations, often contributing to the 'Century,' 'Scribner's,' and 'Harper's' magazines. Besides the various American galleries, he exhibited at the Royal Canadian Academy and the Salon of Paris, and was awarded medals at the Philadelphia centennial exhibition, 1876, and at the Indian colonial exhibition, South Kensington, London, 1886.

He died in London on 21 June 1910, and was buried in Kensal Green. A memorial exhibition of his chief paintings was held in the Imperial Institute, London, in June 1911.

Sandham married on 23 May 1865 Agnes, daughter of John Fraser, a Canadian journalist. Mrs. Sandham was a contributor to the various American magazines. Of six children, two reached maturity—

Arthur, a wood-engraver, and Gwendoline.

[Art in Canada: the Early Painters, by Edmund Morris, Canada, July 1910 (an illustrated article); Morgan, Canadian Men and Women of the Time; Cat. Exhibition of Sandham's work in London, 1911; information from his daughter.] W. S. J.

SANDYS, FREDERICK (1829-1904), Pre-Raphaelite painter, whose full name was originally ANTHONY FREDERICK AUGUSTUS SANDS, was born at 7 St. Giles's Hill, Norwich, on 1 May, probably in 1829. No baptismal entry or other record exists to attest the year. In the Norfolk and Norwich Art Union catalogue of 1839 a note to a drawing (No. 278) entitled 'Minerva, by A. F. A. Sands,' states that the artist was 'aged ten,' and thus makes him born in 1829, but in later years, when he was in the habit of giving friends somewhat varied and inconsistent details of his career, he represented 1832 as the year of his birth. His father, Anthony Sands, originally a dyer by profession, became a drawing-master in Norwich and subsequently a portrait and subject painter; examples of his work are in the Norwich Museum (No. 50) and in Mr. Russell Colman's collection at Norwich; he died in 1883. The mother's maiden name was Mary Anne Negus. An only sister, Emma, who was also a painter and exhibited at the Royal Academy, died in 1877. The spelling of the family name was changed from Sands to Sandys to suggest, it is said, a not well authenticated connection with the family of Lord Sandys. The grandfather was a shoemaker in Upper Westwick Street, Norwich.

Sandys was educated at the Norwich grammar school. His artistic training was presumably superintended by his father, for he acknowledged no other master. But George Richmond [q. v.] was an old friend of his family and a constant visitor to Norwich, and although Sandys repudiated any suggestion of Richmond's influence, analogies in the portraiture of both artists cannot be entirely dismissed. Sandys's first commissions were for illustrations to local handbooks such as 'Birds of Norfolk' and Bulmer's 'Antiquities of Norwich.' He exhibited at local exhibitions until 1852. His first work seen at the Royal Academy was a crayon drawing of Lord Henry Loftus in 1851, when he was living in London at 21 Wigmore Street.

In 1857 he published anonymously in London a lithographic print entitled 'A Nightmare,' which was a caricature of 'Sir Isumbras at the Ford,' Millais's well-known

Pre-Raphaelite picture in the Academy of that year. The faces of Rossetti, Millais, and Holman Hunt were substituted for those of the girl, the knight, and the boy respectively; the horse of the original being transformed into a donkey labelled J. R., i.e. John Ruskin. The verses at the bottom of the print were by Tom Taylor, who was also the author of the mock mediæval lines printed in the Royal Academy catalogue for the original picture. The print measures 13 inches by 19½; a reduced facsimile is reproduced in Fisher's 'Catalogue of Engravings' (1879).

Dante Gabriel Rossetti [q. v.], on whom Sandys had called in order to obtain a likeness for the skit, was delighted. Sandys became an intimate and constant visitor at Rossetti's house, 16 Cheyne Walk. From this time (1857), Sandys associated with the artists, poets, and writers of the Pre-Raphaelite group, which then included Whistler. His painting and drawing grew definitely Pre-Raphaelite in character and handling, and he became an interesting link between the great school of his native place and the Pre-Raphaelites. He always resisted the imputation that he had seen Menzel's work, to which his own has been compared. There was perhaps a common origin in Dürer, or Rethel, whose prints were popular in England.

Sandys soon concentrated much of his energy on wood block designs in black and white, which appeared in 'Cornhill,' 'Once a Week,' 'Good Words,' and other publications between 1860 and 1866. Their technical accomplishment is unsurpassed by that of any contemporaries. They called forth from Millais the compliment that Sandys was 'worth two Academicians rolled into one'; while Rossetti with some exaggeration pronounced his friend the 'greatest living draughtsman.' On a drawing by Sandys of Cleopatra, Swinburne wrote a poem called 'Cleopatra,' which appeared with the woodcut after Sandys's drawing in 'Cornhill Magazine' in September 1866. (The poem was published in a separate volume the same year, but was never reprinted; cf. NICOLL and WISE, *Lit. Anecdotes of Nineteenth Century*, ii. 314-6.) Sandys illustrated poems by George Meredith [q. v. Suppl. II] ('The Chartist'), Christina Rossetti [q. v.] ('Amor Mundi'), and others in current periodicals.

Meanwhile Sandys contributed a few notable subject pictures to the Academy. These included 'Oriana' (1861), 'Vivien' and 'La Belle Ysonde' (1863), 'Morgan

le Fay' (1864), one of the finest, and 'Cassandra' (1868). Two oil portraits, those of Mrs. Anderson Rose (1862) and Mrs. Jane Lewis (in the Academy of 1864), deserve a place among the great achievements of English painting. The two magnificent versions of 'Autumn,' of which the larger belongs to Mr. Russell Colman of Norwich and the smaller is in the Birmingham Art Gallery, are among other of the too rare examples of the artist's achievements in oil. In 1868 'Medea,' an oil painting generally regarded as one of Sandys's masterpieces, though accepted by the hanging committee, was crowded out from the Academy. The violent protests in the press, among which Swinburne's was pitched in his characteristic key, resulted in the picture being hung on the line in the following year, 1869. He continued to contribute to the Academy until 1886; and after 1877 to the Grosvenor Gallery, where he showed altogether nine works. But after 'Medea' Sandys practically abandoned the medium of oil except for a few portraits.

From an early period Sandys had achieved a high repute among patrons and critics by his crayon heads, of which one of the best is 'Mrs. George Meredith' (1864). In 1880 he received a commission from Messrs. Macmillan & Co. for a series of literary portraits, which include Robert Browning, Matthew Arnold, Tennyson, J. R. Green, and J. H. Shorthouse. They are hard and unsympathetic in treatment, though Sandys retained his old correctness and precision. In his last year he executed a series of crayon portraits of members of the Colman family in Norwich, representing five generations. In other works of his late period he succumbed to a sentimental and barren idealism.

Intemperate and bohemian modes of life seem to have atrophied his powers. He was a constant borrower and a difficult if delightful friend. His relations with most of his associates were chequered. In 1866 he accompanied Rossetti on a trip through Kent (ROSSETTI, *Letters*, ii. 189), but a quarrel followed. Rossetti considered that too many of his pictorial ideas were being appropriated by Sandys (W. M. ROSSETTI, *Reminiscences*, p. 320). The breach, which was healed in 1875, prejudicially affected the qualities of Sandys's imagination and technique. A friendship with Meredith lasted longer. Sandys often stayed with the novelist, who mentions him in a letter as a guest at Copseham Cottage in 1864. He was then painting the

background of 'Gentle Spring,' shown in the Academy of 1865. At one time Sandys consorted a good deal with gipsies, one of whom, Kaomi, was a favourite model. She appears in Rossetti's 'Beloved,' and is the original of Kiomi in Meredith's *Harry Richmond*. Sandys was a great 'bruiser' and the hero, by his own account, of a good many brawls.

In 1898 Sandys was elected an original member of the newly formed International Society of Sculptors, Painters and Gravers, and through Mr. Pennell renewed his acquaintance with Whistler. In the intervals of long disappearances he was sometimes seen at the Café Royal in Regent Street, London, in company with Aubrey Beardsley and younger artists.

In appearance Sandys was tall and distinguished: in later life not unlike Don Quixote. He was always neatly dressed, whatever his circumstances, a spotless white waistcoat and patent leather boots being features of his toilet. Personal charm and the lively gift of the raconteur to the end reconciled friends to his embarrassing habit of borrowing. He died at 5 Hogarth Road, Kensington, on 25 June 1904, and was buried at Old Brompton cemetery. No tombstone marks the grave. The cemetery register records his age as seventy-two.

The earliest oil painting by Sandys was a portrait of himself, painted in 1848. This was offered for purchase to the trustees of the National Portrait Gallery and rejected by them. Mr. Fairfax Murray owns a miniature of him (aged six) by his father, Anthony Sands. Most of his pictures and drawings are in private collections in London and Norwich or in America. There is no example of Sandys's work at the Tate Gallery. At the Birmingham Art Gallery, besides the small version of 'Autumn,' are superb examples of his black and white drawings from the Fairfax-Murray collection. Five drawings are in the Print Room of the British Museum; two are in the Norwich Museum (Nos. 354, 377); a portrait of Mr. Louis John Tillett, M.P., hangs in St. Andrew's Hall, Norwich. Some of his works, chiefly drawings, were collected at the Leicester Galleries in London in March 1904, and after his death there was another exhibition at Burlington House in the winter of 1905.

[The fullest and best account, in which Sandys assisted, is *A Consideration of the Art of Frederick Sandys*, by Esther Wood, with admirable reproductions, in a special winter number of *The Artist* (a defunct periodical),

1896. Mrs. Wood challenges the accuracy of certain statements in Mr. J. M. Gray's critical appreciation in the *Art Journal*, March 1884, in the *Hobby Horse*, 1888, vol. iii. and 1892 vol. vii., and in Mr. Pennell's articles in *Pan* (German publication, 1895), in the *Quarto*, 1896, vol. i., and in the *Savoy*, January 1896. See also *Family Letters* of D. G. C. Williamson); information kindly supplied by Mr. James Reeve of Norwich and Miss Colman; personal knowledge.] R. R.

SANFORD, GEORGE EDWARD LANGHAM SOMERSET (1840-1901), lieutenant-general, born on 19 June 1840, was son of George Charles Sanford.

After education at the Royal Military College, Woolwich, he entered the royal engineers as lieutenant on 18 Oct. 1856, when little over sixteen. As a subaltern he saw much service in China, where he arrived in 1858. He took part in the occupation of Canton, in the expedition to Pei-ho, and in the demolition of forts at the mouth of the river and advance to Tientsin. Subsequently he was engaged in the campaign in the north of China in 1860, and received the medal with clasp. In 1862 Sanford joined Charles George Gordon [q. v.] in the operations against the Taipings, and played a useful part in the capture of the stockades of Nanksiang, and in the escalade of the walled cities of Kahding, Singpoo, and Cholin, and of the fortified town of Najow. He did useful survey work during the campaign, and assisted Gordon in drafting a 'Military Plan of the District round Shanghai under the Protection of the Allied Forces' (London, 1864; Shanghai, 1872). Gordon described him as the best officer he had ever met. He was promoted second captain on 8 Feb. 1866 and captain on 5 July 1872.

Returning to England, Sanford served

in the ordnance survey in England until 1872. Next year he proceeded to India as executive engineer in the public works department there, becoming major 10 Dec. 1873. In 1878 he served in the Afriidi expedition as assistant quartermaster-general Peshawar district (medal with clasp). Later in 1878-9 he took part in the Afghan war, and was present at the capture of Ali Masjid. He was mentioned in despatches (*Lond. Gaz.* 7 Nov. 1879) and received the medal with clasp and brevet of lieutenant-colonel (22 Nov. 1879). Sir Frederick (afterwards Earl) Roberts rewarded his efficiency by appointment as assistant quartermaster-general of 1st division in the Peshawar Valley field force. Thenceforth his work lay long in the quartermaster-general's department. In 1880 he was deputy quartermaster-general of the newly formed Indian intelligence department, and during the absence of Sir Charles Macgregor [q. v.] he officiated for a year (1882-3) as quartermaster-general in India. He showed great ability in despatching the Indian contingent to Egypt in 1882, becoming lieutenant-colonel on 26 April of that year. Sanford had previously prepared excellent intelligence reports on Egypt as a possible theatre of war, and the success of the transport arrangement was largely due to him.

On completion of his term as deputy quartermaster-general at headquarters in Dec. 1885, Sanford, who was promoted colonel on 22 Nov. 1883, saw service as commanding royal engineer in the Burmese expedition of 1885-6, and received the thanks of the government of India, being mentioned in despatches (*Lond. Gazette*, 22 June 1886). He was rewarded with the clasp and was made C.B. on 25 Nov. 1886.

From March 1886 till 1893 he was director-general of military works in India, and held office during a period of great activity in connection with frontier defences. On 1 Jan. 1890 he was nominated C.S.I. On leaving the military works department he was in command of the Meerut district in India till 1898. He had been made major-general on 1 Jan. 1895, and became lieutenant-general on 1 April 1898. He was mentioned in 1898 for the Bombay command, when it fell to Lieutenant-general Sir Robert C. Low [q. v. Suppl. II]. A first-rate soldier and an accomplished man, he died, while still on the active list, at Bedford on 27 April 1901.

He married in 1867 Maria Hamilton (d. 1898), daughter of R. Hesketh of Southampton.

[The Times, 11 May 1901; Hart's and Official Army Lists; S. Mossman, General Gordon's Private Diary, 1885, p. 209.] H. M. V.

SANGER, GEORGE, known as 'LORD GEORGE SANGER' (1825-1911), circus proprietor and showman, born at Newbury, Berkshire, on 23 Dec. 1825, was sixth child of ten children of James Sanger (*d.* 1850), a naval pensioner who served on board the Victory at Trafalgar and was afterwards a showman. His mother, a native of Bedminster, was named Elliott. John Sanger [q. v.] was his elder brother. George, who was born to the showman's business and to caravan life, made his first appearance as a performer on the day of Queen Victoria's coronation, 28 June 1838. In 1845 he joined his brother John in a conjuring exhibition at the Onion Fair, Birmingham, and in 1848 he and his brothers William and John started an independent show at Stepney Fair; here George was the first to introduce the naphtha lamp to London. In 1853 George and John Sanger inaugurated on a very modest scale a travelling show and circus, which first appeared at King's Lynn in February 1854. Their equipment steadily increased, and Sanger's circus gradually outstripped its American and English competitors. In 1860 a 'world's fair' was established at the Hoe, Plymouth, with about one hundred separate shows—waxworks, monstrosities, balloon ascents, circuses, and the like. The Agricultural Hall at Islington was soon leased for winter exhibitions; circuses were built in many of the chief towns of Great Britain, a hall was purchased at Ramsgate, and the headquarters of the enterprise was fixed at the Hall by the Sea at Margate. In November 1871 Astley's Amphitheatre in Westminster Bridge Road was bought for 11,000*l.* Soon afterwards the brothers dissolved partnership, George, who outdistanced John in enterprise and public repute, taking over Astley's and the Agricultural Hall and retaining some interest in the Margate centre. Astley's flourished under his management till its demolition in 1893. His shows there were staged on a lavish and generous scale. In 1886 he exhibited the spectacle of 'The Fall of Khartoum and Death of General Gordon' at 280 consecutive performances, in which 300 men of the guards, 400 supers, 100 camels, 200 real Arab horses, the fifes and drums of the grenadiers, and the pipers of the Scots guards were brought on to the stage. Even more ambitious was his pantomime of 'Gulliver's Travels'; the performers in which included three elephants, nine camels,

and 52 horses, as well as ostriches, emus, pelicans, deer, kangaroos, Indian buffaloes, Brahmin bulls, and living lions.

Meanwhile Sanger paid some eleven annual visits to the Continent, making summer tours through France, Germany, Austria, Bohemia, Spain, Switzerland, Denmark, and Holland. On leaving Astley's in 1893 he toured continuously through England and Scotland. On 19 June 1898 he appeared before Queen Victoria at Balmoral, and he repeated the experience at Windsor next year (17 July 1899).

Sanger was in later life hampered by the rivalry of American travelling circus proprietors. In 1887 he took the title of 'Lord' George Sanger by way of challenge to 'the Hon.' William Cody ('Buffalo Bill'), who was touring England with his 'Wild West' show. Universally regarded as the British head of his profession, Sanger owed his success mainly to his gift for patter and pompous phraseology in advertisement, and to his influence over animals, which he tamed by kindness, forbidding his subordinates to employ the harsh methods in vogue elsewhere. He was a tireless worker, a considerate employer, and a generous friend of circus folk. In 1887 he established the Showman's Guild, of which he was president for eighteen years, making generous contributions to its funds. He was one of the last of a calling which decayed in his closing years before the rising popularity of music-halls, football matches, and cinematograph exhibitions, innovations which seemed to Sanger to be symptomatic of degeneracy.

Sanger disposed of his circus in October 1905, and retired to Park Farm, East End Road, Finchley. He published his autobiography, 'Seventy Years a Showman,' in 1910. He was shot dead at Park Farm by one of his employees, to whom he had shown much kindness, on 28 Nov. 1911. The murderer committed suicide. Sanger was buried with municipal honours by the side of his wife at Margate.

He married in November 1850, at St. Peter's church, Sheffield, Ellen Chapman (*d.* 30 April 1899), an accomplished lion tamer, who till her marriage performed at Wombwell's menagerie as Madame Pauline de Vere; they had issue a son (who predeceased Sanger) and a daughter, Harriett, wife of Mr. Arthur Reeve of Asplins Farm, Park Lane, Tottenham. To his daughter he left his property, which was valued for probate at 29,348*l.*

[Seventy Years a Showman, by 'Lord'

George Sanger, 1910 (with photographic reproductions); J. O'Shea, *Roundabout Recollections*, 1892, i. 267 seq.; Charles Frost, *Circus Life*, 1875; *The Times*, 30 Nov. 1911; *Era*, 2 and 9 Dec. 1911 (photograph); *Cassell's Mag.*, vol. xxii. 1896.] W. B. O.

SANKEY, SIR RICHARD HIERAM (1829–1908), lieutenant-general, royal (Madras) engineers, born at Rockwell Castle, co. Tipperary, on 22 March 1829, was fourth son of Matthew Sankey, barrister, of Bawnmore, co. Cork, and Modeshil, co. Tipperary, by his wife Eleanor, daughter of Colonel Henry O'Hara, J.P., of O'Hara Brook, co. Antrim. Educated at the Rev. D. Flynn's school in Harcourt Street, Dublin, he entered the East India Company's military seminary at Addiscombe in February 1845. Sankey showed considerable talent as an artist, and won a silver medal at an exhibition of the Dublin Society in 1845 and the prize for painting on leaving Addiscombe at the end of 1846. Commissioned as second lieutenant in the Madras engineers on 11 Dec. 1846, he arrived in Madras after the usual instruction at Chatham in Nov. 1848.

After serving with the Madras sappers at Mercatur he officiated in 1850 as superintending engineer, Nagpore subsidiary force; but owing to ill-health he was at home for three years (1853–6). Promoted lieutenant on 1 Aug. 1854, he was appointed, on returning to Madras in 1856, superintendent of the east coast canal. In May 1857 Sankey was called to Calcutta as under-secretary of the public works department under Colonel (afterwards General Sir) William Erskine Baker [q. v.].

On the outbreak of the Mutiny Sankey was commissioned as captain of the Calcutta cavalry volunteers, but in September was despatched to Allahabad for field duty. Besides completing the defensive works along the Jumna, he levelled the whole of the Allypunge quarter of the city, employing some 6000 workmen to clear the front of the entrenchments of obstructions and to construct a causeway across the muddy bed of the Ganges. He established a bridge of boats, and having to provide shelter for the advancing troops all along the grand trunk road in the North-west Provinces, he arrived at Cawnpore, in the course of this duty, the day before it was attacked by the Gwalior force under Tantia Topi. He acted as assistant field engineer under Lieutenant-colonel McLeod, the commanding engineer of General Windham's force, and when that

force fell back on the entrenchments was employed in strengthening the defences; noticing that the whole area as far as an outpost some 600 yards away was swept by the enemy's fire, he effectively connected the outpost with the entrenchment by a simple screen of mats fixed during one night.

After the rebels were defeated by Sir Colin Campbell on 6 Dec., Sankey was transferred as field engineer to the Gurkha force under Jung Bahadur. He organised an engineer park at Gorakpur and procured material for bridging the Gogra and Gumti rivers for the march to Lucknow. Alone he reconnoitred the Gogra, which was crossed on 19 Feb. 1858, when the fort Mowrani on the other side of the river was seized. Next day he took part in the action of Phulpur, where he constructed a bridge of boats 320 yards long in two days and a half, and made three miles of road. The Gurkha army, 20,000 strong of all arms, then crossed into Oude, and Sankey received the thanks of his commander and of the government of India for 'his great and successful exertions.' While on the march on 26 Feb., Sankey's conspicuous gallantry in forcing an entry into a small fort at Jumalpur occupied by the rebels was highly commended by the commander in his despatch, and he was unsuccessfully recommended for the Victoria Cross.

Sankey was at the action of Kanduah Nulla on 4 March, and was mentioned in despatches. He constructed the bridge to pass the troops over the river to Sultanpur and received the thanks of government. At Lucknow the Gurkha army was posted in a suburb south-east of the Charbagh, which it attacked on the 14th. Next day Sankey was with the Gurkhas when they carried all before them to the gate of the Kaisar Bagh, which General Thomas Franks [q. v.] had captured. Sankey was also engaged with the enemy on the 15th, 18th, and 19th, and on the final capture of the city made arrangements for establishing the bridge over the canal near the Charbagh.

Soon after the fall of Lucknow Sankey returned to Calcutta in ill-health, and was sent to the Neilgherries to recruit. For his services in the mutiny campaign he received the medal with clasp, was promoted second captain on 27 August 1858, and brevet major the next day. During 1859 he was executive engineer, and also superintendent of the convict gaol at Moulmein in Burma, and received the thanks of the government of India for his management of the prison. In 1860–1 he was garrison engineer at Fort William, Calcutta.

Promoted first captain in his corps on 29 June 1861, and appointed assistant to the chief engineer, Mysore, he held the post with credit until 1864. In 1864 he succeeded as chief engineer and secretary to the chief commissioner, Mysore, and during the next thirteen years managed the public works of that province. He originated an irrigation department to deal scientifically with the old native works; the catchment area of each valley was surveyed, the area draining into each reservoir determined, and the sizes and number of reservoirs regulated accordingly. He also improved the old roads and opened up new ones in all directions. Government offices were built, and the park around them laid out at Bangalore.

In 1870 Sankey spent seven months on special duty at Melbourne, at the request of the Victorian government, to arbitrate on a question of works for supplying water to wash down the gold-bearing alluvium of certain valleys. He was promoted brevet lieutenant-colonel on 14 June 1869, regimental lieutenant-colonel on 15 Oct. 1870, and brevet colonel on 15 Oct. 1875.

In 1877 he was transferred to Simla as under-secretary to the government of India, and in September 1878, when war with the Amir of Afghanistan was imminent owing to the rebuff to the Chamberlain mission, was appointed commanding royal engineer of the Kandahar field force under Lieutenant-general, afterwards Field-marshal, Sir Donald Stewart [q. v. Suppl. I]. Sankey arrived with the rest of his staff at Quetta on 12 Dec., and being sent forward to reconnoitre recommended an advance by the Khawga Pass, leaving the Khojak for the second division under Major-general (afterwards Sir) Michael Biddulph [q. v. Suppl. II]. On 30 Dec. 1878 he was promoted regimental colonel. On 4 Jan. 1879 Sankey was with the advanced body of cavalry under Major-general Palliser when a cavalry combat took place at Takt-i-pul. Stewart's force occupied Kandahar, and advanced as far as Kalat-i-Ghilzai, when the flight of the Amir Shere Ali put an end, for a brief period, to the war. While Sankey was preparing winter quarters for the force at Kandahar he was recalled to Madras to become secretary in the public works department. For his share in the Kandahar expedition he was mentioned in despatches, created a C.B., and given the medal.

During five years at Madras Sankey became member of the legislative council, and was elected a fellow of the Madras

University. He helped to form the Marina and to beautify the botanical gardens and Government House grounds. On 4 June 1883 he was promoted major-general. He retired from the army on 11 Jan. 1884, with the honorary rank of lieutenant-general. He had previously received the distinguished service reward in India.

On his return to England in 1883 Sankey was appointed chairman of the Irish board of works. In 1892 he was gazetted K.C.B. After his retirement in 1896 he resided in London, but his activity was unabated. He visited Mexico and had much correspondence with the president Diaz. He died suddenly at his residence, 32 Grosvenor Place, on 11 Nov. 1908, and was buried at Hove, Sussex. Sankey was twice married: (1) in 1858, at Ootacamund, to Sophia Mary (d. 1882), daughter of W. H. Benson, Indian civil service; (2) in 1890, at Dublin, to Henrietta, widow of Edward Browne, J.P., and daughter of Pierce Creagh; she survived him. By his first wife he had two daughters, one of whom married his nephew, Colonel A. R. M. Sankey, R.E.

[India Office Records; Vibart's Addiscombe; The Times, 12 Nov. 1908; memoir with portrait in Royal Engineers' Journal, June 1909.] R. H. V.

SAUMAREZ, THOMAS (1827-1903), admiral, born at Sutton, Surrey, on 31 March 1827, was grandnephew of James, first Baron de Saumarez, and was son of Captain (afterwards Admiral) Richard Saumarez. After a few years at the Western Grammar School, Brompton, he entered the navy in 1841, and was actively employed during the whole of his junior time on the east coast of South America, at Buenos Ayres, Monte Video, and in Parana. He was made a lieutenant in March 1848. As a lieutenant he served principally on the west coast of Africa, where on 31 March 1851 he saved a man from drowning and received the Royal Humane Society's silver medal. Later in the year he commanded a division of gunboats at Lagos and was severely wounded; in September 1854 he was promoted to commander. In May 1858 he had command of the Cormorant, and served with rare distinction at the capture of the Taku forts, where the Cormorant led the attack, broke through a really formidable boom, and with her first broadside, fired at the same moment, dismounted the largest of the enemy's guns. He afterwards took part in the operations in the river Peiho and in the occupation of Tientsin, and on the coast of

China. His promotion to the rank of captain was dated 27 July 1858. He had no further active service, but his brilliant advance on 20 May 1858 is worthy to be held in remembrance. On 12 April 1870 he was retired, and was nominated a C.B. in 1873. He became by seniority a rear-admiral in 1876, vice-admiral in 1881, and admiral in 1886. He died at his residence, 2 Morpeth Mansions, Westminster, on 22 Jan. 1903. He married (1) in 1854 a daughter (*d.* 1866)* of S. R. Block of Greenhill, Barnet; and (2) in 1868, Eleanor, daughter of B. Scott Riley, of Liverpool. He left no issue.

SAUNDERS, EDWARD (1848-1910), entomologist, born at East Hill, Wandsworth, on 22 March 1848, was youngest of seven children (four sons and three daughters) of William Wilson Saunders, F.R.S. [q. v.]. His elder brother, George Sharp Saunders, F.L.S. (*d.* 1910), also an entomologist, was editor of the 'Journal of the Royal Horticultural Society' from 1906 to 1908. The youngest sister married the Rev. T. R. R. Stebbing, F.R.S.

Saunders, who was educated entirely at home, was the author (from 1867) of many papers on entomology, relating chiefly to the Buprestidae, Hemiptera Heteroptera, and Aculeata Hymenoptera. These he contributed to the 'Entomologist's Monthly Magazine,' the 'Transactions of the Entomological Society,' the 'Journal of the Linnean Society,' and other serials. His independent publications comprised 'The Hemiptera Heteroptera of the British Isles' (1892); 'The Hymenoptera Aculeata of the British Isles' (1896); and a popular work (with illustrations by his daughter) 'Wild Bees, Wasps, and Ants, and other Stinging Insects' (1907).

On 5 June 1902 he was elected F.R.S. He died at Bognor on 6 Feb. 1910, and was buried in Brookwood cemetery. He married in 1872 Mary Agnes, daughter of Edward Brown (*d.* 1866), of East Hill, Wandsworth, East India merchant, and had issue eight sons and four daughters.

T. E. J.

SAUNDERS, SIR EDWIN (1814-1901), dentist, born in London on 12 March 1814, was son of Simon Saunders, senior partner in the firm of Saunders & Ottley, publishers, in Brook Street, London. From an early age he showed aptitude for mechanical contrivances, and from the age of twelve to fourteen he experimented in methods of superseding steam by hydraulic power for the propulsion of vessels. He also invented a sweeping machine for use in city streets, not unlike those now in use. A native bent for civil engineering was not encouraged owing to the uncertain prospects of the profession. The mechanical opportunities which dentistry affords attracted him, and he was articled as a pupil to Mr. Lemaile, a dentist in the Borough. At the end of three years he was thoroughly grounded in dental mechanics, and gave a course of lectures on elementary mechanics and anatomy at a mechanics' institute. Frederick Tyrrell [q. v.], surgeon to St. Thomas's Hospital, who happened to be present at one lecture, was so impressed that, after consultation with his colleagues, he invited Saunders to lecture at St. Thomas's Hospital. Saunders appears to have lectured here unofficially from 1837, but having obtained the diploma of the Royal College of Surgeons in 1839 he was in that year appointed dental surgeon and lecturer on dental surgery to St. Thomas's Hospital, a post he occupied until 1854. In 1855 he was elected F.R.C.S. He was also dentist from 1834 to the Blenheim Street Infirmary and Free Dispensary, and in 1840 he started, in conjunction with Mr. Harrison and Mr. Snell, a small institution for the treatment of the teeth of the poor. It was the first charity of its kind, and lasted about twelve years.

Whilst working at the subject of cleft palate, Saunders came to know Alexander Nasmyth, who had a large dental practice in London, and after 1846, when Nasmyth was incapacitated by an attack of paralysis, Saunders bought Nasmyth's practice, which he carried on at Nasmyth's house, 13a George Street, Hanover Square, until he retired to Wimbledon. He succeeded Nasmyth in 1846 as dentist to Queen Victoria, the Prince Consort, and the other members of the Royal family.

Saunders held that dentistry was a part of medicine. A good organiser and a man of considerable scientific attainments, he was amongst the first to attempt the formation into a compact profession of the heterogeneous collection of men who practised dentistry. In 1856 he, with

others, petitioned the Royal College of Surgeons of England to grant a diploma in dental surgery, but it was not until after many negotiations that the college obtained powers, on 8 Sept. 1859, to examine candidates and grant a diploma in dentistry. The Odontological Society was founded at Saunders's house in 1857 to unite those who practised dental surgery. Saunders was the first treasurer, and was president in 1864 and 1879. Saunders was trustee of the first dental hospital and school established in London, in Soho Square in 1859. The institution prospered, and in 1874 the Dental Hospital in Leicester Square was opened, being handed over to the managing committee free of debt. Saunders rendered to the new hospital important services, which his colleagues and friends commemorated by founding in the school the Saunders scholarship. Saunders was president of the dental section at the meeting of the International Medical Congress which met in London in 1881, and in the same year was president of the metropolitan counties branch of the British Medical Association. In 1883 he was knighted, being the first dentist to receive that honour. In 1886 he was president of the British Dental Association. He died at Fairlawn, Wimbledon Common, on 15 March 1901, and was buried at the Putney cemetery. In 1848 he married Marian, eldest daughter of Edmund William Burgess, with whom he celebrated his golden wedding in 1898.

Saunders was author of: 1. 'Advice on the Care of the Teeth,' 1837. 2. 'The Teeth as a Test of Age considered in reference to the Factory Children. Addressed to the Members of both Houses of Parliament,' 1837; this work was adopted by the inspectors of factories and led to the detection of much fraud.

[Journal of Brit. Dental Assoc., vol. xxii. new ser., 1901, p. 200; Medico-Chirurgical Trans., vol. lxxxv. 1902, p. cii; private information.] D'A. P.

SAUNDERS, HOWARD (1835-1907), ornithologist and traveller, born in London on 16 Sept. 1835, was son of Alexander Saunders by his wife Elizabeth, daughter of Joseph Laundry. Educated at private schools at Leatherhead and Rottingdean, he subsequently entered the firm of Anthony Gibbs & Sons, South American merchants and bankers in the City of London, and in 1855, when twenty years old, left England to take up a post at Callao, in Peru. His love of natural history and archæology

and liking for adventurous travel led him, however, to relinquish business pursuits. Leaving Peru in 1860, he crossed the Andes and explored the headwaters of the Amazon river, descending thence to Pará. The perilous journey provided novel and rich material for scientific study.

After his return in 1862 Saunders devoted himself to ornithological research. His first memoir, which appeared in 1866 in the 'Ibis,' the organ of the British Ornithological Union, gave an account of the albatrosses observed whilst on his voyage from Cape Horn to Peru. Turning his attention to the avifauna of Spain, he next wrote papers on the birds of Spain (*Ibis*, 1869-78) and the birds of the Pyrenees and Switzerland (*Ibis*, 1883-97). He had become an accomplished Spanish scholar and often travelled to Spain, contributing 'Ornithological Rambles in Spain and Majorca' to the 'Field' newspaper in 1874. Saunders was joint-editor with Dr. P. L. Selater of the 'Ibis' (1883-8 and 1894-1900); and from 1901 till his death was secretary and treasurer of the British Ornithological Union, which he had joined in 1870. He was the recorder of *Aves* for the 'Zoological Record' (1876-81).

From 1880 to 1885 Saunders was honorary secretary of Section D (zoology) of the British Association. A fellow of the Zoological and Linnean Societies, he served on the councils of each, and wrote for their 'Proceedings' and 'Journal' memoirs, many of which dealt more especially with the *Laridae* (gulls and terns). He was a fellow of the Royal Geographical Society, and deeply interested in all branches of geographical research.

Saunders's chief independent publication was 'An Illustrated Manual of British Birds' (1889; 2nd edit. 1899). He also edited 'Yarrell's British Birds' (4th edit. 1882-5, vols. iii. and iv.) in succession to Prof. Alfred Newton [q. v. Suppl. II], and he wrote the monograph on terns, gulls, and skuas (vol. xxv. 1896) for the 'Catalogue of the Birds in the British Museum.' He revised and annotated Mitchell's 'Birds of Lancashire' (2nd edit. 1892).

He died at his residence, 7 Radnor Place, W., on 20 Oct. 1907, and was buried in Kensal Green cemetery. He married in 1868 Emily, youngest daughter of William Minshull Bigg, of Stratford Place, W., and had issue two daughters.

Saunders was a frequent writer in the 'Field' and 'Athenæum.' In addition to those cited he wrote memoirs on the eggs collected on the transit of Venus expedi-

tions, 1874-5 (*Phil. Trans.* vol. 168, 1879); on the birds (*Laridæ*) collected during the voyage of H.M.S. Challenger (*Report, Zoology*, vol. ii.), and the article 'Birds' in the 'Antarctic Manual' (National Antarctic Expedition, 1901).

[*Proc. Linn. Soc.*, 1908; *The Ibis*, ser. ix., vol. 2, Jubilee Suppl. (with portrait); *Trans. Norfolk and Norwich Nat. Soc.*, vol. viii.; *Roy. Soc. Catal. Papers; Zoologist*, ser. iv. vol. ii. (with portrait); *Field*, 26 Oct. 1907; *Nature*, 24 Oct. 1907; *Athenæum*, 26 Oct. 1907; *The Times*, 22 Oct. 1907.] T. E. J.

SAUNDERSON, EDWARD JAMES (1837-1906), Irish politician, born on 1 Oct. 1837 at Castle Saunderson, was fourth son of Colonel Alexander Saunderson (1783-1857) of Castle Saunderson, Belturbet, co. Cavan, by his wife Sarah Juliana (d. 1870), elder daughter of the Rev. Henry Maxwell, sixth Baron Farnham. The Saundersons trace their lineage to a family called de Bedic, settled in co. Durham in the fourteenth century, of which one branch after a settlement in Scotland removed to Ireland in the seventeenth century.

Before Saunderson was ten his father shut up his house and chose to live abroad. Saunderson and his brothers were educated chiefly at Nice, by private tutors. He learnt to talk French fluently, but his attention was largely devoted to the designing, building, and sailing of boats, always his favourite recreations. One or two of his foreign tutors were Jesuits, but Saunderson and his brothers grew up in earnest attachment to protestant principles. Through life Saunderson was an ardent protestant and Orangeman, and, although he was not careful of dogmas and formularies, he cherished an absolute faith in divine guidance, was an earnest and eloquent preacher, and was in the habit until death of conducting the services in the church at Castle Saunderson.

His father died in Dec. 1857 and left Castle Saunderson to his younger son, Edward, to come into possession of it on reaching the age of twenty-five in 1862. Settling accordingly in Ireland, Saunderson was high sheriff of Cavan in 1859, and soon joined the Cavan militia, of which he later was colonel commanding (1891-3). At first he spent most of his time in hunting or sailing on Lough Erne. In politics he was a liberal of the whig type, and an admirer of Lord Palmerston. At the general election of 1865 he was returned unopposed for his county (Cavan), his colleague being a conservative, Hugh

Annesley, afterwards earl of Annesley. The two were re-elected without opposition at the election of 1868. Saunderson opposed the disestablishment of the Irish church in 1869, but otherwise gave little sign of political interest or activity. In 1874 he stood for Cavan for a third time, again with Annesley, and both were defeated by home rulers, one of them Joseph Gillis Biggar [q. v. Suppl. I]. For the next ten years Saunderson pursued the uneventful life of a country gentleman at home, with occasional visits abroad. But the advance of the home rule movement under Parnell's leadership, which he regarded as dangerous and disloyal, drew him into the fighting line. In July 1882 he appeared at Ballykilbeg on a platform as an Orangeman. Although he never ceased to call himself a whig, he was in London in 1884 eagerly assisting his conservative friends in their opposition to the franchise bill, which (he foresaw) promised a serious advantage to the followers of Parnell in Ireland. In a pamphlet, 'Two Irelands, or Loyalty versus Treason' (1884), he explained his hostility to the nationalist agitation. At the general election in Nov. 1885 he was elected for North Armagh as a conservative in contest with a liberal, and he represented the constituency until his death, twenty-one years later. He defeated a nationalist at the general election of July 1886, and an independent conservative at that of Oct. 1900; in July 1892, July 1895, and Jan. 1906 he was returned unopposed.

Saunderson rapidly became the most conspicuous member of the Irish unionist party in the House of Commons. He was never a good debater and made little pretence of mastering details, but he had an imposing presence, a fine voice, great fluency, abundant humour, and a zest for personal controversy with opponents. During the passage of Gladstone's second home rule bill through the House of Commons in 1893 he was indefatigable in protest and frequently evoked disturbances by his attacks on the nationalists. He declared the nationalist members to be eighty-five reasons for not passing the bill. On 2 Feb. 1893 he raised a storm by describing an Irish priest named Macfadden as a 'murderous ruffian,' words which he afterwards changed to 'excited politician.' On 27 July 1893, while the home rule bill was in committee, he engaged in a free fight with his Irish foes on the floor of the chamber. Although he supported the conservative party in their main policy,

he showed independence on occasions, and criticised adversely the conservative land bill of 1896, and joined the nationalists in 1897 in denouncing the financial relations between England and Ireland as unjust to the smaller country. In regard to South African policy he was in sympathy with Mr. Joseph Chamberlain. In 1897-8 he visited South Africa, with other members of Parliament, to attend the opening of the Bechuanaland railway, and made several stirring speeches from the English point of view upon the vexed questions which were then disturbing the South African colonies and were leading towards war. On the political platform outside the House of Commons both in England and Ireland Saunderson proved a formidable champion of the Irish union. On 31 May 1894 he took part in an adjourned debate on home rule at the Oxford Union, answering a speech by Mr. John Dillon of the week before. The proposal in favour of home rule was defeated by 344 to 182. He threw himself with enthusiasm into the work of the Orange lodges and was grand master at Belfast from 1901 to 1903.

Saunderson was made a privy councillor in 1898 and lord-lieutenant of Cavan in 1900. In private life his ardent spiritual aspirations never diminished his natural humour nor his love of recreation. He was a capable artist and caricaturist, and many spirited sketches of his parliamentary associates are of historic value. He continued to the last to design and build boats which held their own with the best yachts on Lough Erne. He shot and played billiards and latterly golf. A serious illness in 1904 impaired his health. He died at Castle Saunderson on 21 Oct. 1906, and was buried in the churchyard in his park. He married on 22 June 1865 Helena Emily, youngest daughter of Thomas de Moleyns, third Lord Ventry. He left four sons and one daughter, of whom the eldest son Somerset (late captain, king's royal rifles) succeeded to the property. In 1907 three of his religious addresses were published under the title 'Present and Everlasting Salvation,' with a preface by J. B. Crozier, then bishop of Ossory. A portrait by Edwin Long, R.A., painted in 1890, belongs to Mr. Burdett-Coutts, together with a crayon drawing by R. Ponsonby Staples dated 1899. Another portrait by H. Harris Brown is at Castle Saunderson. A statue by (Sir) William Goscombe John, subscribed for by the public, was unveiled at Portadown in 1910.

[Reginald Lucas's Colonel Saunderson : a Memoir, 1908 ; The Times, 22 Oct. 1906 ;

H. W. Lucy's Home Rule Parliament, 1892-5, and The Salisbury Parliament, 1895-1900.]

R. L.

SAVAGE-ARMSTRONG, GEORGE FRANCIS (1845-1906), poet, born at Rathfarnham, co. Dublin, on 5 May 1845, was the third son of Edmund John Armstrong of Wicklow and Dublin and Jane, daughter of the Rev. Henry Savage of Glaslary, co. Down, of the family of the Savages of the Ards. Edmund John Armstrong, the poet [q. v.], was his elder brother. After some early education in Jersey, he made a pedestrian tour in France with his brother Edmund in 1862, and in later years he tramped through many other continental countries. He matriculated at Trinity College, Dublin, in 1862, won the vice-chancellor's prize for an English poem on Circassia, and graduated B.A. in 1869. In 1869 he published his first volume of verse, 'Poems Lyrical and Dramatic' (2nd edit. 1872), and in the following year 'Ugone: a Tragedy' (2nd edit. 1872), a work largely written in Italy. In 1870 he was appointed professor of history and English literature in Queen's College, Cork. The hon. degree of M.A. was conferred upon him by Trinity College in 1872, and in the same year he issued 'King Saul,' the first part of his 'Tragedy of Israel.' 'King David' and 'King Solomon,' the second and third parts of his trilogy, followed in 1874 and 1876, and in 1877 he brought out an edition of his brother's 'Poems,' following it up with a collection of that writer's 'Essays' and 'Life and Letters.' A journey to Greece and Italy in 1881 led to the publication of his verses entitled 'Garland from Greece' (1882). He was made a fellow of the Royal University (1881), and in 1891 received the honorary degree of D.Litt. from the Queen's University. In 1892 the board of Trinity College commissioned him to write the tercentenary ode, which was set to music by Sir Robert Prescott Stewart [q. v.] and performed with success during the tercentenary celebrations of the summer of 1892.

In 1891, on the death of a maternal aunt, Armstrong assumed the additional surname of Savage. He continued his duties as professor at Cork and as examiner at the Royal University in Dublin until 1905. He died on 24 July 1906 at Strangford House, Strangford, co. Down.

Savage-Armstrong, who in fertility stands almost alone among Irish poets, continued publishing verse till near his death. His latest work was for the most part his best. He wrote of nature with fresh

enthusiasm if in stately diction, and also showed philosophic faculty with command of passion. He has none of the Celtic mysticism of the later Irish school. His mature power is seen to special advantage in his 'Stories of Wicklow' (1886), 'One in the Infinite,' a philosophical sequence in verse (1892), and 'Ballads of Down' (1901). His other works were: 1. 'Victoria Regina et Imperatrix: a Jubilee Song from Ireland,' 1887. 2. 'Mephistopheles in Broadcloth: a Satire in Verse,' 1888. 3. 'Queen-Empress and Empire,' 1897, a loyal tribute in alliterative verse. 4. 'The Crowning of the King,' 1902. A laborious genealogical work, 'The Noble Family of the Savages of the Ards,' appeared in 1888.

He married in 1879 Marie Elizabeth, daughter of John Wrixon, M.A., vicar of Malone, co. Antrim, who survived him, and by whom he had two sons and a daughter.

[Dublin Evening Mail, 25 July 1906; Athenæum, 28 July 1906; Savages of the Ards (as above); Stopford Brooke's and Rolleston's Treasury of Irish Poetry, pp. 534-9; D. J. O'Donoghue, Poets of Ireland, 1912; Brit. Mus. Cat.; personal knowledge and private correspondence.] D. J. O'D.

SAVILL, THOMAS DIXON (1855-1910), physician, born on 7 Sept. 1855 at Kensington, was only son of T. C. Savill, member of a firm of printers and publishers, by his wife, Eliza Clarissa Dixon. He received his early education at the Stockwell grammar school, and, having chosen the profession of medicine, entered St. Thomas's Hospital with a scholarship in natural science. Here he had a distinguished career, gaining the William Tite scholarship and many prizes. He continued his medical studies at St. Mary's Hospital, at the Salpêtrière in Paris, at Hamburg, and at Vienna. In 1881 he graduated M.B. of the University of London, proceeding M.D. in the following year, and being admitted a member of the Royal College of Physicians of London. In rapid succession he became registrar, pathologist, and assistant physician to the West London Hospital, and early showed a bent towards neurology by translating in 1889 the lectures of Professor Charcot on 'Diseases of the Nervous System.'

In 1885 he was appointed medical superintendent of the Paddington Infirmary, then just opened, a post which gave him an intimate knowledge of the working of the poor law hospitals. He was also president of the Infirmary Medical Superintendents' Society, and was recognised as

an authority on many of the questions raised in both the majority and minority reports of the Poor Law Commission in 1909. Much of his medical experience as medical superintendent was embodied in his chief work, 'A System of Clinical Medicine' (2 vols. 1903-5), in which he approached the subject from a symptomatological point of view. Each of the chief systems of the body is discussed seriatim, and under each section descriptions are grouped of prominent symptoms pointing to disease in any particular system. In the section on arterial diseases he gave an account of the condition of the tunica media, which he studied at the Paddington Infirmary, and called arterial hypermyotrophy. This condition Savill, after a large number of investigations both macro- and micro-scopic, concluded to be a genuine hypertrophy of the muscular coat of the arteries.

At the same time Savill made a reputation as a dermatologist, and was appointed in 1897 physician to St. John's Hospital for Diseases of the Skin. Meanwhile he had retired in 1892 from Paddington Infirmary to become a consulting physician, mainly with a view to pursuing his study of neurology. He was soon appointed physician to the West End Hospital for Diseases of the Nervous System. In 1899 he brought out a course of clinical lectures upon Neurasthenia (originally delivered at the Paddington Infirmary and the West End Hospital). The book showed Savill to be an original thinker and clear expositor. Instead of separating the special symptomatic varieties of the neurasthenic condition, such as cardiac, gastric, or pulmonary, he devoted his main thesis to a discussion of its essential nature, suggesting an etiological classification in some ways more satisfactory than had yet been advanced. He embodied further observations in lectures on hysteria and the allied vaso-motor conditions, which were published in 1909. There he defended with a wealth of clinical illustration the thesis that the majority of hysterical phenomena are due to a vascular disturbance affecting especially the central nervous system, and occurring in individuals with an inborn instability of the vaso-motor centres. He admitted, however, that his hypothesis would not explain 'all the various symptoms of this protean and strange disorder' of hysteria.

Savill died at Algiers on 10 Jan. 1910 from a fracture of the base of the skull caused by a fall from his horse.

He married in 1901 Dr. Agnes Forbes Blackadder, then assistant and later full physician to St. John's Hospital for Diseases of the Skin. She aided her husband in his book on 'Clinical Medicine.'

Besides the works mentioned, Savill contributed, mainly to 'The Lancet' (1888-1909), many papers upon neurological and dermatological subjects. Another valuable piece of work was the 'Report on the Warrington Small-Pox Outbreak, 1892-3.'

SAXE-WEIMAR, PRINCE EDWARD OF (1823-1902), field-marshal. [See EDWARD OF SAXE-WEIMAR.]

SCHUNCK, HENRY EDWARD (1820-1903), chemist, born in Manchester on 16 Aug. 1820, was youngest son of Martin Schunck (d. 1872), a leading export shipping merchant of that city, who became a naturalised Englishman. His mother was daughter of Johann Jacob Mylius, senator of Frankfurt on the Main. His grandfather, Carl Schunck, an officer in the army of the Elector of Hesse, had taken part in the American war of independence on the British side. The father settled in Manchester in 1808, on removal from Malta, and founded the firm of Schunck, Mylius & Co., subsequently Schunck, Souchay & Co. After education at a private school in Manchester Schunck studied chemistry abroad. From Berlin, where Heinrich Rose and Heinrich Gustav Magnus were among his teachers, he proceeded to Giessen University, where he worked under Liebig, and graduated Ph.D. On returning from Germany he entered his father's calico-printing works in Rochdale, but after a few years relinquished business with a view to original research in chemistry, particularly in regard to the colouring matters of vegetable substances. To this unexplored field of inquiry he mainly devoted his career. In 1841 Schunck published in Liebig's 'Annalen' his first paper on a research conducted in the Giessen laboratory on the action of nitric acid on aloes. Next year he presented to the Chemical Society of London (*Memoirs*, vol. i.) an investigation made at Liebig's suggestion 'On some of the Substances contained in the Lichens employed for the Preparation of Archil and Cudbear.' This inquiry he pursued in the paper 'On the Substances contained in the *Rocella tinctoria*' (ib. vol. iii. 1846).

He isolated and determined the formula of the crystalline substance *lecanorin*.

From 1846 to 1855 he made new and exhaustive researches on the colouring matter of the madder plant (*Rubia tinctorum*), communicating the results to the British Association in 1846, 1847, and 1848. In the 'Philosophical Transactions' for 1851, 1853, and 1855 he gave further account of his investigation in his classical memoir 'On Rubian and its Products of Decomposition,' and described the peculiar bitter substance which he had isolated and named 'rubian.' Schunck's analyses first showed the chemical nature of alizarin, the colouring matter obtained from madder root by Colin and Robiquet in 1826, and of the other constituents of the root. He thus paved the way for the researches of Graebe and Liebermann, who synthesised alizarin. Subsequently Sir William Henry Perkin [q. v. Suppl. II] by further investigation made alizarin a commercial product (see Schunck's later communications in *Manchester Lit. and Phil. Soc. Memoirs*, 1871, 1873, and 1876). Hermann Roemer collaborated with him from 1875, and with his help Schunck published a series of eighteen papers in the 'Berichte' of the German Chemical Society and elsewhere on the chemistry of colouring matters (1875-80).

Schunck made researches on indigo which had much practical importance. In 1853 he extracted from the plant 'Isatis tinctoria' an unstable syrupy glucoside which he named *indican* (cf. *Manchester Lit. and Phil. Soc. Memoirs*, 1855, 1856, 1857, and 1865). He also published in 1901 a monograph, illustrated with coloured plates, 'The Action of Reagents on the Leaves of *Polygonum tinctorium*.' Study of the constitution and derivatives of chlorophyll, the green colouring matter of plants, occupied Schunck's later years. The initial results appeared in the 'Proceedings of the Royal Society' for 1884 and were subsequently continued with Marchlewski. A crystalline substance, 'phylloporphyrin,' chemically and spectroscopically resembling hæmatoporphyrin, as obtained from the hæmoglobin of the blood, was prepared. Schunck suggested that the chlorophyll in the plant performed a function similar to that of hæmoglobin in the animal, the former being a carrier of carbon dioxide in the same way as the latter acts as a carrier of oxygen. Schunck wrote on 'Chlorophyll' (1890) in Watts's 'Dictionary of Chemistry.'

Schunck joined the Chemical Society in

1841, the year of its foundation. He was elected a fellow of the Royal Society on 6 June 1850 (on the same day as James Prescott Joule [q. v.]), and he was Davy gold medallist for 1899. Elected into the Manchester Literary and Philosophical Society on 25 Jan. 1842, he was secretary (1855–60), and president (1866–7, 1874–5, 1890–1, 1896–7), receiving in 1898 the society's Dalton bronze medal (struck in 1864 but not previously awarded). An original member of the Society of Chemical Industry, he was chairman of its Manchester section in 1888–9, president in 1896–7, and gold medallist in 1900 on the ground of his conspicuous services in applied chemistry. In 1887 Schunck was president of the chemical section of the British Association at the Manchester meeting. Victoria University, Manchester, conferred on him the honorary degree of D.Sc. in 1899. With R. Angus Smith and Henry Roscoe he had already communicated to the British Association (Manchester meeting, 1861) a comprehensive report, 'On the Recent Progress and Present Condition of Manufacturing Chemistry in the South Lancashire District.'

Schunck carried on his investigations in a private laboratory which he had built near his residence at Kersal, and housed there a fine library and large collections. He was deeply interested in travel, literature and art, and in works of philanthropy connected with his native city. He died at his home, Oaklands, Kersal, Manchester, on 13 Jan. 1903, and was buried in St. Paul's churchyard, Kersal. He married in 1851 Judith Howard, daughter of John Brooke, M.R.C.S., of Stockport, and had issue five sons and two daughters. His wife and three sons and a daughter survived him.

In 1895 Schunck presented 20,000*l.* to Owens College, Manchester, of which he was a governor, for the endowment of chemical research. By his will he bequeathed to Owens College, in trust, the contents of his laboratory (together with the building), which constitutes, with the previous endowment, the 'Schunck research laboratory' at the Victoria University of Manchester.

SCOTT, ARCHIBALD (1837–1909), Scottish divine and leader of the general assembly of the Church of Scotland, born at Bogton, in the parish of Cadder, Lanarkshire, on 18 Sept. 1837, was sixth and youngest son of James Scott, farmer, by his wife Margaret Brown. From the parish school he passed to the High School of Glasgow, where Mr. James Bryce was a schoolfellow. Proceeding to the University of Glasgow, he graduated B.A. on 25 April 1856, and after taking the prescribed divinity course was licensed as a probationer of the Church of Scotland by the presbytery of Glasgow on 8 June 1859. Having served as assistant in St. Matthew's parish, Glasgow, and at Clackmannan, he was ordained by the presbytery of Perth, to East church, Perth, in Jan. 1860. In 1862 he was translated to Abernethy in the same county. In 1865 he was selected as first minister of a newly constituted charge, Maxwell church, Glasgow, where his vigorous work brought him into note throughout the west of Scotland. In 1867 he joined the Church Service Society, formed in 1865 for the better regulation of public worship. His next move was to Linlithgow in 1869, and thence in 1871 to Greenside, Edinburgh. In 1873 when James Baird [q. v.] made over 500,000*l.* for the benefit of the Church of Scotland he chose Scott, as a conspicuous example of the 'active and evangelical minister,' to be the clerical member of the governing trustees. Scott thereupon resigned his membership in the Church Service Society, but neither his doctrine, which inclined to be high, nor his form of service underwent any modification. In the controversy which was closed by the Scottish Education Act of 1872, and in the agitation for the abolition of patronage, Scott opposed the more conservative party, headed by Dr. John Cook of Haddington (1807–1874) [q. v.], believing that the Scottish people could be trusted to maintain religious instruction according to 'use and wont'—i.e. the Bible and Shorter Catechism—in the public schools. He sat on the first Edinburgh school board, and acted as chairman from 1878 to 1882. In 1876 the University of Glasgow conferred on him the degree of D.D. In 1890 he was made incumbent of St. George's church in the New Town of Edinburgh. There he held office till his death, working with exemplary fidelity and success.

Although no popular preacher, Scott

exerted great influence in the church courts and especially in the general assembly. For a time convener of the assembly's committee on foreign missions, he was appointed in 1887 convener of the general assembly's joint committee and business committee, positions which carried with them the leadership of the general assembly. He remained leader for twenty-one years, to the end of his life. His power was helped to some extent by his position on the Baird Trust, but it was mainly due to the vigour of his personality, his great capacity for business, his wide knowledge of the church, his magnanimity towards opponents, and good humour in debate. Among the main matters with which he dealt effectually, although he did not always escape charges of opportunism, were the enlargement of the membership of the general assembly, church reform, a case of heresy (the Kilmun case), changes in the educational system, and the agitation for amending the formula of clerical subscription to the Westminster confession. In 1896 he was elected moderator of the general assembly; and in 1902 he visited South Africa as one of a delegation to the presbyterian churches there, which was sent out jointly by the Church of Scotland and the United Free Church. The visit confirmed Scott's older desire for the reunion of Scottish presbyterians. From the larger movement inaugurated, or revived, by Bishop Wilkinson of St. Andrews [q. v. Suppl. II] for a reunion which should embrace the episcopalians also, he kept aloof. Scott was the author of the proposal that the Church of Scotland should confer with the general assembly of the United Free Church (24 May 1907). But before the negotiations began Scott's health suddenly gave way, and he died at North Berwick on 18 April 1909, being buried in the Dean cemetery, Edinburgh.

Scott published: 1. 'Endowed Territorial Work: the Means of Meeting Spiritual Destitution in Edinburgh,' Edinburgh, 1873. 2. 'Buddhism and Christianity: a Parallel and Contrast,' the Croall lecture, 1889-90, Edinburgh, 1890. 3. 'Sacrifice: its Prophecy and Fulfilment,' the Baird lecture, 1892-93, Edinburgh, 1894. 4. 'Our Opportunities and Responsibilities,' the moderator's closing address to the general assembly of the Church of Scotland, Edinburgh, 1896. 5. 'Lectures on Pastoral Theology.'

Scott was twice married: (1) to Isabella, daughter of Robert Greig, merchant, Perth;

by her he had six children, of whom two survive, a daughter and a son, R. G. Scott, Writer to the Signet, Edinburgh; and (2) in 1883 to Marion Elizabeth, daughter of John Rankine, D.D., minister of Sorn, moderator of the general assembly 1883.

A portrait by Sir George Reid, P.R.S.A., painted in 1902, hangs in the offices of the Church of Scotland, 22 Queen Street, Edinburgh; a replica was presented to Scott at the same time. A bronze bust of him, the work of Pittendriugh Macgillivray, R.S.A., was placed in the vestibule of St. George's church by the kirk session and congregation, 1907.

[Private information; Scotsman, 19 April 1909; Layman's Book of the General Assembly, Edinburgh, 1907.] J. C.

SCOTT, CLEMENT WILLIAM (1841-1904), dramatic critic, born at Christ Church vicarage, Hoxton, on 6 Oct. 1841, was son of William Scott (1813-1872) [q. v.], then perpetual curate of Christ Church, Hoxton, by his wife Margaret, daughter of William Beloe [q. v.]. After attending a private day-school at Islington, Scott was at Marlborough College from August 1852 until December 1859. On the nomination of Sidney Herbert, Lord Herbert of Lea [q. v.], a friend of his father, he entered the war office in May 1860 as a temporary clerk; was appointed a junior clerk on the establishment in January 1862, and retired on a pension in April 1879, without receiving any promotion during his service. Devoted to athletics in youth and middle age, he in 1874 played at Prince's Grounds, Hans Place, London, in the first game of lawn-tennis, together with Major Wingfield, the inventor, Alfred Thompson, and Alfred Lubbock.

From boyhood Scott had been interested in light literature and the drama. On the introduction of Thomas Hood the younger [q. v.], a colleague at the war office, he while very young assisted Frederick Ledger, editor of the 'Era.' In 1863 he became dramatic writer for the 'Sunday Times,' but retired after two years owing to the frankness of his pen, being succeeded by Joseph Knight (1829-1907) [q. v. Suppl. II]. He then wrote for the 'Weekly Dispatch' and for the comic weekly paper 'Fun,' of which his friend Hood became editor in 1865; his colleagues included H. J. Byron, (Sir) Frank Burnand, and (Sir) William Schwenck Gilbert, with all of whom he grew intimate. In 1870 he joined the staff of the 'London Figaro,' contributing caustic criticism of the drama over the signature of Almaviva.

Scott began in 1871 a long connection with the 'Daily Telegraph.' He then became assistant to the dramatic critic, Edward Laman Blanchard [q. v. Suppl. I], whom he shortly afterwards succeeded. With the 'Daily Telegraph' he was associated till 1898, becoming the best known dramatic critic of his day, and largely leading popular opinion in theatrical matters. For a time in 1893 he was also dramatic critic for the 'Observer,' and later of the 'Illustrated London News.' From 1880 to 1889 he edited the monthly periodical called 'The Theatre.'

Scott also tried his hand at the drama. On 1 April 1871 John Hollingshead produced anonymously at the Gaiety Theatre his 'Off the Line,' a popular farce from the French. In March 1877 he adapted at (Sir) Squire Bancroft's suggestion, for the Prince of Wales's Theatre, Octave Feuillet's 'Le Village' under the title of 'The Vicarage.' But his chief dramatic successes were won in the adaptation of comedies of Victorien Sardou, also for the Bancroft management. With B. C. Stephenson, Scott based 'Peril' on Sardou's 'Nos Intimes' (October 1876) and 'Diplomacy' on Sardou's 'Dora' (January 1878). The joint adapters called themselves 'Bolton Rowe and Saville Rowe.' 'Diplomacy' was parodied by Burnand at the Strand Theatre in 'Diplunacy.' In 1882, when the Bancrofts had removed to the Haymarket Theatre, Scott anonymously produced 'Odette,' a third adaptation of Sardou.

Lightly written accounts of holiday tours which Scott contributed serially to the 'Daily Telegraph' and other newspapers he collected into volumes under such titles as 'Round about the Islands' (1873), and 'Poppy Land,' a description of scenery of the east coast (1885; often reissued). An account of a journey round the world, which he made in 1893, was similarly issued as 'Pictures round the World' (1894). He also showed fluency as a versifier. After his friend (Sir) Frank Burnand became editor of 'Punch' in 1880, he occasionally contributed effective verse of sentimental flavour to that periodical, some of which he collected in 'Lays of a Londoner' (1882), 'Poems for Recitation' (1884), and 'Lays and Lyrics' (1888).

After his withdrawal from the 'Daily Telegraph' in 1898, Scott founded in 1901 a penny weekly paper, the 'Free Lance,' which obtained no recognised position. He died in London, after a long illness, on 25 June 1904, and was buried in the chapel of the Sisters of Nazareth at Southend.

He married (1) on 30 April 1868, at Brompton Oratory, Isabel Busson du Maurier, sister of the artist, by whom he had four sons (two dying in infancy) and two daughters; she died on 26 Nov. 1890; and (2) in April 1893 Constance Marguerite, daughter of Horatio Brandon, a London solicitor. A portrait by Mordecai belongs to his widow.

Despite the popular influence of his dramatic criticism, Scott's habit of mind was neither impartial nor judicial. Against modern schools of acting and of realistic drama of the Ibsen type he nursed a prejudice which involved him latterly in frequent controversy. In the van when he began to criticise, he never moved beyond the ideals of Robertson and Sardou. Yet he was a pioneer in the picturesque style of dramatic criticism in the daily press, which superseded the earlier method of bare reporting and owed something to the example of his fellow writer on the 'Daily Telegraph,' George Augustus Sala [q. v.].

Besides the books mentioned, Scott published numerous volumes chiefly collecting his newspaper criticisms of the drama; these include: 1. 'Thirty Years at the Play,' 1892. 2. 'From "The Bells" to "King Arthur": a critical record of the productions at the Lyceum Theatre from 1871 to 1895,' 1896. 3. 'The Drama of Yesterday and To-day,' 1899. 4. 'Ellen Terry: an Appreciation,' 1900. 5. 'Some Notable Hamlets of the Present Time,' 1900; 2nd edit. 1905.

[The Times, and Daily Telegraph, 26 June 1904; Marlborough Coll. Reg.; War Office Records; The Bancrofts: Recollections of Sixty Years, 1909, passim; Joseph Knight, Theatrical Notes, 1893, pp. 156, 198; Sir F. C. Max Beerbohm's Caricatures, May 1911, No. 25 (caricature of Scott).] L. M.

SCOTT, LORD CHARLES THOMAS MONTAGU-DOUGLAS (1839-1911), admiral, born at Montagu House, Whitehall, on 20 Oct. 1839, was fourth son of Walter Francis Scott, fifth duke of Buccleuch [q. v.], by his wife Charlotte Ann Le Thynne (d. 1895), youngest daughter of Thomas, second marquess of Bath. After beginning his education at Radley, he entered the navy on 1 May 1853 as a cadet on board the St. Jean d'Acre, then newly commissioned by Captain Keppel [see KEPPEL, SIR HENRY, Suppl. II]. In her Scott took part in the Baltic campaign of 1854,

being present at the capture of Bomarsund, and in 1855 saw further active service in the Black Sea. He received the Baltic, Crimean, and Turkish medals. In Nov. 1856 he followed Keppel into the Raleigh, going out to the China station, and after the wreck of the ship in April 1857 served in the tenders to which the officers and crew were transferred. He was thus present at the engagements at Escape Creek, Fatshan Creek, and other boat actions in the Canton River in June and July 1857, for which he received the China medal with Fatshan clasp. In July he was appointed to the Pearl, Capt. Sotheby [see *SOTHEY, SIR EDWARD SOUTHWELL*, Suppl. II], which with the Shannon was ordered from Hong Kong to Calcutta on the outbreak of the Indian Mutiny. Scott landed with the Pearl's naval brigade in Sept. 1857, and served ashore with it till the end of the following year, the brigade forming part of the Goruckpore field force during the operations in Oudh. Lord Charles was twice specially mentioned in despatches, for gallant conduct at Chanderpore on 17 Feb. 1858, and again for having, with three others, captured and turned upon the enemy one of their own guns at the battle of Belwa on 5 March. He received the Indian medal and, having passed his examination on 21 May 1859, was specially promoted to lieutenant on 19 July following. In that rank he served on board the Forte, Keppel's flagship, on the Cape of Good Hope and south-east coast of America stations, and in June 1861 was appointed to the frigate Emerald, attached to the Channel Squadron. From Nov. 1863 until he was promoted to commander on 12 Sept. 1865 he was a lieutenant of the royal yacht. Early in 1868 he went out to the China station to take command of the sloop Icarus, and in Nov. of that year served as second in command of the naval brigade under Capt. Algernon Heneage landed for the protection of British subjects at Yangchow; in December he commanded a flotilla of boats which, in co-operation with a naval brigade under Commodore Oliver Jones, destroyed three piratical villages near Swatow. He returned home in 1871, and was promoted to captain on 6 Feb. 1872.

From 1875 to 1877 Lord Charles commanded the Narcissus, flagship of the detached squadron, and in July 1879 commissioned the Bacchante, in which ship he had the immediate charge of the royal cadets, Albert Victor, duke of Clarence and Avondale, and his younger brother George (subsequently King George V),

who made their first cruise in her. The Bacchante went first to the Mediterranean, and to the West Indies and back; then, after cruising for a short time with the Channel squadron, she joined the flag of Rear-admiral the earl of Clanwilliam [see *MEADE, RICHARD JAMES*, fourth EARL OF CLANWILLIAM, Suppl. II], commanding the detached squadron. The squadron, after touching at Monte Video and the Falkland Islands, went to Simon's Bay, Australia, Japan, and China, and returned home by way of Singapore and the Mediterranean in 1882. For this service Scott was awarded the C.B. (civil). In 1885 and 1886 he commanded the Agincourt in the Channel, and in Jan. 1887 became captain of the dockyard at Chatham. He was an aide-de-camp to Queen Victoria from June 1886 until promoted to his flag on 3 April 1888. For three years from Sept. 1889 Lord Charles was commander-in-chief on the Australian station; on 10 March 1894 he was promoted to vice-admiral, and in May 1898 he was made a K.C.B. (military). On 30 June 1899 he reached the rank of admiral, and in March 1900 was appointed commander-in-chief at Plymouth, where he remained for the customary three years. He was advanced to the G.C.B. on 9 Nov. 1902, and retired on 20 Oct. 1904. He died, after a long illness, on 21 Aug. 1911 at Boughton House, near Kettering.

Lord Charles married on 23 Feb. 1883 Ada Mary, daughter of Charles Ryan of Derriweit Heights, Macedon, Victoria, Australia, by whom he had issue two sons.

SCOTT, HUGH STOWELL (1862-1903), novelist, who wrote under the pseudonym of HENRY SETON MERRIMAN, born at Newcastle-on-Tyne on 9 May 1862, was son of Henry Scott, a shipowner, of Newcastle-on-Tyne, by his wife Mary Sweet, daughter of James Wilson Carmichael [q. v.], marine painter. Hugh was educated at Loretto school, Musselburgh, and afterwards at Vevey and Wiesbaden. At eighteen he was placed by his father in an underwriter's office at Lloyd's in London. The routine of commerce proved distasteful. He cherished an ardent desire to travel abroad and to study foreign nationalities, and was thus impelled to try his hand at romance. His first experiment was 'Young Mistle,' which he submitted to Bentley and published anonymously in 1888 (2 vols.)

In his next book, 'The Phantom Future' (1889, 2 vols.), he adopted the pseudonym of Henry Seton Merriman in order to evade the disapproval of his family, and he used the same disguise to the end. 'The Phantom Future' was followed by two other stories equally immature, 'Suspense' (1890, 3 vols.) and 'Prisoners and Captives' (1891, 3 vols.). Scott subsequently suppressed these three novels in England, but he failed to prevent their continued circulation in America. In 1892 he succeeded in interesting James Payn, then editor of 'Cornhill,' in a well-constructed story of French and English life, 'The Slave of the Lamp,' which after running through the magazine was well received on its separate issue. Its successor, 'From One Generation to Another' (1892), was welcomed so warmly as to justify Scott, whose means were always ample, in abandoning the City and in adopting exclusively the profession of novelist. In 1894 his West African story, 'With Edged Tools,' caught the fancy of the public and gave him a prominent position among popular romancists of his day. There quickly followed 'The Grey Lady' (1895), which dealt with seafaring life; some of its scenes were drawn from a visit to the Balearic Islands. Henceforth Merriman, as he was invariably called by the critics, lived a comparatively secluded life in the country, varied by foreign travel.

In conjunction with Stanley J. Weyman, a literary comrade who achieved a success parallel to his own, he studied the methods of Dumas and devoted all the time and money he could spare to the detailed *mise en scène* of a series of novels of modern nationalities. His most ambitious and on the whole most successful performance was the exciting Russian story which appeared in 1896 entitled 'The Sowers,' went through thirty editions in England alone, and was included in the Tauchnitz collection. It was followed at intervals of nearly eighteen months each by 'Flotsam,' a story of Delhi in Mutiny days (1896); 'In Kedar's Tents,' a tale of Spanish Carlist intrigue (1897); 'Roden's Corner,' an Anglo-Dutch story embodying an attack on unprincipled company promoting (1898); 'Dross' (Toronto, 1899), which was not issued in volume form in Great Britain; 'The Isle of Unrest,' a story of Corsican vendetta somewhat in the *Mérimée* vein (1900); 'The Velvet Glove' (1901), in which, following the lead of 'In Kedar's Tents,' he depicted a Spanish gentleman and put some of his best work; 'Barlasch of the Guard'

(1902), a story of Dantzic in 1812 and of Borodino and after, one of his most successful attempts at historical presentation; 'The Vultures' (1902), dealing with the abortive rising in Poland after the assassination of the Czar Alexander in 1881; and 'The Last Hope' (1904), a curious story of 1849 in which strands of Bourbon and Louis Napoleon romance are ingeniously mixed. The last work was issued posthumously. At his death Scott was one of the most effective and widely read novelists of his day. His success under a pseudonym had led several impostors to represent themselves as authors of his most widely circulated books. More than most novelists he worked by a strenuous method, which involved rigid concentration and omission, close personal study of his backgrounds, and much rewriting of dialogue. His faults were a growing tendency to a moralising and sentimental cynicism, a stereotyped repertory of characters—strong silent gentlemen, reserved and romance-loving maidens, and inflexibly trusty servants, and a progressive heightening of human faculties and idiosyncrasies at the expense of verisimilitude. His method did not suit either the short story or the essay, and his attempts in these directions, 'Tomaso's Fortune and other Stories' (1904), remained deservedly obscure. Scott's success was exclusively literary, for he avoided all self-advertisement.

Of singularly equable and genial temper, with a bent towards stoicism and the simple life, he had a gipsy-like love of 'the open road,' and watched with keen absorption the life about him, especially in foreign towns. He died prematurely, after an attack of appendicitis, on 19 Nov. 1903, at Long Spring, Melton, near Woodbridge, and was buried at Eltham, Kent. He married on 19 June 1889 Ethel Frances Hall, who survived him without issue and became in August 1912 wife of the Rev. George Augustus Cobbold, perpetual curate of St. Bartholomew's, Ipswich.

In two volumes of short stories, 'From Wisdom Court' (1893) and 'The Money Spinner' (1896), Scott collaborated with his wife's sister, Miss E. Beatrice Hall, who writes under the pseudonym of S. G. Tallentyre. A memorial collected edition of fourteen of Scott's novels in as many volumes appeared in 1909-10.

[The Times, 20 Nov. 1903; preface to Memorial Edition, 1909, by E. F. Scott] and S. G. T., i.e. Miss E. Beatrice Hall; private information.] T. S.

SCOTT, SIR JOHN (1841-1904), judicial adviser to the Khedive, born at Wigan on 4 June 1841, was one of the family of three sons and a daughter of Edward Scott, solicitor of Wigan, by his first wife, Annie Glover. His father's second wife was Laura, sister of George Birkbeck Hill [q. v. Suppl. II], who married a daughter of Scott by his first wife. There were two sons and two daughters of the second marriage.

From 1852 to 1860 John was educated at Bruce Castle School, Tottenham, of which Birkbeck Hill's father was headmaster; matriculating at Pembroke College, Oxford, he graduated B.A. in 1864 and proceeded M.A. in 1869. A fast left-hand bowler, he was captain of his college eleven, and in 1863 he played for Oxford against Cambridge.

Called to the bar by the Inner Temple on 17 Nov. 1865, he joined the northern circuit. He wrote on legal questions for 'The Times,' the 'Law Quarterly,' and other periodicals, and his 'Bills of Exchange' (1869) became a widely read text-book. Heart affection hampered him through life, and drove him to the Riviera for many months in 1871-2. There he mastered French and Italian and the French legal system. On medical advice he went to Alexandria, at the close of 1872, to pursue his profession there, and found his knowledge of French and Italian of essential service. In 1874, on the formation of a court of international appeal from the courts for foreign and native litigants, Scott was made, on the recommendation of the British agent and consul-general, the English judge. He won a high reputation in this post, and in Feb. 1881 was made vice-president of the court. George Joachim (afterwards Lord) Goschen [q. v. Suppl. II], on his mission to Egypt in 1876, nominated Scott English commissioner of the public debt, but the Khedive, Ismail Pasha, declined to deprive the appeal court of his services, and the appointment went to Lord Cromer (then Major Baring). From 1873 onwards Scott regularly contributed to 'The Times' from Alexandria, and his letters form a useful record of Egyptian history of the period. He interested himself keenly in the condition of the fellahen, and persistently used his influence to suppress slavery. In the Alexandria riots of June 1882 he narrowly escaped massacre, but remained at the court house day and night to assist in protecting the records.

In Oct. 1882, when the Khedive conferred on him the order of the Osmanie, he was appointed as puisne judge of the high

court at Bombay. He quickly mastered the complex customs and usages of India. One of his judgments settled the law of partition among Hindus, and another defined the extent of Portuguese ecclesiastical jurisdiction over the Roman Catholics of Western India. Scott continued to write for the local and London press, frequently noticing Egyptian affairs. A letter of his to the 'Times of India' (26 Dec. 1884), signed 'S,' foreshadowed later political transitions in India. For a year from April 1890 his services were lent by the government of India to Egypt in order that he might examine the whole system of native jurisprudence in Egypt, and make proposals for its amendment. Despite the opposition of the Egyptian premier, Riaz Pasha, Lord Cromer induced the Khedive to accept Scott's recommendations and to appoint him judicial adviser to the Khedive. Thereupon Riaz Pasha resigned (May 1891) on the plea of ill-health.

Scott's impartiality and manifest goodwill towards the Egyptian people, combined with a constructive genius which enabled him to remould, instead of destroying, existing material and institutions, helped him to create in Egypt a sound judicial system (CROMER'S *Modern Egypt*, chap. xl.; MILNER'S *England in Egypt*, 1892). In place of only three centres of justice, circuits were established, comprising forty stations. The procedure of the courts was simplified and accelerated; a system of inspection and control was carefully organised; incompetent judges were replaced by men of better education and higher moral character; and for the supply of judges, barristers, and court officials an excellent school of law was established. Scott did much of the inspection himself, travelling all over the country, and his annual reports from 1892 to 1898 are of profound interest. Even the critics of the British occupation have nothing but commendation for Scott's work (cf. H. R. FOX BOURNE'S *Admn. of Justice in Egypt: Notes on Egyptian Affairs*, pamph. No. 6, 1909).

Scott, who was made K.C.M.G. in March 1894, retired in May 1898 from considerations of health and other reasons. The Khedive conferred on him the order of the Mejidie of the highest class. In June 1898 Oxford bestowed the hon. D.C.L., and he became an honorary fellow of his old college, Pembroke. He was elected a member of the Athenæum under Rule II. Wigan, his native town,

conferred upon him its freedom early in 1893. He was a vice-president of the International Law Association.

At the close of 1898 he was appointed deputy judge advocate-general of the army, an ordinarily light post which the South African war rendered onerous. With other ex-judges of India he joined in a memorial advocating the separation of judicial and executive functions in India, dated 1 July 1899. He died after long illness at his residence at Norwood on 1 March 1904. He was buried in St. John's churchyard, Hampstead.

He married on 16 Feb. 1867 Edgeworth Leonora—named after Maria Edgeworth [q. v.]—daughter of Frederic Hill (1803–1896), inspector of prisons for Scotland, a brother of Sir Rowland Hill [q. v.] (cf. *FREDERIC HILL'S Autobiography*, 1893). Of four sons and four daughters, Leslie Frederic, K.C., became conservative M.P. for the Exchange division of Liverpool in Dec. 1910.

A portrait by Mr. J. H. Lorimer, R.S.A., presented by the courts in Egypt, is in Lady Scott's possession, and a portrait in chalks, showing him in judge's robes in India, by his sister-in-law, Miss E. G. Hill, is in the senior common room of Pembroke College.

SCOTT, JOHN (1830–1903), shipbuilder and engineer, born at Greenock on 5 Sept. 1830, was eldest son in the family of five sons and six daughters of Charles Cunningham Scott of Halkhill, Largs, Ayrshire, by his wife Helen, daughter of John Rankin. His father was member of Messrs. Scott & Co., a leading firm of shipbuilders on the Clyde, which was founded by an ancestor in 1710. After education at Edinburgh Academy and Glasgow University, John served an apprenticeship to his father, and, on attaining his majority, was admitted to partnership in the firm. In 1868 he became its responsible head, in association with his brother, Robert Sinclair Scott, and directed its affairs for thirty-five years. The ships constructed in the Scott yard during his charge of it

included many notable vessels for the mercantile marine as well as for the British navy; others, such as the battleships *Canopus* and *Prince of Wales*, were engined there.

Scott was closely connected with the development of the marine steam-engine. At an early date he recognised the economy likely to result from the use of higher steam-pressures, and about 1857 he built the *Thetis*, of 650 tons, which was fitted with a two-cylinder engine of his own design and with water-tube boilers of the Rowan type, the working-pressure being 125 lbs. per square inch. The result was satisfactory so far as economy of fuel was concerned, though internal corrosion of the tubes rendered it necessary to withdraw the boilers after a short time. A little later, with the assent of M. Dupuy de Lôme, then head of the French navy department, Scott introduced the water-tube boiler into a corvette which his firm built for the French navy—the first French warship fitted with compound engines. Similar boilers and engines were proposed by him and accepted for a corvette for the British navy, but owing to the impossibility of complying with the requirement that the tops of the boilers should be at least one foot below the load-line, the adoption of the water-tube boiler was deferred. Further pursuit of the question of higher steam-pressures brought him the acquaintance of Samson Fox [q. v. Suppl. II.], with whom he was associated for many years in the development of the corrugated flue. He became chairman of the Leeds Forge Company, and carried out in conjunction with Fox the first effective tests of the strength of circular furnaces.

Although his business claimed the greater part of his attention, Scott had several other interests. He made three unsuccessful attempts to enter Parliament as conservative candidate for Greenock—in 1880, 1884, and 1885. For many years he was deputy chairman of the Greenock Harbour Trust, and for twenty-five years chairman of the local marine board. He was a lover of books and formed one of the finest private libraries in Scotland, containing some rare first editions and early manuscripts as well as literature relating to his own profession. An ardent yachtsman, he was a member of many Scottish yacht clubs, and commodore of the Royal Clyde Yacht Club.

Scott also took an active interest in the volunteer movement, and in 1859 he raised two battalions of artillery volunteers. From 1862 to 1894 he was lieutenant-

colonel of the Renfrew and Dumbarton artillery brigades, and on relinquishing active duty in the latter year he was made honorary colonel. For his services in connection with the movement he was made C.B. in 1887.

He was one of the original members of the Institution of Naval Architects, established in 1860, and became a member of council in 1886, and a vice-president in 1903. In 1889 he contributed to the Society's 'Transactions' a paper, 'Experiments on endeavouring to burst a Boiler Shell made to Admiralty Scantlings,' which was the outcome of some tests made by him with boilers for the gunboats Sparrow and Thrush built by his firm for the British navy. He was elected a member of the Institution of Civil Engineers in 1888, and was also a member of the Institution of Engineers and Shipbuilders in Scotland, F.R.S. of Edinburgh and F.S.A. Scotland.

He died at Halkhill on 19 May 1903, and was buried at Largs. He married in Sept. 1864 Annie, eldest daughter of Robert Spalding of Kingston, Jamaica, and had by her two sons and a daughter.

Scott's library, which was rich in works connected with Scotland and the Stuarts as well as in naval and shipbuilding literature, was sold at Sotheby's (27 March-3 April 1905).

Scott's portrait in oils, painted by (Sir) George Reid in 1885, was presented to Scott by the conservatives of Greenock, and is now at Halkhill.

[Engineering, 22 May 1903; Trans. Inst. Naval Architects, xlv. 335 (portrait); The Engineer, 22 May 1903; Athenæum, 25 March 1905.] W. F. S.

SCOTT, LEADER, pseudonym. [See BAXTER, Mrs. LUCY (1837-1902), writer on art.]

SEALE-HAYNE, CHARLES HAYNE (1833-1903), liberal politician, born at Brighton on 22 Oct. 1833, was only son of Charles Hayne Seale-Hayne of Fuge House, Dartmouth (1808-1842), by his wife Louisa, daughter of Richard Jennings, of Portland Place, London. His father was second son of Sir John Henry Seale (1785-1844), first baronet and M.P. for Dartmouth, whose family was connected since the seventeenth century with Devonshire, where they were large landowners and held many public offices. Charles was educated at Eton, and called to the bar at Lincoln's Inn on 30 April 1857. In that year and in 1860 he unsuccessfully con-

tested Dartmouth in the liberal interest. In 1885 he was elected M.P. for the Mid or Ashburton division of Devonshire, and retained the seat for the liberals to the day of his death. He was assiduous in his attendance at Westminster, and became in 1892 paymaster-general in Gladstone's fourth administration, being also made privy councillor. He held office until the defeat of the liberal government in 1895. He was treasurer of the Cobden Club, and took an active part in the local affairs of Devonshire. For many years he held the rank of lieutenant-colonel in the South Devon militia, and afterwards the same rank in the 2nd Devon volunteer artillery. He died, unmarried, in London on 22 Nov. 1903, and was buried at Kensal Green cemetery. By his will, dated 17 Jan. 1889, Seale-Hayne directed that, after paying certain legacies, the residue of his property should form a trust to establish and endow a college, to be erected in the neighbourhood of Newton Abbot, Devonshire, for the technical education of artisans and others, without distinction of creed, and for the special encouragement of the industries, manufactures, and products of the county of Devon. The trustees accordingly received the sum of over 90,000*l.*, from which a farm of 225 acres has been purchased two and a half miles outside Newton Abbot. A college is to be erected in the centre of the property. Seale-Hayne's publications include 'Annals of the Militia: being the Records of the South Devon Regiment' (Plymouth, 1873) and 'Politics for Working Men, Farmers and Landlords.'

[The Times, and Western Times, 23 Nov. 1903; Western Mag. and Portfolio, Jan. 1904; personal information.] H. T. S.

SEDDON, RICHARD JOHN (1845-1906), premier of New Zealand, born at Eccleston Hill, St. Helens, Lancashire, on 22 June 1845, was second child in the family of four sons and three daughters of Thomas Seddon, headmaster of Eccleston Hill grammar school, by his wife Jane Lindsay of Annan, Dumfriesshire, headmistress of the denominational school in the same place. The father afterwards became an official of the board of guardians at Prescott, and later a greengrocer in the Liverpool Road, St. Helens. After attendance at his father's school, where he proved refractory and showed no aptitude for anything save mechanical drawing, he was sent at twelve to his

grandfather at Barrownook Farm, Bickerstaffe, and then at fourteen was apprenticed to the firm of Daglish & Co., engineers and ironfounders, of St. Helens. After five years at St. Helens he entered the Vauxhall Iron Foundry at Liverpool, and obtained his board of trade engineer's certificate.

Dissatisfied with his prospects in England he worked his way out to Victoria in the *Star of England* in 1863, and made for the goldfields of Bendigo. There his efforts were unsuccessful. From 1864 he was employed as a journeyman fitter in the railway workshops of the Victoria government at Williamstown. But in 1866 he was persuaded by an uncle, who had settled on the west coast of New Zealand, to try his luck anew at the old Six Mile diggings at Waimea. He joined several mates in washing a claim on the Waimea Creek without result. His knowledge of engineering however proved useful, and through his uncle's influence he did some work for the Band of Hope water race. He pressed for the construction of water races to bring water from higher levels to sluice the claims, and zealously pushed the miners' interests against sluggish or hostile authorities. Abandoning the diggings, he soon opened a store at Big Dam, and it prospered. In 1869 he was made chairman of the Arahura road board, where he showed himself a strong administrator. He unsuccessfully contested a seat for the Westland county council; but the affairs of his road board brought him to Stafford town, where he became a member of the school committee.

In 1874 Seddon moved his store to the new goldfields at Kumara, and there he at once played a prominent part in local affairs. At his persuasion the goldfields warden laid the place out as a township under the Mining Act; the citizens named one of their streets after him and elected him the first mayor. A member of the board of education, he supported the secular against the denominational system. As member for Arahura on the Westland provincial council, he was appointed chairman of committees. From 1876, when Westland became a county, he was chairman of the county council until 1891. From 1869 Seddon combined management of his store with practice as miners' advocate in the goldfields warden's court, for which his fighting instincts, cheery, voluble power of speech, and legal ability well fitted him. His public influence grew steadily. Although in 1876 he failed to win the parliamentary constituency of Hokitika as a supporter

of Sir George Grey, he was in 1879 returned as second member. In 1881 he was elected for Kumara (which was renamed Westland in 1890). That constituency he represented till death.

When Seddon entered parliament the conservative party was in power on sufferance under Sir John Hall [q. v. Suppl. II]. The liberal opposition was split into two sections, the smaller of which followed the late prime minister, Sir George Grey, and the larger was without a leader. Seddon joined the latter section, known as the Young New Zealand reform party. The conservative government could retain office only by introducing liberal bills. Seddon carefully studied parliamentary procedure, and his readiness of speech enabled him to practise obstruction on a formidable scale. From 1884, when a liberal government was formed under Sir Robert Stout, Seddon introduced many private bills which he succeeded in passing at a later period. The most important of these were his bill for licensing auctioneers and regulating sales and one to abolish the gold duty, a tax which pressed heavily on the miners, whose interests he always furthered. In 1888, during the period of economic disturbance and labour unrest which attended Atkinson's conservative administration (1889-90), Seddon with his liberal colleagues accepted John Ballance [q. v. Suppl. I] as their party's leader, and a policy of social reform was adopted. In 1890 Seddon succeeded in reducing the audit office vote. In the course of the same year he spoke in support of the great shipping strike, and advocated principles of state ownership and state interference, urging the government to end the strike by taking over the steamships. At the general election in December 1890 the liberal party secured a large majority, and in January 1891 Seddon joined Ballance's cabinet as minister for mines, public works, and defence.

In office Seddon at once distinguished himself. He stopped the sub-letting of government contracts, and introduced a system of letting government work in small sections to co-operative parties of workmen, a system which proved successful and was adopted in other colonies. In the country he strengthened his position by constant speaking in different places.

The ministry meanwhile was busy with land legislation of great importance and with its programme of social reform. Economic conditions were improving, and general confidence in the government was strong. On 6 Sept. 1891 Ballance fell

ill, and owing to Seddon's mastery of parliamentary procedure he became acting premier in the premier's brief absence. On 3 June 1892 he became minister for marine, and on 1 May 1893, on Ballance's death, he became premier, retaining at the same time the portfolios of public works, mines, and defence. On 6 Sept. he exchanged the department of mines for that of native affairs. Pledged to carry out his predecessor's policy, he accepted and carried the measure for conferring the parliamentary vote on women, although he personally disapproved of women's entry into the political sphere (19 Sept.). Other important acts passed by his government during this year were one simplifying and consolidating the criminal code, and another creating a form of local option to control the liquor traffic. At the general election of November 1893 Seddon's party was returned with a majority of thirty-four in a house which contained seventy white members.

In 1894 Seddon prevented a financial crisis by bringing government aid to the Bank of New Zealand, with which the government dealt, when the bank was on the point of failure. During this and the next two years Seddon and his colleagues carried an immense amount of progressive legislation, including a bill in 1896 to allow local authorities to levy their rates on the unimproved value of the land. The country was prosperous, and Seddon's personal popularity increased.

Although at the general election of 1896 the government's majority fell to twelve, Seddon's influence was unimpaired. All departments of government were more or less under his control. He gave up his posts as minister of public works and defence early in 1896, but he had become minister for labour on 11 Jan. 1896. Till his death he retained that office with the premiership, the colonial treasurership, on which he first entered on 16 June 1896, and the ministry of defence, which he resumed in 1899. He also held from the latter date the commissionerships of customs and electric telegraphs (till 21 Dec. 1899) and the commissionership of trade (till 29 Oct. 1900), in addition to the ministry of native affairs which he had held since 1893, and only gave up in December 1899. He attended Queen Victoria's diamond jubilee in London in 1897, when he was made a privy councillor and hon. LL.D. of Cambridge, but his democratic principles would not allow him to accept a knighthood. At the colonial conference of that year he proposed a

consultative council of colonial representatives to advise the English government. The proposal was not carried. Brought much into touch with Mr. Joseph Chamberlain, the colonial secretary, he was attracted by his imperialistic views, and developed a strong sympathy with imperial federation and a preferential tariff. After his return to New Zealand, Seddon in 1898 passed the most important measure for which he was personally responsible, an old age pensions bill. In 1899 the pensioners numbered 7000, but in 1900 he enlarged the scope of the act by increasing the amount of the pension and lowering the age limit, and in 1906, the year of his death, over 12,000 persons were in receipt of pensions.

At the end of 1899 Seddon set the colonies an example of patriotism by despatching the first of nine contingents to help Great Britain in the South African war; 6700 officers and men and 6620 horses were despatched in the aggregate. After the general election (December 1899), Seddon had a majority of thirty-six in the new parliament. He again added to his other responsibilities the ministry of defence. On 8 October 1900 the Cook Islands were included within the boundaries of New Zealand. In 1901 his government arranged for a universal penny postage, and made coal mines and fire insurance concerns of the state.

Alike in the colony and in the empire at large Seddon was now a highly popular and imposing figure. In May 1902 he again set out for England to attend the coronation of King Edward VII, receiving before he left a congratulatory address and a testimonial which took the form of a purse of money (8 April). On his way he visited South Africa at the invitation of Lord Kitchener, and was warmly welcomed at Johannesburg and Pretoria, as well as at Cape Town. In London he was greeted with enthusiasm. At the colonial conference he urged a double policy of preferential tariffs within the Empire and a scheme for imperial defence, and during his stay he was granted the freedom of the cities of Edinburgh, of Annan, and of St. Helens, and was made hon. LL.D. of Edinburgh University.

On 25 Oct. 1902 he was back in New Zealand. On 26 Nov. a new election gave him a majority of twenty, and he added the ministries of immigration and education to his other offices. Next year, while speaking repeatedly on the prosperity of the colony, he flung himself into ardent

support of Mr. Chamberlain's scheme of imperial tariff reform. Naval defence also found in him a strong champion, and in the autumn of 1903 he passed a naval defence bill which laid an annual charge of 40,000*l.* on New Zealand for the Australian squadron. At the same time he passed a Preferential and Reciprocal Trade Act, which favoured British imports at the expense of imports from foreign countries. In a series of enactments having what he termed a 'humanistic' basis, of which the chief was an act for the erection of state-owned workmen's dwellings, he sought to improve the health and comfort of the working-classes, particularly of mothers and young children.

In September 1904 he warmly declared against the introduction of Chinese labour into South Africa without the sanction of the votes of the white population. Troops, he said, would not have been sent to the war, if he could have foreseen the use to which the English victory would be put.

On 13 Dec. 1905 he fought his last general election, and his fifth as premier, securing, in a house of seventy-six white members, a majority of thirty-six. He remained minister of defence, labour, education, and immigration, and colonial treasurer, as well as premier. Later in the year he recommended a larger contribution to naval defence, forbade the admission of Japanese to the colony, promised to reduce indirect taxation and to increase the graduated land tax, and announced a larger surplus than had been known before.

Next year his health began to fail. On 12 May he left Wellington for Australia, to arrange for an international exhibition at Christchurch later in the year. He started from Sydney on his return voyage in the *Oswestry Grange* on 9 June 1906, and died at sea on the following day. He was buried at Wellington City cemetery on Cemetery Hill, and a monument in the form of a pillar was subsequently erected there by public and private subscription. On receipt of news of his death King Edward VII and the English government sent messages of sympathy. A memorial service was held in St. Paul's Cathedral, London, on 19 June. The New Zealand parliament granted Mrs. Seddon 6000*l.* on 28 Sept. 1906.

The social policy which Seddon helped to carry out was enlightened and commanded public sympathy, but his personal popularity was only partly due to his political principles. Frank and genial in manner and abounding in self-confidence,

constantly moving about the country, he divined what the people of New Zealand wanted, and sought to satisfy their needs. His sympathy with democratic aspirations was combined with an imperialist fervour which notably won the hearts of the English people on his visits to Great Britain in 1897 and 1902. As an administrator he was energetic, industrious, and courageous. As a speaker he greatly improved in delivery with his years, and he was always liberal in information. He introduced over 550 bills into the lower house, and 180 of them became law.

New choir stalls were presented by Mrs. Seddon in his memory to the parish church of Eccleston, St. Helens, in February 1908. A bust with memorial tablet was unveiled in the crypt of St. Paul's Cathedral, London, on 10 Feb. 1910 (cf. *The Times*, 11 Feb. 1910). A cartoon portrait of Seddon appeared in 'Vanity Fair' in 1902.

Seddon married at Melbourne in 1869 Lousia Jane, daughter of Captain John Spotswood, of Melbourne. She survived him with six daughters and three sons. His eldest son, Captain R. J. S. Seddon, fought with the New Zealand troops in the South African war, and was afterwards appointed military secretary to the defence minister. The second son, Mr. T. E. Y. Seddon, is a member of the house of representatives.

[J. Drummond's *The Life and Work of R. J. Seddon*, 1907; J. E. le Rossignol and W. D. Stewart, *State Socialism in New Zealand*; Gisborne, New Zealand Rulers, 1897 (with portrait); *The Times*, 11 and 12 June 1906; private information.]

A. B. W.

SEE, SIR JOHN (1844-1907), premier of New South Wales, born at Yelling, Huntingdonshire, on 14 Nov. 1844, was son of Joseph See, formerly of that place. In 1853 he accompanied his parents to New South Wales. The family settled first at Hinton on the Hunter river, where See obtained his education and was employed upon a farm until he was sixteen. Accompanied by a brother, he then settled on the Clarence river and engaged in farming. Dissatisfied with his prospects, he soon went to Sydney and entered the produce trade, and by strenuous application and unremitting toil built up the flourishing concern of John See & Company, of which he was the head. At the same time he became a partner in the small coastal shipping house of Nipper & See, which ultimately developed into the North Coast

Steam Navigation Company, of which he was managing director.

See's first association with political life began in November 1880, when he was returned to the legislative assembly of New South Wales as member for Grafton. That constituency he represented continuously until 1904, being re-elected eleven times. In 1885 he joined Mr. (afterwards Sir George) Dibbs's first ministry, in which he was postmaster-general from 7 Oct. to 22 Dec., being sworn a member of the executive council. As treasurer in the third Dibbs administration (23 Oct. 1891–2 Aug. 1894) he introduced and piloted through parliament the protectionist tariff of the government. On 12 Sept. 1899 See joined the government of Mr. (afterwards Sir William) Lyne as chief secretary and minister for defence, and arranged for the despatch of troops to South Africa during the Boer war. He succeeded Sir William Lyne, who took office in the federal government as premier on 27 March 1901, and thus became the first premier of New South Wales as a state in the federation. During his term of office he received King George V and Queen Mary when, as duke and duchess of Cornwall and York, they visited Australia in 1901. On 15 June 1904 he resigned office on private grounds, and retired from the legislative assembly, but accepted a seat in the legislative council, which he held till his death. He was mayor of Randwick for three years and president of the Royal Agricultural Society of New South Wales, and was director of numerous insurance and other business concerns. He was created K.C.M.G. on 26 June 1902. See died at his residence, 'Urara,' Randwick, on 31 Jan. 1907, and was buried in the Long Bay cemetery.

He married on 15 March 1876, at Randwick, Charlotte Mary, daughter of Samuel Matthews, of Devonshire, and had four sons and three daughters.

[The Times, Sydney Daily Telegraph, and Sydney Morning Herald, 1 Feb. 1907; Sydney Mail, 6 Feb. 1907; Year Book of Australia, 1905; Johns's Notable Australians, 1908; Burke's Peerage, 1907; Colonial Office Records, 1908.] C. A.

SEELEY, HARRY GOVIER (1839–1909), geologist and palaeontologist, born in London on 18 Feb. 1839, was second son of Richard Hovill Seeley, goldsmith, by his second wife, Mary Govier, who was of Huguenot descent. Sir John Richard Seeley [q. v.], the historian, was his cousin. Privately educated, he as a youth became

interested in natural history, attended lectures by Sir Andrew Crombie Ramsay [q. v.] and Edward Forbes [q. v.] at the Royal School of Mines, read Lyell's 'Principles of Geology,' began to collect fossils, and received help and encouragement from Samuel Pickworth Woodward [q. v.], in the geological department of the British Museum. He described two new species of chalk starfishes in 1858 (*Ann. Mag. Nat. Hist.*). In 1859 he was invited by Adam Sedgwick, professor of geology at Cambridge, to assist in the arrangement of the rocks and fossils in the Woodwardian Museum. Sedgwick found that Seeley 'could not only be trusted to arrange and increase the collection, but could occasionally take his place in the lecture-room' (CLARK and HUGHES, *Life and Letters of Sedgwick*, ii. 356). Seeley entered Sidney Sussex College, there continuing his general education, but he never graduated. His interests were concentrated on his geological work, devoting himself zealously to the local geology, to the invertebrate fossils of the Cambridge greensand or basement chalk, the Hunstanton red rock, familiarly known as the red chalk, and the lower greensand. He also studied the great fen clay formation, separating the Ampthill clay (as he termed it) and associated rock-beds of Corallian age from the Kimmeridge clay above and the Oxford clay below. He accompanied Sedgwick on excursions to the Isle of Wight, Weymouth, and the Kentish coast in 1864–5, and remained his assistant until 1871.

His first paper on vertebrata, published in 1864, dealt with the pterodactyle, and fossil reptilia thenceforth engrossed much of his attention. In 1869 he published the important 'Index to the Fossil Remains of Aves, Ornithosauria, and Reptilia' in the Woodwardian Museum. Questions in ancient physical geography also interested him. In 1865 he wrote 'On the Significance of the Sequence of Rocks and Fossils' (*Geol. Mag.*), while he discussed the relationship between pterodactyles and birds. In 1870 he founded the genus *Ornithopsis* on remains from the Wealden of 'a gigantic animal of the pterodactyle kind,' which, however, was afterwards proved to be dinosaurian.

In 1872 Seeley settled in London, devoting himself to literary work and lecturing. In 1876 he was appointed professor of geography and lecturer on geology in King's College, London, and also professor of geography and geology in Queen's College, London, where he became dean

in 1881. In 1896 he succeeded to the chair of geology and mineralogy at King's College. In 1885 he formed the London Geological Field Class, conducting summer excursions in and around the metropolis. During 1880-90 he lectured for the London Society for the Extension of University Teaching; and in 1890 he became lecturer and a year later professor of geology and mineralogy in the Royal Indian Engineering College at Cooper's Hill, a post he occupied until 1905. As a speaker he was deliberate and monotonous in articulation, but he taught clearly the methods as well as the results of research.

This educational work left time for much original research. During vacations he visited all the principal public museums in Europe for the special study of fossil reptilia, and he contributed descriptions of new points of structure and of new species of amphibians, reptiles, birds, and other vertebrata to scientific societies and magazines. Thus in 1874 he described a new ichthyosaurian genus from the Oxford clay under the name *Ophthalmosaurus*; in 1880 he called attention to evidence that the *Ichthyosaurus* was viviparous, and in 1887 he pointed out that the young of some plesiosaurs were similarly developed. Aided by a grant from the Royal Society, he devoted himself to a study of the structure of the anomodont reptilia, to which Sir Richard Owen [q. v.] had already given special attention. These fossil reptiles supply links, as he showed, between the older types of amphibia and the later reptilia and mammalia. He journeyed to Cape Colony and investigated the geological horizons whence anomodonts had been obtained, and was fortunate in finding in the Karroo a practically complete skeleton of *Pareiasaurus*, as well as many other interesting remains. He delivered in 1887 the Royal Society's Croonian lecture 'On *Pareiasaurus bombidens* (Owen) and the Significance of its Affinities to Amphibians, Reptiles, and Mammals,' and in 1888 he commenced the publication in the 'Philosophical Transactions' of 'Researches on the structure, organisation, and classification of the Fossil Reptilia.' In succeeding parts of this, his most important contribution to palæontology (10 parts, 1888-96), he dealt specially with the results of his South African work.

Seeley, who was a member of numerous scientific societies, was elected F.R.S. in 1879; he was awarded the Lyell medal in 1885 by the Geological Society, and became a fellow of King's College, London, in 1905.

D.N.B. 1901-1911

He died in Kensington, London, on 8 Jan. 1909, and was buried at Brookwood cemetery. Seeley married in 1872 Eleonora Jane, only daughter of William Mitchell, of Bath. His wife, who received a civil list pension of 70*l.* in July 1910, assisted him in his scientific work. Their family consisted of four daughters, the eldest of whom, Maud, was married in 1894 to Dr. Arthur Smith Woodward, F.R.S., now keeper of the geological department of the British Museum (natural history).

Seeley's published works include: 1. 'The Ornithosauria,' 1870. 2. 'Physical Geology and Palæontology,' being part i. of a second edition (entirely rewritten) of John Phillips' 'Manual of Geology,' 1885 (issued 1884). 3. 'The Freshwater Fishes of Europe,' 1886. 4. 'Factors in Life. Three Lectures on Health, Food, Education' (delivered 1884), 1887. 5. 'Handbook of the London Geological Field Class,' 1891. 6. 'Story of the Earth in Past Ages,' 1895. 7. 'Dragons of the Air: an account of Extinct Flying Reptiles,' 1901.

[Geol. Mag. 1907, p. 241 (with portrait and bibliography); Men and Women of the Time, 1899; Quart. Journ. Geol. Soc. lxx. 1909, p. lxx; Proc. Roy. Soc. lxxxiii. B. p. xv. 1911 (memoir by Dr. A. S. Woodward).]

H. B. W.

SELBY, VISCOUNT. [See GULLY, WILLIAM COURT (1835-1909), speaker of the House of Commons.]

SELBY, THOMAS GUNN (1846-1910), Wesleyan missionary in China, born at New Radford near Nottingham on 5 June 1846, was the son of William Selby, engaged in the lace trade, by his wife Mary Gunn. He was educated at private schools at Nottingham and Derby. At the age of sixteen he preached his first sermon, and in 1865 became a student at the Wesleyan College, Richmond. In 1867 he entered the Wesleyan ministry, and left England in the following year to become a missionary in China. He remained there for the greater part of fifteen years. He was in charge of the Wesleyan mission at Fatshan (Canton province) until 1876, and after eighteen months in England started in 1878 the North River Mission at Shiu Chau Foo, also in the province of Canton. He made long and perilous pioneer journeys into the interior of the province. He spent a month in the island of Hainan disguised as a Chinaman. He also travelled in India, Palestine, and Egypt. He made a close study of the Chinese language and wrote a 'Life of Christ' (about 1890) in Chinese,

which is still used as a text-book in native missionary colleges.

Returning to England in 1882, Selby was pastor in various circuits: at Liverpool (1883), Hull (1886), Greenock (1889), Liverpool (1892), and Dulwich (1895-8). He was a successful preacher and sermon-writer. 'The Holy Writ and Christian Privilege,' written in 1894, was accorded in many circles the rank of a Christian classic. He also published in 1895 some translations of Chinese stories entitled 'The Chinaman in his own Stories.' His work was recognised in the Wesleyan ministry by his election to the 'Legal Hundred' in 1891 and his appointment as Fernley lecturer in 1896.

In 1898 Selby became a 'minister without pastoral charge.' Residing at Bromley in Kent, he devoted himself to preaching and writing, and in his 'Chinamen at Home' (1900) and 'As the Chinese see us' (1901) showed much insight and local knowledge. He was for twenty-five years a member of the Anti-Opium Society and a zealous advocate of the temperance cause. He died at his residence, Basil House, Oaklands Road, Bromley, Kent, on 12 Dec. 1910.

Selby married, in 1885, Catharine, youngest daughter of William Lawson, of Otley in Wharfedale. He had one son and five daughters.

Besides the works cited Selby published numerous volumes of collected sermons and many expositions of Scripture. 'The Commonwealth of the Redeemed' was published posthumously in 1911.

[Who's Who, 1910; The Times, 15 Dec. 1910; obituary notice presented to the Wesleyan Methodist Conference at Cardiff, July 1911; private information from Mrs. Selby.] S. E. F.

SELWIN-IBBETSON, SIR HENRY JOHN, first BARON ROOKWOOD (1826-1902), politician, born in London on 26 Sept. 1826, was only son of Sir John Thomas Ibbetson-Selwin, sixth baronet, by his wife Elizabeth, daughter of General John Leveson Gower, of Bill Hill, Berkshire. His father had assumed the surname of Selwin on inheriting in 1825 the Selwin estates at Harlow, Essex. After education at home Henry was admitted a fellow-commoner at St. John's College, Cambridge, on 2 July 1845. He graduated B.A. in 1849, and proceeded M.A. in 1852. After leaving Cambridge, he travelled widely, and was present in the Crimea at the declaration of peace in 1856. In the same year he embarked, as a conservative, upon his political career. After twice suffering defeat at

Ipswich, in March 1857 and in April 1859, he headed the poll for South Essex in July 1865. On a new division of the Essex constituencies (due to Disraeli's reform bill), he was returned without contest for the western division in 1868, again in 1874, and by a large majority in 1880. Subsequently (after the reform bill of 1884) he sat for the Epping division till his elevation to the peerage in 1892. Selwin took from the first a useful part in parliamentary discussion, cautiously supporting moderate reforms. In 1867 he resumed the old family name of Ibbetson in addition to that of Selwin, and in 1869 he succeeded his father in the baronetcy. In the same year, being then in opposition, he introduced and contrived to pass into law a bill which aimed at diminishing the number of beer-houses by placing all drink-shops under the same licensing authority and by leaving none under the control of the excise. He showed a commendable freedom from party ties in the support he gave in 1870 to the Elementary Education Act of William Edward Forster [q. v.].

In 1874 the conservatives were returned to power, and Selwin-Ibbetson became under-secretary to the home office after declining the chairmanship of ways and means. He proved a laborious and efficient administrator, but was perhaps too prone to deal with details which might have been left to subordinates. During his tenure of office acts were passed for the improvement of working-class dwellings in 1875, for the amendment of the labour laws so as to relax the stringency of the law of conspiracy, and for the provision of agricultural holdings, a measure which was largely based on information he had himself collected. In 1878 he became parliamentary secretary to the treasury, and piloted through the house the bill which made Epping Forest a public recreation ground, as well as the cattle diseases bill. As early as 1871 he had championed in the house public rights in Epping Forest.

In 1879 he declined the governorship of New South Wales. In Oct., while in Ireland with the chancellor of the exchequer, Sir Stafford Northcote [q. v.], he sanctioned a scheme for improving the navigation of the Shannon and planned a reconstruction of the Irish board of works which never became law but led to changes in the personnel of the board. In 1880 Ibbetson retired from office on the defeat at the polls of the conservative government. He acted as second church estates commissioner from 7 July

1885 to 2 March 1886, and again from 8 Sept. 1886 to 20 June 1892. At the general election of 1892 he was raised to the peerage by Lord Salisbury as Baron Rookwood, the title being taken from an old mansion in Yorkshire long in the possession of the Ibbetson family.

Through life Lord Rookwood devoted himself to county business, frequently presiding at quarter sessions with efficiency and impartiality. He also did much work for hospitals and charities. A keen sportsman, he was master of the Essex hounds from 1879 to 1886. In March 1893 Essex men of all parties presented him with his portrait by (Sir) W. Q. Orchardson, R.A., which is now at Down Hall, Harlow, Essex; it was engraved.

He died at Down Hall on 15 Jan. 1902, and was buried at Harlow, Essex. He was married thrice: (1) in 1850 to Sarah Elizabeth Copley, eldest daughter and co-heiress of Lord Lyndhurst [q. v.]; she died in 1865; (2) in 1867 to his cousin Eden, daughter of George Thackrah and widow of Sir Charles Ibbetson, Bart., of Denton Park, Yorkshire; she died on 1 April 1899; (3) in Sept. 1900 to Sophia Harriet, daughter of Major Digby Lawrell; she survived him. Lord Rookwood left no issue, and the barony became extinct at his death.

[Hansard, *passim*; The Times, 16 Jan. 1902; Essex County Chron. 17 Jan. 1902, with a letter from Colonel Lockwood, M.P.; Lord Eversley, Commons, Forests, and Footpaths, 1910; Report of Select Committee on Police Superannuation Funds, 13 April 1877; Ball and Gilbey, The Essex Foxhounds, 1896; Yerburch, Leaves from a Hunting Diary, 1900, 2 vols.; Irish Times, 13 Oct. 1879; Report of the Commissioners of Public Works in Ireland, 1879-1880, p. 28.] W. B. D.

SELWYN, ALFRED RICHARD CECIL (1824-1902), geologist, born at Kilminster, Somersetshire, on 28 July 1824, was son of Townshend Selwyn, rector of Kilminster, vicar of Milton Clevedon, and a canon of Gloucester; his mother was Charlotte Sophia, daughter of Lord George Murray [q. v.], bishop of St. David's, and granddaughter of John Murray, third duke of Atholl [q. v.]. First educated at home by private tutors, and afterwards in Switzerland, where he developed great interest in geology, he was in 1845 appointed an assistant geologist on the geological survey of Great Britain, and for seven years was actively engaged in the difficult mountainous districts of North Wales. He personally surveyed areas about Snowdon, Festiniog, Cader Idris, in the Llyn promontory, and

Anglesey, as well as portions of Shropshire. In 1850 he recognised evidence of unconformity in Anglesey between the Cambrian and an older series of schists, now admitted to be pre-Cambrian. The results of Selwyn's work in North Wales were embodied in the geological survey memoir by Sir Andrew Crombie Ramsay [q. v.] on 'The Geology of North Wales' (1866; 2nd edit. 1881); and the geological maps and sections which he prepared in conjunction with Ramsay and Joseph Beete Jukes [q. v.] were models of careful detailed work.

In July 1852 Selwyn was appointed director of the geological survey of Victoria, Australia. His work in Australia extended over sixteen years (1853-1869). Areas of special economic importance claimed his attention, and he himself gave much time to field-work. Studying the distribution of the gold-bearing 'drifts' or placer-deposits, he found that certain of the tertiary strata derived from the waste of the older rocks contained little or no gold, while other and later deposits were rich. The former proved to be of miocene age, and Selwyn concluded that the quartz-veins formed prior to that period were barren, whereas auriferous quartz-veins of later date furnished material for the rich gold-bearing gravels of Ballarat and Bendigo (*Geol. Mag.* 1866, p. 457). In addition to his official reports on the geology of Victoria, he prepared special reports on some of the coal-bearing strata and goldfields of Tasmania and South Australia. In 1869 Selwyn resigned his directorship owing to the refusal of the colonial legislature of Victoria to grant the funds necessary to carry on the survey in a satisfactory way. Thereupon from Dec. 1869 until 1894 he was, in succession to Sir William Edmond Logan [q. v.], director of the geological survey of Canada, where his work increased as various provinces and territories in British North America were added to the Dominion. His aim was to make the department of growing practical use to parliament and the public. Special attention was given to the goldfields and other mineral areas, to the building materials, soils, agriculture and sylviculture, and to water-supply. As in Australia so in Canada Selwyn personally engaged in field-work. He was an enthusiastic sportsman and often had to use gun and rod for a living when camping out.

Apart from his many official reports dealing with the progress of the survey and with the economic products, he published in 1881 an important paper in

the 'Canadian Naturalist' on 'The Stratigraphy of the Quebec Group and the Older Crystalline Rocks of Canada.' He also rendered valuable services to the Canadian commissioners at the Philadelphia Centennial Exhibition of 1876, the Paris Universal Exhibition of 1878, and the Colonial and Indian Exhibition, London, 1886.

Selwyn was elected F.R.S. in 1874, was made LL.D. in 1881 by the McGill University, Montreal, and was appointed C.M.G. in 1886. An original fellow of the Royal Society of Canada (founded in 1882), he was president in 1896. The Murchison medal was awarded to him by the Geological Society of London in 1876, and the Clarke gold medal by the Royal Society of New South Wales in 1884.

Selwyn died at Vancouver, B.C., on 19 Oct. 1902. He married in 1852 Matilda Charlotte, daughter of Edward Selwyn, rector of Hemingford Abbots in Huntingdonshire; three sons and a daughter survived him, one son, Percy H. Selwyn, being secretary of the Geological Survey of Canada.

Selwyn's few published works, apart from official reports, articles on Canada and Newfoundland in Stanford's 'Compendium of Geography and Travel' (1883), include: 1. 'Notes on the Physical Geography, Geology, and Mineralogy of Victoria' (with G. H. F. Ulrich), Melbourne, 1866. 2. 'Descriptive Catalogue of a Collection of the Economic Minerals of Canada, and Notes on a Stratigraphical Collection of Rocks,' Montreal, 1876 (for the Philadelphia Exhibition).

[Memoirs by Dr. H. Woodward, with portrait, in *Geol. Mag.* 1899, p. 49; by Dr. H. M. Ami in *Trans. Roy. Soc. Canada*, x. 1904, p. 173 (with portrait); by W. Whitaker in *Proc. Roy. Soc.* lxxv. 1905, p. 325; cf. *Letters, &c.*, of J. Beete Jukes, 1871, and Sir A. Geikie, *Memoir of Sir A. C. Ramsay*, 1895.] H. B. W.

SENDALL, SIR WALTER JOSEPH (1832-1904), colonial governor, born on 24 Dec. 1832 at Langham Hall, Suffolk, was youngest son of S. Sendall, afterwards vicar of Rillington, Yorkshire, by his wife Alice Wilkinson. A delicate boy, he attended the grammar school at Bury St. Edmund's, and in 1854 proceeded to Christ's College, Cambridge, where he was a contemporary and friend of (Sir) Walter Besant, John Peile, afterwards Master, and above all Charles Stuart Calverley, whose sister he married later. He graduated B.A. in 1858 as junior optime and first classman in classics (M.A. in 1867).

In 1859 Sendall joined the educational branch of the civil service in Ceylon, and next year became inspector of schools there. In 1870 he rose to be director of education; but the climate and work told on his health, and in 1872, when on leave in England, he resigned.

In 1873 Sendall became assistant poor law inspector in the Oxfordshire district, but during 1875 these appointments were abolished and for six months he was out of employment and devoted himself to studying and reporting on the Dutch poor laws. Then in 1876 he became a poor law inspector in Yorkshire under the local government board; in 1878 he was appointed an assistant secretary of the board. Ambitious to follow the career of a colonial administrator, he in 1882 accepted an offer of the lieutenant-governorship of Natal. But the politicians of that colony declined to approve the choice of one so little known, and the nomination was withdrawn.

In 1885 Sendall became the first governor in chief of the Windward Islands on their separation from Barbados. Here he organised the new administration, living at the charming little government house of Grenada, which became the chief island of the group. In 1889 he was transferred to Barbados, and in 1892 became high commissioner of Cyprus, with the progress of which he closely identified himself. At the end of his term in 1898 he was transferred to British Guiana, where he arrived on 23 March. With the question of the boundary of the dependency with Venezuela, which was the subject of arbitration during his governorship, he had nothing directly to do. He left the colony on retirement on 1 Aug. 1901. Next year he represented the West Indian colonies at the coronation of King Edward VII.

Sendall appeared to lack quickness of sympathy and personal geniality, but his sound judgment and high character won him unqualified esteem and confidence in his capacity of governor. He was made C.M.G. in 1887, K.C.M.G. in 1889, and G.C.M.G. in 1899. He received the honorary LL.D. degree from Edinburgh. In his retirement he found recreation in literary work, as well as in the microscope, mechanics, and the lathe. He was a fellow of the Linnean, Royal Microscopical, and other scientific societies, as well as of the Hellenic Society. He was also chairman of the Charity Organisation Society. He edited the 'Literary Remains of C. S. Calverley,' with a memoir, in 1885.

Sendall died at Kensington on 16 March

1904. His remains were cremated and interred at Golder's Green. He married in 1870 Elizabeth Sophia, daughter of Henry Calverley, vicar of South Stoke, and prebendary of Wells. He left no issue. A bust was executed by Edward Lanteri. A memorial bronze has been placed in the chapel of St. Michael and St. George in St. Paul's Cathedral.

[Who's Who, 1903; C. O. List, 1903; The Times, 17 March 1904; private information; personal knowledge.] C. A. H.

SERGEANT, ADELINE (1851-1904), novelist, whose full Christian names were Emily Frances Adeline, born at Ashbourne, Derbyshire, on 4 July 1851, was second daughter of Richard Sergeant by his wife Jane, daughter of Thomas Hall, a Wesleyan minister. The father came of a Lincolnshire family, long settled at Melton Ross, which in the eighteenth century revival embraced dissent of a pronounced and political type. He began lay preaching as a lad, was accepted as a candidate for the Wesleyan ministry at seventeen, and sent to the Hoxton Institution under Dr. Jabez Bunting [q. v.]. He spent six years in Jamaica, married in 1840, abandoned missionary work and became a travelling preacher. He issued 'Letters from Jamaica' (1843), and with the Rev. R. Williams, a 'Compendium of the History and Polity of Methodism,' with other Wesleyan tracts and sermons. His wife, under the name 'Adeline,' wrote many evangelical lays and stories as well as 'Scenes in the West Indies and Other Poems' (1843; 2nd edit. 1849) and 'Stray Leaves' (1855).

Adeline Sergeant was thus brought up amid much literary and spiritual activity. At first educated by her mother, she was sent at thirteen to a school at Weston-super-Mare. At fifteen a volume of her poems was published (1866) with an introduction by 'Adeline'; it was noticed favourably in Wesleyan periodicals. From 'Laleham,' the nonconformist school at Clapham, the girl went to Queen's College, London, with a presentation from the Governesses' Benevolent Institution, and she won a scholarship there.

On her father's death in 1870 she joined the Church of England, and for the greater part of ten years was governess in the family of Canon Burn-Murdoch at Riverhead, Kent. After some minor literary experiments she in 1882 won a prize of 100*l.*, offered by the 'People's Friend' of Dundee, with a novel, 'Jacobi's Wife,' which she wrote while she was visiting Egypt with

her friends, Professor and Mrs. Sheldon Amos. The work appeared serially in the paper and was published in London in 1887. By agreement with the proprietors of the 'People's Friend,' John Leng & Co., she was a regular contributor until her death, and gave the firm for a time exclusive serial rights in her stories. She wrote at great speed and two or three novels ran serially every year through the Dundee newspaper. For two years (1885-7) she lived in Dundee.

From 1887 to 1901 her home was in Bloomsbury, where, while busily engaged on fiction, she took an active part in humanitarian efforts, such as rescue work and girls' clubs; she also joined the Fabian Society and travelled much abroad, spending the spring of 1899 in Palestine. Her religious opinions underwent various developments. Her best novel, 'No Saint' (1886), reflects a phase of agnosticism. From 1893 she associated herself with the extreme ritualists at St. Alban's, Holborn, and on 23 Oct. 1899 was received into the Roman catholic church. The processes of thought she described in 'Roads to Rome, being Personal Records of some . . . Converts,' with an introduction by Cardinal Vaughan (1901). She removed to Bournemouth in 1901, and died there on 4 Dec. 1904.

Miss Sergeant wrote over ninety novels and tales. Her fertility, which prejudiced such literary power as she possessed, grew with her years (cf. *Punch*, 11 Nov. 1903, p. 338). Six novels appeared annually from 1901 to 1903, and eight in her last year. After her death fourteen volumes, seven in 1905, four in 1906, two in 1907, and one in 1908, presented work which had not been previously published. She often made an income of over 1000*l.* a year, but her generous and unbusinesslike temperament kept her poor.

Miss Sergeant, who was most successful in drawing the middle-class provincial nonconformist home, is seen to advantage in 'Esther Denison' (1889) (partly autobiographical), in 'The Story of a Penitent Soul' (anon. 1892), and in 'The Idol Maker' (1897). Other of her works are: 1. 'Beyond Recall,' 1882; 2nd edit. 1883. 2. 'Under False Pretences,' 1892; 2nd edit. 1899. 3. 'The Surrender of Margaret Bellarmine,' 1894. 4. 'The Story of Phil Enderby,' 1898, 1903. 5. 'In Vallombrosa,' dedicated to Leader Scott, 1897. 6. 'This Body of Death,' 1901. 7. 'A Soul Apart,' her one catholic novel, 1902. 8. 'Anthea's Way,' 1903. 9. 'Beneath the Veil,' 1903, 1905. She

contributed to 'Women Novelists of the Nineteenth Century' (1897), and was one of twenty-four authors who wrote without collusion 'The Fate of Fenella,' which appeared serially in the 'Gentlewoman' and was published in 1892.

[Life, by Winifred Stephens, 1905; Roads to Rome, 1901; works and personal knowledge; Athenæum, 10 Dec. 1904.] C. F. S.

SERGEANT, LEWIS (1841-1902), journalist and author, son of John Sergeant, who was at one time a schoolmaster at Cheltenham, by his wife Mary Anne, daughter of George Lewis, was born at Barrow-on-Humber, Lincolnshire, on 10 Nov. 1841. Adeline Sergeant [q. v. Suppl. II.] was Lewis's first cousin, being daughter of Richard Sergeant, his father's brother.

Lewis, after education under a private tutor, matriculated at St. Catharine's College, Cambridge, in 1861, graduating B.A. with mathematical honours in 1865. At the union he distinguished himself as an ardent liberal and supporter of Mr. Gladstone. On leaving college, after a period as assistant master under Dr. Hayman at Cheltenham grammar school, he took to journalism, becoming editor, in succession, of 'An anti-Game Law Journal,' of the 'Examiner,' and of the 'Hereford Times.' He was afterwards long connected with the 'Athenæum' and with the London 'Daily Chronicle' as leader writer. He became meanwhile a recognised authority on education, was elected to the council of the College of Preceptors, and edited the 'Educational Times' from 1895 to 1902.

Deeply interested in modern Greece, he worked zealously in Greek interests. From 1878 onwards he acted as hon. secretary of the Greek committee in London. He published 'New Greece' in the same year (republished 1879), and 'Greece' in 1880. There followed 'Greece in the Nineteenth Century: a Record of Hellenic Emancipation and Progress, 1821-1897,' with illustrations, in 1897. King George of Greece bestowed on him the Order of the Redeemer in October 1878.

Sergeant's historical writings covered a wide ground, and include: 1. 'England's Policy: its Traditions and Problems,' Edinburgh, 1881. 2. 'William Pitt,' in 'English Political Leaders' series, 1882. 3. 'John Wyclif,' in 'Heroes of the Nations' series, 1893. 4. 'The Franks' in 'Story of the Nations' series, 1898. He also wrote a volume of verse; a novel, 'The Caprice of Julia' (1898); and other fiction pseudony-

mously. Sergeant died at Bournemouth on 3 Feb. 1902. He married on 12 April 1871 Emma Louisa, daughter of James Robertson of Cheltenham, and left, with other children, an elder son, Philip Walsingham Sergeant, author of historical biographies.

[The Times, 4 Feb. 1902; Athenæum, 8 Feb. 1902; Sphere (with portrait), 8 Feb. 1902; Who's Who, 1901; Hatton's Journalistic London, 1882; private information.] C. F. S.

SETON, GEORGE (1822-1908), Scottish genealogist, herald, and legal writer, only son of George Seton of the East India Company's service, and Margaret, daughter of James Hunter of Seaside, was born at Perth on 25 June 1822. He was the representative of the Setons of Cariston, senior coheir of Sir Thomas Seton of Olivestob and heir of a line of Mary Seton, one of 'the Four Maries' of the Queen of Scots. He was brought up by his widowed mother, and after attending the High School and University of Edinburgh, entered on 11 Nov. 1841 Exeter College, Oxford (B.A. 1845 and M.A. 1848). He was called to the Scottish bar in 1846, but did not persevere in seeking to obtain a practice. In 1854 he was appointed secretary to the registrar-general for Scotland in Edinburgh, and in 1862 superintendent of the civil service examinations in Scotland; he held both offices till 1889. He was one of the founders of the St. Andrews Boat Club (Edinburgh) in 1846, the first vice-chairman of the Society for Improving the Condition of the Poor, a fellow of the Royal Society of Edinburgh and of the Society of Antiquaries of Scotland. Keenly interested in the characteristics of different nations and peoples, he spent much of his time in travelling, visiting Russia, Canada, and South Africa. Over six feet five inches in height, he was also of fine athletic build and lithe and active to an advanced age. Owing to his great height he occupied the position of right-hand man in the royal bodyguard of Scottish archers. He raised in 1859 a company of forty volunteer grenadier artillerymen (Midlothian coast artillery), all over six feet high. He died in Edinburgh on 14 Nov. 1908. By Sarah Elizabeth (d. 1883), second daughter of James Hunter of Thurston, whom he married in 1849, he had a surviving son, George, engaged in Indian tea-planting industry at first in Calcutta and then in London, and three daughters, of whom two predeceased him.

Seton's two principal works are 'The

Law and Practice of Heraldry in Scotland' (Edinburgh, 1863), a standard work, and the minutely learned and sumptuous 'Memoirs of an Ancient House: a History of the Family of Seton during Eight Centuries' (2 vols., privately printed, Edinburgh, 1896). Two other privately printed books are 'The Life of Alexander Seton, Earl of Dumfermline, Lord Chancellor of Scotland' (Edinburgh, 1882) and 'The House of Moncrieff' for Sir Alexander Moncrieff, K.C.B. (Edinburgh, 1890). His other works include: 1. 'Genealogical Tables of the Kings of England and Scotland,' 1845. 2. 'Treatment of Social Evils,' 1853. 3. 'Sketch of the History and Imperfect Condition of the Parochial Records of Scotland,' 1854. 4. 'Practical Analysis of the Acts relating to the Registration of Births, Deaths and Marriages,' 1854; 5th edit. 1861. 5. 'Cakes, Leeks, Puddings, and Potatoes' (a lecture on the national characteristics of the United Kingdom), 1864; 2nd edit. 1865. 6. 'Gossip about Letters and Letter Writers,' 1870. 7. 'The Convent of St. Catherine of Sienna near Edinburgh,' 1871. 8. 'The Social Pyramid,' 1878. 9. 'St. Kilda, Past and Present,' 1878. 10. 'Amusements for the People,' 1880. 11. 'Budget of Anecdotes relating to the Current Century,' 1886; 3rd edit. 1903. He also contributed various papers to the 'Transactions' of the Edinburgh Royal Society and the Scottish Society of Antiquaries.

[Who's Who; The Times, 16 Nov. 1908; Scotsman, 16 Nov. 1908; Seton's History of the House of Seton, which includes a biography of himself; Foster's Alumni Oxonienses.] T. F. H.

SEVERN, WALTER (1830-1904), water-colour artist, born at Frascati, near Rome, on 12 Oct. 1830, was eldest son of Joseph Severn [q.v.] by his wife Elizabeth, daughter of Archibald, Lord Montgomerie. His brother Arthur became a distinguished landscape painter, and his sister Mary, who married Sir Charles Newton [q. v. Suppl. I], was a clever figure painter. Walter was sent in 1843 with his brother Arthur to Westminster School, and from an early age showed a fondness for art. In 1852 he entered the civil service, and was for thirty-three years an officer in the education department. Meanwhile he took a lively interest in varied branches of art. In 1857, with his friend Charles Eastlake [q. v. Suppl. II], he started the making of art furniture. In 1865 he made a vigorous effort to resuscitate the almost forgotten craft of art needlework and embroidery, for skill in which

he earned medals in South Kensington and much encouragement from Ruskin. But his leisure was chiefly devoted to landscape painting in water-colours. Fifty of his water-colours were exhibited in 1874 at Agnew's Gallery in Bond Street. The most popular of his works, 'Our Boys,' circulated widely in an engraving. He also made illustrations for Lord Houghton's poem 'Good Night and Good Morning' in 1859. In 1861 he published an illustrated Prayer Book, and in 1865 an illustrated calendar. In 1865 Severn instituted the Dudley Gallery Art Society. The Old Water-colour Society had lately rejected his brother Arthur when he applied for membership. The Institute of Painters in Water-colours also seemed to Severn too exclusive. He accordingly called a meeting of fifty artists at his brother's house, when Tom Taylor [q. v.], art critic of 'The Times,' took the chair, and the Dudley Gallery Art Society was the outcome. Exhibitions were held annually at the Egyptian Hall in Piccadilly until its demolition in 1909, when they were continued in the new building erected on the site of the hall. The artists who sent pictures included Albert and Henry Moore, George Leslie, Burne-Jones, and Watts. The merit of the Dudley Society's exhibitions led the Institute of Painters in Water-colours in 1883 to elect several of its members 'en bloc,' including Severn's brother Arthur, but not himself. Severn was elected president of the Dudley Society in 1883, and held office till his death on 22 Sept. 1904 at Earl's Court Square.

Examples of Severn's work are at the National Galleries of Melbourne, Sydney, and Adelaide. There is a portrait of him painted by C. Perugini.

He married on 23 Dec. 1866 Mary Dalrymple, daughter of Sir Charles Dalrymple Fergusson, fifth baronet, by whom he had five sons and one daughter.

[William Sharp's Life and Letters of Joseph Severn; Gordon's Life of Dean Buckland; The Times, 23 Sept. 1904; private information.] F. W. G.-N.

SEWELL, ELIZABETH MISSING (1815-1906), author, born at High Street, Newport, Isle of Wight, on 19 Feb. 1815, was third daughter in a family of seven sons and five daughters of Thomas Sewell (1775-1842), solicitor, of Newport, and his wife Jane Edwards (1773-1848). She was sister of Henry Sewell [q. v.], of James Edwards Sewell [q. v. Suppl. II], warden of New College, Oxford, of Richard Clarke Sewell [q. v.], and of William Sewell (1804-

1874) [q. v.]. Elizabeth was educated first at Miss Crooke's school at Newport, and afterwards at the Misses Aldridge's school, Bath. At the age of fifteen she went home, and joined her sister Ellen, two years her senior, in teaching her younger sisters.

About 1840 her brother William introduced her to some of the leaders of the Oxford movement, among others, Keble, Newman, and Henry Wilberforce. Influenced by the religious stir of the period, she published in 1840, in 'The Cottage Monthly,' 'Stories illustrative of the Lord's Prayer,' which appeared in book form in 1843. Like all her early works these 'stories' were represented to have been edited by her brother William.

The family experienced money difficulties through the failure of two local banks, and the father died in 1842 deep in debt. Elizabeth and the other children undertook to pay off the creditors, and set aside each year, from her literary earnings, a certain sum until all was liquidated. Until 1844 the family lived at Pidford or Ventnor, but in that year Mrs. Sewell and her daughters settled at Sea View, Bonchurch. Elizabeth bought the house, enlarged it in 1854, and later changed the name to Ashcliff.

In 1844 Miss Sewell published 'Amy Herbert,' a well written tale for girls, embodying Anglican views. It has been many times reprinted and has enjoyed great success both in England and in America. In 1846 there followed two of the three parts of 'Laneton Parsonage,' a tale for children on the practical use of a portion of the Church Catechism. She interrupted her work on this book to publish 'Margaret Perceval' (1847), in which at the suggestion of her brother William she urged on young people, in view of the current secessions to Rome, the claims of the English church. The third part of 'Laneton Parsonage' appeared in 1848.

Her mother died in 1847, and in 1849 Miss Sewell made an expedition to the Lakes with her Bonchurch neighbours Captain and Lady Jane Swinburne and their son Algernon, the poet, then a boy of twelve. They visited Wordsworth at Rydal Mount. In 1852 she published 'The Experience of Life,' a novel largely based on her own experience and observations; her most notable literary production.

Miss Sewell had now assumed responsibility for the financial affairs of the family, and finding that her writing was not sufficiently lucrative, she and her sister Ellen (1813-1905) decided to take pupils. They never regarded their venture as a

school, but as a 'family home,' which they conducted till 1891. They began with six girls, including their nieces. Seven was the customary number. Miss Sewell defined her methods of education in her 'Principles of Education, drawn from Nature and Revelation, and applied to Female Education in the Upper Classes' (1865). Good accounts of the life at Ashcliff are given in Miss Whitehead's 'Recollections of Miss Elizabeth Sewell and her Sisters' (1910, pp. 15-26 and pp. 33-42) and in Mrs. Hugh Fraser's 'A Diplomatist's Life in Many Lands' (1910, pp. 220-32); both the writers were pupils. Miss Sewell defied the demands of examinations, and made her pupils read widely, and take an interest in the questions of the day (cf. her article 'The Reign of Pedantry in Girls' Schools' in *Nineteenth Century*, 1888). She herself gave admirable lessons in general history. The holidays were often passed abroad, and in 1860 Miss Sewell spent five months in Italy and Germany, the outcome of which was a volume entitled 'Impressions of Rome, Florence, and Turin' (1862). She was in Germany again at the outbreak of the war of 1870 (cf. *Autobiography*, pp. 185-9). On visits to London and Oxford she met among others Miss Yonge, Dean Stanley, and Robert Browning. She had made Tennyson's acquaintance in the Isle of Wight in 1857.

In 1866 Miss Sewell, convinced of the need of better education for girls of the middle class, founded at Ventnor St. Boniface School, which came to have a building of its own and to be known as St. Boniface Diocesan School. Its many years' prosperity was gradually checked by the High Schools which came into being in 1872. The death of her sister Emma in 1897 caused deep depression, and her brain became gradually clouded. She died at Ashcliff, Bonchurch, on 17 Aug. 1906, and was buried in the churchyard there. A prayer desk was put up in memory of her by pupils and friends in Bonchurch church, where there is also a tablet commemorating Miss Sewell and her two sisters.

Miss Sewell's influence over young people was helped by her dry humour. Despite her firm Anglican convictions, she won the ear of those who held other views. She was an accomplished letter writer. Of small stature, with well-marked features, and fine brown eyes, she was painted by Miss Porter in 1890. That portrait and some sketches of her by her sister Ellen are in possession of Miss Eleanor Sewell at Ashcliff.

Between 1847 and 1868 Miss Sewell published, besides those already mentioned, seven tales, of which 'Ursula' (1858) is the most important. She wrote also many devotional works and schoolbooks. Of the former 'Thoughts for Holy Week' (1857) and 'Preparation for the Holy Communion' (1864) have been often reprinted, as late as 1907 and 1910 respectively. Her schoolbooks chiefly deal with history, and two volumes of 'Historical Selections' (1868) were written in collaboration with Miss Yonge. Miss Sewell contributed to the 'Monthly Packet.' Her autobiography appeared in 1907.

[The Times, 18 Aug. 1906; Autobiography of Elizabeth M. Sewell, ed. Eleanor L. Sewell, 1907; C. M. W[hitehead]'s Recollections of Miss Elizabeth Sewell and her Sisters, 1910; Mountague Charles Owen's The Sewells of the Isle of Wight; Brit. Mus. Cat.; private information.] E. L.

SEWELL, JAMES EDWARDS (1810-1903), warden of New College, Oxford, born at Newport, Isle of Wight, on 25 Dec. 1810, was seventh child and sixth son of Thomas Sewell, solicitor, of Newport, by his wife Jane, daughter of Rev. John Edwards, curate of Newport. He was one of a family of twelve, which included Richard Clarke Sewell, legal writer [q. v.], William Sewell, divine [q. v.], Henry Sewell, first premier of New Zealand [q. v.], and Elizabeth Missing Sewell [q. v. Suppl. II], authoress. Admitted a scholar of Winchester College in 1821, James became a probationary fellow of New College, Oxford, in 1827, and a full fellow in 1829. He graduated B.A. in 1832, proceeding M.A. in 1835, B.D. and D.D. in 1860, and was ordained deacon in 1834 and priest in 1836. Except for a few months in 1834-5, when he was curate to Archdeacon Heathcote [q. v.] at Hursley, he resided in New College from 1827 to his death in 1903. He filled successively every office in the college, and in 1860 was elected warden. He took a large part in university affairs, was the first secretary of the Oxford local examinations delegacy, and from 1874 to 1878 was vice-chancellor. He actively aided in the preservation and arrangement of the MS. records in the library of the college. The chief share in the growth of New College during his long wardenship is to be attributed to his colleagues, but Sewell loyally accepted changes which did not commend themselves to his own judgment. It was largely owing to him that there was no

break in the continuity of college tradition and feeling, and that older generations of Wykehamists were reconciled to the reforms made by successive commissions and by the college itself. Sewell died unmarried in the warden's lodgings, New College, on 29 January 1903, and was buried in the cloisters of the college. A portrait by Sir Hubert von Herkomer (which has been engraved) hangs in the hall of New College. A cartoon portrait by 'Spy' appeared in 'Vanity Fair' in 1894. Sewell compiled a list of the wardens and fellows of New College, with notes on their careers; the MS. is preserved in the college library.

SHAND (afterwards BURNS), ALEXANDER, BARON SHAND OF WOODHOUSE (1828-1904), Scottish judge and lord of appeal, born at Aberdeen on 13 Dec. 1828, was son of Alexander Shand, merchant in Aberdeen, by his wife Louisa, daughter of John Whyte, M.D., of Banff. His grandfather, John Shand, was parish minister of Kintore. Losing his father in early boyhood, he was taken to Glasgow by his mother, who there married William Burns, writer, in whose office her son worked as a clerk while attending lectures at Glasgow University (1842-3). He assumed the surname of Burns, and was a law student at Edinburgh University (1843-52), spending during the period a short time at Heidelberg University. He became a member of the Scots Law Society and of the Juridical Society (17 March 1852), and passed to the Scottish bar on 26 Nov. 1853. His progress was rapid, and he was soon in full practice. In 1860 he was appointed advocate depute, in 1862 sheriff of Kincardine, and in 1869 of Haddington and Berwick. In 1872 he was raised to the bench. After serving with great distinction as a judge for eighteen years, he retired, and settled in London in 1890.

On 21 Oct. 1890 he was sworn of the privy council, and on 11 November following took his seat at the board of the judicial committee (under the Appellate Jurisdiction Act, 1887, 50 & 51 Vict. c. 70, sect. 3) as a privy councillor who had held 'a high judicial position.' He was elected an honorary bencher of Gray's Inn on 23 March 1892. On 20 August of that year he was raised to the peerage as Baron Shand of Woodhouse, Dumfriesshire, and for twelve

years sat in the House of Lords as a lord of appeal. Of these, one of the last, and by far the most important, was the appeal by the minority of the Free Church of Scotland against the judgment of the Court of Session which rejected the minority's claim to the whole property of the Free Church on union with the United Presbyterians. Six lords of appeal heard the arguments, which finished on 7 Dec. 1903. Judgment was reserved. Shand and two other lords were believed to uphold the judgment of the Court of Session; but on 6 March 1904 Shand died in London, and was buried at Kintore, Aberdeenshire. In consequence of his death the appeal was re-heard by seven judges, who, on 1 August 1904, by a majority of five to two, reversed the judgment under review, and gave the whole property of the Free Church to the small minority which had opposed the union. The unfortunate effects of this decision were afterwards partially remedied by a commission, appointed in 1905, under Mr. Balfour's administration, which distributed the property on an equitable basis (5 Edw. VII, c. 12).

In politics Shand was a liberal, but never prominent. He took a useful share in public business, was president of the Watt Institute and School of Arts at Edinburgh, an active member of the Educational Endowments Commission of 1882, and in Jan. 1894 was nominated by the speaker of the House of Commons chairman of the coal industry conciliation board. He wrote letters to 'The Times' on law reform, and frequently delivered lectures to public bodies on that subject, publishing addresses in favour of the appointment of a minister of justice for Great Britain (before the Scots Law Society, 1874); on 'the liability of employers: a system of insurance by the mutual contributions of masters and workmen the best provision for accidents' (before the Glasgow Juridical Society, 1879); and on technical education (before the Watt Institute and School of Arts, 1882). He was made honorary LL.D. of Glasgow in 1873, and D.C.L. of Oxford in 1895.

Shand married in 1857 Emily Merelina (d. 1911), daughter of John Clarke Meymott, but had no family. He was of unusually small stature. A portrait of him, by Sir George Reid, hangs in one of the committee rooms at Gray's Inn. A caricature by 'Spy' appeared in 'Vanity Fair' in 1903.

[Scotsman, and The Times, 7 March 1904; Records of the Juridical Society; Roll of Faculty of Advocates; Law Reports, Appeals, 1904, pp. 515-764.] G. W. T. O.

SHAND, ALEXANDER INNES (1832-1907), journalist and critic, born at Fettercairn, Kincardineshire, on 2 July 1832, was only child of William Shand of Arnhall, Fettercairn, by his second wife, Christina (d. 1855) daughter of Alexander Innes of Pitmedden, Aberdeenshire. His father possessed a considerable estate in Demerara, but his income was greatly reduced on the abolition of slavery. The family then moved to Aberdeen, where Alexander, after being educated at Blair Lodge school, entered the university, graduating M.A. in 1852.

Declining an offer of a commission in the 12th Bengal cavalry, owing to his widowed mother's objection to his going abroad, he turned to the law. But in 1855, on his mother's death, he began a series of prolonged and systematic European tours. When at home he engaged in sport and natural history on the estate of Major John Ramsay, a cousin, at Straloch in Aberdeenshire. In 1865 he was admitted to the Scottish bar and, marrying, settled in Edinburgh. Owing to his wife's health he soon migrated to Sydenham, and while there he discovered his true vocation. After contributing papers on 'Turkey,' 'America,' and other subjects during 1867 to the 'Imperial Review,' a short-lived conservative paper under the editorship of Henry Cecil Raikes [q. v.], he began writing for 'The Times' and for 'Blackwood's Magazine,' and also joined the brilliant staff of John Douglas Cook [q. v.], editor of the 'Saturday Review.' To these three publications he remained a prolific contributor for life, although at the same time he wrote much elsewhere. 'He fluked himself,' he wrote, 'into a literary income' (*Days of the Past*). But although he wrote too rapidly and fluently to be concise or always accurate, his habit of constant travel, wide reading, good memory, and powers of observation made him a first-rate journalist. To 'The Times' he contributed biographies of, among others, Tennyson, Lord Beaconsfield, and Napoleon III (cf. SHAND's 'Memories of The Times,' *Cornhill Mag.* April 1904), as well as descriptive articles from abroad, from the west of Ireland and the highlands of Scotland, several series of which were collected for separate issue. He was also an occasional correspondent for the newspaper during the Franco-German war (1870), republishing his articles as 'On the Trail of the War.'

Shand at the same time wrote novels which enjoyed some success, but he showed

to greater advantage in biography. In 1895 he published a life of his intimate friend, Sir Edward Hamley [q. v. Suppl. I], which reached a second edition. 'Old World Travel' (1903) and 'Days of the Past' (1905), consisting mainly of later sketches in the 'Saturday Review,' give a charming picture of Shand's character, of his capacity for making friends with 'poachers, gamekeepers, railway guards, coach drivers, railway porters, and Swiss guides,' and of his experience of London clubs, where he was at home in all circles. A tory of the old school, he united strong personal convictions with large-hearted tolerance. Among his friends were George Meredith, Laurence Oliphant, and George Smith the publisher. He was devoted to children and all animals, especially dogs, was a fine rider, good shot, and expert angler. He knew how to cook the game he killed, and wrote well on culinary matters.

In 1893 he was British commissioner with Sir Philip Cunliffe Owen at the Paris Exhibition. He was busily engaged in writing till his death, which took place on 20 Sept. 1907 at Edenbridge, Kent. He was buried in the churchyard of Crookham Hill. He married on 25 July 1865 Elizabeth Blanche, daughter of William Champion Streatfeild, of Chart's Edge, Westerham, Kent. She died on 6 June 1882, leaving no children.

Shand published, besides the works mentioned: 1. 'Against Time,' a novel, 1870. 2. 'Shooting the Rapids,' a novel, 1872. 3. 'Letters from the Highlands,' 1884. 4. 'Letters from the West of Ireland,' 1885. 5. 'Fortune's Wheel,' a novel, 1886. 6. 'Half a Century,' 1887. 7. 'Kilcurra,' a novel, 1891. 8. 'Mountain, Stream and Covert,' 1897. 9. 'The Lady Grange,' a novel, 1897. 10. 'The War in the Peninsula,' 1898. 11. 'Shooting' (in 'Haddon Hall Library'), in collaboration, 1899. 12. 'Life of General John Jacob,' 1900. 13. 'Wellington's Lieutenants,' 1902. 14. 'The Gun Room,' 1903. 15. 'Dogs' (in 'Young England Library'), 1903. There came out posthumously: 16. 'Soldiers of Fortune,' 1907. 17. 'Memories of Gardens' (his last sketches in the 'Saturday Review'), 1908.

Shand also contributed chapters on 'Cookery' to 8 vols. of the 'Fur, Fin, and Feather' series (1898-1905), and prefixed a memoir to Kinglake's 'Eothen' (1890 edition).

[Sir Rowland Blennerhassett's memoir prefixed to *Memories of Gardens*, 1908; The

Times, 23 Sept. 1907; Shand's works, especially *Old World Travel* and *Days of the Past*; private information.] W. B. D.

SHARP, WILLIAM, writing also under the pseudonym of FIONA MACLEOD (1855-1905), romanticist, born at Paisley, on 12 Sept. 1855, was eldest son of David Galbraith Sharp, partner in a mercantile house, by his wife Katherine, eldest daughter of William Brooks, Swedish vice-consul at Glasgow. The Sharp family came originally from near Dunblane. His mother was partly of Celtic descent, but he owed his peculiar Celtic predilections either to the stories and songs of his Highland nurse or to visits three or four months each year to the shores of the western highlands. After receiving his early education at home he went to Blair Lodge school, from which with some companions he ran away thrice, the last time in a vain attempt to get to sea as stowaways at Grangemouth. In his twelfth year the family removed to Glasgow, and he went as day scholar to the Glasgow Academy. At the University of Glasgow, which he entered in 1871, he showed ability in the class of English literature; but it was mainly through access to the library that he found the university of advantage.

After spending a month or two with a band of gypsies, he was placed by his father, in 1874, in a lawyer's office in Glasgow, mainly with a view to discipline. While faithful to his office duties, he devoted himself to reading, the theatres, and similar diversions, allowing himself but four hours' sleep. After the death of his father in 1876 consumption threatened, and he went on a sailing voyage to Australia. Although he enjoyed a tour in the interior, the colonist's rough life was uncongenial, and he returned to Scotland resolved to 'be a poet and write about Mother Nature and her inner mysteries.' Without means or prospects, he was about to join the Turkish army against Russia in 1878 when a friend procured him a clerkship in London at the City of Melbourne Bank. Meanwhile he began to contribute verses to periodicals, and in 1881 he had the 'extraordinary good fortune' of obtaining from Sir Noel Paton an introduction to Dante Gabriel Rossetti, who encouraged him with kindly criticism and advice. Through Rossetti he obtained access to many 'literary houses' (see *Life*, p. 53). Failing to satisfy the requirements of the bank, he obtained a temporary post in the Fine Art Society's gallery in Bond Street; but soon depending wholly

on his pen for a livelihood, he often ran risk of starvation.

At the end of 1882 Sharp wrote a short life of Rossetti (who died in April 1882). In 1882, too, appeared a volume of poems, 'The Human Inheritance,' which obtained some recognition and led to an invitation from the editor of 'Harper's Magazine' for other poems, which brought him 40%. A cheque for 200*l.* sent him by an unknown friend enabled him to study art in Italy for five months (1883-4). He contributed a series of articles on Etruscan cities to the 'Glasgow Herald,' and was appointed art critic to the paper. In 1884 he married his cousin and published a second volume of verse, 'Earth's Voices,' vividly impressionist, but somewhat diffuse. In 1884 he became editor of the 'Canterbury Poets,' contributing himself editions of Shakespeare's Sonnets (1885), English Sonnets (1886), American Sonnets (1889), and Great Odes (1890). For a series of 'Biographies of Great Writers' he wrote on Shelley (1887), Heine (1888), and Browning (1890). He also published 'The Sport of Chance' (1888), a sensational story, for the 'People's Friend'; contributed boys' stories to 'Young Folks,' which he edited in 1887; and published 'Romantic Ballads and Poems of Phantasy' (1888; 2nd edit. 1889), fluently fanciful but lacking in finish, and 'The Children of To-morrow' (1889), a romantic tale, in which he voiced his impatience of conventionality.

A visit in the autumn of 1889 to the United States and Canada reawakened his desire to wander. After a stay of some months in the summer of 1890 in Scotland and a tour through Germany, he went in the late autumn to Rome, where he wrote a series of impressionist unrhymed poems in irregular metre, 'Sospiri di Roma,' printed for private circulation in 1891. In the spring of that year he left Italy for Provence on the way to London, where he completed the 'Life and Letters of Joseph Severn' (published in 1892). Subsequently at Stuttgart he collaborated with the American novelist, Blanche Willis Howard, in a novel, 'A Fellowe and his Wife' (published in 1892). In the winter of 1891-2 he was again in America, when through an introduction from his friend, the American poet, E. C. Stedman, he had an interview with Walt Whitman. He also arranged for the publication in America of his 'Romantic Ballads' and 'Sospiri di Roma,' in one volume, under the title 'Flower o' the Vine' (New York, 1892). The spring of 1892 was spent in Paris and

the summer in London; and in the autumn he rented Phenice Croft, a cottage in Sussex, where, probably under the impulse of the Whitman visit and in a fit of irresponsible high spirits, he projected the 'Pagan Review,' edited by himself as W. H. Brooks and wholly written by himself under various pseudonyms. Only one number appeared; and, owing to his wife's unsatisfactory health, he set himself to the completion of two stories for 'Young Folks,' in order to obtain money to spend the winter in North Africa. Returning to England in the spring of 1893, he, while busy with articles and stories for the magazines, prepared a series of dramatic interludes, entitled 'Vistas'—'vistas of the inner life of the human soul, psychic episodes' (published 1894).

At Rome in 1890 he began a friendship with a lady who, 'because of her beauty, her strong sense of life and of the joy of life,' stood as 'a symbol of the heroic women of Greek and Celtic days, . . . unlocked new doors' within him, and put him 'in touch with ancestral memories' (*Life*, p. 223). Sharp thenceforth devoted himself to a new kind of literary work, penning much mystical prose and verse under the pseudonym of 'Fiona Macleod,' whose identity with himself he carefully concealed. Although in this phase of his literary production there was no collaboration with the lady of his idealism, he yet believed 'that without her there would have been no Fiona Macleod.' Much of the 'Fiona' literature was written under the influence of a kind of mesmeric or spiritual trance, or was the record of such trances.

The first of the books which Sharp wrote under the pseudonym of 'Fiona Macleod' was begun at Phenice Croft in 1893. It appeared in 1894 as 'Pharais: a Romance of the Isles,' and Sharp declared it to have been written 'with the pen dipped in the very ichor of my life.' The 'Fiona' series was continued in 1895 in 'The Mountain Lovers,' 'more elemental still' (1895), and 'The Sin Eater,' consisting of Celtic tales and myths 'recaptured in dreams' (1895). The latter volume was published by Patrick Geddes and Colleagues, a firm established in Edinburgh by Professor Geddes, with Sharp as literary adviser, for the publication of Celtic literature and works on science. There quickly succeeded 'The Washer of the Ford' (1896), a collection of tales and legendary moralities; 'Green Fire,' a Breton romance (1896), a portion of which, entitled 'The Herdsman,' was included in the 'Dominion of Dreams' (1899; revised American edit.

1901; German trans. Leipzig, 1905); 'From the Hills of Dream,' poems and 'prose rhythms' (Edinb. 1896; new edit. Lond. 1907); 'The Laughter of Peterkin,' a Christmas book of Celtic tales for children (1897); and 'The Divine Adventure; Iona; By Sundown Shores' (1900), a series of essays. A Celtic play, by 'Fiona,' 'The House of Usna,' was performed by the Stage Society at the Globe Theatre on 29 April 1900; and after its appearance in the 'National Review' on 1 July was issued in book form in America in 1903. Another drama, 'The Immortal Hour,' was printed in the 'Fortnightly Review' (Nov. 1900; reissued posthumously in America in 1907 and in London in 1908). 'Fiona' was also a contributor of articles to periodicals, many of which were collected, as 'The Winged Destiny' (1904) and 'Where the Forest murmurs' (1906). Selections of 'Fiona's' tales appeared in the Tauchnitz series as 'Wind and Wave' (Leipzig, 1902; German trans. Leipzig, 1905; Danish trans. Stockholm, 1910), and as 'The Sunset of Old Tales' (1905). A uniform edition of 'Fiona's' works was published in England in 1910.

The secret of Sharp's responsibilities for the 'Fiona' literature was well kept in his lifetime. He sedulously encouraged the popular assumption that 'Fiona Macleod' was a young lady endowed with 'the dreamy Celtic genius.' Sharp contributed to 'Who's Who,' a fictitious memoir of 'Fiona Macleod,' describing her favourite recreations as 'boating, hill-climbing, and listening,' and he corresponded with her admiring readers through the hand of his sister. Educated Highland Celts detected in the books the imperfection of the supposed lady's Celtic equipment. While her work reflected the influence of old Celtic paganism, it was chiefly coloured by a rapturous worship of nature and mirrored the insistent vividness and weirdness of dreams.

Meanwhile Sharp, under his own name, found it needful, both for pecuniary reasons and for the preservation of the 'Fiona' mystery, to be as productive as before. Fiction mainly occupied him. Of two volumes of short stories, one, 'The Gypsy Christ,' published in America in 1895, was reissued in 1896 in England as 'Madge o' the Pool,' and the other, 'Ecce Puella,' appeared in London in 1896. Later works of fiction were 'Wives in Exile,' a comedy in romance (Boston, Mass. 1896; London 1898) and 'Silence Farm,' a tale of the Lowlands (1899). With Mrs. Sharp he edited in 1896 'Lyra Celtica,' an anthology of

Celtic poetry, with introduction and notes; and there followed 'The Progress of Art in the Century' (1902; 2nd edit. 1906) and 'Literary Geography' (from the 'Pall Mall Magazine') (1904; 2nd edit. 1907). In 1896-7 he was also editor of a quarterly periodical, the 'Evergreen,' issued by the Geddes firm. Two volumes of papers, critical and reminiscent, containing some of the best work of William Sharp, are included in a reissue of some of his writings (1912).

The 'Fiona' development, implying the 'continual play of the two forces in him, or of the two sides of his nature,' produced 'a tremendous strain on his physical and mental resources, and at one time, 1897-8, threatened him with a complete nervous collapse' (*Life*, p. 223). He found relief in travel and change of scene: the Highlands, America, Rome, Sicily, Greece, were all included in a constantly recurring itinerary. But his restless energy gradually undermined his constitution. After a cold caught during a drive in the Alcantara valley in Sicily he died at Castle Maniace, the home of his friend, the Duke of Brontë, to the west of Mount Etna, on 14 Dec. 1905. He was buried in a woodland cemetery on the hillside, where an Iona cross, carved in marble, has been erected. He left a letter, to be communicated to his friends, explaining why he found it necessary not to disclose his identity with 'Fiona.'

On 31 Oct. 1884 Sharp married Elizabeth, daughter of his father's elder brother, Thomas Sharp, by Agnes, daughter of Robert Farquharson of Breda and Allargue; he became secretly pledged to her in September 1875. There were no children of the marriage.

Sharp was tall, handsome, fair-haired, and blue-eyed. A painted portrait of him by Daniel Wehrschmidt and a pastel by Charles Ross are in the possession of his widow. There are also etchings by William Strang and Sir Charles Holroyd.

[Mémorial by his wife, Elizabeth A. Sharp, 1910; Fiona Macleod, by Mr. Ernest Rhys, in *Century Mag.*, May 1907; *Academy*, 16 Dec. 1905; *Dublin Review*, Oct. 1911; information from Mrs. Sharp.] T. F. H.

SHARPE, RICHARD BOWDLER (1847-1909), ornithologist, was born on 22 Nov. 1847, at 1 Skinner Street, Snow Hill, London, where his father, Thomas Bowdler Sharpe, edited and published 'Sharpe's London Magazine.' His grandfather, Lancelot Sharpe, was rector of All Hallows Staining, and headmaster of St. Saviour's grammar school, Southwark. From the

age of six till nine Sharpe was under the care of an aunt, Mrs. Magdalen Wallace, widow of the headmaster of Sevenoaks grammar school, and herself a good classical scholar, who kept a preparatory school at Brighton. He afterwards gained a King's scholarship at Peterborough grammar school, where his cousin, the Rev. James Wallace, was master, and he became a choir-boy in the cathedral; but subsequently he migrated to Loughborough grammar school when his cousin was appointed master there.

From 1863 to 1865 Sharpe was a clerk with Messrs. W. H. Smith and Son. From 1865 to 1866 he was in the employment of Bernard Quaritch, the bookseller, where he had access to the finest books about birds; and from 1866 to 1872 he was the first librarian to the Zoological Society.

Meanwhile he was from boyhood devoted to the study of birds, carefully observing them, and enjoying a day's shooting. When about sixteen, he began the 'Monograph of Kingfishers,' which was issued in quarterly parts (1868-71). Prof. Alfred Newton declared the work of the youthful author, 'though still incomplete as regards their anatomy,' to be 'certainly one of the best of its class.' One hundred and twenty-five species were described, and nearly all were 'beautifully figured by Keulemans.'

Sharpe then began a comprehensive 'History of the Birds of Europe,' in collaboration with Mr. H. E. Dresser; but after fifteen parts were issued he abandoned the project on his appointment, in 1872, at the recommendation of Dr. John Edward Gray [q. v.], keeper of zoology in the British Museum, to the post of senior assistant in Gray's own department, to take charge of the birds. In 1895, on the recommendation of Sir William Flower, the director of the museum, a new post, that of assistant keeper of vertebrates, was created, and Sharpe was appointed to it. The sphere of his responsibilities was thus widened; but his own work remained exclusively ornithological. This position he retained till his death. Sharpe was elected a fellow of the Linnean Society in 1870, an honorary fellow of the Zoological Society in 1875, and became LL.D. of Aberdeen in 1891.

To Sharpe was entrusted the preparation of the British Museum Catalogue of Birds. Sharpe wrote no fewer than eleven of the twenty-seven volumes, with parts of two others, comprising more than 5000 species, fully described with bibliography and geographical distribution; a volume by him

appeared approximately every two years from 1874 to 1898. His second important official publication was 'A Hand-list of the Genera and Species of Birds' (5 vols. 1899-1909); the last volume was published just before his death. Largely owing to Sharpe's zeal, the ornithological collection under his control at the museum increased from 35,000 specimens to over half a million, four or five times the number in any other museum. The confidence of donors in the use to which Sharpe would put their gifts stimulated their generosity, as was admitted by Mr. Allen Hume, who gave his Indian collection, and by the marquess of Tweeddale, who gave his Asiatic series. In 1886, at Mr. Hume's request, Sharpe went to Simla to pack and bring home his collection of 82,000 specimens.

After the death of John Gould [q. v.] in 1881, Sharpe completed the series of illustrated works on ornithology which Gould left unfinished, including 'The Birds of Asia,' 'The Birds of New Guinea,' and monographs on the trogons and humming birds. The publication extended from 1875 to 1888. Sharpe completed the work in 1893 with an index and memoir. Similarly he issued a revised and augmented edition of E. L. Layard's 'Birds of South Africa' (1875-84); and after the death of Henry Seebohm [q. v.] in 1895, he edited and completed his 'Eggs of British Birds' (1896) and 'Monograph of the Thrushes' (1898-1902).

Sharpe edited Allen's 'Naturalists' Library' in sixteen volumes, the first four volumes, on 'The Birds of Great Britain' (1894-7), being his own writing. More important original contributions to systematic ornithology were his monographs of the swallows, in collaboration with C. W. Wyatt (1885-94), and of the birds of paradise (1891-8). He illustrated the fulness of his scientific knowledge in his catalogue of the osteological specimens in the College of Surgeons Museum (1891), and in the address on the classification of birds at the second International Ornithological Congress at Buda-Pest (1891), when the Emperor of Austria conferred upon him the gold medal for art and science. Sharpe was long a popular lecturer on ornithological topics, showing some exquisite lantern-slides. He issued the substance of some of his lectures as 'Wonders of the Bird World' in 1898.

In 1892 Sharpe founded the British Ornithologists' Club, which organised research, especially with regard to migration; and in 1905 he presided over the

International Ornithological Congress in London, giving a presidential address on the history of the British Museum collection. This he also described in an official volume containing biographies of the various collectors (1906).

A vice-president of the Selborne Society, Sharpe laboriously edited White's 'Natural History' (1900, 2 vols.; for the fancy portraits of White, Sharpe repudiated responsibility, cf. *Nature Notes*, 1902, p. 135). While preparing this edition, Sharpe lived much at Selborne, and thoroughly studied the architecture and records of the district. At his death he had printed part of a work on 'Gilbert White's Country,' and was engaged on a history of the siege of Basing House. He died of pneumonia, at his home in Chiswick, on Christmas Day 1909. Sharpe married in 1867 Emily, daughter of James Walter Burrows of Cookham, who survived him with ten daughters. In 1910 his widow and three daughters were awarded a civil list pension of 90%.

In addition to the literary work already mentioned, Sharpe supplied the ornithological portion of the 'Zoological Record' between 1870 and 1908, and he described the birds in the 'Zoology of the Voyage of H.M.S. Erebus and Terror' (1875), in Frank Oates' 'Matabele Land' (1881), in the 'Voyage of H.M.S. Alert' (1884), in J. S. Jameson's 'Emin Pasha Relief Expedition' (1890), in the 'Second Yarkand Mission' (1891), and in the 'Voyage of the Southern Cross' (1902). He was also an extensive contributor to Cassell's 'New Natural History,' edited by Prof. Martin Duncan (1882), the 'Royal Natural History' (1896), and the volume on natural history in the 'Concise Knowledge Library' (1897).

[British Birds, 1910, iii. 273-288 (with a bibliography and photogravure portrait); Selborne Mag. 1910, xxi. 7, 127.] G. S. B.

SHAW, ALFRED (1842-1907), cricketer, born of humble parents at Burton Joyce, a village five miles north of Nottingham, on 29 Aug. 1842, was the youngest of thirteen children. Two of his brothers, William (b. 5 Aug. 1827) and Arthur (1834-1874), played in Nottinghamshire cricket. On his mother's death in 1852 Alfred left school to work as a farm servant. At eighteen he was apprenticed to a hand frame knitter. Early developing an aptitude for cricket, in 1862 he succeeded his brother Arthur as professional to the Grantham cricket club. Playing for the Notts Colts against the county eleven in 1863, he first displayed his great power as a bowler by taking 7

wickets, and helping to dismiss the county for 41 runs. In 1864, on his first appearance at Lord's for the Colts of England v. M.C.C., Shaw took 7 wickets for 24 runs and 6 for 39. Straightway appointed to the ground staff at Lord's, he held the post (with a brief interval in 1868 and 1869 when he was a member of George Parr's All-England eleven) until 1882. For several seasons he was the club's leading bowler.

Shaw played regularly for Notts from 1865 to 1887, and to his bowling was largely due the high position of the county during that period. His best bowling performances were for the M.C.C. v. the North of England, in June 1874, when he took all 10 wickets for 73 runs, and for Notts v. M.C.C., in June 1875, when in the second innings he dismissed seven of his opponents (including Dr. W. G. Grace, Lord Harris, and I. D. Walker) for 7 runs. In 1884, in Notts v. Gloucester, Shaw performed the 'hat trick' (i.e. obtained three wickets with successive balls) in each innings.

Shaw first appeared for the Players v. Gentlemen in 1865, and during his career played in twenty-eight of the matches. In the match at the Oval in 1880 he dismissed seven of the Gentlemen for 17 runs, and in 1881, at Brighton, six for 19. In 6-8 Sept. 1880 he played for England v. Australia in the first test match in this country.

Shaw paid two visits to America—in 1868 with Edgar Willsher's team, and again with that of Richard Daft [q. v. Suppl. I.] in 1879, when he made the marvellous record of 178 wickets for 426 runs. He visited Australia five times: as a member of James Lillywhite's team in 1876-7; as captain and joint-manager of the English team in 1881-2, 1884-5, 1886-7; and as manager to Lord Sheffield's team in the autumn of 1891. [See HOLROYD, HENRY NORTH, third earl of Sheffield, Suppl. II.]

From 1883 to 1894 Shaw had a private cricketing engagement with the earl of Sheffield in Sussex; during that period he coached many rising players for Sussex, and during 1894-5 he played for that county. He accompanied Lord Sheffield on a tour to Norway in August 1894, and took part in a match on board the Lusitania by the light of the midnight sun at Spitzbergen, on 12 Aug. 1894. Next year (Oct.-Nov.) he was with Lord Sheffield in the Crimea. After his retirement in 1895 Shaw acted as umpire in first-class matches.

Shaw, called by Daft 'The Emperor of Bowlers,' was a slow medium bowler, with a very short run, and with his arm almost level with the shoulder. Untiring and most

accurate in attack, he was unplayable on 'sticky' wickets. He was a fair batsman, and a first-class fieldsman at 'shortslip.'

Along with professional cricket Shaw pursued some other occupation. From 1869 till 1878 he was landlord of the Lord Nelson inn in his native village, whence he went to Kilburn in November 1878 to take charge of the Prince of Wales' inn; while there he joined Arthur Shrewsbury [q. v. Suppl. II] in an athletic outfitter's business in Nottingham, and in 1881 left Kilburn to become landlord of the Belvoir inn, Nottingham.

He died on 16 Jan. 1907, after a long illness, at Gedling, near Nottingham, where he was buried.

[Daff's Kings of Cricket (portrait, p. 123); A. W. Pullin's Alfred Shaw, Cricketer, 1902; Wisden's. Cricketers' Almanack, 1908 (pp. 130-2); The Times, 17 and 21 Jan. 1907; M.C.C. Cricket Scores and Biographies, 1877, viii. pp. 302-3; W. G. Grace's Cricketing Reminiscences, 1899, pp. 376-7 (picture of Shaw bowling, p. 212); information from Mr. P. M. Thornton.] W. B. O.

SHAW, SIR EYRE MASSEY (1830-1908), head of the London Metropolitan Fire Brigade, born at Ballymore, co. Cork, on 17 Jan. 1830, was third son of Bernard Robert Shaw of Monkstown Castle, co. Cork, by his first wife, Rebecca, daughter of Edward Hoare Reeves of Castle Kelvin and Ballyglissane, co. Cork. After attending Dr. Coghlan's school at Dublin he passed into Trinity College and graduated B.A. in 1848, proceeding M.A. in 1854. He was destined for holy orders, but doubting his fitness at the last moment he took ship for America, and after many weeks found himself on the western side of the Atlantic. His family intervened and obtained a commission for him in the army in 1854; he remained six years in the army and became captain in the North Cork rifles (militia), retiring in 1860. In 1859 he obtained the post of chief constable or superintendent of the borough forces of Belfast. His duties included control of the Belfast fire service, which he succeeded in reorganising. With characteristic vigour he suppressed disturbances and party fights in the town, which at that time were frequent, and his impartiality was recognised by both Orange and Catholic factions. His repute travelled outside the limits of Ulster. On the death of James Braidwood [q. v.], superintendent of the London fire brigade, at the great fire in Tooley Street in 1861, Shaw was chosen to fill his place. For the next thirty years he retained the

office, and during that period by his personal efforts perfected the organisation of the metropolitan system, which it was his ambition to render the best in the world. He never spared himself. During the first six years of his command he was absent from duty only sixteen days. He was always astir at 3 a.m. to drill and train his men. He paid frequent visits to foreign countries to study any novel arrangements. While he was head of the brigade the number of fire-engine stations grew from 13 to 59, the number of firemen from 113 to 706, and the length of hose from 4 to 33 miles. He dealt with a total of 55,004 fires, an average of five a day, and 2796 men in all passed through his hands. He was more than once injured while directing operations—twice severely.

The instruction, discipline, and finance of the brigade were all under Shaw's control, and he gave important evidence before select parliamentary committees in the Houses of Lords and Commons. He also wrote on his special subject many treatises, which were reckoned of standard authority. Among these were 'Records of the Late London Fire Brigade Establishment' (1870); 'Fire Surveys: a Summary of the Principles to be observed in estimating the Risks of Buildings' (1872); 'Fires in Theatres' (1876; 2nd edit. 1889); 'Fire Protection' (1876); and 'A Complete Manual of the Organisation, Machinery, Discipline and General Working of the Fire Brigade of London' (1876; revised edit. 1890). In 1879 he was nominated C.B., and in 1884 he received the good service medal. When he retired on a pension in 1891, he was nominated K.C.B. (civil). He received the freedom of the Coachmakers' Company in the same year, and the freedom of the City of London in 1892. On his retirement the fire insurance companies showed their appreciation of his admirable work by the presentation of a splendid silver service. He was subsequently managing director of the Palatine Insurance Company, chairman of the Metropolitan Electric Supply Company, and a D.L. for Middlesex.

Shaw was a sportsman, engaging in early life in hunting and shooting, and subsequently in yachting. Some years before his death he suffered, despite his exuberant vitality, amputation of a diseased leg, and the remaining limb was removed at a later date. He met his physical disabilities in old age with courage. He died at Folkestone on 25 Aug. 1908, and was buried at Highgate.

In 1855 he married Anna (*d.* 1897),

daughter of Señor Murto Dove of Lisbon and Fuzeta, Portugal, and by her he had several daughters. A caricature by 'Ape' appeared in 'Vanity Fair' in 1871.

[The Times, 26 and 31 Aug. 1908; Daily Telegraph, 26 Aug. 1908; Dod's Knightage; Walford's County Families; private information.] H. M. V.

SHAW, JAMES JOHNSTON (1845-1910), county court judge, born at Kirkcubbin, co. Down, on 4 Jan. 1845, was second son of seven children of John Maxwell Shaw (*d.* 1852), a merchant and farmer at Kirkcubbin, by his wife Anne, daughter of Adam Johnston. Shaw was first taught in a local national school, and later by James Rowan, presbyterian minister of Kirkcubbin. In 1858 he was sent to the Belfast Academy, where he became a favourite pupil of the principal, Rev. Reuben John Bryce, LL.D. (uncle of Mr. James Bryce). In 1861 he entered Queen's College, Belfast, gaining the highest entrance scholarship in classics, the first of many honours. Diverging to the study of mental science and political economy, he graduated B.A. in 1865 and M.A. in 1866 in the Queen's University of Ireland with first-class honours in those subjects. In 1882 he received the honorary degree of LL.D. from his university.

After studying theology in the general assembly's college, Belfast, and at the University of Edinburgh, he was licensed to preach in 1869 by the presbytery of Ards, and was appointed in the same year by the general assembly professor of metaphysics and ethics in Magee College, Londonderry. In 1878 he resigned this chair and was called to the Irish bar, where he rapidly attained success. Meanwhile in 1876 he was elected Whately professor of political economy in Trinity College, Dublin. Several papers on economic subjects which he read before the Statistical and Social Inquiry Society of Ireland, the British Association, the Social Science Congress, and elsewhere, were published and attracted attention. He became president of the Statistical Society in 1901. In 1886 he was made a member of the senate of the Royal University of Ireland, and in 1891 a commissioner of national education. In the last year, however, he became county court judge of Kerry. The work of the new office proved congenial and afforded leisure to apply to other work. In 1902 he joined the council of trustees of the National Library of Ireland, and in 1908 was chairman of a viceregal commission

of inquiry into the mysterious disappearance of the crown jewels from Dublin castle. When the Queen's University of Belfast was founded by royal charter in 1908 he was appointed by the crown chairman of the commission charged with the framing of the statutes, and the duties of this office he discharged with marked ability. He was also a member of the governing body of the University, and in 1909 pro-chancellor in succession to Sir Donald Currie [q. v. Suppl. II]. In 1909 he was created recorder of Belfast, and county court judge of Antrim. A singularly clear thinker and writer, and a high-principled administrator, Shaw died in Dublin on 27 April 1910, and was buried in the Mount Jerome cemetery there. In 1911 his portrait by Sydney Rowley was placed in the hall of the Queen's University of Belfast, together with a memorial brass; a Shaw prize in economics was also founded in his memory.

Shaw married in 1870 Mary Elizabeth (*d.* 1908), daughter of William Maxwell of Ballyherley, co. Down, by whom he had one daughter, Margaret (who married Robert H. Woods, president of the Royal College of Surgeons in Ireland, 1910-11), and two sons.

Shaw translated the 'Enchiridion' in 1873, for an edition of the works of Augustine edited by Dr. Marcus Dods. After his death his daughter, Mrs. Woods, collected and edited, with a biographical sketch, a number of his papers on economic and other subjects under the title 'Occasional Papers' (Dublin, 1910).

[Personal knowledge; address by Right Hon. Christopher Pelles at unveiling of memorial tablet in Belfast University, 1911; biographical sketch by Mrs. Woods, *ut supra.*]

T. H.

SHEFFIELD, third EARL OF. [See HOLROYD, HENRY NORTH (1832-1909), sportsman.]

SHELFORD, SIR WILLIAM (1834-1905), civil engineer, born at Lavenham, Suffolk, on 11 April 1834, was eldest son of William Heard Shelford (*d.* 1856), fellow of Emmanuel College, Cambridge, and rector of Preston St. Mary, Suffolk. His grandfather and great-grandfather were also clergymen of the same name. His mother was Emily Frost, eldest daughter of Richard Snape, rector of Brent Eleigh. Of his brothers, Thomas became a member of the legislative council of the Straits Settlements, and was made C.M.G., while Leonard Edmund was appointed prebendary of St. Paul's

Cathedral in 1889 and vicar of St. Martin's-in-the-Fields, London, in 1903.

In Feb. 1850 Shelford went to Marlborough College, leaving at midsummer 1852 to become an engineer. He was first apprenticed to a mechanical engineer in Scotland, but in 1854 he became a pupil of William Gale, waterworks engineer, of Glasgow. During his two years' term of service he attended lectures at Glasgow University. In 1856, being thrown on his own resources by his father's death, he left Glasgow to seek his fortune in London, and in December of that year he entered the office of (Sir) John Fowler [q. v. Suppl. I] as an assistant engineer, remaining in his service until 1860. He was engaged upon the Nene river navigation and improvement works, of which he was in due course placed in charge, until 1859, when he was transferred to London and was engaged on the laying-out and construction of the first section of the Metropolitan railway. Leaving Fowler's service in the autumn of 1860, Shelford became an assistant to F. T. Turner, joint engineer with Joseph Cubitt of the London, Chatham and Dover railway. After employment on various surveys he was appointed resident engineer on the high-level railway to the Crystal Palace, an act of parliament for which was obtained in 1862. With the exception of the ornamentation of the stations, he designed and superintended all the engineering works of that line. In 1862-5 he was also engaged, under Turner, as resident engineer on the eastern section of the London, Chatham and Dover railway, to Blackheath Hill. In 1865 he started practice on his own account in partnership with Henry Robinson, who was afterwards professor of engineering at King's College, London. The work carried out by the firm during the next ten years included the railways, waterworks, sewage-works and pumping- and winding-engines, shafts, &c., for collieries and mines at home and abroad. In 1869 he visited Sicily and installed machinery and plant for working sulphur mines there, which had previously been worked by very primitive methods. For his services he was made a chevalier of the Order of the Crown of Italy.

The partnership was terminated in 1875, and thenceforward Shelford practised at 35a Great George Street, Westminster, taking his third son, Frederic, into partnership in 1899, and relinquishing work in 1904. His practice during these twenty-nine years covered an unusually wide field. In 1881 Shelford was appointed engineer

of the Hull, Barnsley and West Riding Junction railway, which was designed to connect a new (Alexandra) dock at Hull with the Barnsley and West Riding districts. The Hull and Barnsley railway, which involved much difficult engineering work, was Shelford's most important piece of railway construction at home. The line authorised by the original act of parliament, which was sixty-six miles in length, was opened in June 1885, and extensions to Huddersfield and Halifax were made subsequently.

Shelford, who was in much request as an engineering witness, was consulting engineer to the corporation of Edinburgh in connection with the enlargement of Waverley Station and the attempt of the Caledonian Railway Company to carry its line into Edinburgh. Other work in Scotland included the Brechin and Edzell railway, which he carried out in 1893-5.

He reported on many railway schemes abroad, visiting for the purpose Canada in 1885, Italy in 1889, and the Argentine in 1890. With Sir Frederick Bramwell [q. v. Suppl. II] he was consulting engineer to the Winnipeg and Hudson's Bay railway, and under their direction forty miles of this line from Winnipeg were completed in Jan. 1887. His chief work abroad and the main work of his later years was the construction of railways in West Africa, in which he acted as consulting engineer to the crown agents for the colonies. After preliminary surveys, begun in 1893, a line of 2 ft. 6 in. gauge from Freetown, Sierra Leone, to Songo Town was commenced in March 1896 and opened in 1899. This line was gradually extended until, in Aug. 1905, shortly before Shelford's death, it had reached Baiima, 220 miles from Freetown. In the Gold Coast Colony a line of 3 ft. 6 in. gauge from Sekondi to Tarkwa was begun in 1898 and completed in May 1901. By October 1903 the line had been extended as far as Kumasi, 168 miles from Sekondi. In the colony of Lagos a line from Lagos to Ibadan (123 miles) was completed in March 1901. A short railway, six miles in length, from Sierra Leone to the heights above Freetown, was opened in 1904, and road-bridges were built to connect the island of Lagos with the mainland. On Shelford's retirement in 1904 Sir William MacGregor, formerly governor of Lagos, acknowledged Shelford's services to the colony, and how by his skill and perseverance he had overcome the formidable obstacles of the unhealthy climate, the density of the tropical forests which

the lines traversed, and the difficulties of landing railway material.

From an early period Shelford interested himself in the engineering works of rivers and estuaries, with which his principal contributions to the literature of his profession dealt. In 1869 he presented to the Institution of Civil Engineers a paper 'On the Outfall of the River Humber,' for which he received a Telford medal and premium. In 1879 he examined the River Tiber and reported upon a modification of a scheme proposed by Garibaldi for the diversion of the floods of that river. For his paper presented in 1885 to the institution, 'On Rivers flowing into Tideless Seas, illustrated by the River Tiber,' he was awarded a Telford premium.

Shelford's colonial services were recognised by the honour of the C.M.G. in 1901 and the K.C.M.G. in 1904. He was elected a member of the Institution of Civil Engineers on 10 April 1866, and from 1887 to 1897 and from 1901 till death was a member of the council. In 1888 he was a vice-president of the mechanical science section of the British Association, before which he read two papers, in 1887 on 'The Improvement of the Access to the Mersey Ports,' and in 1885 on 'Some Points for the Consideration of English Engineers with Reference to the Design of Girder Bridges.' He was a fellow of the Royal Geographical and other societies, and served upon the engineering standards committee as a representative of the crown agents for the colonies.

After his retirement from practice he resided at 49 Argyll Road, Kensington, where he died on 3 Oct. 1905. He was buried at Brompton cemetery. He married in 1863 Anna, daughter of Thomas Sopwith, F.R.S. [q. v.], who survived him; by her he had eight children.

A portrait by Seymour Lucas, which was subscribed for by his staff for presentation to him but was not finished at his death, belongs to his widow.

[Life of Sir William Shelford, by Anna E. Shelford (his second daughter), printed for private circulation, 1909; Minutes of Proc. Inst. Civ. Eng. clxiii. 384; The Engineer, 6 Oct. 1905.] W. F. S.

SHENSTONE, WILLIAM ASHWELL (1850-1908), writer on chemistry, born at Wells-next-the-Sea, Norfolk, on 1 Dec. 1850, was eldest son of James Burt Byron Shenstone, pharmaceutical chemist of Colchester, by his wife Jemina, daughter of James Chapman, of Wells-next-the-Sea, Norfolk.

Through his grandfather, Joseph Shenstone (b. at Halesowen), he traced collateral connection with William Shenstone the poet.

Educated at Colchester grammar school, Shenstone afterwards entered his father's business. He qualified as a chemist in the school of the Pharmaceutical Society of Great Britain, securing there a Bell scholarship (1871), and was awarded in 1872 the Pereira medal. For two years he was demonstrator of practical chemistry in that school under Professor J. Attfield, leaving to become assistant to Dr. (afterwards Sir) W. A. Tilden, chief science master at Clifton College. In 1875 he was appointed science master at Taunton School, and in 1877 science master at Exeter grammar school, where he built a laboratory (see *Nature*, 26 July 1878). He returned to Clifton in 1880, succeeding Dr. Tilden as science master and holding this post until his death.

While assistant to Tilden at Clifton, Shenstone collaborated with him in an investigation on the terpenes, the results appearing in the paper 'Isomeric Nitroso-terpenes' (*Trans. Chem. Soc.* 1877). Jointly with Tilden he published also the memoir 'On the Solubility of Salts in Water at High Temperatures' (*Phil. Trans. Roy. Soc.* 1884), and 'On the Solubility of Calcium Sulphate in Water in the Presence of Chlorides' (*Proc. Roy. Soc.* 1885). Other important papers, published in the Transactions of the Chemical Society, comprised 'Ozone from Pure Oxygen: its Production and its Action on Mercury' (1887, jointly with J. T. Cundall); 'Studies on the Formation of Ozone from Oxygen' (1893, jointly with M. Priest); 'Observations on the Properties of some Highly Purified Substances' (1897); and 'Observations on the Influence of the Silent Discharge on Atmospheric Air' (1898, jointly with W. T. Evans).

Shenstone was admitted a fellow of the Chemical Society in 1876, and was member of the council 1893-5; he was a fellow of the Institute of Chemistry from 1878, serving on the council 1905-6. He was an original member of the Society of Chemical Industry, and was elected F.R.S. on 9 June 1898.

He died on 3 Feb. 1908, at Polurrian, Mullion, Cornwall, and was buried there. He married in 1883 Jane Mildred, eldest daughter of Reginald N. Durrant, rector of Wootton, near Canterbury, and had issue one son and one daughter. Devoted to his profession, Shenstone was highly successful as a teacher in physical science, and generally influenced the introduction of improved methods of science teaching in schools.

Shenstone's chief independent publications were: 1. 'A Practical Introduction to Chemistry,' 1886; 3rd edit. 1892. 2. 'The Methods of Glass Blowing,' 1886; 3rd edit. 1894; a German translation was published at Leipzig, 1887. 3. 'Justus von Liebig: his Life and Work,' 1895. 4. 'The Elements of Inorganic Chemistry,' 1900. 5. 'The New Physics and Chemistry,' 1906, a reprint of a series of essays contributed to the 'Cornhill Magazine.' On 8 March 1901 he gave a lecture at the Royal Institution on 'Vitrified Quartz,' detailing important practical applications of the material for laboratory apparatus. For Henry Watts's 'Dictionary of Chemistry' he wrote the article 'Ozone.'

Journ., 8 Feb. 1908; Poggenorff's Handwörterbuch, 1904; Roy. Soc. Catal. Sci. Papers; Nature, 13 Feb. 1908; The Times, 7 Feb. 1908.] T. E. J.

SHERINGTON, MADAME HELEN
LEMMENS- (1834-1906), soprano vocalist.
[See LEMMENS-SHERINGTON.]

SHIELDS, FREDERIC JAMES
(1833-1911), painter and decorative artist, born at Hartlepool on 14 March 1833, was the third of the six children of John Shields, a bookbinder and printer, by his wife Georgiana Storey, daughter of an Alnwick farmer. His brothers and sisters all died in infancy. His father, after fighting as a volunteer in Spain for Queen Isabella (1835-6), removed to Clare Market in London, where the boy's mother opened a dressmaker's shop.

Frederic attended the charity school of the parish of St. Clement Danes until the age of fourteen. Having shown an early talent for drawing, he worked from the antique at the British Museum for a few months after leaving school, and on 4 Oct. 1847 was apprenticed to Maclure, Macdonald & Macgregor, a firm of lithographers. His indenture was for a term of three years, but after about a year he was sent for by his father, who had obtained work at Newton-le-Willows, although he was unable to provide for his family. He helped Frederic to find employment at 5s. a week with a firm of mercantile lithographers in Manchester.

An ingrained piety, a love of literature, and a passion for sketching enabled Shields to face stoically nine years of grinding

poverty and of uncongenial drudgery at commercial lithography. In 1856 he obtained a better engagement in the like trade at Halifax at 50s. a week. There the first opportunity of book illustration was offered him, and he prepared fourteen illustrations for a comic volume called 'A Rachde Felley's Visit to the Grayt Eggshibishum.' The proceeds of this work enabled him to give up lithography, and he accepted the offer of C. H. Mitchell, a landscape painter at Manchester, to put figures and animals into his pictures. He was much influenced by the Pre-Raphaelite works which he saw at the great Manchester Exhibition of 1857. On a sketching tour in Devonshire with Mitchell he executed many successful water-colour drawings, for which he found purchasers, while his commissions for drawings on wood grew. In 1860 he received an important though badly paid commission for a series of drawings illustrating the 'Pilgrim's Progress,' some plates for which he sent to Ruskin in 1861, and they evoked the art critic's enthusiastic praise. To Ruskin's teaching, he wrote later, he owed 'a debt of inexpressible and reverential gratitude' (*Bookman*, Oct. 1908, p. 30). He also corresponded with Charles Kingsley, who encouraged him. After spending some time on water-colour work at Porlock and occasionally engraving for 'Once a Week,' Shields established his fame as an illustrator by his designs for Defoe's 'Journal of the Plague Year,' which were engraved in 1863. A water-colour version of his illustration of Solomon Eagle for this work is in the Manchester Art Gallery. In 1865 he was elected associate of the Royal Society of Painters in Water Colours. From 1864 onwards he spent some time each year in London, and there met Dante Rossetti and Madox Brown, as well as Ruskin, Holman Hunt, and Burne-Jones. With Rossetti and Brown his relations grew very close. He was with Rossetti through his fatal illness at Birchington in 1882, and designed the memorial window in the church there. But from 1867 to 1875 Shields's headquarters were lonely houses at Manchester, until 1871 at Cornbrook Park, and then at Ordsall Hall. After some time at Blackpool, he made a tour in Italy early in 1876, and on his return settled in London. For the next twenty years he resided at Lodge Place, St. John's Wood, whence he moved in 1896 to Wimbledon.

In later life Shields neglected that illustrative work for which his gifts eminently fitted him, and devoted himself to more ambitious decorative designs and oil-painting,

in which he followed the lead of the Pre-Raphaelites without showing a trace of their romanticism. He was not a great colourist but a sound draughtsman. His later work is cold, formal, didactic and out of touch with actual life, though it is not lacking in loftiness of aim and nobility of design. Between 1875 and 1880 he designed the stained-glass windows for Sir William Houldsworth's private chapel at Coodham, Kilmarnock a work which was followed by the stained-glass and mosaic decoration for the duke of Westminster's chapel at Eaton. Shields also executed in 1887 the symbolic decoration for St. Luke's church, Camberwell (cf. HUGH CHAPMAN'S *Sermons in Symbols*, 1888). His most important work, which kept him busy for about twenty years from 1889, and was finished only a few months before his death, was the pictorial decoration of the walls in the Chapel of the Ascension, Bayswater Road, which was designed by Mr. Herbert P. Horne. The commission came from Mrs. Russell Gurney, to whom Lady Mount Temple had introduced Shields in 1889, and the work was executed in 'spirit-fresco.' Before beginning the work, Shields visited Italy for suggestions.

Shields, whose piety was a constant feature of his life, died at Morayfield, Wimbledon, on 26 Feb. 1911, and was buried at Merton churchyard. He was married at Manchester on 15 Aug. 1874 to Matilda Booth, a girl of sixteen, who was frequently his model; but they had no children, and husband and wife lived much apart. His features are recorded in the head of 'Wicklyffe' in Ford Madox Brown's fresco at Manchester town hall. An exhibition of his works was held at the Brazenose Club, Manchester, in May 1889, and there was a memorial exhibition at the Alpine Club Gallery in October 1911.

Nearly the whole of his substantial fortune was bequeathed to foreign missionary societies. The cartoons for the windows at Eaton were presented by his executors to the Young Men's Christian Association for their new London headquarters in Tottenham Court Road. A portfolio of Shields's studies for his 'Pilgrim's Progress' designs was purchased for the Victoria and Albert Museum in 1912.

SHIPPARD, SIR SIDNEY GODOLPHIN ALEXANDER (1837-1902), colonial official, born at Brussels on 29 May 1837 and sprung of a naval family, was eldest son of Captain William Henry Shippard of the 29th regiment (son of Rear-Admiral Alexander Shippard [q. v.]) by his wife Elizabeth Lydia, daughter of Captain Joseph Peters. Educated at King's College School, London, he obtained an exhibition at Oriel College, Oxford, in 1856, but next year migrated to Hertford College on winning a scholarship. He graduated B.A. in law and modern history in 1863, and became B.C.L. and M.A. in 1864. Studying for the bar, he was called of the Inner Temple on 26 Jan. 1867, and soon afterwards he went out to South Africa. He was admitted to practise as an advocate of the supreme court of the Cape Colony in 1868.

On 25 Jan. 1873 Shippard was appointed acting attorney-general of Griqualand West, which had some two years previously been proclaimed a part of the British dominions, and had been attached to the Cape Colony, but under a practically separate administration. Shippard was formally appointed attorney-general on 17 Aug. 1875. In 1877 he acted as recorder of the high court of Griqualand West. Coming into collision with Sir Bartle Frere [q. v.] and Sir Owen Lanyon, he resigned his post. In 1878 he was in England, and took his D.C.L. degree at Oxford. On 20 April 1880 he was appointed a puisne judge of the supreme court of the Cape Colony.

From February to September 1885 Shippard served as British representative on the joint commission which sat at Capetown to determine the Anglo-German claims in respect of property acquired before the declaration of the German protectorate over Angra Pequena and the West Coast (see *Blue Book C.* 5180/87).

On 30 Sept. 1885, when a protectorate was formally proclaimed over Bechuanaland, Shippard was appointed administrator and chief magistrate of British Bechuanaland, and president of the land commission which was charged with determining the complicated claims to lands between the natives and concessionaires;

the result of his labours is embodied in a Blue Book (C. 4889/86). This position he held for ten years; and amongst the more interesting episodes of his administration were his expedition with a small escort in 1888 to visit Lobengula, whose attitude he changed from hostility to compliance, and discussions with the chief Khama on the liquor question. By the former he paved the way in some measure for the Charter of the British South Africa Company. He retired on pension on 16 Nov. 1895, when British Bechuanaland was annexed to Cape Colony. On his way home he was at Johannesburg just after the Jameson raid, and threw all his influence on the side of peace.

Shippard, who was made C.M.G. in 1886, and K.C.M.G. in 1887, became on 21 April 1898 a director of the British South Africa Company, and rendered the board wise and loyal service at a time when the development of the company's territories was at an anxious and critical stage. He died on 29 March 1902 at his residence, 15 West Halkin Street, London. He was buried at Nynehead, Somerset.

Shippard married, first, in 1864, Maria Susanna, daughter of Sir Andries Stockenström of Cape Colony (she died in 1870, leaving three children); secondly, on 18 Dec. 1894, Rosalind, daughter of W. A. Sanford of Nynehead Court, who with four children survived him.

Shippard, a man of culture and refinement, with a taste for music, acquired a high reputation as a Roman-Dutch lawyer. He published 'Dissertatio de vindicatione rei emptæ et traditione' (thesis for D.C.L. 1868), 'Report of Case of Bishop of Grahamstown (v. Merriman)' (1879), and several legal judgments in 'Buchanan's (Cape) Reports' (1880-5).

[The Times, 31 March 1902; South Africa, 5 April 1902; C.O. lists, 1875-1895; official blue books; Who's Who, 1901; Anglo African Who's Who, 1905; information from Lady Shippard.] C. A. H.

SHIRREFF. [See GREY, MRS. MARIA GEORGINA (1816-1906), promoter of women's education.]

SHORE, WILLIAM THOMAS (1840-1905), geologist and antiquary, born on 5 April 1840 at Wantage, was son of William Shore, architect, by his wife Susannah Carter. Brought up at Wantage, he became (about 1864) organising secretary to the East Lancashire Union of

Institutions at Burnley. In 1867 he was sent (with others) by the science and art department at South Kensington to the Paris Exhibition to report on scientific and technical education, and gave evidence on the subject before a select committee of the House of Commons in 1868. In 1873 he was appointed secretary to the Hartley Institution (now the Hartley University College) at Southampton and curator of the museum, and later became executive officer of the institution. Shore was the founder of the Hampshire Field Club and Archæological Society, and remained its honorary secretary until his death. He contributed many papers to the society's 'Transactions', including 'Ancient Hampshire Forests' (1888), 'The Clays of Hampshire and their Economic Uses' (1890), and 'Hampshire Valleys and Waterways' (1895). In 1882 he was secretary of the geological section of the Southampton meeting of the British Association. He was elected fellow of the Geological Society on 3 April 1878. Both as a geologist and an antiquary he was an authority of high repute upon Hampshire. In 1896 Shore moved to London and founded the Balham Antiquarian Society. Shortly before 1901 he became joint honorary secretary of the London and Middlesex Archæological Society, and contributed to its 'Transactions' a series of papers on 'Anglo-Saxon London and Middlesex.' He died suddenly at his residence, 157 Bedford Hill, Balham, on 15 Jan. 1905, and was buried at the cemetery of St. Mary Extra, Woolston, Southampton.

On 24 Jan. 1861 he married Amelia Lewis of Gloucester, who died on 31 May 1891; by her he had two sons, William Shore, M.D., dean of the medical school of St. Bartholomew's Hospital, and Lewis Erle Shore, lecturer on physiology at Cambridge, and three daughters.

Shore published: 1. 'Guide to Southampton and Neighbourhood,' 1882. 2. Letterpress description to 'Vestiges of Old Southampton,' by Frank McFadden, 1891. 3. 'A History of Hampshire, including the Isle of Wight' (Popular County Histories), 1892. At his death he was engaged on 'Origin of the Anglo-Saxon Race,' which was edited posthumously by his sons. A 'Shore Memorial Volume' (pt. i. 1908, ed. G. W. Minns), undertaken by the Hampshire Field Club and Archæological Society, contains his contributions to the society and other papers.

[Quarterly Journal Geol. Soc. 61, lviii-lix; private information.] C. W.

SHORTHOUSE, JOSEPH HENRY (1834-1903), author of 'John Inglesant,' eldest son of Joseph Shorthouse (*d.* Oct. 1880) and his wife Mary Ann, daughter of John Hawker, was born on 9 Sept. 1834 in Great Charles Street, Birmingham, where his father inherited some chemical works from his great-grandfather. Both parents belonged to the Society of Friends. At ten Shorthouse went to a quakers' school near his new home in Edgbaston, and at fifteen to Tottenham College, his studies being interrupted by a bad nervous stammer—a defect which developed powers of mental concentration. At sixteen he went into the family business, but he remained an intensive reader, being attracted by Hawthorne and Michelet and repelled by Macaulay. He was trained in writing by a Friends' Essay Society, to which he contributed papers much debated and commended by his associates. Through this meeting he came to know Sarah, eldest daughter of John and Elizabeth Scott of Edgbaston, to whom he was married at the Meeting house, Warwick, before he was three-and-twenty (19 Aug. 1857). Powerfully affected by Ruskin and Pre-Raphaelitism, Shorthouse discovered a strong sentimental sympathy for the Anglicanism of the seventeenth century as he conceived it; in Aug. 1861 he and his wife were baptised at St. John's, Ladywood, by his friend Canon Morse, to whom he afterwards dedicated 'Sir Percival' (1886). In 1862 he had an attack of epilepsy which made him more or less of an invalid. From 1862 to 1876 he lived in Beaufort Road, within a stone's throw of Newman at the Oratory; there he started a Greek Testament Society in 1873.

There too a psychological and historical romance, 'John Inglesant,' grew in its author's mind by a process of incrustation and was slowly committed to writing, beginning about 1866. Every free evening he was in the habit of reading a paragraph or two to his wife and to no one else. In 1876 the book was finished at Llandudno; but the publishers were shy of it, and great expense being involved in moving at this period from Beaufort Road to a beautiful house in spacious grounds, known as Lansdowne, Edgbaston, the manuscript remained undisturbed for five years in the drawer of a cabinet. Early in 1880 a notion of private issue was resumed; it was printed handsomely in a thick octavo of 577 pages with a vellum binding, and dedicated to Rawdon Levett, 17 June 1880. Private readers of this edition, commencing with the author's father, were greatly im-

pressed; but James Payn [*q. v.* Suppl. I], reader of Messrs. Smith, Elder & Co., who read it with a view to its publication by his firm, gave an unfavourable verdict (cf. *PAYN'S Literary Recollections*). The 'Guardian' however took a more complacent view. Mrs. Humphry Ward was struck by the book, a copy of which with the author's consent she forwarded to Alexander Macmillan; and on 18 Feb. 1881 Macmillan wrote to Shorthouse to say that he would feel it an honour to publish the book. That a man whose paths had not lain among scholars and libraries and who had never travelled two hundred miles from his home should have written such a book as 'Inglesant,' with its marvellous atmospheric delineation of Italy, struck the world of English letters with amazement. That a mystic should arise from the ranks of the Birmingham manufacturers stimulated their curiosity. Though called a romance, wrote Macmillan, "'John Inglesant'" is full of thought and power.' It attracted the interest of a remarkable variety of people—Gladstone, Huxley, Miss Yonge, and Cardinal Manning, and the writer was much lionised in London. He and his wife spent a week with his publisher at Tooting, where Huxley and others met him. At a reception at Gladstone's, where the Prince of Wales and many persons of distinction were assembled, Shorthouse was a centre of attraction. Nearly nine thousand copies were sold in the year. The success was partly due to fashion, for 'Inglesant,' which lacked the qualities of good continuous narrative, greatly over-accentuated the value of the Romanising movement of the time, was full of vague sermonising, and was destitute of humour. Some of the episodes (the Little Gidding ones prominently) exhibit beauty and pathos, which the author's fidelity to his period enabled him to clothe in an idiom of singular purity and charm, and the book fitted in admirably with a wave of catholic and historical feeling which was passing over the country. Few new books have had a more ardent cult than 'John Inglesant.'

Shorthouse rapidly extended his acquaintance, his new friends including Canon Ainger, Professor Knight, Mr. Gosse, and Bishop Talbot. Although he was incited to new effort he was essentially *homo univrs libris*. His prefaces to Herbert's 'Temple' (1882) and the 'Golden Thoughts' of Molinos (1883), his essays on 'The Platonism of Wordsworth' (1882) and 'The Royal Supremacy' (1899), and his minor novels, chief among them 'Sir Percival' (1886),

corroborate the idea of a choice but limited talent. The reviewers, who criticised them with blunted weapons, were unimpressed by Shorthouse's long and self-complacent Platonic disquisitions.

In life, as in scholarship, Shorthouse was an eclectic and a conservative. The constant foe of excess, eccentricity, over-emphasis, self-advertisement, he stood notably for cultured Anglicanism. His health began to fail in 1900, and muscular rheumatism compelled his abandonment of business; reading and devotion were his solace to the end. He died at his residence, Lansdowne, Edgbaston, on 4 March 1903, and was buried in Old Edgbaston churchyard. There also was buried his widow, who died on 9 May 1909. He left no issue. His library was sold at Sotheby's on 20 Dec. 1909.

In addition to the novels already mentioned, Shorthouse published: 1. 'The Little Schoolmaster Mark,' 1883. 2. 'The Countess Eve,' 1888. 3. 'A Teacher of the Violin, and other Tales,' 1888. 4. 'Blanche Lady Falaise,' 1891.

SHREWSBURY, ARTHUR (1856-1903), Nottinghamshire cricketer, fourth son of seven children of William Shrewsbury and Elizabeth Ann Wragg, was born in Kyle Street, New Lenton, Nottinghamshire, on 11 April 1856. His father, a designer, draughtsman, and lace manufacturer, was also proprietor of the Queen's Hotel, Nottingham. His elder brother William (b. 30 April 1854), who succeeded his father as proprietor of the Queen's Hotel in 1885 and emigrated to Canada in 1891, played cricket for Notts county in 1876, and was for a time cricket coach at Eton. After education at the People's College, Nottingham, Shrewsbury became a draughtsman. Showing promise in local cricket, as well as in football, he turned professional cricketer, and modelling his style on that of Richard Daft [q. v. Suppl. I], first appeared at Lord's for the Colts of England v. M.C.C. in May 1873. Ill-health prevented him from playing in

1874, but next year he played regularly for the Notts team, and in June 1876 he scored his first century (118 v. Yorkshire) in first-class cricket. In 1880 he established an athletic outfitter's business in Queen Street, Nottingham, with Alfred Shaw [q. v. Suppl. II].

The turning-point in Shrewsbury's career was his visit, in the winter of 1881, to Australia as joint manager of Alfred Shaw's team; the climate improved his health and strength. Shrewsbury thrice subsequently (in 1884-5, 1886-7, 1887-8) visited Australia as manager with Shaw. The fourth tour proved financially disastrous. But Shrewsbury remained in the colony after its close and managed, again at financial loss, a Rugby football tour, which he and Shaw organised, to Australia and New Zealand. On his return to England at the end of 1888 he received a testimonial from Nottingham, and played regularly (except in 1894 owing to ill-health) for the county until 1902.

Shrewsbury's most successful seasons were from 1882 to 1893, during which he headed the English batting averages on five occasions (in 1885, 1887, 1890, 1891, 1892); his chief scores were 207 for Notts v. Surrey at the Oval in August 1882, and 164 for England v. Australia at Lord's in July 1886, when he played the famous Australian bowlers with ease and confidence. In 1887 his success was unparalleled; he played eight three-figure innings (including 267 v. Middlesex), scored 1653 runs, and had the remarkable average of 78. Later noteworthy scores were 206 v. All Australia during his fourth visit to Australia in 1887-8, and 108 and 81 for England v. Australia at Lord's in July 1893 on a difficult wicket. In May 1890 he with William Gunn created a fresh record by putting on 398 runs for the second wicket for Notts v. Sussex. In his last season (of 1902) he scored in July two separate centuries (101 and 127 not out) in the match v. Gloucester at Trent Bridge. During his career he scored sixty centuries in first-class cricket.

The main features of Shrewsbury's batting were, like those of his model, Richard Daft, his strong back play and his perfect timing; his strong defence, caution, and unwearied patience made him excellent on treacherous wickets. He was short, and his body worked like clockwork together with the bat. He did much to popularise leg play. His fielding was first-class, especially close in to the wickets.

In 1903 an internal complaint, which

Shrewsbury believed to be incurable, unhinged his mind, and he shot himself at his sister's residence, The Limes, Gedling, on 19 May 1903, being buried in the churchyard there.

SHUCKBURGH, EVELYN SHIRLEY (1843-1906), classical scholar, born at Aldborough on 12 July 1843, was third and eldest surviving son (in a family of twelve children) of Robert Shuckburgh, rector of Aldborough in Norfolk, by his wife Elizabeth (d. 1876), daughter of Dr. Lyford, Winchester. Evelyn was educated for some time at a preparatory school kept at Winchester by the Rev. E. Huntingford, D.C.L. Thence he proceeded to Ipswich grammar school, under Dr. Hubert Ashton Holden [q. v. Suppl. I], the editor of Aristophanes, of whose teaching Shuckburgh always talked with enthusiasm. His father died in 1860, and in 1862 Shuckburgh entered Emmanuel College as an exhibitioner. He was shortsighted, which probably prevented his taking an active part in athletics, but he took the lead in the intellectual life of the college, and as a speaker at the Union Debating Society became widely known in the university. He was president of the Union in 1865, and graduated as thirteenth classic in the classical tripos of 1866. From 1866 to 1874 he was a fellow and assistant tutor of Emmanuel College. In the latter year, having vacated his fellowship by his marriage with Frances Mary, daughter of the Rev. Joseph Pullen, formerly fellow and tutor of Corpus Christi College, Cambridge, and Gresham professor of astronomy, he accepted an assistant mastership at Eton. There he remained for ten years, when he returned to Cambridge. He was soon appointed librarian of Emmanuel College, and devoted himself, apart from his comparatively light duties in this capacity, to teaching and writing. He wrote with great facility, and immediately after his degree had published

anonymously various translations of classical works for university examinations. He now undertook the editing of many volumes of elementary school classics, chiefly for Messrs. Macmillan and the Cambridge University Press. These books were for the most part compilations, but the notes are clear and to the point, and it is noticeable that, instead of being spoilt as a scholar by work of this kind, he showed greater accuracy, width of knowledge, and scholarship in his later books than in his earlier. For his skill in such work he was selected by Sir Richard Jebb [q. v. Suppl. II] to adapt his edition of Sophocles for use in schools. Shuckburgh however lived only to publish the 'Œdipus Coloneus,' 'Antigone,' and 'Philoctetes.' In 1889 he executed a complete translation of Polybius, the first and, in some respects, the most arduous of his labours in this field, though in point of length it was surpassed by his translation of the whole of Cicero's letters in Messrs. Bell's series (1889-1900). With his edition of Suetonius's 'Life of Augustus' (Cambridge University Press, 1896), Shuckburgh broke ground long untilled in England. This work obtained for him the degree of Litt.D. from the university in 1902. 'The Life of Augustus' (1903) was a natural corollary to the life by Suetonius, and gives Shuckburgh's own views of Augustus and his age. 'A General History of Rome to the Battle of Actium' had appeared in 1894. In 1901 Shuckburgh produced for the University Press 'A Short History of the Greeks from the Earliest Times to B.C. 146,' and in 1905, for the 'Story of the Nations' series, 'Greece from the Coming of the Hellenes to A.D. 14.' He devoted some attention also to earlier English literature, editing in 1889 with an introduction 'The A.B.C. both in Latyn and Englishe, being a facsimile reprint of the earliest extant English Reading Book,' and in 1891 Sidney's 'Apologie for Poetrie' from the text of 1595. To his college he was devotedly attached, and made many contributions to college history, including the account (anonymously published) of the 'Commemoration of the Three Hundredth Anniversary of Emmanuel College' (1884); 'Lawrence Chaderton (First Master of Emmanuel College), translated from a Latin Memoir of Dr. Dillingham and Richard Farmer (Master of Emmanuel 1775-1797). An Essay' (1884); 'Two Biographies of William Bedell, Bishop of Kilmore, with a Selection of his Letters and an unpublished Treatise' (1902); and the

'History of Emmanuel College' in Robinson's series of 'College Histories' (1904). He also published from a MS. in the library of Emmanuel College in 1894 'The Soul and the Body, a Mediæval Greek Poem.'

Shuckburgh also contributed essays and occasional verses to literary journals. He wrote for the 'Edinburgh Review' on the correspondence of Cicero (January 1901), and prepared several memoirs for this Dictionary.

Shuckburgh was an excellent conversationalist and a man of wide reading. His literary work was too voluminous and produced too rapidly to be all of first-class merit, but it was never slipshod, though he was an ineffectual corrector of proof. No small part of his time was devoted to examining in his own and other universities and in the public schools. In 1901 he was appointed by the Intermediate Education Board for Ireland to report on secondary education in Irish schools. He died suddenly on 10 July 1906, in the train between Berwick and Edinburgh, while on his way to examine at St. Leonard's School, St. Andrews, and was buried at Grantchester, where for some years he had lived. He left a family of two sons and three daughters.

Shuckburgh was tall and in countenance resembled Cardinal Newman. A good photograph hangs in the parlour of Emmanuel College, and in the library there is a bronze relief by Mr. E. Gillick.

[Information from the family; a Memoir by Dr. J. Adam in the Emmanuel College Magazine, 1906; personal knowledge.]

P. G.

SIEVEKING, SIR EDWARD HENRY (1816-1904), physician, born on 24 Aug. 1816 at 1 St. Helen's Place, Bishopsgate Street Within, London, was eldest son of Edward Henry Sieveking (1790-1868), a merchant who removed from Hamburg to London in 1809, by his wife Emerentia Luise, daughter of Senator J. V. Meyer (1745-1811) of Hamburg. The Sievekings long held a foremost position in Hamburg in commerce and municipal affairs. The father returned to Germany and served in the Hanseatic legion throughout the war of liberation (1813-14); he was a linguist, speaking five languages fluently and two fairly well (cf. H. CRABB ROBINSON'S *Diary*, ii. 196). A life of Sir Edward's aunt, Amelia Wilhelmina Sieveking (1794-1859), a pioneer in philanthropic work in Hamburg, and the friend of Queen Caroline of Denmark and of Mrs. Elizabeth Fry, was translated from the German by Catherine Winkworth [q. v.] in 1863.

After early education in England Sieve-

king went in 1830 to the gymnasiums at Ratzeburg and at Berlin; in 1837 he entered the University of Berlin and studied anatomy and physiology, the latter under Johann Müller. During 1838 he worked at surgery at Bonn, and returning to England devoted two years to medicine at University College and graduated M.D. at Edinburgh in 1841, with a thesis on erysipelas. After a further year abroad, spent in visiting the hospitals of Paris, Vienna, Würzburg, and Berlin, he settled down in 1843 to practise among the English colony in Hamburg, and was associated with his aunt in founding a children's hospital there. Returning to London in 1847, Sieveking became a licentiate (corresponding to member) of the Royal College of Physicians, and while settling in practice, first in Brook Street and then in Bentinck Street, took an active part in advocating the nursing of the sick poor. In 1851 he became assistant physician to St. Mary's Hospital, being one of the original staff and the writer of the first prescription in that institution, where in due course he lectured on *materia medica* for sixteen years and was physician (1866-1887) and consulting physician. In 1855 he assisted John Propert in founding Epsom College, a school for the sons of medical men. He was also physician to the London Lock Hospital (1864-89) and to the National Hospital for the paralysed and epileptic (1864-7). He became a fellow of the Royal College of Physicians in 1852, and in 1858 he took a prominent part in bringing about the first reform at the college for 336 years, which gave to the general body of the fellows powers formerly enjoyed only by 'the eight elect.' He held numerous offices there, being censor in 1869, 1870, 1879, 1881, and vice-president in 1888; he delivered the Croonian lectures (1866) 'On the localisation of disease' and the Harveian oration (1877), containing a description of the MS. of Harvey's lectures, which had just been rediscovered. His reputation as a consulting physician was recognised by his election as president of the Harveian Society (1861), and of the Royal Medical and Chirurgical Society (1888), and as first honorary president of the British Balneological and Climatological Society (1895). He was a staunch supporter of the British Medical Association, and served on its council. He was also appointed in 1863 physician in ordinary to Edward VII when Prince of Wales; in 1873 physician extraordinary, and in 1888 physician in ordinary to Queen Victoria, and

physician extraordinary to Edward VII in 1902. He was made hon. LL.D. of Edinburgh in 1884 at the tercentenary of the University. Together with Sir David Brewster and Dr. Charles Murchison he founded the Edinburgh University Club in London in 1864. He was knighted in 1886.

Sieveking, who invented in 1858 an aethesiometer, an instrument for testing the sensation of the skin, was author of: 'A Treatise on Ventilation' (in German, Hamburg, 1846); 'The Training Institutions for Nurses and the Workhouses' (1849); 'Manual of Pathological Anatomy' (1854, with C. Handfield Jones, the illustrations reproducing excellent water-colours by Sieveking; 2nd edit. 1875, ed. by J. F. Payne); 'On Epilepsy and Epileptiform Seizures' (1858; 2nd edit. 1861); 'Practical Remarks on Laryngeal Disease as illustrated by the Laryngoscope' (1862); 'The Medical Adviser in Life Assurance' (1873; 2nd edit. 1882). He translated Rokitsky's 'Pathological Anatomy' (vol. ii. 1849) and Romberg's 'Nervous Diseases' (2 vols. 1853) for the Sydenham Society. He also edited the 'British and Foreign Medico-Chirurgical Review' from 1855, and contributed largely to medical periodicals, especially on nervous diseases, climatology, and nursing.

Sieveking died at his house, 17 Manchester Square, W., on 24 Feb. 1904, and was buried in the family grave at Abney Park cemetery, Stoke Newington. A portrait painted in 1866 by W. S. Herrick and a pastel picture by Carl Hartmann done in 1847 are in the possession of his family. A posthumous portrait is at the Royal Academy of Medicine. There is a brass tablet to his memory in the ancient chapel of the crypt beneath St. John's church, Clerkenwell, on which he is [described as 'an ardent worker for the ambulance department of the Order (of St. John of Jerusalem) since 1878.' He had been gazetted a Knight of Grace in 1896.

Sieveking married, on 5 Sept. 1849, Jane, daughter of John Ray, J.P., of Finchley, and had issue eight sons and three daughters, the eldest of whom, Florence Amelia, married firstly Dr. L. Wooldridge and secondly Prof. E. H. Starling, F.R.S., and has translated some of Metchnikoff's works. A son, Mr. A. Forbes Sieveking, F.S.A., is well known as a writer on gardens and fencing.

[Lancet, 1904, i. 680; Med.-Chir. Trans., 1905, lxxxviii. p. cviii; Presidential Address to the Royal College of Physicians by Sir W. S. Church, 23 March 1904; information from his son, Herbert Sieveking, M.R.C.S.]

H. D. R.

SIMMONS, Sir JOHN LINTORN ARABIN (1821-1903), field marshal and colonel commandant royal engineers, born at Langford, Somersetshire, on 12 Feb. 1821, was fifth son of twelve children of Captain Thomas Simmons (d. 1842), royal artillery, of Langford, by his wife Mary, daughter of John Perry, of Montego Bay, for many years judge of the supreme court of Jamaica. His father was author of the treatise 'On the Constitution and Practice of Courts Martial,' which was long an authorised textbook. Six out of his eight brothers were officers in the army.

Educated at Elizabeth College, Guernsey, and at the Royal Military Academy at Woolwich, Simmons received his first commission in the royal engineers on 14 Dec. 1837, and after professional instruction at Chatham embarked for Canada in June 1839. He was promoted first lieutenant on 15 Oct. following. While in Canada he was employed for three years in the then disputed territory on the north-east frontier of the United States of America, constructing works of defence, and making military explorations.

Returning to England in March 1845, Simmons was stationed in the London district for a year, was then an instructor in fortification at the Royal Military Academy at Woolwich, and being promoted second captain on 9 Nov. 1846, was appointed next month inspector of railways under the railway commissioners. In 1850 he became secretary to the railway commissioners, and when the commission was absorbed by the board of trade on 11 Oct. 1851, secretary of the new railway department of the board.

In Oct. 1853 Simmons travelled on leave in Eastern Europe, where war had been declared between Turkey and Russia. After his arrival at Constantinople, he was of service to the British ambassador, Lord Stratford de Redcliffe [q. v.], in reporting on the defences of the Turkish Danube frontier and of the Bosphorus, and he also visited with Sir Edmund Lyons's squadron the Black Sea ports.

Promoted first captain on 17 Feb. 1854, he was preparing to leave for England when on 20 March the British ambassador sent him to warn Omar Pasha, the Turkish commander on the Danube, of the intention of the Russians to cross the Lower Danube near Galatz. With great promptitude and energy he found Omar at Tertuchan, and the hasty retreat of the Turkish army prevented catastrophe. Meanwhile in reply to a summons from the board of trade to

return home at once or resign his appointment, Simmons, who had outstayed his leave, sent in his resignation, which was accepted on 30 June 1854. When at the end of March the Western powers allied themselves with Turkey against Russia, Simmons was formally attached to Omar Pasha's army on the Danube as British commissioner. He gave advice and help in the defence of Silistria, which he left during the siege on 18 June to join Omar Pasha and the allied generals at Varna. Five days later the siege of Silistria was raised, and the generals at Varna decided that Omar Pasha should take advantage of this success to cross the river and attack the Russian army at Giurgevo.

On 7 July Simmons was in command of 20,000 men of all arms at the passage of the Danube and the battle of Giurgevo. He threw up the lines of Slobodzie and Giurgevo in presence of the enemy, who tried to prevent him, while a Russian army of 70,000 men lay within seven miles. For his services with the Turkish army and his share in the defence of Silistria and the battle of Giurgevo, when the Russians were routed, Simmons was promoted brevet major on 14 July 1854, and given the local rank of lieutenant-colonel (a brevet lieutenant-colonelcy following, 12 Dec.). During the retreat of the Russians and the occupation of Wallachia by the Turks, Simmons was frequently in charge of reconnaissances upon the enemy's rear until they had evacuated the principality.

In the meantime the allies had invaded the Crimea, the battles of the Alma, Balaclava, and Inkerman had been fought, and the siege of Sevastopol was in progress. Simmons opposed Napoleon III's proposal that the Turks should advance on the Pruth so as to act on the Russian line of communications with the Crimea. Realising the weakened condition of the allies after Inkerman and that there were no reserves nearer than England and France, he urged that the Turkish army should reinforce the allies in the Crimea. After much discussion the advanced guard of the Turkish army in Jan. 1855 occupied Eupatoria, which Simmons at once placed in a state of defence, in time to repulse a determined attack by the Russians on 17 Feb. The Russians were 40,000 strong, while the Turkish garrison was small. After this action the remainder of the Turkish army arrived from Varna, and Simmons laid out and constructed an entrenched camp. From April to September 1855 he was with

Omar Pasha's army before Sevastopol, taking part in the siege until the place fell. He was created C.B. on 13 Oct.

When after the fall of Sevastopol Omar Pasha took his army to Armorica to operate against the Russians south of the Caucasus, and thus relieve the pressure on the fortress of Kars invested by the Russians, Simmons continued with him as the British commissioner. Omar, advancing into Mingrelia with 10,000 men, encountered 12,000 Russians on the river Ingur on 6 Nov. 1855. Simmons commanded a division which, crossing the river by the ford of Ruki and turning the Russian position, captured his works and guns and compelled the enemy to retreat. The casualties were small, so sudden and unexpected was their turning movement, the Russians losing 400 and the Turks 300 in killed and wounded. Omar Pasha in his despatch attributed the success mainly to Simmons. Unfortunately the campaign began too late to enable the relief of Kars to be effected. It capitulated on 26 Nov.

Early in 1856 Omar Pasha sent Simmons to London to explain his views for the next campaign in Asia Minor against Russia, but, by the time he arrived in England, peace negotiations were in progress, and the treaty of Paris was signed on 30 March. For his services Simmons received the British war medal with clasp for Sevastopol; the Turkish gold medal for Danubian campaign, and the Turkish medal for Silistria; the third class of the order of the Mejidie (the second class was sent by the Sultan, but the British government refused permission for him to accept it on account of his rank); the Turkish Crimean medal; the French legion of honour, fourth class; and the Sultan of Turkey presented him with a sword of honour and made him a major-general in the Turkish army. In his service with the Turkish army Simmons had shown a knowledge of strategy and a power of command which should have led to further command in the field, but did not.

In March 1857 he was nominated British commissioner for the delimitation of the new boundary under the treaty of Paris between Turkey and Russia in Asia. Major-general Charles George Gordon [q. v.] was one of three engineer officers who accompanied him as assistant commissioners. The whole frontier from Ararat to the Black Sea was traversed and questions of principle were settled by the commission; the actual marking of the boundary line was carried out by their expert assistants in the following year.

There were no carriage roads, and everything had to be carried on pack animals, while the altitudes over which they marched varied from 3000 to 7500 feet. Simmons returned home in Dec. 1857, and was promoted to a brevet colonelcy.

For two years (20 Feb. 1858-60) Simmons was British consul at Warsaw, where he gained the friendship of the viceroy, Prince Gortschakoff, and the esteem of both the Polish and the Russian communities. Promoted a regimental lieutenant-colonel on 31 Jan. 1860, Simmons was for the next five years commanding royal engineer at Aldershot. He received the reward for distinguished service on 3 Aug. 1862. Among several important committees of which he was a member during his command was one in 1865, on the Royal Engineers establishment at Chatham, presided over by the quartermaster-general, Sir Richard Airey [q. v.]. In September of the same year Simmons became director of the Royal Engineers establishment (now the School of Military Engineering) at Chatham with a view to carrying out the recommendations of the committee.

In Oct. 1868 he relinquished this appointment after his promotion as major-general (6 March), and in March 1869 he was made lieutenant-governor of the Royal Military Academy at Woolwich, becoming K.C.B. on 2 June. Hitherto the commander-in-chief was nominally governor of the Royal Military Academy, but in 1870 Simmons became governor with full responsibility. On 27 Aug. 1872 he was promoted lieutenant-general and was made a colonel commandant of royal engineers. The French Prince Imperial became a cadet at Woolwich in December, and thenceforth the Empress Eugénie regarded Sir Lintorn as a personal friend. While governor at Woolwich Simmons was a member of the royal commission on railway accidents in 1874 and 1875. After a highly successful reign of over six years he left Woolwich on his appointment as inspector-general of fortifications at the war office (1 Aug. 1875). In that office, which he held till 1880, he was the trusted adviser of the government on all questions connected with the defence of the empire. As chief technical military delegate with the British plenipotentiaries, Lord Beaconsfield and Lord Salisbury, at the Berlin Congress of 1878, he rendered valuable service. He had been promoted to be general on 1 Oct. 1877, and on 29 July 1878 was awarded the G.C.B. His services were again utilised by the

foreign office at the international conference of Berlin, in June 1880, on the Greek frontier question, when he was chief technical military delegate with the British plenipotentiary, Lord Odo Russell [q. v.].

After leaving the war office in the summer of 1880 Sir Lintorn served on Lord Carnarvon's royal commission on the defence of British possessions and commerce abroad, until it reported in 1882. He was also a member of Lord Airey's committee on army reorganisation; he had published a pamphlet on the subject, 'The Military Forces of Great Britain,' in 1871.

Appointed governor of Malta in April 1884, Simmons satisfactorily inaugurated a change in the constitution whereby the number of elected members, which had been the same as the number of official members of council, was more than doubled. He did much to improve the condition of the island, especially as regards drainage, water supply, and coinage. On 24 May 1887 he was awarded the G.C.M.G. He remained at Malta until his retirement on 28 Sept. 1888. On 29 Oct. 1889 Sir Lintorn was appointed envoy extraordinary and minister plenipotentiary to Pope Leo XIII on a special mission with reference to questions of jurisdiction under the royal proclamation providing for the existing establishment of religion in Malta. With the assistance of Sir Giuseppe Carbone, the chief justice of Malta, he brought to a successful issue protracted negotiations respecting the marriage laws.

On 14 March 1890 the Sultan of Turkey conferred on Sir Lintorn the first class of the order of the Mejidie, and on 21 May of the same year Queen Victoria made him a field-marshal. As a devoted friend of General Gordon, Simmons was chairman of the Gordon Boys' Home, established in Gordon's memory. He spent the last years of his life with his son-in-law and daughter, Major and Mrs. Orman, at Hawley House, near Blackwater, Hampshire, where he died on 14 Feb. 1903; he was buried by his own wish at Churchill, Somersetshire, beside his wife. A military funeral service was held by command of King Edward VII at Hawley church. A memorial to the field-marshal's memory has been erected by his brother officers in the crypt of St. Paul's Cathedral, London, and at the Gordon Boys' Home at Woking.

Simmons was elected an associate of the Institution of Civil Engineers in 1847. He was also a member of the Royal United Service Institution, the Society of Arts,

the Colonial Institute, and the Institute of Electrical Engineers.

His portrait in oils as a general was painted by Frank Holl, R.A., in 1883 for the corps of royal engineers, and hangs in the mess at Chatham. Another portrait in oils as a field-marshal, about 1890, was painted by H. Heute, a German artist, and is in Mrs. Orman's possession.

Simmons was married twice: (1) at Keynsham, near Bristol, Somersetshire, on 16 April 1846, to his cousin Ellen Lintorn Simmons, who died on 3 Oct. 1851, leaving a daughter, Eleanor Julia (*d.* unmarried in 1901); (2) in London, on 20 Nov. 1856, to Blanche (*d.* Feb. 1898), only daughter of Samuel Charles Weston, by whom he had one daughter, Blanche, wife of Major Charles Edward Orman, late Essex regiment.

R. H. V.

SIMON, SIR JOHN (1816-1904), sanitary reformer and pathologist, born in the City of London on 10 Oct. 1816, was sixth of the fourteen children of Louis Michael Simon (1782-1879), a member of the Stock Exchange, who served on the committee from 1837 till his retirement in 1868. His grandfathers were both Frenchmen, but having emigrated to England, each had there married an Englishwoman. Both his parents were very long lived, his father dying within three months of completing his ninety-eighth year, and his mother, Matilde Nonnet (1787-1882), within five days of completing her ninety-fifth year.

After three or four years at a preparatory school at Pentonville, John Simon spent seven and a half years at a private school at Greenwich kept by the Rev. Dr. Charles Parr Burney, son of Dr. Charles Burney [q. v.]. He then went to Rhenish Prussia to study with a German parrrer for a year. The familiarity with the German language which he thus acquired was of great advantage to him later. He was intended for the medical profession, and on his return from Germany he was in the autumn of 1833 apprenticed for six years to Joseph Henry Green [q. v.], surgeon at St. Thomas's and professor of surgery at King's College, his father paying a fee of 500 guineas. In 1838 he became M.R.C.S. and in 1844 was made hon. F.R.C.S. In 1840, when King's College developed a hospital of its own, he was appointed its senior assistant surgeon. He held this post till 1847, when he was made

lecturer on pathology at 200*l.* a year. He eventually became surgeon at St. Thomas's Hospital, his 'old and more familiar home,' where with progressive changes of title he remained officer for life (cf. *Personal Recollections*, privately printed, 1903). He became a great leader and teacher in pathology. In 1862-3 Simon was one of those who successfully urged the removal of the hospital from the Borough to the Albert Embankment. In 1876 he retired from the post of surgeon and was made consulting surgeon and governor of the hospital.

Ambitious of eventually becoming a consulting surgeon, Simon did not at first devote himself to his professional work with undue rigour. He spent his spare time on non-professional pursuits—on metaphysical reading, on Oriental languages, on study in the print-room of the British Museum. Such distribution of interest left the impress of literary ability and culture on his future writings and tastes (Dr. J. F. PAYNE in *Lancet*, ii. 1904). As early as 1842 he had written a pamphlet on medical education, and contributed the article 'Neck' to the 'Cyclopædia of Anatomy.' In 1844 he gained the first Astley-Cooper prize by an essay on the thymus gland (published with additions in the following year), and wrote for the Royal Society a paper on the thyroid gland (*Phil. Trans.* vol. 134), the value of which that society promptly recognised by electing him a fellow in January 1845, at the early age of twenty-nine. (As to the importance of these two researches in comparative anatomy, see Sir JOHN BURDON SANDERSON'S Memoir in *Proc. Roy. Soc.* 1905, lxxv. 341.)

The current of Simon's thoughts and activities was wholly changed by his appointment in October 1848 as first medical officer of health for the City of London at a salary of 500*l.* a year (eventually 800*l.*). Liverpool was the first town in England to appoint a medical officer of health; London was the second. Simon, whose continued study of pathology at St. Thomas's Hospital gave him great advantage as a health officer, set to work at once with characteristic thoroughness, and presented a series of annual and other reports to the City commissioners of sewers which attracted great attention at the time, and may still be read with profit. They were unofficially reprinted in 1854, with a preface in which Simon spoke strongly of 'the national prevalence of sanitary neglect,' and demonstrated the urgent need of control of the public health by a responsible minister of state.

These views Simon kept steadily before him throughout his official career.

The general board of health had been created by government in 1848. It was reconstituted in 1854, and by a further act of 1855 the board was empowered to appoint a medical officer. Simon accepted the post in October 1855. The board was subject to successive annual renewals of its powers, and the new office was one of undefined purpose and doubtful stability (see a consolatory letter from Ruskin to Simon dated Turin, 20 July 1858, in vol. xxxvi. of *RUSKIN'S Complete Works*, p. 286). In 1858 the board was abolished, its duties being taken over by the lords of the council under the Public Health Act (1858), which to disarm opponents was framed to last for a single year. Simon thus became medical officer of the privy council. The act of 1858 was only made permanent in 1859 in face of strong opposition. Simon always held in grateful remembrance Robert Lowe [q.v.], then vice-president of the council for education, whose promptitude and vigour saved the bill (see his *English Sanitary Institutions*, chap. xii. p. 277 seq.; and for his appreciations of Lowe, *PATCHETT MARTIN'S Life*, ii. 185-98, 501-14).

Simon made to the general board of health several valuable and comprehensive reports: on the relation of cholera to London water supply (1856), on vaccination (1857), on the sanitary state of the people of England (1858), and on the constitution of the medical profession (1858). These are reprinted in full in his 'Public Health Reports' (vol. i. 1887). As medical officer of the privy council he instituted in 1858 annual reports on the working of his department, treating each year special subjects with broad outlook and in terse and graphic phrase. The most important parts were reprinted in 'Public Health Reports' (vol. ii. 1887). During this period (1858-71) Simon was implicitly trusted by his official superiors, was allowed a free hand, and rallied to his assistance a band of devoted fellow-workers, who helped to make the medical department a real power for good.

In August 1871, in accordance with the report of the royal sanitary commission which was appointed in April 1869 to consider means of co-ordinating the various public health authorities, the old poor law board, the local government act office (of the home office), and the medical department of the privy council were amalgamated to form one new department, the local government board. Simon became chief medical

officer of the new board in the belief that his independent powers would be extended rather than diminished. But neither (Sir) James Stansfeld [q. v. Suppl. I], president of the board, nor (Sir) John Lambert [q. v.], organising secretary, took his view of his right of initiative and administrative independence. Simon protested in vigorous minutes and appeals, which were renewed when George Selater-Booth [q. v.] became president in 1874. In the result, after a fierce battle with the treasury, his office was 'abolished,' and Simon retired in May 1876 on a special annual allowance of 1333l. 6s. 8d. He was less than sixty years old, and his energies were undecayed, so that the cause of sanitary progress was prejudiced by his retirement.

Simon received the inadequate reward of C.B., and was also made a crown member of the medical council, on which he did much good work until his resignation in 1895. In 1881 he was president of the state medicine section of the International Medical Congress held in London. With his friend, J. A. Kingdon, F.R.C.S., he was mainly responsible for the establishment by the Grocers' Company of scholarships for the promotion of sanitary science.

Simon took an active part in the affairs of the Royal College of Surgeons; from 1868 to 1880 he was one of the college council, from 1876 to 1878 was vice-president, and during 1878-9 acted as president. He filled also various honorary offices in professional societies. In 1887, on the occasion of Queen Victoria's first jubilee, he was promoted K.C.B. At the end of his career he received the first award of two medals which had been founded for the purpose of recognising eminence in sanitary science—the Harben medal of the Royal Institute of Public Health (1896) and the Buchanan medal of the Royal Society (November 1897). He was made hon. D.C.L. Oxford (1868), Med. Chir. Doctor Munich (1872), LL.D. Cambridge (1880), LL.D. Edinburgh (1882), and M.D. Dublin (1887).

In addition to professional and official acquaintances, Simon had many literary and artistic friends, including Alfred Elmore, R.A., Sir George Bowyer, George Henry Lewes, Mowbray Morris, (Sir) Edwin Chadwick, Thomas Woolner, R.A., Tom Taylor, Arthur Helps, and in particular John Ruskin [q. v. Suppl. I]. Simon first became acquainted with Ruskin and his parents through a chance meeting in Savoy in 1856, and the acquaintance ripened into a very warm friendship. Simon became in Ruskin's

vocabulary, from the identity of Christian name, Ruskin's 'dear brother John' (*Works of Ruskin*, xxxv. 433; see especially *Sesame and Lilies*, xviii. 105, and *Time and Tide*, § 162, xvii. 450). Simon gave Ruskin sound advice as to his health, which Ruskin did not always adopt (see Sir E. T. Cook's *Life of Ruskin*, 1911, i. 392, and Ruskin's correspondence with Simon and his wife in *Ruskin's Works*, ed. Cook and WEDDERBURN, xxxvi.-vii. passim). To Ruskin the Simons owed their friendship with Sir Edward Burne-Jones and Lady Burne-Jones.

In March 1898, being then in failing health, Simon prepared for private circulation some 'Personal Recollections,' which were revised on 2 Dec. 1903, 'in blindness and infirmity.' He died at his house, 40 Kensington Square (where he had lived since 1867), on 23 July 1904, and was buried at Lewisham cemetery, Ladywell. By his will the ultimate residue of his estate was bequeathed to St. Thomas's Hospital. A bust by Thomas Woolner, R.A., executed in 1876, is at the Royal College of Surgeons.

On 22 July 1848 he married Jane (1816-1901) daughter of Matthew Delaval O'Meara, deputy commissary-general in the Peninsular war. He had no issue. Lady Simon was as close a friend of Ruskin as was her husband, and Ruskin familiarly named her his 'dear P.R.S.' (Pre-Raphaelite sister and Sibyl), or more shortly 'S.' (cf. LADY BURNE-JONES, *Memorials of Sir Edward Burne-Jones*, i. 257).

Sir Richard Douglas Powell, in his presidential address to the Royal Medico-Chirurgical Society in 1905 (vol. lxxxviii. p. cxv), said of Simon that he 'was a man gifted with true genius, and inspired with the love of his kind. He will ever remain a noble figure in the medicine of the nineteenth century, and will live in history as the apostle of sanitation.' The most important feature of Simon's work was his insistence that practice should be based on scientific knowledge, and his recognition of the large field for investigation without reference to immediate practical results. He was confident that such research (to use his own words) 'would lead to more precise and intimate knowledge of the causes and processes of important diseases, and thus augment, more and more, the vital resources of preventive medicine.'

Simon's chief reports and writings on sanitary subjects were issued collectively by subscription by the Sanitary Institute of Great Britain (2 vols. 1887). In

1890 he brought out 'English Sanitary Institutions, reviewed in their Course of Development, and in some of their Political and Social Relations' (2nd edit. 1897), a masterly survey which contains an elaborate vindication of his official career. Besides addresses to medical bodies, Simon wrote in 1878 a comprehensive article on Contagion for the 'Dictionary of Medicine' edited by Sir Richard Quain [q. v. Suppl. I].

[Personal Recollections of Sir John Simon, K.C.B. (privately printed in 1898, and revised in 1903); Public Health Reports (ed. Dr. E. Seaton), 2 vols. 1887 (with two portraits from photographs in 1848 and in 1876); English Sanitary Institutions, 1890; The Times, 25 July 1904; Lancet, vol. ii. 1904 (by Dr. J. F. Payne), pp. 308 et seq.; Brit. Med. Journal, vol. ii. 1904, pp. 265-356; Journal of Hygiene, vol. v. 1905, pp. 1-6; Proc. Roy. Soc., vol. lxxv. 1905 (by Sir John Burdon Sanderson); personal knowledge; private information.] E. C.

SIMONDS, JAMES BEART (1810-1904), veterinary surgeon, born at Lowestoft, Suffolk, on 18 Feb. 1810, was son of James Simonds (d. Oct. 1810) by his wife, a daughter of Robert Beart of Rickenhall, Suffolk, an agriculturist and horse-breeder. The father was grandson of James Simonds (born in 1717), who early left the original family home at Redenhall, Norfolk, for Halesworth, Suffolk. Of his five sons born there, Samuel (born in 1754), the fourth, who resided at Bungay in Suffolk, had four sons, the eldest (Samuel) and youngest (John) entering the veterinary profession; the second son, James, was father of the subject of this notice.

James Beart, brought up by his grandparents at Bungay, was educated at the Bungay grammar school, and entered the Veterinary College in London as a student on 7 Jan. 1828. He received his diploma to practise in March 1829, and succeeded to his uncle Samuel's business as a veterinary surgeon at Bungay. In 1836 he migrated to Twickenham, and shortly after took a share in organising the scientific work connected with the animals of the farm of the then newly established English Agricultural Society, of which he became an ordinary member on 25 July 1838 (honorary member, 3 April 1849; foundation life governor, 5 March 1890). In 1842 he was appointed to a new professorship of cattle pathology at the Veterinary College in Camden Town, and was made consulting veterinary surgeon to the Royal Agricultural Society (a position he held

for sixty-two years until his death). Settling in London, and disposing of his practice at Twickenham, he was active in the movement for obtaining the charter which was granted on 8 March 1844 to the Royal College of Veterinary Surgeons, of which in due course (1862-3), he became president. He took a prominent part in the efforts of the Royal Agricultural Society to popularise information amongst farmers as to the diseases of animals, and he investigated their causes and means of prevention. In 1857 he carried out an inquiry on the Continent into the cattle plague, which was then committing great ravages, and made a report of eighty-three pages thereon. His information proved useful on a sudden outbreak of the same disease in London in June 1865. The privy council office, owing to doubt of its legal powers, delayed the issue of an order for the slaughtering and burial in quicklime of all diseased animals, until the infection had spread over a great part of England. A veterinary department was improvised at the privy council office to deal with the matter. Simonds was appointed chief inspector and professional adviser, and amongst his helpers was Professor (afterwards Sir) George Thomas Brown [q. v. Suppl. II]. After the stamping out of the outbreak of cattle plague, which was estimated to have cost five millions sterling in money loss alone, it was decided to continue the veterinary department as a permanent branch of the council office, and Simonds remained at its head until November 1871, when he resigned in order to become principal of the Royal Veterinary College in succession to Professor Charles Spooner [q. v.]. Owing to failing health, he retired in June 1881 on a pension, removing to the Isle of Wight. He remained senior consulting veterinary surgeon to the Royal Agricultural Society until his death, at the age of ninety-four years, on 5 July 1904.

He was twice married, his first wife being his cousin, Martha Beart (*d.* 22 Aug. 1851), by whom he was father of James Sexton Simonds, for some time chief of the metropolitan fire brigade, and of two daughters. His second wife survived him.

[Autobiography, reprinted with portrait from the *Veterinarian*, vol. lxxvii. (1894), and privately issued in 1894; *Veterinary Record*, 9 July 1904; personal knowledge.] E. C.

SIMPSON, MAXWELL (1815-1902), chemist, was youngest son of Thomas Simpson, Beach Hill, co. Armagh, where he was

born on 15 March 1815. His mother's maiden surname was Browne. After attending Dr. Henderson's school at Newry he entered Trinity College, Dublin, in 1832. Here he made the acquaintance of Charles Lever, by whose advice he began to study medicine. He graduated B.A. in 1837, but left Dublin without a medical degree. On a visit to Paris he heard a lecture by the chemist Jean Baptiste André Dumas on chemistry, which induced him to study that subject seriously. For two years he worked under Thomas Graham [q. v.] at University College, London. On his marriage in 1845 he returned to Dublin, and in 1847 he became lecturer on chemistry in the Park Street Medical School, Dublin, and proceeded M.B. In 1849, on the closure of the Park Street School, he became a lecturer on chemistry in the Peter Street or 'Original' School of Medicine. In 1851 he was granted three years' leave of absence. He studied in Germany under Adolph Kolbe in Marburg and Robert Bunsen in Heidelberg, and accomplished his first original work. In 1854 he resumed his duties at Dublin, but in 1857 resigned his lectureship and again went to the Continent, working chiefly with Wurtz in Paris till 1859. In 1860 Simpson took a house in Dublin and fitted up a small laboratory in the back kitchen. There he pursued with ardour and success chemical investigations which placed him among the first chemists of his time. One of his earliest results was the discovery of a method of determining the nitrogen in organic compounds difficult to burn. He obtained synthetically for the first time succinic and certain other di- and tri-basic acids (*Phil. Trans.* 1860, p. 61; *Proc. Roy. Soc.* 1863, pp. 12, 236), while not a year passed without his publishing one or two papers of the first importance. In 1867 he revisited Wurtz's laboratory in Paris, and for a few subsequent years he lived in London. He acted as examiner at Woolwich, at Coopers Hill for the Indian Civil Service, and in the Queen's University of Ireland. In 1872 he was appointed professor of chemistry in Queen's College, Cork, and held the post till 1891, devoting himself to teaching, to the practical exclusion of research.

In 1862 Simpson was elected a fellow of the Royal Society, and he was a fellow of the Royal University of Ireland from 1882 to 1891. From Dublin he received the honorary degrees of M.D. in 1864 and LL.D. in 1878, and from the Queen's University of Ireland the honorary degree of D.Sc. in 1882. In 1868 he was elected an honorary fellow of the

King's and Queen's College of Physicians. He became a fellow of the Chemical Society in 1857, and was vice-president from 1872 to 1874. He was president of the chemical section of the British Association at its Dublin meeting in 1878.

After his retirement in 1891 from the chair of chemistry at Cork, he resided in London, and died at 7 Darnley Road, Holland Park Avenue, London, on 26 Feb. 1902. He was buried in Fulham cemetery.

He married in 1845 Mary (*d.* 1900), daughter of Samuel Martin of Longhorne, co. Down, and sister of John Martin, M.P., the Irish politician [q. v.]. She was enthusiastically interested in her husband's work. There were six children of the marriage, of whom two survived him. Simpson was a man of wide culture, lively humour, and kindly personality.

[Obituary Notices in Year-Book of the Royal Society, 1903; Transactions of the Chemical Society (by Prof. A. Senier), June 1902; The Times, 8 March 1902; Cameron's History of the Royal College of Surgeons in Ireland; Todd's Catalogue of Graduates in the University of Dublin; MS. SIMPSON, WILFRED. [See HUDLESTON, WILFRED HUDLESTON, F.R.S. (1828-1909), geologist.]

SINGLETON, MRS. MARY. [See CURRIE, MARY MONTGOMERIE, LADY CURRIE (1843-1905), author under the pseudonym of 'VIOLET FANE.']

SKIPSEY, JOSEPH (1832-1903), the collier poet, born on 17 March 1832 at Percy, a parish in the borough of Tynemouth, Northumberland, was youngest of the eight children of Outhbert Skipsey, a miner, by his wife Isabella Bell. In his infancy his father was shot in a collision between pitmen and special constables during some labour disturbances. Skipsey, who worked in the coal pits from the age of seven, had no schooling, but he soon taught himself to read and write. Until he was fifteen the Bible was the only book to which he had access. After that age he managed to study Milton, Shakespeare, Burns, and some translations from Latin, Greek, and German, particularly the poems of Heine and Goethe's 'Faust.' In 1852 he walked most of the way to London; and after finding employment connected with railway construction, and marrying his landlady, returned to work first at Coatbridge in Scotland for six months, then at the

Pembroke Collieries near Sunderland, and subsequently at Choppington. In 1859 he published a volume of 'Poems,' no copy of which seems extant (cf. pref. to *Miscellaneous Lyrics*, 1878). The book attracted the attention of James Clephan, editor of the 'Gateshead Observer,' who obtained for him the post of under storekeeper at the Gateshead works of Hawks, Crawshaw, and Sons. In 1863, after a fatal accident to one of his children in the works, he removed to Newcastle-on-Tyne, to become assistant librarian to the Newcastle Literary and Philosophical Society. The duties proved uncongenial, and he returned in 1864 to mines near Newcastle, remaining at work for various coal firms until 1882. Subsequently he obtained lighter employment. From 1882 to 1885 he and his wife were caretakers of the Bentinck board schools in Mill Lane, Newcastle. From September 1888 to June 1889 he was janitor at the Armstrong College (Durham University College of Science).

Meanwhile his poetic and intellectual faculty steadily developed, and his literary ambitions were encouraged by his friend Thomas Dixon, the working-man of Sunderland to whom Ruskin addressed the twenty-five letters published as 'Time and Tide by Weare and Tyne.' Skipsey published 'Poems, Songs, and Ballads' (1862); 'The Collier Lad, and other Lyrics' (1864); 'Poems' (1871); and 'A Book of Miscellaneous Lyrics' (1878, re-issued with additions and omissions as 'A Book of Lyrics,' 1881). There followed 'Carols from the Coalfields' (1886); and 'Songs and Lyrics' (1892). Skipsey's published work soon received praise from critics of insight. D. G. Rossetti commended his poems of mining life. 'A Book of Miscellaneous Lyrics' was appreciatively reviewed in the 'Athenæum' (16 Nov. 1878) by Theodore Watts-Dunton. Oscar Wilde likened his 'Carols from the Coalfields' to the work of William Blake. In 1884-5 Skipsey acted as first general editor of the 'Canterbury Poets' (published by Walter Scott of Newcastle), and wrote rhetorical and discursive but suggestive prefaces to the reprints of the poetry of Burns (two essays), Shelley, Coleridge, Blake, and Poe. A lecture, 'The Poet as Seer and Singer,' was delivered before the Newcastle-on-Tyne Literary and Philosophical Society in 1883, and was published in 1890.

Meanwhile in 1880 Dixon brought Skipsey to London and introduced him to Burne-Jones, to whose efforts the grant of

a civil list pension of 10% (raised in 1886 to 25%, with a donation of 50% from the Royal Bounty Fund) was largely due. On 24 June 1889 Skipsey and his wife were appointed custodians of Shakespeare's birthplace at Stratford-on-Avon on the recommendation of Browning, Tennyson, Burne-Jones, John Morley, Dante Gabriel Rossetti, William Morris, and other literary men of eminence. But he soon grew impatient of the drudgery of acting as cicerone to miscellaneous tourists, and he resigned the post on 31 Oct. 1891 (cf. HENRY JAMES'S story, 'The Birthplace,' in *The Better Sort*, 1903, which was suggested by a vague report of Skipsey's psychological experience at Stratford-on-Avon). Thenceforth Skipsey and his wife subsisted in the north on his pension and the assistance of his children, with whom they lived in turns. Visits to the English Lakes and to Norway (with Newcastle friends, Dr. and Mrs. Spence Watson) varied the seclusion of his last years. He died at Gateshead, in the house of his son Cuthbert, on 3 Sept. 1903, and was buried in Gateshead cemetery. In 1854 he married Sara Ann (daughter of Benjamin and Susan Hendley), the proprietress of the boarding-house at which he was staying in London. His wife died in August 1902. Two out of five sons and the eldest of three daughters survived him.

Skipsey's poems were mainly lyrical, although he occasionally attempted more sustained flights, and they show the influence of Burns and Heine. He is at his best in the verse which was prompted by his own experience as a pitman. He acquired the habit of carefully revising his work, but he failed to conquer a native ruggedness of diction. De Chatelain translated his 'Fairies' Parting Song' and other shorter poems in his 'Beautés de la poésie anglaise,' vol. iii. A projected 'History of Aestheticism' proved beyond his powers. For a time he put faith in spiritualism, conceiving himself to be a clairvoyant, and he left some unpublished writings on the subject.

A portrait of Skipsey was painted by a German artist for Wigham Richardson, a member of a firm of shipbuilders of Walker-on-Tyne, and hangs in the Mechanics' Institute there.

Edward Burne-Jones, ii. 107-8; Shakespeare's Birthplace records; private information.]

E. S. H.-R.

SLANEY, WILLIAM SLANEY KENYON- (1847-1908), colonel and politician. [See KENYON-SLANEY.]

SMEATON, DONALD MACKENZIE (1846-1910), Anglo-Indian official, born at St. Andrews on 9 Sept. 1846, was eldest of the twelve children of David James Smeaton, schoolmaster of Letham House, Fife, and Abbey Park, St. Andrews, by his wife Elizabeth, daughter of Capt. Donald Mackenzie of the 42nd Black Watch, who fought through the Peninsular war and at Waterloo. His ancestors included Thomas Smeton [q. v.], the first principal of Glasgow University, and John Smeaton, the engineer [q. v.]. His next brother, Robert Mackenzie (1847-1910), was his colleague in the civil service of the North-West provinces of India and a member of the local legislative council.

Smeaton was educated at his father's efficient school, Abbey Park, St. Andrews, and at the university there, where he graduated M.A. He passed second in the Indian civil service examination of 1865, and arriving in India in November 1867, served in the North-West provinces as assistant magistrate and collector, and from May 1870 in the settlement department. He won a medal and 100% for proficiency in oriental languages. In 1873 he published an annotated edition of the revenue act of the provinces, and in 1877 a useful monograph on Indian currency. In April 1879 he was sent to Burma to organise the land revenue administration there, and in May 1882 he was appointed secretary in that department and director of agriculture.

After serving as director of agriculture and commerce in the North-West provinces from May 1886, he returned in April 1887 to Burma, on the annexation of the upper province, as officiating chief secretary to the chief commissioner, Sir Charles Bernard [q. v. Suppl. II]. In Upper Burma he closely studied the hill races of the new province, and he embodied his inquiries in 'Loyal Karens of Burma' (1887), which is the standard work on its theme. In May 1888 he became commissioner of the central division of Upper Burma, and his vigorous work in suppressing dacoits gained him the Burma medal with two clasps. Smeaton's interest in the people and mastery of their vernaculars

established his influence over both the Burmans and the semi-civilised hill tribes. In March 1891 he was appointed financial commissioner of Burma, and helped to develop the mining industries, while rigidly abstaining from any private investments. Acting chief commissioner in May 1892, and also from 25 April to 9 Aug. 1896, he officially represented Burma on the supreme legislative council from 1898 to 1902. In the council he showed characteristic independence. He advocated an amendment of the Lower Burma chief courts bill, which the government of India opposed, and he boldly criticised Indian land revenue policy in March 1902. Selected by Lord Curzon to be secretary of the famine relief committee of 1900, he showed an energy which was acknowledged by the award of the Kaisar-i-Hind medal of the first class on its institution in May 1900. Disappointed of the lieutenant-governorship of Burma in succession to Sir Frederick Fryer, he retired from the service in 1902.

Settling for five years at Winchfield, Hampshire, Smeaton interested himself in local affairs and in the cause of the liberal party. He subsequently removed to Gomshall, Surrey. On platforms in London and in Scotland he urged reform of the government of India (cf. *A Future for India*, a reprint from *India*, 12 Feb. 1904), but he did not identify himself with the extreme section of Indian agitators. At the general election of 1906 he was elected liberal M.P. for Stirlingshire. In parliament he supported the strong measures taken by the Indian government against disorder in 1907 and 1908, and in the debates on the Indian Councils Act, 1909, embodying Lord Morley's reforms, he acknowledged the importance of maintaining the essentials of British authority. He worked hard in committee of the House of Commons, and followed Scottish questions with assiduity, speaking briefly and to the point, and obeying the party 'Whip' with conscientious discrimination. Failing health disabled him from offering himself for re-election on the dissolution in January 1910. He died on 19 April 1910 at his residence, Lawbrook, Gomshall, Surrey, and was buried at Peaslake, Surrey. An oil painting by Mr. H. J. C. Bryce belongs to his widow. He married twice: (1) on 2 Feb. 1873 Annette Louise, daughter of Sir Henry Lushington, fourth baronet; she died on 17 Jan. 1880; by her he had a son, Arthur Lushington, lieutenant in the 18th Tiwana lancers, who was killed at polo in July 1903, and a daughter; and (2) on

12 Nov. 1894 Marion, daughter of Major Ansell of the 4th (K.O.) regiment; she survived him with one daughter.

[India List, 1910; Ind. Finan. Statement and Discussion thereon for 1902-3; Parly. Debates, 1906 to 1909; Rangoon Gaz. and Rangoon Times of various dates; Pioneer, 5 and 20 Feb. 1902; The Times, 21 April 1910; personal knowledge; information kindly supplied by Mrs. Smeaton.] F. H. B.

SMILES, SAMUEL (1812-1904), author and social reformer, born at Haddington on 23 Dec. 1812, was one of eleven children of Samuel Smiles, at first a paper maker and afterwards a general merchant, who died of cholera early in 1832. His mother was Janet, daughter of Robert Wilson of Dalkeith. His paternal grandfather was an elder and field-preacher of the Cameronians, the sect which suffered persecution in Charles II's reign.

After education at Haddington grammar school, Smiles was bound apprentice for five years on 6 Nov. 1826 to a firm of medical practitioners in the town. Dr. Lewins, one of the partners, moved to Leith in 1829 and took Smiles with him. The lad matriculated at Edinburgh University in Nov. 1829 and attended the medical classes there. John Brown [q. v.], author of 'Rab and his Friends,' was a fellow student. On the expiration of his apprenticeship he took lodgings in Edinburgh and, pursuing his medical education, obtained his medical diploma on 6 Nov. 1832. Thereupon he settled as a general practitioner at Haddington, but his ambitions travelled beyond the routine of his profession, and he soon supplemented his narrow income by popular lectures on chemistry, physiology, and the conditions of health, as well as by contributions to the 'Edinburgh Weekly Chronicle.' In 1837 he published at Edinburgh, at his own expense, 750 copies of 'Physical Education, or the Nurture and Management of Children' (2nd edit. 1868). The work was generally commended. A new edition with additions by Sir Hugh Beevor, bart., appeared in 1905.

Discontented with the prospects of his Haddington practice and anxious to widen his experience, Smiles, in May 1838, sold such property as he possessed and left Haddington for Hull, with a view to a foreign tour. From Rotterdam he went to Leyden, where he submitted himself to examination for a degree. A pedestrian tour followed through Holland and up the Rhine. In Sept. 1838 he paid a first visit to London, lodging in the same boarding

house (in Poland Street, Oxford Street) as Mazzini, and presenting introductions to (Sir) Rowland Hill. On his way north he visited Ebenezer Elliott at Sheffield. Thence in answer to a newspaper advertisement, he passed to Leeds to fulfil an engagement on the 'Leeds Times,' an organ of advanced radicalism, from the editorship of which Robert Nicoll [q. v.] had just retired. In Nov. 1838 Smiles became editor at a salary of 200*l.* a year.

At Leeds Smiles combined with his editorial duties an active share in political agitation in the advanced liberal cause. He was the first secretary of the Leeds 'Household Suffrage Association' for the redistribution and extension of the franchise. At public meetings in the city and its neighbourhood he advocated the anti-corn law movement. He corresponded with Cobden and enthusiastically supported Joseph Hume's abortive candidature for the representation of Leeds at the general election of 1841. While he opposed chartism, he urged the social and intellectual amelioration of the working classes, and interested himself in industrial organisation and the progress of mechanical science. In 1842 he resigned the editorship of the 'Leeds Times.' Devoting himself to popular lecturing and literary hack work, he prepared guides to America and the colonies, and brought out in 1843, in monthly numbers, 'A History of Ireland and the Irish People under the Government of England,' which was published collectively in 1844.

In June 1840 Smiles had attended the opening of the North Midland railway from Leeds to Derby, and met for the first time George Stephenson. When, at the end of 1845, the Leeds and Thirsk railway was projected, Smiles was appointed assistant secretary. He was closely associated with railway enterprise for the next twenty-one years. The new Thirsk line was opened on 9 July 1849. In the same year Smiles published an essay on 'Railway Property, its Conditions and Prospects,' which ran through two editions. Smiles also acted as secretary of the board which managed the new Leeds central station, into which many companies ran their trains. He was prominent in the negotiations for the amalgamation of the Leeds and Thirsk railway with the North Eastern, which was effected in 1854 and abolished his own office. Thereupon he left Leeds for London on being appointed secretary to the South Eastern railway (11 Nov.). He held the post for twelve years, in the

course of which he successfully arranged for the extension of the line from Charing Cross to Cannon Street (1853-9).

Smiles's railway work had not blunted his energies as an advocate, in the press and on the lecture platform, of political and social reform, in agreement with the principles of the Manchester school. In the 'Constitutional,' a Glasgow paper, he urged the transference of private bills to local legislatures. He wrote much in behalf of workmen's benefit societies in the 'Leeds Mercury' and elsewhere, and for a time edited the 'Oddfellows' Magazine.' He championed state education. The formation of public libraries was one of his strenuous interests, and he gave evidence in their favour before a House of Commons committee in 1849, welcoming the permissive Library and Museums Act of the following year. From 1855 Smiles wrote occasionally on industrial subjects to the 'Quarterly Review'; an article on 'Workmen's Earnings, Strikes, and Savings' was reissued as a pamphlet in 1861. A speech at Huddersfield on the 'Industrial education of foreign and English workmen' was published in 1867.

Smiles was drawn to the study and writing of biography, in which he made his chief reputation, by the sanguine belief that concrete examples of men who had achieved great results by their own efforts best indicated the true direction and goal of social and industrial progress. On the death in 1848 of George Stephenson, with whom he had come into occasional contact at Leeds, he wrote a memoir in 'Eliza Cook's Journal' in 1849, and afterwards persuaded Stephenson's son Robert to allow him to write a full life. The book appeared in June 1857, and was received with enthusiasm; 2500 copies were sold before September, 7500 within a year. An American reprint appeared at Boston in 1858. An 18th thousand was reached in 1864, and an abridgment came out in 1859. The biography fully maintained its popularity in subsequent years. Fresh work on the same lines soon followed. In 1861-2 he produced 'Lives of the Engineers' (3 vols.); in 1863 'Industrial Biography: Iron Workers and Tool Makers'; and in 1865 'Lives of Boulton and Watt.' A new edition of the 'Life of George Stephenson' in 1868 contained an account of the son, Robert Stephenson. All these volumes were reissued under the single title of the 'Lives of the Engineers' in 1874 in 5 vols. (popular edit. 1904). Smiles had full access to manuscript sources, and

the books are standard contributions to English biographical literature. A French translation of all the volumes came out in 1868. A supplemental compilation, 'Men of Invention and Industry,' appeared in 1884.

As early as March 1845 Smiles had delivered, at a small mutual improvement society at Leeds, an address on the education of the working classes, in which he showed how many poor men had created for themselves, with beneficial effect on their careers, opportunities of knowledge and culture. The lecture, which owed something to George Lillie Craik's 'Knowledge pursued under Difficulties' (1830-1), was constantly repeated with expansion, and was received with great applause in many parts of the country. By degrees Smiles enlarged the lecture into a substantial treatise under the title of 'Self-Help, with Illustrations of Character and Conduct.' The MS. was refused in 1855 by the publisher Routledge, but in July 1859 John Murray, who published Smiles's 'George Stephenson' and the other engineering biographies, undertook the publication on commission. An immense success was the result: 20,000 copies were sold in the first year; 55,000 by 1864; 150,000 by 1889, and 120,000 copies since. The book impressed the public to whom it was especially addressed, and Smiles was in constant receipt of assurances of the practical encouragement which he had given artisans in all parts of the world. 'Self-Help' was translated into almost all foreign languages—including Dutch, German, Danish, Swedish, Spanish, Italian, Turkish, Arabic, Japanese, and the native tongues of India. In succeeding volumes, 'Character' (1871), 'Thrift' (1875), 'Duty' (1880), and 'Life and Labour' (1887), Smiles pursued his useful scheme of collecting biographical facts and co-ordinating them so as to stimulate good endeavour. Repetition in these volumes was inevitable, and the triumph of 'Self-Help' did not recur. 'Character' approached but failed to reach the great sales of its predecessor. Yet all but the latest of these books achieved exceptional circulations in English-speaking countries as well as in foreign translations. In 1875 Smiles successfully brought an action against a Canadian publisher named Belford for smuggling into the United States pirated copies of 'Thrift.'

On 30 Aug. 1866 he left the South Eastern railway, receiving a service of plate from the directors and staff with a pass over the company's lines. He thereupon became

president of the National Provident Institution, and in that capacity travelled much about the country. A lecture on a fresh topic, 'The Huguenots in England and Ireland,' which he delivered at Dublin to the Young Men's Christian Association, while on a business journey, was developed into a volume on 'The Huguenots: their Settlements, Churches and Industries in England and Ireland' (published Nov. 1867); 10,000 copies were rapidly sold.

A sharp stroke of paralysis, the result of overwork, in Nov. 1871 disabled Smiles for a year, and he retired from the National Provident Institution. But he made a good recovery, and thenceforth divided his time between literature on much the same lines as before, and travel during which he amused himself by close observation of racial characteristics. Besides tours in Ireland and Scotland, he visited the Huguenot country in the south of France, and embodied new researches in 'The Huguenots in France after the Revocation of the Edict of Nantes; with a Visit to the Vaudois' (1874). He returned to the south of France in 1881 to study the Basque people and language, and in the Gascon country during 1888 he collected details of the biography of the barber-poet of Agen, Jacques Jasmin (1798-1864), whose career illustrated his favourite text and of whom he published a memoir in 1891. In 1871 and 1881 he made a tour in Friesland and neighbouring lands, and in 1884 through the west coast of Norway. He thrice visited Italy, where his works enjoyed a wide circulation, and on his second visit in the spring of 1879 he was accorded a great reception in Rome, where he visited Garibaldi and Queen Margherita. Next year he received the Italian order of St. Maurice and St. Lazarus. On visits to Scotland he found fresh biographical materials of the kind which specially appealed to him, and he brought out lives of the self-taught Scotch naturalist, Thomas Edward of Banff, in 1876, and of Robert Dick, a baker of Thurso, who was also a botanist and geologist, in 1878.

Smiles lived at Blackheath until 1874, when he settled in Kensington. In 1878 he received the hon. degree of LL.D. from Edinburgh, and in the same year he issued a life of the philanthropist, George Moore, a task which he undertook reluctantly, but which was more popular than any of his later publications. He printed for the first time James Nasmyth's autobiography in 1883, but the edition had a scanty sale. Subsequently, for his friend and publisher John Murray, Smiles produced in 1891

'A Publisher and his Friends: Memoir and Correspondence of the late John Murray, with an Account of the Origin and Progress of the House, 1768-1843' (2 vols.; abridged edit. 1911). In 1894 there followed 'Josiah Wedgwood, F.R.S., his Personal History.' His last years were mainly spent on an unpretentious autobiography, bringing his career to 1890; it was edited for posthumous issue in 1905 by his friend Thomas Mackay. Smiles's powers slowly failed, and he died at his residence at Kensington on 16 April 1904, being buried at Brompton Cemetery.

Smiles married at Leeds, on 7 Dec. 1843, Sarah Ann Holmes (*d.* 1900), daughter of a Leeds contractor, and had issue three daughters and two sons. He edited in 1871 'A Boy's Voyage round the World in 1868-9,' by his younger son.

A portrait painted by Sir George Reid is in the National Portrait Gallery; it was etched by Paul Rajon. A sketch of Smiles was made at Rome by Guglielmo de Sancto in March 1889. Rossetti, an Italian sculptor, also executed a bust at Rome in 1879.

[Smiles's Autobiography, ed. Thomas Mackay, 1905; *The Times*, 17 April 1904; T. Bowden Green's Samuel Smiles, his Life and Work, with pref. by Mrs. Alec Tweedie, 1904 (a slight pamphlet with portraits); Sarah Tytler's Three Generations, 1911.] S. L.

SMITH, SIR ARCHIBALD LEVIN (1836-1901), judge, born at Salt Hill near Chichester on 27 Aug. 1836, was only son of Francis Smith of that place, by his wife Mary Ann, only daughter of Zadik Levin. After attending Eton, and receiving private tuition at home and at Chichester, he completed his education at Trinity College, Cambridge, where he graduated B.A. in 1858. Like several of his contemporaries on the judicial bench, he rowed in the university eight in the Oxford and Cambridge boat-race three years running (1857, 1858, 1859). On the last occasion the race was rowed in a gale of wind, and the Cambridge boat filled and sank between Barnes Bridge and the finish. According to tradition, Smith alone of the Cambridge oarsmen could not swim, and sat stolidly rowing until, when the water was up to his neck, he was rescued not without difficulty. Smith was also through life a good cricketer, playing frequently for the Gentlemen of Sussex. He had entered as a student of the Inner Temple on 27 May 1856, and was called on 17 Nov. 1860, when he joined the home circuit. He rapidly acquired a good and increasing junior practice, being largely employed in commercial cases and in election

petitions, and having a full pupil-room. In 1879, on the appointment of Charles (afterwards Lord) Bowen [*q. v.* Suppl. I] to a judgeship, he was nominated by Sir John Holker [*q. v.*], attorney-general, to be standing junior counsel to the treasury, and after an unusually short tenure of that office he was made a judge of the Queen's Bench Division in 1883. He was elected a bencher of his inn on 12 April, and was knighted on 20 April of that year.

Smith, big and strong physically, was devoted to sport, and was in an exceptional degree 'a good fellow.' To these advantages he added cheerful and unremitting industry and great natural acuteness. Consequently it mattered very little that his voice was weak, or that he had no gift of eloquence, his language being to the end of his life confined to the homeliest vernacular. He was extremely fond of shooting and fishing; he was (in 1899) president of the M.C.C., and the university boatrace and cricket-match aroused his never-failing interest. He was, in the best sense of the words, a man of the world, and his honesty, vigour, and good sense were everywhere recognised.

In 1888 Smith was appointed a special commissioner with Sir James Hannen [*q. v.*] and Mr. Justice Day to inquire into allegations published by 'The Times' affecting C. S. Parnell and other Irish nationalists. During the sitting of this tribunal the commissioners adopted a practice of silence. On one occasion, when the president, Hannen, who had a gift for saying much in the fewest words, observed that he had not thought or imputed something of which some of those appearing before the commission had complained, Smith said 'Nor I,' and Day made an inarticulate sound of concurrence; but it was believed that, with this exception, neither of the junior judges said a word during the prolonged proceedings. Smith tried, while he was in the Queen's Bench Division, the first case heard under the Foreign Enlistment Act, 1870, when a Colonel Sandoval was convicted of fitting out a hostile expedition against Venezuela, and was sentenced to three months' imprisonment.

In 1892 Smith was promoted, with general approval, to the Court of Appeal, his original colleagues there being Esher, Master of the Rolls, Lindley, Bowen, Fry, and Kay. Esher had much in common with Smith; the others were all more learned lawyers. Smith's modesty, force of character, and great intelligence enabled him however to hold his own so effectively that he was appointed in October 1900

without any sign of dissatisfaction to succeed Lord Alverstone as Master of the Rolls. His health and strength soon began to fail. In August 1901 his wife, who had suffered from a long and distressing illness, was drowned in the Spey, near Aberlour, almost in his presence. Smith never recovered from the shock, and died at Wester-Elchies House, Aberlour, Morayshire, the residence of his son-in-law, Mr. Grant, on 20 Oct. 1901, a few days after resigning the mastership of the rolls. He was buried at Knockando, Morayshire. Smith married in 1867 Isobel, daughter of John Charles Fletcher, and left two sons and three daughters.

Smith contributed to 'The Walkers of Southgate' (1900) a chapter entitled 'Reminiscences by an old friend.'

[Foster's Men at the Bar; The Times, 21 Oct. 1901; Haygarth's Cricket Scores and Biographies, viii. 319; Wisden's Cricketers' Almanack for 1902, p. lxx.] H. S.

SMITH, SIR CHARLES BEAN EUAN- (1842-1910), diplomatist. [See EUAN-SMITH.]

SMITH, SIR FRANCIS, afterwards SIR FRANCIS VILLENEUVE (1819-1909), chief Justice of Tasmania, born at Lindfield, Sussex, on 13 Feb. 1819, was elder son of Francis Smith, then of that place, and a merchant of London, by his wife Marie Josephine, daughter of Jean Villeneuve. At an early age Smith accompanied his father to Van Diemen's Land (now Tasmania), where the latter purchased an estate called Campania, near Richmond, in that colony. Returning to England for his education, he attended University College, London, and London University, where he graduated B.A. in 1840 and took a first prize in international law. He was called to the bar by the Middle Temple on 27 May 1842, and was a bencher of his Inn from 1890 to 1898. In October 1844 he was admitted to the bar of Van Diemen's Land.

During 1848 he acted as solicitor-general of the colony in the absence on leave of A. C. Stonor. On 1 Jan. 1849 he was appointed crown solicitor and clerk of the peace, and again acted as solicitor-general from 15 Dec. 1851 to 1 Aug. 1854, when he was appointed attorney-general, taking office only on the condition of being at liberty to oppose the influx of convicts into the colony. He retained the post until the change in the constitution in 1856, when his office was abolished and he

was granted 4500*l.* as compensation. On 15 Dec. 1851 he was nominated a member of the legislative council.

Although opposed to the introduction of responsible government on the ground that the colony did not possess a leisured class from which suitable ministers could be drawn, and that the system would involve constant changes of administration, yet Smith was returned as one of the representatives of Hobart in the first House of Assembly, and accepted the portfolio of attorney-general in the first responsible ministry, which was formed by W. T. Champ on 1 Nov. 1856; he was also sworn a member of the executive council. Champ's administration fell by an adverse vote in the house on 26 Feb. 1857, but Smith returned to office on 25 April as attorney-general in W. P. Weston's government. On 12 May 1857 he took over the duties of premier in addition to those of attorney-general, and the re-constructed ministry remained in office for three years and a half. During that time much legislation of a useful character was passed, including the settlement of the long-pending 'Abbott claim,' the establishment of scholarships, the liberalising of the land laws, and the amendment of the Constitution Act.

On 1 Nov. 1860 Smith was made a puisne judge of the supreme court, and on 5 Feb. 1870 he was appointed chief justice in succession to Sir Valentine Fleming. In that position his legal knowledge and ability, combined with his high character, won for him every confidence. Twice he administered the government of the colony in the absence of the governor, viz. from 30 Nov. 1874 to 13 Jan. 1875, and again from 6 April to 21 Oct. 1880. He was knighted by patent on 18 July 1862, and retired on a pension 31 March 1884. He spent his remaining years in England, and died on 17 Jan. 1909 at his residence, Heathside, Tunbridge Wells. His remains were cremated at Golder's Green.

Smith married on 4 May 1851 Sarah (d. 29 July 1909), only child of the Rev. George Giles, D.D., and left one son and two daughters. In 1884 he assumed the additional name of Villeneuve.

SMITH, GEORGE (1824-1901), publisher, the founder and proprietor of the Dictionary. [See Memoir prefixed to the First Supplement.]

SMITH, GEORGE BARNETT (1841-1909), author and journalist, born at Owendun, Yorkshire, on 17 May 1841, was son of Titus and Mary Smith. Educated at the British Lancastrian school, Halifax, he came in youth to London, and there worked actively as a journalist. From 1865 to 1868 he was on the editorial staff of the 'Globe,' and from 1868 to 1876 on that of the 'Echo.' He was subsequently a contributor to the 'Times.' With literary tastes and poetical ambition, Smith managed to become a contributor to the chief magazines, among them the 'Edinburgh Review,' the 'Fortnightly Review,' and the 'Cornhill Magazine.' Although he lacked scholarly training, he was an appreciative critic. A memoir of Elizabeth Barrett Browning in the ninth edition of the 'Encyclopædia Britannica' (1876) satisfied Robert Browning, with whom Smith came into intimate relations. It was the poet's custom to send Smith proof-sheets of his later volumes in advance, to enable him to write early reviews.

An industrious compiler, Smith gained the ear of the general public by a long series of biographies, the first of which dealt with Shelley (1877). A strong liberal in politics, he was more successful in his 'Life of W. E. Gladstone' (1879; 14th edit. 1898), and in his 'Life and Speeches of John Bright' (1881). There followed popular lives of Victor Hugo (1885), Queen Victoria (1886; new edit. 1901), and the German Emperor William I (1887). His most ambitious publication, 'History of the English Parliament' (2 vols. 1892), occupied him five years, and claimed to be 'the first full and consecutive history of Parliament as a legislative institution from the earliest times to the present day'; but Smith's historical faculty was hardly adequate to his task.

Interested in art, Smith in his leisure practised etching with success. Several specimens of his work were included in 'English Etchings' (1884-7). An etching by him of Carlyle was purchased by Edward VII when Prince of Wales.

In 1889 lung-trouble forced Smith to leave London for Bournemouth, and for the rest of his life he was an invalid. A conservative government granted him a civil list pension of 80*l.* in 1891, and a liberal government increased it by 70*l.* in 1906.

Writing to the last, he died at Bournemouth on 2 Jan. 1909, and was buried in the cemetery there. Smith was twice married: (1) to Annie Hodson (*d.* 1868); (2) in 1871, to Julia Timmis, who survived him. He had four daughters, of whom two survived him. An etching of him by Mortimer Menpes and an oil-painting by Rosa Corder are in the possession of his widow.

Smith published under the pseudonym of Guy Roslyn three volumes of verse and 'George Eliot in Derbyshire' (1876). He was an occasional contributor to the early volumes of this Dictionary. Among works not already noticed are the following: 1. 'Poets and Novelists,' 1875. 2. 'English Political Leaders,' 1881. 3. 'Women of Renown,' 1893. 4. 'Noble Womanhood,' 1894. 5. 'The United States,' 1897. 6. 'Canada,' 1898. 7. 'Heroes of the Nineteenth Century,' 3 vols. 1899-1901. 8. 'The Romance of the South Pole,' 1900.

[Letters of Robert Browning, privately printed by T. J. Wise, 1895; Brit. Mus. Cat.; The Times, 4 Jan. 1909; private information.]

SMITH, GEORGE VANCE (1816?-1902), unitarian biblical scholar, son of George Smith of Willington, near Newcastle-on-Tyne, was born in October, probably 1816 (he himself was not sure of the exact year), at Portarlinton, King's and Queen's Cos., where his mother (Anne Vance) was on a visit. Brought up at Willington, he was employed at Leeds, where his preparation for a college course was undertaken by Charles Wicksteed (1810-1885), then minister of Mill Hill chapel. In 1836 he entered Manchester College (then at York) as a divinity student under Charles Wellbeloved [q. v.], John Kenrick [q. v.], and William Hincks [see HINCKS, THOMAS DIX]. In 1839-40 he was assistant tutor in mathematics. Removing with the college to Manchester in 1840, he pursued his studies under Robert Wallace [q. v.], James Martineau [q. v. Suppl. I], and F. W. Newman [q. v. Suppl. I], and graduated B.A. in 1841 at the London University, to which the college was affiliated. His first ministry was at Chapel Lane, Bradford, West Riding, where he was ordained on 22 Sept. 1841. He removed to King Edward Street chapel, Macclesfield, in 1843, remaining till 1846, when he was appointed vice-principal, and professor of theology and Hebrew, in Manchester College. On Kenrick's retirement in 1850 from the principalship Smith was appointed his successor. In 1853, on the removal of the college to London, John

James Taylor was made principal, and Smith professor of critical and exegetical theology, evidences of religion, Hebrew, and Syriac. He resigned in 1857, went abroad, and obtained at Tübingen the degrees of M.A. and Ph.D. In 1858 he became Wellbeloved's assistant and successor at St. Saviourgate chapel, York.

In 1870, after Kenrick had declined to serve on the score of age, Smith accepted Dean Stanley's invitation to join the New Testament revision company. His participation in the celebration of the eucharist in Henry VII's chapel, Westminster Abbey, on the morning of the first meeting of the company (June 1870) led to much criticism. The upper house of the Canterbury convocation, on the motion of Samuel Wilberforce [q. v.], passed a resolution condemning the appointment to either company of any person 'who denies the Godhead of our Lord,' and affirming that any such one should cease to act; a similar resolution was rejected by the lower house (Feb. 1871). Smith bore all this with an inflexible and irritating calmness. His work as a reviser was diligent and conscientious, though he was often in a minority of one. In 1873 the university of Jena made him D.D.

In July 1875 Smith left York for the ministry of Upper chapel, Sheffield, but in September 1876 he was promoted to the principalship of the Presbyterian College, Carmarthen, an office which he held till 1888, combining with it from 1877 the charge of Park-y-velvet chapel, Carmarthen. Retiring from the active ministry, he resided first at Bath, and latterly at Bowdon, Cheshire. Among unitarians his position was that of a mild conservatism; hence he was more at home in Carmarthen College than he had been in the atmosphere of the Manchester College. He died at Cranwells, Bowdon, on 28 Feb. 1902, and was buried at Hale, Cheshire, on 4 March. He married (1) in 1843 Agnes Jane, second daughter of John Fletcher of Liverpool, by whom he had three sons and one daughter; and (2) in 1894 Elizabeth Anne, daughter of Edward Todd of Tadcaster, who survived him.

Besides sermons and lectures, singly and in collections, his chief works are: 1. 'The Priesthood of Christ,' 1843 (Letters to John Pye Smith, D.D.; two series). 2. 'English Orthodoxy, as it is and as it might be,' 1863. 3. 'Eternal Punishment,' 1865, 12mo; 4th edit. 1875 (reprinted in 'The Religion and Theology of Unitarians,' 1906). 4. 'The Bible and Popular Theology,' 1871 (3rd edit. 1872); revised as 'The Bible

and its Theology as popularly taught,' 1892, 1901. 5. 'The Spirit and the Word of Christ,' 1874; 2nd edit. 1875. 6. 'The Prophets and their Interpreters,' 1878. 7. 'Texts and Margins of the Revised New Testament affecting Theological Doctrine,' 1881. 8. 'Chapters on Job for Young Readers,' 1887. 9. 'Confession of Christ what it is not, and what it is,' 1890. He translated in an abridged form Tholuck's 'The Credibility of the Evangelic History Illustrated,' 1844; 'The Prophecies relating to Nineveh and the Assyrians, translated . . . with Introduction and Notes,' 1857; and in 'The Holy Scriptures of the Old Covenant,' 1857-62 (a continuation of Wellbeloved's work), I and II Samuel, Ezra, Nehemiah, Esther, Isaiah, Jeremiah, and Lamentations. To J. R. Beard's 'Voices of the Church' (1845) he contributed 'The Fallacy of the Mythical Theory of Dr. Strauss.'

[The Times, 4 March 1902; Services at Chapel Lane, Bradford, 1841; Manning, Hist. of Upper Chapel, Sheffield, 1900 (portrait); memoir (by present writer) in Christian Life, March 1902; information from Rev. G. Hamilton Vance.] A. G.

SMITH, GOLDWIN (1823-1910), controversialist, was born on 13 Aug. 1823 at 15 Friar Street, Reading, where a tablet now records the fact. His father, Richard Prichard Smith (1795-1867), a native of Castle Bromwich, Warwickshire, was son of Richard Smith (1758-1820), rector of Long Marston, Yorkshire; he was educated at Repton and at Caius College, Cambridge, where he graduated M.B. in 1817 and M.D. in 1825; was elected F.R.C.P. in 1826; practised with great success for many years at Reading; helped to promote the Great Western railway, of which he became a director, and ultimately retired to a large country house, Mortimer House, eight miles from Reading. Goldwin Smith was his son by his first wife, Elizabeth, one of the ten children of Peter Breton, of Huguenot descent. She died at Reading on 19 Nov. 1833, and was buried in St. Lawrence's churchyard, having borne her husband three sons and two daughters, of whom only Goldwin survived youth. In 1839 Goldwin's father married a second wife, Katherine, daughter of Sir Nathaniel Dukinfield, fifth baronet, and sister of Sir Henry Dukinfield, sixth and last baronet, rector of St. Giles's, Reading; with his stepmother Goldwin's relations were always distant. Goldwin was named after his mother's uncle, Thomas Goldwin

(d. 1809) of Vicars Hill, Lymington, Hampshire, formerly a Jamaica planter, who distributed by will (proved 16 Nov. 1809) a part of a large fortune among his many nephews and nieces of the Breton family. He owned at his death 'slaves and stock' in Jamaica.

At eight the boy went to a private preparatory school at Monkton Farleigh, near Bath, and from 1836 to 1841 was a collegier at Eton. He boarded in the house of Edward Coleridge, whose nephew John Duke, afterwards Lord Coleridge, was a life-long friend. Henry Fitzmaurice Hallam, son of the historian, was another close companion at school. Goldwin abstained from games and was reckoned reserved and solitary. According to his own account he did not work hard. He only studied classics and chiefly Latin composition. Proceeding to Oxford, he matriculated at Christ Church on 26 May 1841, and benefited little, he said in after life, by the tuition of William Linwood [q. v.]. Next year he was elected demy of Magdalen College, where Martin Routh [q. v.] was president. At Magdalen there were few undergraduates besides the thirty demies. Among these John Conington was the 'star,' and Goldwin was his chief satellite. Roundell Palmer, recently elected a fellow, showed him kindly attention, and their affectionate relations continued through later years. For Magdalen College he always cherished a warm regard. Although he attended Buckland's lectures on geology, his main energies were absorbed by the classics, for which he showed unusual aptitude. He read privately with Richard Congreve [q. v. Suppl. I], and made a record as a winner of classical prizes in the university. The Hertford scholarship fell to him in 1842, and the Ireland in 1845, together with the chancellor's Latin verse prize for a poem on 'Numa Pompilius,' the Latinity of which his friend Conington highly commended. In the same year, too, he won a first class in literæ humaniores, and graduated B.A., proceeding M.A. in 1848. In 1846 he carried off the chancellor's prize for the Latin essay on 'The Position of Women in Ancient Greece,' and in 1847 the chancellor's prize for the English essay on 'The Political and Social Benefits of the Reformation in England.' Thus three years running he recited prize compositions at the enœnia in the Sheldonian theatre. Meanwhile he had contributed Latin verse to the 'Anthologia Oxoniensis' of 1846, some of which was reproduced in the 'Nova Anthologia Oxoniensis'

(ed. A. D. Godley and Robinson Ellis, 1899). Although Smith shone in the society of congenial undergraduates, he was (he wrote) 'unoratoric' and he did not join in the union debates (E. H. COLERIDGE's *Lord Coleridge*, 1904). His views on religious and political questions were from the first pronouncedly liberal. While he admired Newman's style, he was impatient of the Oxford movement and was scornful of all clerical influences. He characterised the pending religious controversy as 'barren.'

When Queen's College, with what was then rare liberality, threw open a fellowship to general competition, Smith's candidature failed, owing as he thought to his anti-clerical views (cf. MEYRICK's *Memories of Oxford*, 1905, whose accuracy Smith disputed). In 1846 however he was elected Stowell law professor of University College; and his career was intimately associated with that college till 1867. But for his first four years there he resided intermittently. With a view to making the law his profession, he had entered as a student at Lincoln's Inn on 2 Nov. 1842, and after taking his degree spent most of his time in London. He saw much of Roundell Palmer, and through his Eton friends came to know Henry Hallam and Sir John Taylor Coleridge. He went on circuit as judge's marshal with the latter, and afterwards with Sir James Parke and Sir Edward Vaughan Williams. But although he was duly called to the bar on 11 June 1850, the law proved uncongenial. He would rather (he wrote to his friend Roundell Palmer) seek fame through 'a decent index to Shakespeare than the chancellorship.' The autumn of 1847 was devoted to a foreign tour with Conington and other Oxford friends. Conington and he were contemplating an elaborate joint edition of Virgil, on which a little later they set seriously to work. Some progress was made with the *Elogues* and the *Georgics*. But the task was ultimately accomplished by Conington alone, who in dedicating the first volume to Smith in 1858 generously acknowledged his initial co-operation. The tour of 1847 extended to France, Italy, Switzerland, and Tirol, and Goldwin visited Guizot at Val Richer. His faith in liberal principles was confirmed by his social experience in London, where his Eton master introduced him to the duke of Newcastle, and he came to know the leading Peelites. But he hoped for progress without revolution, and in 1848 he acted as a special constable during the Chartist scare.

Meanwhile Oxford was stirring his reforming zeal. Already in 1848 he described himself as 'rouge' in university politics (SELBORNE, ii. 195). In 1850 his relations with Oxford became closer on his accepting an ordinary fellowship and tutorship at University in succession to Arthur Penrhyn Stanley [q. v.]. He held the tutorship for four years and the fellowship for seventeen. The current agitation for academic reform attracted him more than normal educational duties. He threw in his lot with those who were attacking clerical ascendancy and were endeavouring to dissipate the prevailing torpor. With Jowett and William Charles Lake [q. v. Suppl. I] he drafted a memorial to the prime minister, Lord John Russell, urging the grant of a royal commission of inquiry into the administration of the university. His hand, too, appears in the vigorously phrased letters in support of the same cause published soon afterwards in 'The Times' above the signature 'Oxonienensis' (*Life of A. C. Tait*, i. 158-9). A royal commission was appointed on 31 Aug. 1850, and Stanley and Smith were made joint secretaries. The report, which was issued on 27 April 1852, approved the relaxation of religious tests, the abrogation of restrictive medieval statutes, the free opening of fellowships to merit, and the creation of a teaching professorate. The government introduced a bill to give moderate and tentative effect to these findings, and Gladstone, who during 1854 piloted the measure through the House of Commons, frequently invited Smith's assistance. On the passing of the Oxford University Reform Act an executive commission was appointed to frame the necessary regulations for the university and the colleges. Of this body Smith again became joint secretary with the Rev. Samuel Wayte, and he was busily occupied with the task for nearly two years until it was completed in 1857. It fell to him to draw the statute which instituted the order of non-collegiate students. The general result fell far below his hopes, but he looked forward to a future advance, now that the ice was broken.

The business of the commission kept Smith much in London, where he widened his intercourse with men of affairs. With A. C. Tait, one of the original commissioners, with Edward Cardwell, and with Sidney Herbert he grew intimate, and he was a frequent guest of Lord Ashburton at the Grange near Alresford, where he met Carlyle and Tennyson.

His leisure in London Smith devoted to journalism of the best literary type.

As early as 1850 he had begun writing for the 'Morning Chronicle,' the Peelite organ, and when the editor of that journal, Douglas Cook, started the 'Saturday Review' in 1855 Goldwin Smith joined his staff. To the first number, 3 Nov. 1855, he contributed an article 'On the War Passages in Tennyson's "Maud,"' in which he betrayed that horror of militarism which became a lasting obsession. He wrote regularly in the 'Saturday' for three years, chiefly on literary themes, for he was out of sympathy with the political and religious tone of the paper. Cook, the editor, described him as his 'most effective pen.' He also occasionally acted as literary critic for 'The Times,' reviewing sympathetically Matthew Arnold's 'Poems, by A' in 1854. His pen was likewise busy in the service of Oxford. To the 'Oxford Essays' he contributed in 1856 an essay on 'The Roman Empire of the West' by his old tutor Congreve, and another on 'Oxford University Reform' in 1858.

In the last year Smith's usefulness and ability were conspicuously acknowledged by an invitation to become a full member of another royal commission of great importance—that on national education, under the chairmanship of the duke of Newcastle. The section of the report issued in 1862 on the proper application of charitable endowments was from his pen. Smith deprecated the suggestion that his services should be recognised by office in a public department. But greatly to his satisfaction, on the nomination of Lord Derby, the conservative prime minister, he was appointed in 1858, without making any application, regius professor of modern history at Oxford. His predecessor was Henry Halford Vaughan [q. v.], and both Richard William Church [q. v. Suppl. I] and Edward Augustus Freeman [q. v. Suppl. I] were candidates for the vacancy. Smith's new post was, he asserted, 'the highest object of his ambition,' but he lacked the qualification of historical training. Abandoning for the moment his journalistic work in London, he settled down at Oxford, as it seemed, for life. Always of delicate health, he built for himself a house to the north of the city, beyond The Parks, in what was then the open country. For many years the house stood alone, but it subsequently became the centre of a populous suburb. The building, which was greatly enlarged after he ceased to occupy it, has since been known as 7 Norham Gardens, and was long tenanted by Prof. Max Müller.

Goldwin Smith delivered his inaugural

lecture as regius professor early in 1859. It was an eloquent and temperate plea for widening the old curriculum. Here, as in nearly all his subsequent public professorial lectures, his aim was to stimulate the thought and ethical sense of his hearers rather than to teach history in any formal way. His elevated intellectual temper broadened his pupils' outlook while his political fervour won adherents to his opinions. In private classes he was suggestive in comment, but he failed to encourage research, for which he had small liking or faculty. Controversy was for him inevitable, and he did not confine his controversial energy to the domain of history. In an early public lecture on the 'Study of History' he somewhat ironically imputed an agnostic tendency to H. L. Mansel's metaphysical Bampton lectures of 1858. Mansel complained of misrepresentation, and Smith retorted, with a thinly veiled sceptical intention, in 'Rational Religion and the Rationalistic Objections of the Bampton Lecturer of 1858.' With Bishop Wilberforce he was even in smaller sympathy than with Mansel. In 'The Suppression of Doubt is not Faith, by a Layman' (Oxford, 1861) he attacked some of the bishop's sermons and pleaded openly for the rights of scepticism. In a second tract, 'Concerning Doubt' (Oxford, 1861), he defended his position against the published censure of 'A Clergyman.'

In 1861 Smith collected into a volume five lectures on modern history. The fourth, 'On some Supposed Consequences of the Doctrine of Historical Progress,' was a suggestive contribution to political philosophy, and the fifth, 'On the Foundation of the American Colonies,' approached nearer than any other to the historical sphere and gave him an opportunity of proclaiming his democratic ardour. In Michaelmas term 1859 King Edward VII (then Prince of Wales) matriculated at Oxford, and Goldwin Smith gave him private lectures in modern history at the prince's residence at Frewen Hall. Goldwin Smith expressed a fear that he bored his royal pupil, but he was impressed by the prince's admirable courtesy, and the prince always treated him with consideration in later life (THOMPSON'S *Life of Liddell*). An invitation to accompany the prince on his Canadian tour of 1860 was declined, on the ground of Smith's duties at Oxford. In general university politics he continued to act with the advanced party, and warmly pleaded for a fuller secularisation of endowments. In

regard to national politics he proved in the university an effective radical missionary. He supported Gladstone through the period of his liberal development. 'Young Oxford,' he wrote to the statesman (June 1859), 'is all with you; but old Oxford takes a long time in dying' (MORLEY'S *Gladstone*, ii. 630). His 'wonderful epigrammatic power' won him respect. 'With all his bitterness,' wrote J. B. Mozley to his sister, 'he is something of a prophet, a judge who tells the truth though savagely.' Prof. George Rolleston, Prof. H. J. S. Smith, and Prof. J. E. Thorold Rogers were his closest friends among resident graduates of his own way of thinking, but he maintained good relations with some leaders in the opposite camp. With (Canon) William Bright [q. v. Suppl. II], who was a fellow of University during Smith's residence there, he formed, despite their divergences of opinion, a close intimacy.

Public affairs distracted Smith's attention from the work of his chair, and he soon flung himself with eager enthusiasm into the political agitation of the day. From the Peelites he had transferred his allegiance to Cobden, Bright, and the leaders of the Manchester school. With a persistence which never diminished he preached the school's doctrines of universal peace and freedom, and the duty of refusing responsibilities which condoned war or persecution. His admirable style, his power of clear and eloquent expression, and his passionate devotion to what he deemed to be righteous causes fitted him for a great pamphleteer, and he developed some capacity for carefully premeditated public speaking. The imperialistic trend of public opinion, which he identified with a spirit of wanton aggression, and the Irish discontent first brought him prominently into the political arena. In 1862-3 he contributed to the 'Daily News' a series of letters on 'The Empire' which were collected with some additions in a volume in 1863. He argued for what he called 'colonial emancipation'—for the conversion of the self-governing colonies into independent states. He advocated the abandonment of Gibraltar to Spain, declared his belief that India would be best governed as an independent empire under an English emperor, and described the Indian empire in its existing guise as 'a splendid curse' (letter to John Bright). Smith hailed the cession by Lord Palmerston's government of the Ionian Isles to Greece in 1862-3 as a step in support of his own principles. His views, which attracted much attention,

offended a large section of the public. The colonial press, especially in Australia, hotly repudiated them (cf. Sir G. F. BOWEN, *Thirty Years of Colonial Government*, 1889, i. 209; letter from Bowen to Gladstone, 18 Aug. 1862). Disraeli in the House of Commons ridiculed 'the wild opinions' of all professors, rhetoricians, prigs and pedants (*Hansard*, 5 Feb. 1863), and thenceforth he habitually imputed a mischievous tendency to Smith's political propaganda.

In 1862 Smith visited at Dublin his friend Cardwell, who was chief secretary for Ireland, and in the same year issued 'Irish History and Irish Character.' He divided the blame for the miseries of Ireland between English misgovernment, which disestablishment of the Irish church and revision of the land laws might correct, and defects of Irish character, which were irremediable.

But Smith's interests were soon absorbed by the civil war in America. His antipathy to war at first led him to doubt the adequacy of the federal cause, and to favour the claim of the South to the right of secession. But the eloquence of John Bright, which always powerfully influenced him, convinced him that the main principle at stake in the conflict was the liberation of the slave, and before long he engaged with fiery zeal in the agitation in England on behalf of the federal government. He first appeared on a political platform at the Free Trade Hall, Manchester, on 6 April 1863, at a meeting of the Manchester Union and Emancipation Society, which Thomas Bayley Potter [q. v.] had formed in the federal interest and was supporting at his own cost. Smith protested with sombre earnestness 'against the building and equipping of piratical ships in support of the Southern slaveholders' confederacy' (J. F. RHODES, *Hist. of the Civil War*, iii. 470). Soon afterwards, at the Manchester Athenæum, he lectured on 'Does the Bible sanction American Slavery?' and answered the question in the negative. In the same year he published a pamphlet attesting 'the morality of the emancipation proclamation.'

Next year he resolved to visit America to carry to the North a message of sympathy from England. He landed on 5 Sept. 1864 at New York and saw much of the country during some three months' stay. At Washington, where he was the guest of Seward, the secretary of state, he was received with characteristic absence of ceremony by President Lincoln, whose precise and minute information impressed

him (A. T. RICE, *Reminiscences of Lincoln*, 1886). He visited the federal camp before Richmond on the Potomac and conversed with General Butler. At Cambridge, Massachusetts, he met C. E. Norton and Lowell, and at Boston, where he witnessed the presidential election (9 Nov.), he saw Emerson and the historian Bancroft. At Providence, Brown University conferred on him the degree of LL.D. Chicago and Baltimore also came within the limits of his tour (*Proc. Mass. Hist. Soc.* Oct. 1910, account of Smith's visit, pp. 3-13). In letters to the London 'Daily News' he described some of his experiences, and commended the steady purpose of the North and its grim determination to make the South submit. The confederate press abused him roundly, but he was enthusiastically received by the federals, and before he left America the Union League Club entertained him at New York (12 Nov. 1864), when he expressed abounding sympathy with the American people.

Until the final triumph of the North, Smith continued its defence among his countrymen. A pamphlet 'England and America' (1865) effectively sought to bring the sentiments of the two countries into accord. At the meeting which saw the disbandment of the Manchester Union and Emancipation Society in Jan. 1866 he spoke with optimistic eloquence of America's future. 'Slavery,' he said, 'is dead everywhere and for ever.' 'By war no such delivery was ever wrought for humanity as this.'

Next year he engaged with wonted heat in another agitation. In 1867 he joined the Jamaica committee which was formed to bring to punishment Governor Eyre for alleged cruelties in suppressing a rebellion of negroes. J. S. Mill was the moving spirit of the committee, and with him Smith grew intimate. An opposing committee in Eyre's favour, of which Carlyle, Kingsley, Tennyson, and Ruskin were members, drew from Smith much wrathful denunciation; Ruskin's championship of what Smith viewed as cruelty excited his especial scorn, and a rancorous controversy followed later between the two men. In the interests of the funds of the Jamaica committee, Smith went about the country delivering a series of four 'Lectures on three English Statesmen'—one each on Pym and Cromwell and two on Pitt. These he published in 1867 with a dedication to Potter. His powers of historical exposition are here seen to advantage, but an irrepressible partisan fervour keeps the

effort within the category of brilliant pamphleteering. With other philosophical radicals he co-operated in 'Essays on Reform' (1867), writing on 'Experience of the American Commonwealth.' Robert Lowe taxed Smith with an extravagant faith in democracy when he criticised the volume in the 'Quarterly Review' (July 1867).

Private anxieties unsettled Smith's plans. His father during 1866 had been injured in a railway accident; his mind was permanently affected, and he found relief only in his son's society. Smith was constantly at Mortimer House, and the frequency of his enforced absences from Oxford led him to resign his professorship in the summer of 1866. While he was away from home during the autumn of 1867 his father died by his own hand (7 Oct. 1867). Goldwin and his step-mother were executors of the will, which was proved on 30 Oct. by Goldwin for under 30,000*l.* and gave him a moderate competence. The shock powerfully affected Smith's nerves. The increase of private fortune again changed his position at Oxford; it disqualified him for his fellowship at University College, which was only tenable by men of smaller means. At Easter 1867 he had been chosen honorary fellow of Oriel—the college which, under the new statutes of 1857, had contributed 250*l.* a year to his professional salary—but no closer tie with the university remained.

Uncertain as to his prospects, Smith determined to revisit America. A rumour that he was leaving England for good quickly spread. Dean Church communicated it to Asa Gray on 17 Jan. 1868 (*Life of Church*, p. 24). In a letter to the 'New York Tribune' of the same date Smith explained that he had resolved on 'a prolonged residence in America in order to study American history.' His place of settlement was as yet undetermined. He had no intention of becoming an American citizen (cf. reprint in *The Times*, 11 Feb. 1868). In the spring of 1868 Andrew Dickson White, who had been appointed president of the newly projected Cornell University in Ithaca, New York State, arrived in England with a view to securing the aid of English teachers in the new venture. Smith had met Ezra Cornell, the founder of the institution, in 1864, and he strongly approved Cornell's design of endowing a university for comparatively poor men which should be free of all religious restrictions. Dickson's offer to Smith of a chair on the new foundation was accepted. Smith agreed to become first professor of

English and constitutional history at Cornell University. As he desired to be wholly untrammelled by conditions of service, he declined remuneration. His political friends who had urged him to enter the House of Commons at the imminent general election lamented his decision. Chelsea was vainly pressed on him as a safe seat. There was talk of his candidature for the city of Oxford, where he had lately helped to found an Oxford Reform League (17 July 1866). He promised to stay in England and help the party till the coming general election was over. At the Manchester Reform Club he made (10 April 1868) a long speech on current political questions, which drew the censure of a leader writer in 'The Times' (13 April). He declared he would remain a good Englishman wherever he was. To Samuel Morley [q. v.], an organiser of the party, who again pressed him to stay at home, he replied that 'a student's duty' called him elsewhere. Later in the year he actively promoted the candidature of A. J. Mundella at Sheffield.

Smith's resolve of exile, to which many motives contributed, was doubtless influenced to some extent by disappointment at the slow advance of the cause of reform in the university. Amid other political distractions he had always found time for an active share in the current agitation for the complete abolition of tests at both universities. At an influential meeting in support of legislation on the subject held in the Freemasons' Tavern in Great Queen Street, London, on 10 June 1864 he was a chief speaker, and he published a powerful pamphlet on the question in the same year. There he seems for the first time to have applied the term 'the Free churches' to the dissenting persuasions. No legislation for the abolition of tests was passed till 1871 (L. CAMPBELL, *On the Nationalisation of the Old English Universities*, 1901).

Goldwin Smith's farewell to Oxford took the form of a pamphlet on the 'Reorganisation of the University' (1868). After regretting the limited character of the reforms of 1854, he pleaded for university extension, for the raising of the standard of pass examinations, for the separation of prize and teaching fellowships, for the marriage of fellows, and for various changes of administration. He dissociated himself from the cry for the endowment of research. But he privately urged on the University Press the preparation of a standard English Dictionary, and he recommended that new provincial universities, the creation of which he foresaw, should

undertake technical instruction in some kind of affiliation with Oxford and Cambridge, while the two old universities should still confine their efforts to the humanities. He sought to preserve Oxford from discordant features of industrial progress, and in 1865 had by speech and pen actively resisted the choice of the city as the site of the Great Western railway's factories and workshops. He had, too, encouraged the volunteering movement of 1859, and had joined the university corps, but he deprecated the increasing zeal for athletic sports, and he always regarded the college rowing races as largely misapplied energy.

Smith left England for Cornell University on 25 Oct. 1868, and although his life was prolonged for another forty-one years and he paid frequent visits to his native country, his place of permanent residence thenceforth lay across the Atlantic. He reached Ithaca in November 1868, a month after Cornell University opened and long before the university buildings were erected. He entered with energy on the duties of his chair. Residence was not compulsory, but he took lodgings at first in an hotel, and then at 'Cascadilla,' a new boarding-house for the professors. The two years and more during which he watched at close quarters and with fatherly devotion the growth of the new institution were, he always declared, save for the time spent at Magdalen, the 'happiest of his life.' He cheerfully faced the discomforts of the rough accommodation and always cherished pleasant memories of his intercourse with his nine colleagues, who included Alexander Agassiz the naturalist, George William Curtis, Bayard Taylor, and Lowell, whom he had already met at Cambridge. He sent for his library from Oxford and subsequently presented it to the university with a small endowment fund (\$14,000). He wrote to his friend Auberon Herbert to send out English stonemasons and carvers to work on the new university structures. In the 'campus' he placed a stone seat inscribed with the words 'Above all nations is humanity.' To John Bright he wrote (from Ithaca, 6 Sept. 1869) of his kind reception, and that only a little more health and strength was needed to make him 'altogether prosperous and happy.'

While at Cornell, intercourse with friends in England was uninterrupted, and he exchanged free comment with them on the public affairs of the two countries. Amid his academic work, he was soon disquieted by the course of current politics in America.

During 1869 a popular outbreak of bitter hostility to England sprang out of the negotiations concerning the Alabama's depredations and the old disputes over Canadian boundaries and fisheries. Smith's first publication on American soil was a pamphlet called 'Relations between England and America' (Ithaca, May 1869), in which, at the beginning of the storm, he defended England's political aims and morality from the severe strictures of the American statesman and orator, Charles Sumner. The effort proved of small avail, and 'hatred of England' grew. On 7 Dec. 1869 he wrote from Ithaca to his friend T. B. Potter, 'The feeling is still very bad, especially in New England, and everything we say and do, however friendly, turns sour, as it were, in the minds of these people.' Among the people at large he was, however, hopeful of a better tone, but 'the politicians one and all' he denounced as 'hopeless'—as 'a vile crew quite unworthy of the people.' His perturbation was the greater because the principle of protection was making rapid headway, and the doctrine of free trade which he sought to propagate in the United States was repudiated as a piece of British chicanery, devised for the ruin of American manufacturers. The political and economic situation in America continued to occasion him grave concern through the early months of 1870. Nor was it lessened by an unwelcome reminder from home of his recent political activity there. Disraeli on the platform had already sneered at him as an 'itinerant spouter of stale sedition' and as a 'wild man of the cloister going about the country maligning men and things.' In 1870 the statesman published his 'Lothair,' and there he rancorously introduced an unnamed Oxford professor 'of advanced opinions on all subjects, religious, social and political, of a restless vanity and overflowing conceit, gifted with a great command of words and talent for sarcasm, who was not satisfied with his home career but was about to settle in the New World. Like sedentary men of extreme opinions he was a social parasite.' The attack stung Smith, and he injudiciously replied in a letter to 'The Times' (9 June 1870) in which he branded Disraeli's malignity as 'the stingless insults of a coward.' Smith's retort bore witness to an extreme sensitiveness linked with his reckless aggressiveness. Thenceforth he lost almost all self-control in his references to Disraeli, and with an illogical defiance of liberal principle seized every

opportunity of assailing Disraeli's race. The 'tribal' character of the Jews and their unfitness for civic responsibilities in Christian states was a constant theme of his pen in middle life. On such grounds he went near justifying the persecution of the Jews in Russia and other countries of Eastern Europe.

In the autumn of 1870 Tom Hughes, Prof. A. V. Dicey, and Mr. James Bryce visited Smith at Cornell and saw him at his work. In the same year he made a tour in Canada, going as far as what was then the village of Winnipeg. This experience combined with a certain disillusionment in his views of American politics led him to alter his plans. Several cousins were settled at Toronto, and early in 1871 he left his comfortable quarters at Ithaca for the residence at Toronto of his relatives Mr. and Mrs. Colley Foster. It was thus that Toronto became his home for life, and his professorial labours at Cornell came gradually to an end. He paid frequent visits to the university till the end of 1872, when he formally resigned his resident professorship. He was thereupon appointed non-resident professor, and in 1875 he was also made lecturer in English history, but thenceforth he gave only occasional lectures. He ceased to be professor in 1881, but retained the lectureship till 1894, when he received the title of emeritus professor. He never ceased to speak with satisfaction of the part he played in the inauguration of Cornell University. Till his death he deeply interested himself in its welfare.

On 3 Sept. 1875 he married at St. Peter's, Toronto, a lady of wealth, Harriet, daughter of Thomas Dixon and widow of Henry Boulton of The Grange, Toronto. That old-fashioned house had been built by Boulton's father in 1817. There Smith lived in affluence from his marriage till his death. His wife, who was born at Boston in 1825, was his junior by two years. He spent many vacations in Europe, travelling in Italy on his latest visit in 1889; he also twice crossed Canada to the Pacific coast, and was always a frequent visitor to the United States. But he grew attached to The Grange, and disliked the notion of living elsewhere.

As soon as he settled in Toronto Smith zealously studied colonial life, and sought his main occupation in journalism. Although he wrote much on current literature, on religious speculation, and on the public affairs of the European continent, he applied his pen chiefly to the politics of

Canada, England, and the United States. He adhered with tenacity and independence to the principles which he had upheld in England, and maintained warfare with undiminished vehemence on militarism, imperialism, and clericalism. In Canadian politics he always described himself as an onlooker or a disinterested critic. His favourite signature in the Canadian press was that of 'A Bystander,' a fit title he declared for 'a Canadian standing outside Canadian parties.' But his genuine ambition was to mould public opinion; he contemplated in 1874 finding a seat in the Ontario legislature and never shrank from close quarters with the political conflict.

On arriving in Toronto in 1871 he became a regular contributor to the 'Toronto Globe,' an advanced radical organ owned and edited by George Brown [q. v. Suppl. I.]. A laudatory review by Smith of George Eliot's 'Middlemarch,' which offended the religious and moral susceptibilities of many readers, led to his withdrawal from the paper. The consequent quarrel with Brown moved Smith to aid others in the establishment of the 'Toronto Evening Telegram,' of which he was a staunch supporter, and to start a series of short-lived weekly or monthly journals of his own, in which he expounded his political and religious creed without restriction. His first venture, 'The Nation,' ran for two years (1874-6). 'The Bystander,' the whole of which came from his own pen, was a miscellany notable for its variety of topic and lucidity of expression; it was first a monthly and then a quarterly (1880-3). The 'Leader' and the 'Liberal' enjoyed briefer careers. The 'Week,' to which he contributed a weekly article signed 'A Bystander,' lasted from 1883 to 1886. At the same time his pen was active in a newly founded magazine, at first called 'The Canadian Monthly,' and afterwards 'The Canadian Magazine'; there he regularly wrote both literary and political essays from 1872 to 1897. He was subsequently the contributor of a weekly article on current events, again signed 'A Bystander,' to a weekly paper known at first as 'The Farmers' Sun' and afterwards as 'The Weekly Sun.' There was indeed scarcely any newspaper in Canada to which he failed to address plainly worded letters, and the lucid force of his style did much, despite the unpopularity of his opinions, to raise the standard of writing in Canadian journalism. At the same time in the United States he found in the New York 'Nation' and in the 'New York Sun' further outlets
